—The new plant of the Ford Motor Company in Highland Park, Detroit, has been opened in all its departments. Operations have been conducted there on a liberal scale, although much of the work was done in the old Piquette avenue plant while the power house for the new plant was being put in commission. Now the scene has shifted, and henceforth the new plant will be the real center of activity. The plant will employ 4,500 men, and has a daily capacity of 240 complete cars.

—Three additional agencies were opened in Boston during the past few days. I. Ross Lippard, general manager of the Victor Motor Truck Company, of Buffalo, placed an agency for his line with the Curtis-Hawkins Company, handlers of the Speedwell in the Hub. Fisher and Allison, of the Prestolite Company, formed the Empire Motor Car Company to handle the Empire "20" in Massachusetts, with headquarters at 94 Massachusetts avenue, and the Kline agency was opened with salesrooms in the Motor Mart, Park square, with N. L. Rush as manager.

—Arrangements have been made for exhibiting Overland cars at the Paris and London auto shows this winter. S. Krauss, manager of the foreign department of the Willys-Overland Company, has just returned from a trip of 7,000 miles by motor car, through England, France, Germany, Belgium, Holland, Denmark, Norway, Sweden, Russia, Austria and Hungary. He had the distinction of being the first American tourist to take advantage of the Tryptique system. In many sections traversed it was the pioneer invasion of the American car and attracted much attention.

—At the adjourned meeting of the Wisconsin State Automobile Association in Milwaukee the following additional directors were elected: R. D. Gorham, Monroe; J. E. Plum, Manitowoc; P. C. Avery, Milwaukee; C. H. Moore, Oakfield; John W. Tufts, Milwaukee; C. D. Dickinson, Appleton; Emil Schandein, Milwaukee; A. P. Cheek, Baraboo; H. O. Deysonroth, Columbus; Dr. R. W. Edden, Janesville. The board is now made up of 25 members, and each local club is represented.

Will Sell Drop Forgings and Die Castings

Incorporation papers are being put through this week for a large selling company that will handle the entire output and be the sole representative of the Billings & Spencer Company, of Hartford, Conn., large producers of drop forgings and tools, and the E. B. Van Wagner Manufacturing Company, of Syracuse, N. Y. Negotiations are under way with two or three other companies.

The name of the corporation will be Claire L. Barnes & Company, and the capital stock is $30,000. Claire L. Barnes will be president and general manager. The general offices will be in Chicago, with branches in Detroit and New York.

Mr. Barnes remains an official of the Billings & Spencer Company, and will also become an official of the E. B. Van Wagner Manufacturing Company. He was secretary of the Detroit Steel Products Company until he resigned to become sales manager of the Billings & Spencer Company. He is director in the Motor & Accessory Manufacturers' Association.

American Fiat Factory's First Cars

The Fiat Company, of Turin, Italy, has just attained the realization of a project which they had determined upon nearly three years ago, namely, the operation of a factory in the United States for the simultaneous production here of such of its models as are in greatest demand in America.

The demonstrating cars of the 35-horsepower 1911 model will be shown to the public in Turin and in New York at the same relative hour.

Like all Fiat models, this new car is built entirely in the Fiat works, many of the more vital parts, especially those composed of special alloy steels, being furnished by this company's Turin shops. The American factory is at Poughkeepsie, N. Y.

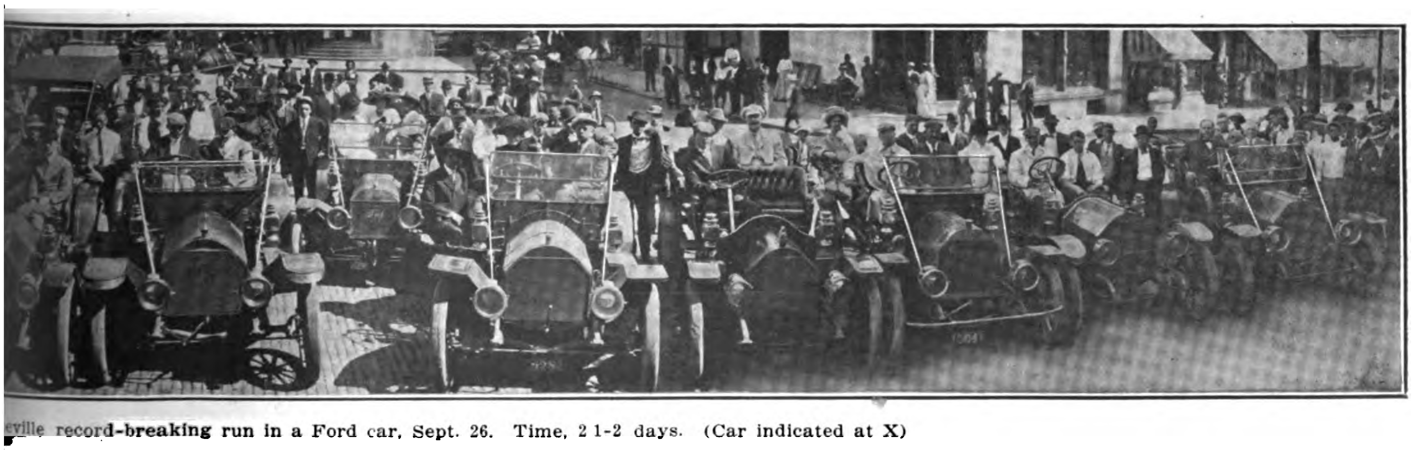
Worcester Club Leases Old Quarters

WORCESTER, MASS., Oct. 24—The governors of the Worcester Automobile Club held a special meeting at their temporary headquarters in the Bay State House, Friday night, and voted in thirty-four new candidates for membership, twenty-nine of which were formerly members of the Hancock Club, which recently voted to merge with the local automobile club.

The plan of taking over the Hancock club house at Lincoln Square, which was talked of by the officers and board of governors of the Worcester Automobile Club, has been dropped and the old quarters re-leased with several more rooms.

The new rooms of the club or the old ones which were destroyed by fire will be completed by the first of the year and will be far superior to the old suite in every way.

Included in the new headquarters will be two dining rooms, two card rooms, ladies' reception room, ladies' dining room, reading room, billiard room, Dutch room, library and office, besides a large general reception room.



ville record-breaking run in a Ford car, Sept. 26. Time, 2 1-2 days. (Car indicated at X)

Prominent Automobile Accessories

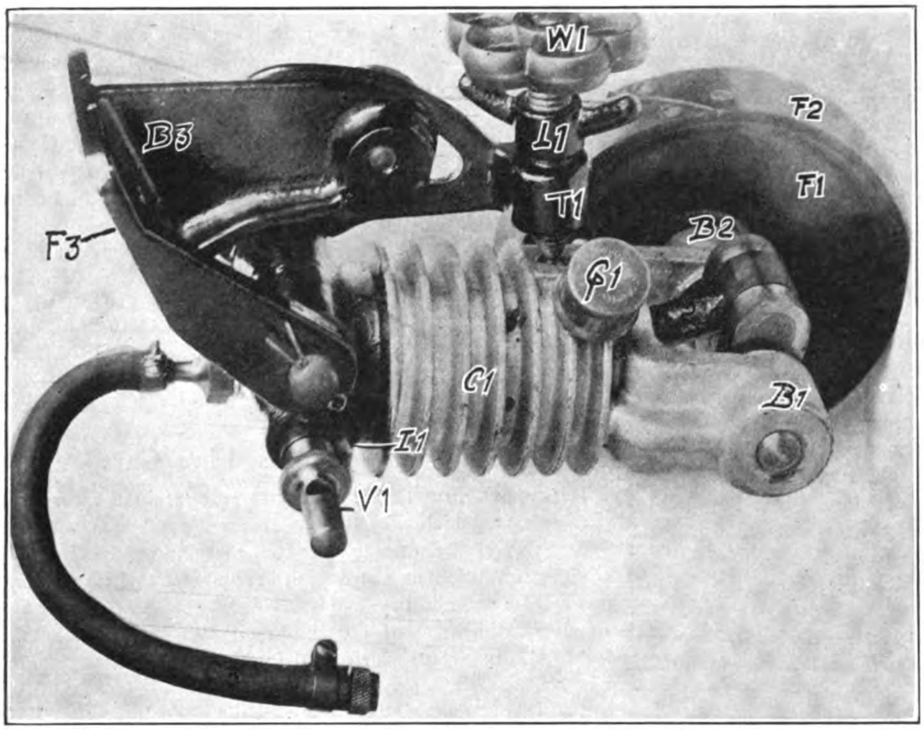


Fig. 1—Tryon tire pump made to take its power from the flywheel of the motor of the automobile and whistle when the tire is inflated

FOR INFLATING AUTOMOBILE TIRES

Next to maintaining tires in good condition, free from open wounds, it is necessary to maintain the tire pressure so high that flexure will be avoided, otherwise the life of the fabric will be reduced below the point of economy, even to the level of the commercially impossible. The tire pump as illustrated in Fig. 1 offers a fine opportunity to keep the tires properly inflated, which is more than can be expected from a motorist on a hot Summer day using a hand pump of no great pretension.

This pump is comprised of a cylinder C1 of cast gray iron, fastened to the bracket B3 of bronze, and air is sucked into the cylinder, due to reciprocation, when the flywheel F1 is brought into contact with the flywheel of the motor, the face F2 of the flywheel F1 being covered with leather, so that the friction will be adequate for the intended purpose when the tightening screw T1 is screwed up by turning on the wheel W1, after which it is locked by the wing-nut L1. The crankshaft rotates in bearings B1 and B2, and the connecting rod C2, of bronze, is provided with liberal bearings at pin and cross head so that the whole structure is substantial and well made.

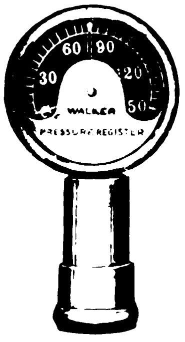

Fig. 2—A device to register tire pressure

The device is fastened to the chassis frame at a point opposite the flywheel of the motor, and the face F3 of the bracket B3 is wide, and finished accurately, to accommodate itself to the rest it is given on the web of the chassis frame. Air, under proper pressure, leaves the pump through the hose connection C3. When the air is pumped into the tire to be inflated up to the desired pressure, a whistle in the valve V1 makes a shrill sound, warning the automobilist of the fact, and an indicator I1 on the side of the valve V1 tells how much pressure is in the tire. This pump is made by the Tryon Auto Pump Co., with headquarters at 1733 Broadway (Room 205), New York City. Thos. Jacobs is president of the company, and the inventor, E. E. Tryon, is vice-president; Arthur W. Leonard is secretary.

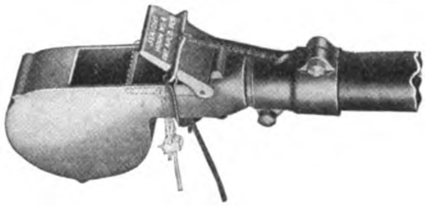

Fig. 3—Signal operated by the exhaust

JERICHO MOTOR CAR SIGNAL

As will be seen from Fig. 3 this instrument or whistle is placed on the outlet of the exhaust pipe and secured to it by a double clamp coupling. Made from aluminum and compact in size, the attachment adds but little extra weight to the car. As all the necessary fittings are supplied, occasional lubrication and cleaning is all that is required. This horn is manufactured by the Randall-Faichney Company, Boston, Mass.

TO SAVE THE HANDS IN WINTER

To prevent the hands from chafing and protect them from the cold in Winter the "Eze-Grip" removable wheel cover (Figs. 4 and 5) should fill a long-felt want. It is considerably more elegant than binding twine round the wheel and in the event of wet can be unlaced and speedily removed. It is made of soft, pliable leather either in black or tan and lined with soft wool felt. It is made by the Hayne Surridge Commission Co., Lucas avenue, St. Louis, Mo.

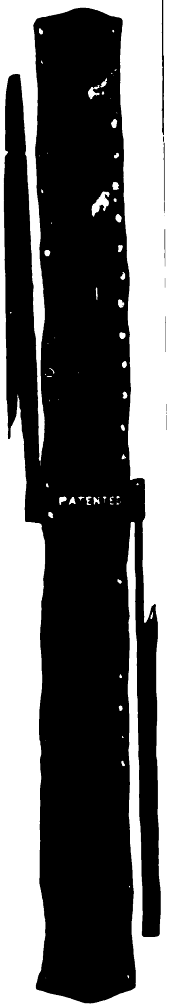

Fig. 4 — "Eze-Grip" unwrapped

PRESSURE REGISTER

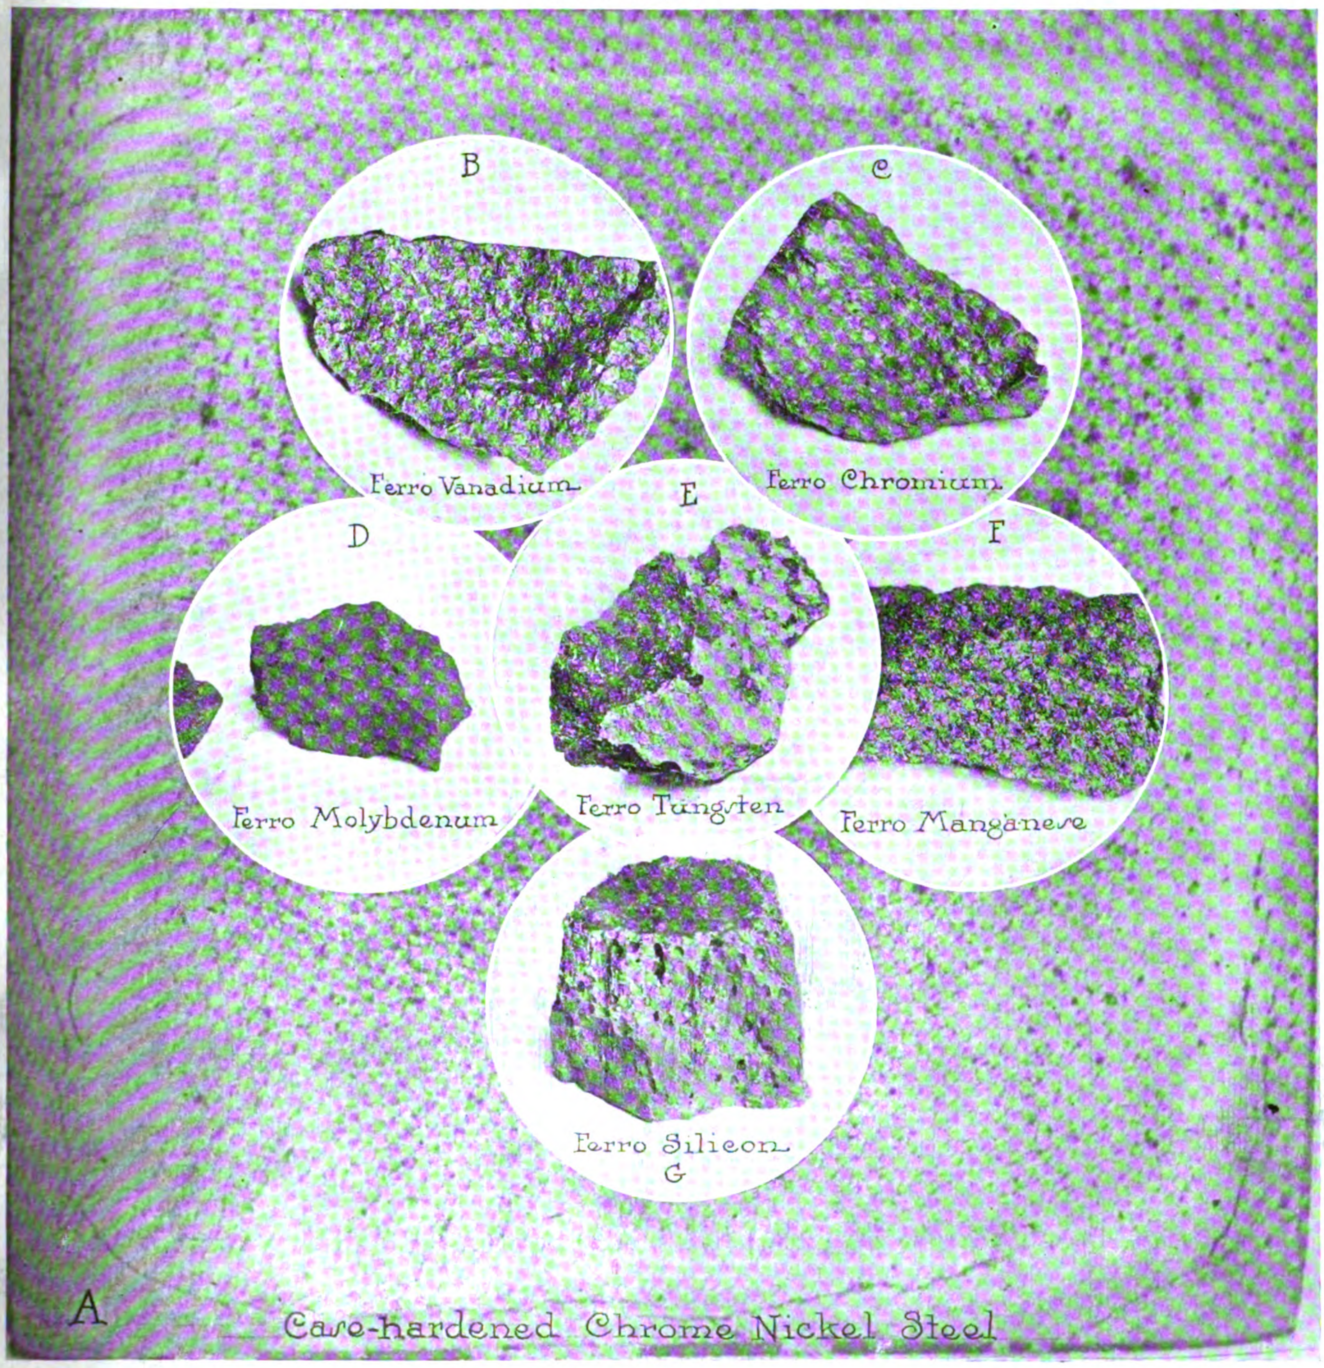
The latest tire gauge to be marketed by H. W. Walker, of Syracuse, N. Y., is known as the Walker Tire Pressure Register, No. 2 (Fig. 2). This is a small register, three inches long and designed so as to be easily carried in the vest pocket. This gauge is fully guaranteed to be accurate and reliable by the manufacturer.

Fig. 5—"Eze-Grip" applied to steering whee

VOL. XXIII NEW YORK—THURSDAY, NOVEMBER 3, 1910—CHICAGO No. 18

THE AUTOMOBILE

PROBLEMS OF STANDARDIZATION



PROGRESS in the automobile art has been so rapid that the questions of standardization have been handled as the natural result of practical effort without any attempt to direct the issue. In some ways it has proven to be advantageous to "cut and try" rather than to fix upon a standard only to find as the result of practice that the standard itself was cramped. Within the year the leading engineers, realizing the short-comings of a too rapid growth, took the time to assemble at Detroit,

H

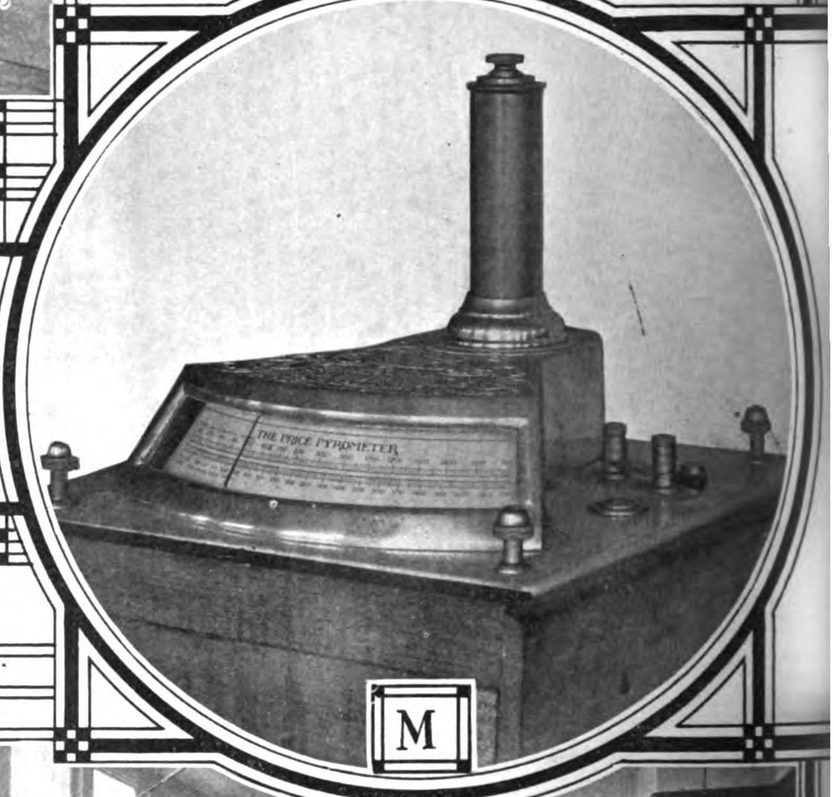
under the auspices of the Society of Automobile Engineers, devoting themselves to the good of the industry, with particular reference to the questions of standardization. Excellent headway was made and a plan of campaign was mapped out such as should resound in the building of better automobiles, with a two-fold direct advantage, *i. e.,* (a) the elimination of extravagances in the various manufacturing processes, and (b) the purchase and use of more appropriate and regular grades of raw material.

Many of the problems that have to be coped with are almost beyond the province of the automobile engineer. Take steel as an illustration of the point to be made; if the policy of any given maker of automobiles is such that the engineering department of the same company is compelled to use steel from a mill that is devoted to "quantity production," the probability of obtaining a good automobile out of quantity steel is in the ratio of 1 to 1,000,000. The fact remains that the engineer in charge will not be able to outshine his Board of Directors, so, that no matter how skillful the design may be, it will become

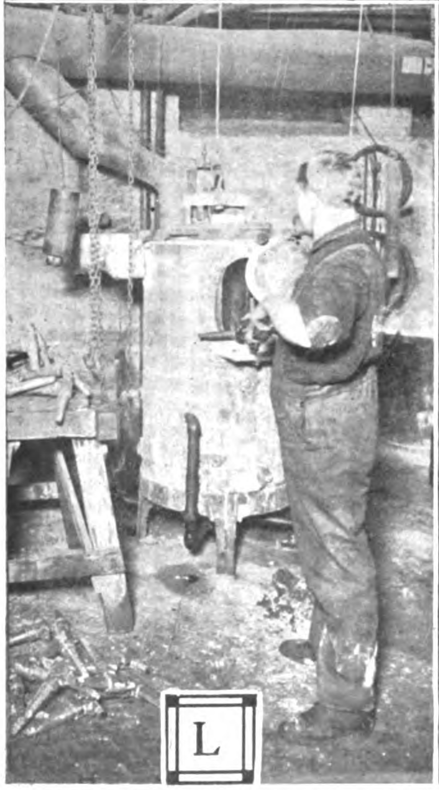
I

J

K

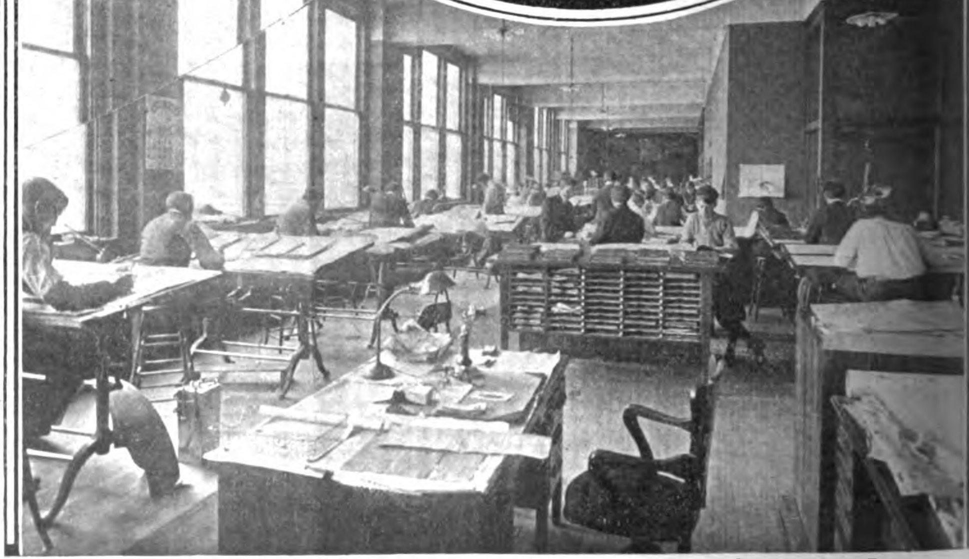


M



L

N



a monument to the stupidity of the concern that inflicts it upon an unsuspecting clientele.

The illustrations here afforded are offered as suggesting a line of thought, and referring to Fig. N of a commodious, well-lighted, and altogether comfortable designing establishment, the thought occurs that such a fine place devoted to the methods of giving concrete expression to the official thoughts of an official engineering corps could be of no lasting value in the face of commercial domination of the character that would compel the use of quantity-produced steel in the building of the product.

Every designer, when he starts out to fashion a part, must decide as to the strength and appropriateness of the material he proposes to use in order that he will be able to fix upon the percentage of the ultimate strength that is safe to preempt, taking into account the kinetic qualities of the material if the work is of a kinetic character, or the static ability of the steel if the load is quiescent. What a waste of time, then, to discover that the purchasing officer of the company is instructed by its Board of Directors to patronize a quantity mill.

Electric Refining of Steel Promises a Future

Of what possible avail will it be to claim that automobiles are up to the highest obtainable standard if the material used therein does not check up with the high claim? In the October issue of *Metallurgical and Chemical Engineering,* Joseph W. Richards reviewed the conditions as they obtain in Germany, taking cognizance of the refinements there made in the production of steel, utilizing electric furnaces, and he states on page 563: "A prominent American mechanical engineer, on returning from Germany, declared that the Germans were fifteen years ahead of the United States." The article deals with the electric production of steel at the Stahlwerke Rich. Lindenberg, Aktien Gesellschaft at Remscheid-Hasten; and in concluding Mr. Richards says: "Americans, wake up!"

In describing the qualities of electrically refined steel in THE AUTOMOBILE of September 15, it was pointed out that the quality of the fabric is better, considering a given grade of ores, that the metalloids are less deleterious in their action, and that the process is one that offers wide possibilities beyond the realization of the present time in so far as production is tied down to old and less efficacious methods.

Alloy steel has been developed to a high state in response to automobile requirements, and yet many automobile engineers have had but poor experience with the alloyed fabrics. It is not uncommon to find that an inferior grade of steel is rendered even less fit, due to the mingling of alloying elements, but those of the fabricators of steel who are mostly concerned about the size of their dividends take advantage of high-sounding phraseology, wasting good alloying elements in a poor field, and make up for lack of quality by loudness of talk long enough to inflict an impossible product onto the attention of an unfortunate engineer, making the same charge as if the very quality they talk about were present.

It seems to be the habit to charge a minimum of about 12 cents per pound for a fabric carrying chromium and nickel. An inferior grade of relatively high carbon steel that is doped with these elements is as easy to machine as a hunk of flint. Paying 12 cents per pound for this impossible material is a mere detail; it costs $12.00 per pound to machine it. On the other hand, there are grades of chrome-nickel steel that are marvelously strong, and their kinetic qualities are pronounced, notwithstanding which fact tooling is not difficult, considering, of course, the use of modern machinery equipment and the use of tungsten steel for the cutters.

In the same way, alloying with vanadium in conjunction with nickel or chromium, or both, or using vanadium alone, brings home to the ambitious designer the fullest compensation for his effort, if, perchance, the vanadium is used under proper conditions in a suitable grade of steel; but if the vanadium becomes a mere means for an advertising end, the steel is as unruly as a mad elephant in the hands of the machinists who do the work, and as irresponsible as a fire bug in the hands of the purchaser of the automobile.

From the point of view of the progressive engineer who is not swayed from his intelligent course by a blind Board of Directors, there is work to be done on the problems of standardization far beyond that as ordinarily outlined, and it is a question as to whether or not the agents of the fabricators of steel should be permitted to participate in the deliberations, it being the case that steel mills should furnish what is ordered rather than to tell engineers what they should use. Every effort, thus far, to bring about a condition of standardization of material has proven to be futile, due to the influence of the agents of the steel makers who give a wide variety of reasons why the mills should be permitted to work to a specification that has had its legs or its arms amputated and charge a price that is surely enough to pay for the fullest measure of extremities. What the automobile man wants is the best grade of steel that can be had in France, Germany, or Hongkong, at a price that should not exceed half of the 12-cent level that seems to be so fashionable in quotation circles

---

Descriptive Captions of the Illustrations Accompanying This Article

A—Specimen of Lindenberg chrome nickel steel known as brand C N S-2 in the case-hardened state, enlarged to show the thickness of the shell, with the soft core Bendayed to bring out in relief the shell proper. The strength of this material in this state is 285,000 pounds per square inch tensility, with an elastic limit of 280,000 pounds per square inch, and at contraction of 8 per cent. in 2 inches on a ½-inch diameter test proof, with a reduction of area of 30 per cent. The chemical composition of this metal is 4.5 per cent. nickel, 2 per cent. chromium, and 0.10 carbon. The metalloids run, phosphorus 0.015, and sulphur 0.015, the manganese was 0.3, and the silicon 0.2.

B—Specimen of ferro-vanadium containing 25 per cent. vanadium. This material has a melting point of 3,055 degrees Fahrenheit and a specific weight of 5.5. Vanadium is used in certain types of automobile steel, sometimes with carbon alone, and in other cases with chromium.

C—Specimen of ferro-chromium containing 66 per cent. chromium, 2.3 per cent. carbon, and 31.7 per cent. iron. The melting point of chromium is 2,910 degrees Fahrenheit, and the specific weight is 6.8.

D—Specimen of ferro-molybdenum containing 88 per cent. molybdenum. The melting point of this element is 5,600 degrees Fahrenheit, and the specific weight is 10. Molybdenum is used with tungsten and chromium in the production of tool steel, but owing to its high melting point the success of its use has been retarded, excepting in the electric furnace. The presence of molybdenum in tool steel makes it possible to hold a cutting edge at a dark red heat.

E—Ferro-tungsten containing 85 per cent. tungsten, 1.3 per cent. carbon and 13.7 per cent. iron. Tungsten is used up to 25 per cent. in tool steel, and is employed up to 7 per cent. in magnet steel. It is finding a use in structural materials.

F—Specimen of ferro-manganese containing 80 per cent. manganese. This element has a melting point of 3,450 degrees Fahrenheit, and a specific weight of 7.2. It is used to a limited extent in carbon steel, is present in all forms of alloy steel, and takes rank as an alloying element in certain forms of spring steel, and chassis frame materials.

G—Specimen of ferro-silicon containing 50 per cent. silicon.

H—Special form of annealing oven used at the Maxwell plant arranged with a tier of drawers by means of which the work is stored in the oven and promptly removed therefrom at will, in which the front panel of the respective drawers serves as the air-tight cover.

I—Specimen of ferro-silicon containing 90 per cent. silicon. Melting point of silicon is 2,650 degrees Fahrenheit, and the specific weight is 2.5. Silicon is used up to 5 per cent. in steel for special purposes.

J—Specimen of ferro-titanium containing 25 per cent. of the latter. This metal is not known in the pure state; its melting point is 5,600 degrees Fahrenheit, and its specific weight is 4.2. This alloy is being used to some extent in conjunction with chromium and nickel in the production of alloy steel.

K—Specimen of ferro-chromium containing 80 per cent. chromium, 1 per cent. carbon and 12 per cent. iron. The melting point of chromium is 2,910 degrees Fahrenheit; the specific weight is 6.8. Chromium is used with carbon alone in tool steel and for ball bearing work; it is used with carbon and nickel in alloy steel for structural purposes and with vanadium as an alternative in structural work.

L—Example of barium chloride heat-treatment work, using a bath of this salt in the molten state at a pre-determined temperature for the purpose of correcting the structure of drop-forged front wheel knuckles and other important parts used in automobiles.

M—A simple form of milli-volt meter with the scale rearranged to read in both degrees Fahrenheit and Centigrade connected up to a pyrometer unit in an annealing furnace at the Elmore plant, by means of which the temperature of the annealing furnace is observed, and through suitable means of regulation it is maintained at any desired temperature consistent with the character of the work that is being done.

N—Taken at the Packard plant, showing a well-appointed drawing office with a surfeit of light, proper methods of heating, good ventilation, and such other facilities as will facilitate accuracy of engineering expression.

O—Type of cold saw used in cutting off steel in the production of gear blanks and other parts, presenting a real problem when alloy steel is used, owing to the short life of the saw blades and the slow rate of cutting.

P—In the hardening shop at the Packard plant, showing two rows of hardening furnaces with quenching baths between, and a system of ventilation by means of which the health of the operators is conserved, it being the case that some of the cementing materials, as potassium cyanide, are poisonous.

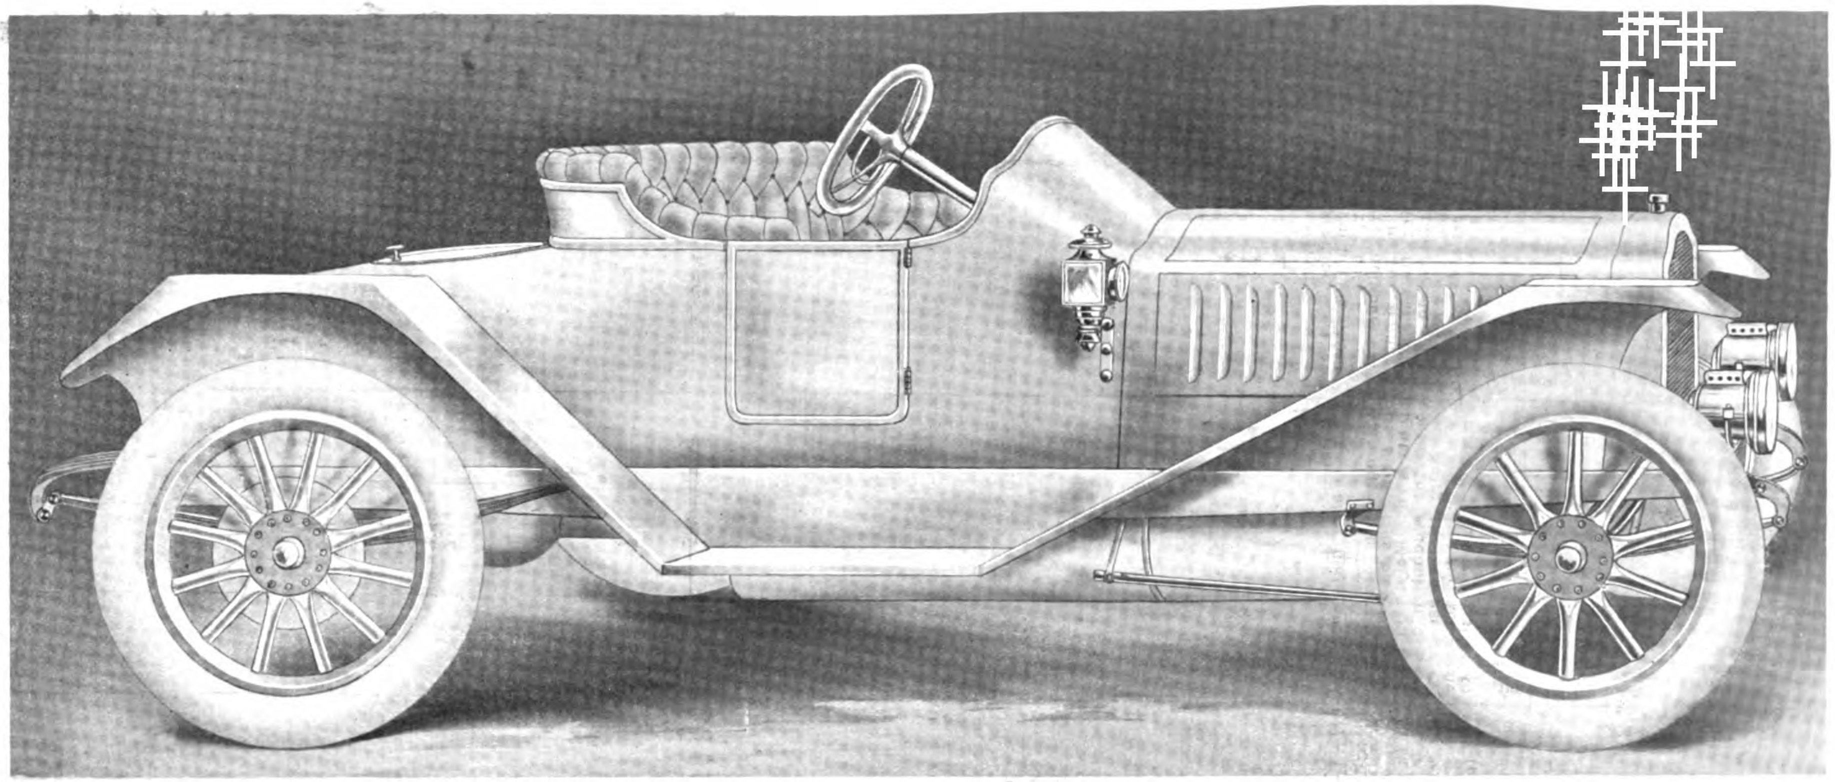
Q—A Frankfort annealing furnace which is self-contained, with precise means of regulating the temperatures—used at the Elmore plant.

R—Specimen of ferro-tungsten holding 85 per cent. tungsten, 0.75 per cent. carbon and 14.25 per cent. iron. The melting point of tungsten depends upon the purity, being 3,450 degrees Fahrenheit for high carbon ferro-tungsten up to 5,575 degrees Fahrenheit for chemically pure tungsten. The specific heat of tungsten is 17.5 to 19, and even higher for the tungsten wire used in incandescent lamps.

S—Specimen of nickel 99 per cent. pure, with a melting point of 2,690 degrees Fahrenheit, and a specific weight of 9.05. Nickel is the most used alloying element of all, serving in nickel steel, which is in common use, chrome nickel steel, and for other purposes as well.

T—Specimen of silico manganese holding 50 per cent. silicon and an equal amount of manganese. This compound is used in the production of spring and other equivalent grades of steel.

U—Simple form of heat-treatment furnace available for use with gas or oil as the source of heat and with a balanced sliding door and means for maintaining a constant temperature.



Among the Makers—Suggesting a Single-Seated Automobile for the Retired Gentleman

SUPPLANTING the horse is the problem that confronts the automobile; the task is half completed, but there still remain some 7,000,000 horse-drawn vehicles to be replaced, among which mention may be made of the little side-bar roadster, with its seat for one, drawn by a $10,000 horse with a pedigree as long as the arm of the exclusive fastidious gentleman who is done with the hurly-burly of the world, and prefers to enjoy life in his own self-contained way, taking great pride in his horse and trappings, with perhaps a well-bred dog to whom it is possible to look with safety for advice. It will be an undertaking to so design an automobile that it will be a fitting substitute for the graceful bit of equestrian animation which enters into the life of the man who is through with money only in so far as it will afford to him the means of living in his own way.

Of course the time will come when the almost entire absence of horse-drawn vehicles will have a marked bearing upon the equanimity of the man; there will be a mental struggle, and a few heart pangs, but the horse will have to go, making way for the nearest equivalent, which will probably be in the shape of a powerful, noiseless, elegant automobile. First cost will have no bearing upon the situation, nor will there be any requirements beyond those as mentioned, provided the car will accomplish precisely the work that is now being done by the horse-drawn equivalent. There is no reason why the coming of this type of automobile should be deferred; certainly the chassis may be had for the asking, and all that remains is to design a suitable body, and introduce this type of patron to the future source of the only enjoyment that he will consider worth while.

Cunningham Automobile

ANNOUNCING THE LATEST EFFORT OF A CARRIAGE COMPANY THAT MADE ITS DEBUT IN 1838, CHANGING OVER TO AUTOMOBILES IN 1911

THE early part of the year 1838 witnessed the modest beginning of a company that was destined to see the rise and fall of the carriage business, a company, in fact, that became a dominant factor, making the carriage business what it was and by its conservative and far-seeing policy produced the kind of carriages that were pleasure giving and profitable to its large clientele, but now that automobiles are rapidly eating into the progressive users' field, the policy of the company has been sufficiently modified to permit it to respond to the requirements of its customers, and in doing so place before its users a type of automobile that will appeal not only to the artistic side of the man who is accustomed to first-class carriage work, but to the mechanical keenness of the automobile expert as well.

The general appearance of the new car is brought out in Fig. 1, showing straight line design of body of the fore-door type, the same being of aluminum construction, seating seven passengers with ample room on a luxurious basis and a certain elegance of appearance and aspect that is accentuated to the utmost degree by the use of that character of upholstery that suggests permanence under severe conditions of service without becoming shabby.

In a mechanical way, James Cunnningham, Son & Company, of Rochester, N. Y., takes advantage of the latest and most approved methods in automobile designing, and the main features of the mechanical equipment are as set down in the table as here given; it being the case that the power plant and other mechanical features are identical in the five models, including touring car, close-couple roadster, limousine and landaulette. The price is the same for all the body options. The mechanical arrangement will best be appreciated by examining Fig. 4 of the stripped chassis, showing the radiator R1 on the center line of the front axle and the motor M1 as a self-contained unit, including the clutch C1 and the transmission gear G1, leading back to the live rear axle A1, through a propeller shaft S1, torsion being taken by the torsion member M2, and two universal joints U1 and U2 being used between the transmission gear and the live rear axle, notwithstanding the fact that the angularity of the power plant with respect to the live rear axle is reduced to a minimum under normal conditions of operation. The chassis frame has widened flanges at the point of narrowing N1, and is provided with three cross bars B1, B2 and B3 with integral flitch plates at points of fastening of the cross bars with the side bars.

The front spring suspension is half-elliptic, but the rear springs are three-quarter-elliptic, the idea being to take advantage of the fixed loading at the front, which is best handled by half-elliptic springs, and to afford soft riding in the tonneau by the use of properly contrived three-quarter-elliptic springs.

The power plant unit is shown in Fig. 2 of the right-hand side, with the motor case C1 in two halves, with the holding arms A1 and A2 integral with the upper half and the lower half C2 flanging on the center line, with an oil chamber in the bottom and an oil well W1 passing up and through the upper half to a filler through which the lubricating oil is spilled when it is desired to fill the oil well.

The flywheel is snugly encased in the housing H1, and the clutch C3 comes just at the point of flanging of the transmission gear case C4. The half-time gears are encased in the housing H2 and an extension E1 is provided with a bushed journal to support the cranking extension to which the starting crank C5 is attached. The magneto M1 is on a shelf S1 in a mid position and the centrifugal water pump W2 is in line with the magneto, both being driven by a suitably contrived shafting system that is driven by a pinion which meshes with

the half-time train. The air propeller P1 is driven by a wide flat belt and the flanged driving pulley is on the same shaft driving the water pump and the magneto.

The cylinders C6 and C7 are cast in pairs, with an overhead-valve mechanism V1, V2, V3 and V4, with lifts passing up on the exterior of the cylinders from the camshaft, located on the right-hand side of the motor. The pedals P1 and P2 control the clutch and service brakes, respectively, but instead of fastening to cross bar at the chassis frame they are on a shaft which has its journals in the gearcase and are supported outside by two brackets, one of which is shown as B1. The linkage L1 is in an accessible position outside, with a means of adjustment whereby any wear that may creep in as a result of prolonged service may be compensated for. The extension of the power shaft through the back of the gearcase is flanged at F1, to which the universal joint is fastened and by means of which the torque of the motor is transmitted to the propeller shaft. The racks R1 and R2 are connected up with the side lever by means of which the gears are manipulated, utilizing a stout but much simplified linkage system with a liberal provision of bearing surfaces at every point and means for lubrication.

e ..	Selecti'e.	3	Motor	Shaft .	124	56	P. Steel..	Plain...	Ball....	Roller...	3800	36x4½	36x4½

The simplicity of the working side of the motor as shown in Fig. 2 is carried out only in a more marked degree on the opposite side of the same as shown in Fig. 3, but for purposes of safety, the carbureter C1 is located in a mid position on the side opposite to the magneto, with a simplified intake pipe P1, leading up with two branches B1 and B2, through which the mixture passes to respective pairs of cylinders C2 and C3. The water connections W1 at the top and W2 at the bottom lead the water from the cylinders to the radiator and back again; they are of neat design and light construction, properly flanged with secure water-tight joints at finished flanging faces, suitably placed on the two pairs of cylinders. The exhaust manifold M1 is of large diameter, and its four branches lead in an upward direction to the point of flanging on the cylinders, so that the holding bolts are in a perfectly accessible position. There is one new and commendable feature to be observed in this manifold; it has lugs L1 and L2 which extend downward and afford a means by which the mixture manifold is held in place through the use of studs that pass through the lugs on the exhaust manifold and bear against cupped bosses in juxtaposition on the mixture manifold.

The importance of good lubrication is recognized in this power plant not only from the point of view of long life and the close limiting of internal losses, but with the understanding that noise must be conspicuous by its absence in any event. In order that the operator may know whether or not the supply of oil is adequate, a tell-tale T1 extends up from the lower half, permitting the operator to see at a glance just how much oil there is in the container and to observe the rate of reduction of the same during service. At points of vantage hand-holes are located and suitable covers are provided for each, with a ready means for their removal, so that the operator is permitted to inspect the mechanisms, clean off the working parts and maintain a profuse state of lubrication or the lower half of the crankcase, and the cover of the transmission gearcase may be removed.

The ignition system is of the Bosch dual type, utilizing one set of spark plugs, they being located on the left-hand side of the motor somewhat below the top, spacing between the lifts and delivering the spark at a point in the combustion chamber that has been found to deliver unusually good results. The gasoline tank holds 20 gallons, of which three are held in reserve for emergency purposes, the tank being so constructed as to bring about this result. The steering column is of the irreversible nut type with an adjustment take-up wear, and an 18-inch mahogany grip is fastened to an aluminum spider, so arranged with respect to the driver's seat that his position is natural, and his control of the movements of the car is rendered precise. Attention is called to the length of the wheelbase, which is 124 inches, and the pressed steel channel frame is designed utilizing a fine grade of material and a liberal

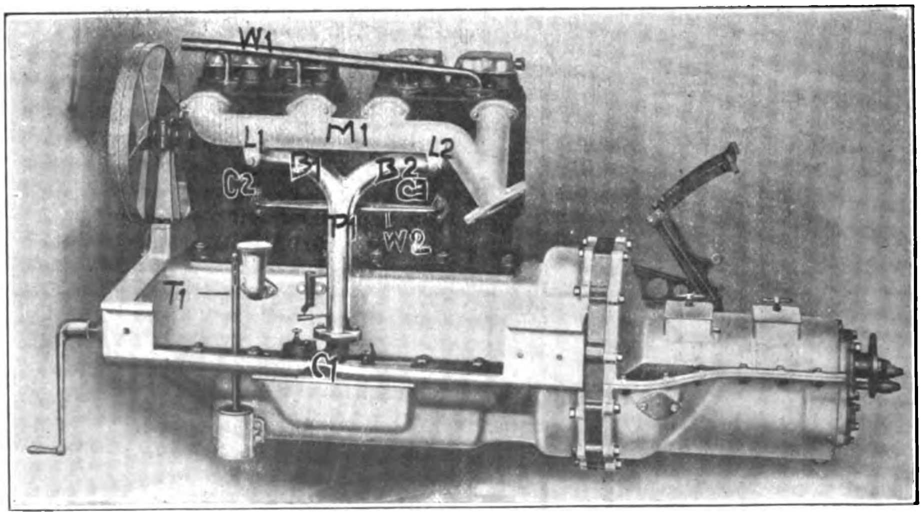

Fig. 3—Inlet and exhaust side of motor, also showing oil gauge

SPECIFICATIONS OF MATERIALS IN CUNNINGHAM CARS

Crankshaft—40 carbon steel, forged hydraulically under 100-ton press, heat treated and ground.

Connecting Rod—Special analysis high carbon auto steel, drop forged, I-beam section, heat treated.

Cylinders and Pistons—Finest grade of close-grained gray iron made in a foundry which produces nothing but gas-engine castings. Both are partially machined, then annealed to relieve internal strains and afterwards finished and ground.

Valves—3 1-2 per cent. nickel steel, heat treated and ground.

Valve Rocker Levers—Special auto steel, drop forged, heat treated and ground.

Crankshaft and Magneto Shaft Gears—Special auto steel, drop forged, teeth helical, heat treated.

Camshaft Gear—Cast iron, teeth helical.

Crankcase—Aluminum and copper alloy, of light weight and great strength.

Bearings—Parsons white brass, die cast under pressure, insuring a close grain and tough metal.

Piston Pin—Steel tubing, hardened and ground.

Camshaft—High carbon steel, heat treated and ground.

Clutch Facing—Oak tanned leather, with cork inserts.

Transmission Gears—Chrome nickel steel, drop forged and tempered.

Transmission Shafts—Chrome nickel steel, drop forged and tempered.

Transmission Bearings—Imported F. & S. annular ball bearings of very liberal proportions.

Auxiliary Gear and Fan Bearing—Imported F. & S. annular ball bearings.

Clutch Bearings—Timken roller bearings.

Wheel and All Rear Axle Bearings—Timken roller bearings.

Front Axle—3 1-2 per cent. nickel steel, drop forged, one piece, no weld, heat treated.

Rear Axle Housing—Pressed steel, autogenously welded horizontally.

Universal Joints—Spicer dust-proof.

Frame—High carbon pressed steel, heat treated.

Bearing Bushing—All small shaft bushings, such as camshaft, pumpshaft, oil pumpshaft, etc., are lined with Non-Gran bronze, which is conceded to be the best material for this purpose.

Cams—Drop forged, special case hardened steel, ground to shape and size. Case hardened face, soft collars, double pinned to shaft.

Cam Rollers—Case hardened and ground outside and inside.

Cam Roller Pins—Case hardened and ground.

GENERAL DIMENSIONS OF THE POWER PLANT

Bore	4 3-4"
Stroke	5 3-4"
Valve diameter	1 7-8"
Valve lift admission	5-16"
Valve lift exhaust	3-8"
Crankshaft diameter	2"
Front bearing length	3 1-2"
Center bearing length	4"
Rear bearing length	4 7-8"
Crank pin length	3 1-4"
Connecting rod length	12 9-16"
Camshaft diameter	1"
Timing gears, face 3 helical	1 1-8"
Cams—base dia. (harmonic motion)	2"
Cam roller diameter	1 1-2"
Cone clutch diameter	14 1-2"
Cone clutch face	3"
Flywheel diameter	17"
Main transmission shaft diameter	1 7-8"
Transmission jackshaft diameter	1.635"
Transmission gears, face	1" and 1 1-4"
Transmission gears, pitch	6-8 stub
Percentage of clearance space (compression space) to total cylinder volume	23%
Clutch spring	450 pounds

:tion with a view to safely spanning this wheelbase length. While this question of the quality of material is up, attention called to the use of chrome nickel steel I-section front axles, ile the rear axle is of the full floating type, with a pressed steel shell and roller bearings throughout. The brakes are of the external contracting band type for service use and internal expanding type for emergency use, both located on the rear road wheels, taking advantage of large diameter pressed steel drums.

Practical Considerations in Body Finishing

The great question is to be practical; make the most of every int; be sure that the materials are pure and appropriate for intended purpose—and be particular. A poor result always lows if the man who does the work has his heart in his ots.

For English purple lake use a ground of ivory black, for timuc lake a ground of English Indian red. Rose lake should ve a ground of English Tuscan red.

For a quick development of English scarlet lake, at the present ie popular with automobile folk, lay the lake over a ground deep orange chrome. Orange mineral makes a good ground the light lake. In the application and preparation of all lakes it is essential to understand that these pigments are, as a rule, rich in proportion to their depth. It is necessary, therefore, to avoid making the ground too light.

All the lakes, and all the grounds for the lakes, should be given ample time to perfectly harden before coating over them, otherwise they will lose in point of brilliancy and wearing capacity.

Furthermore, all grounds and preparatory surfaces should be brought out with a perfection of detail which admits of no surface defects. To repair a defect in the surface after the ground has been made ready for the lake is a very delicate, and in most cases unsuccessful, operation. If the lake is to be placed directly upon the old paint, the surface should first be touched up with some lead mixture, then puttied, and rubbed smooth.

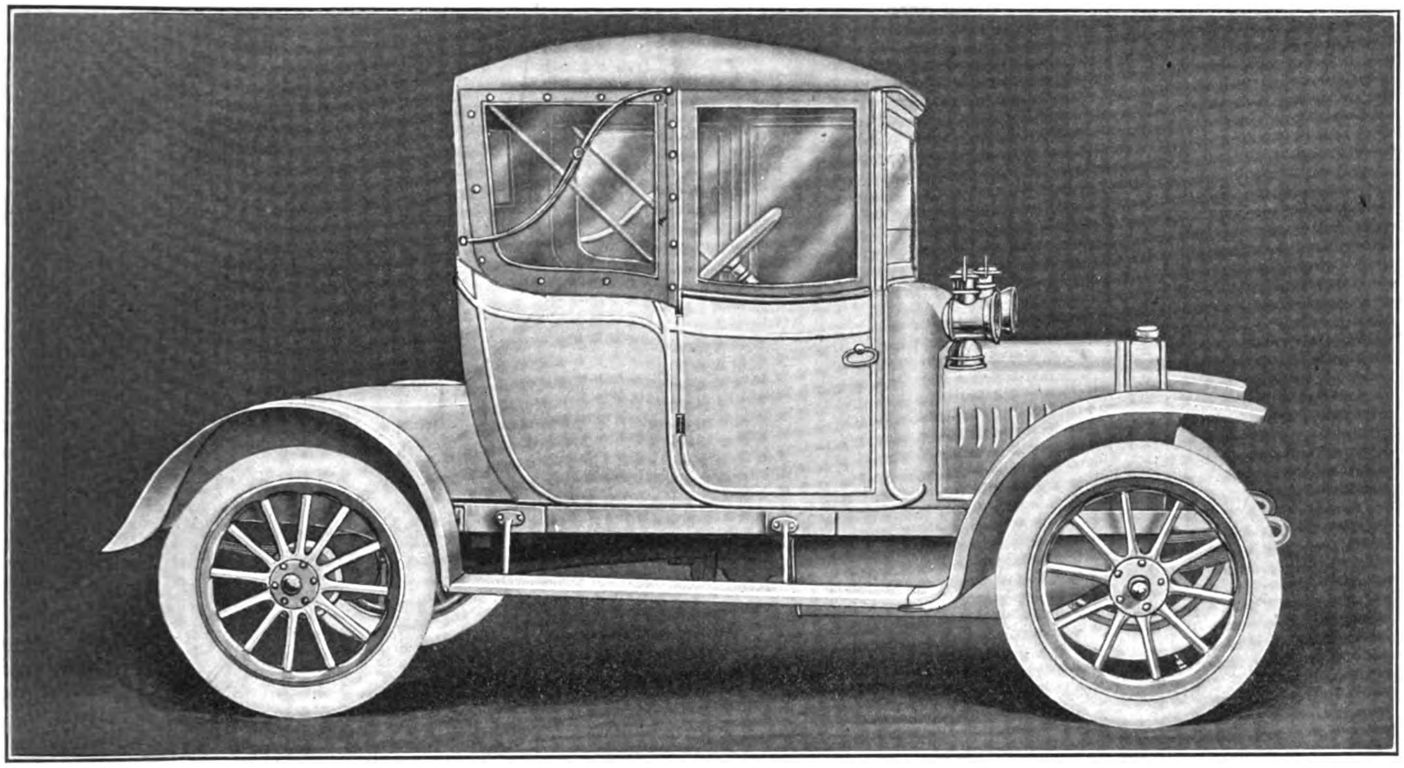
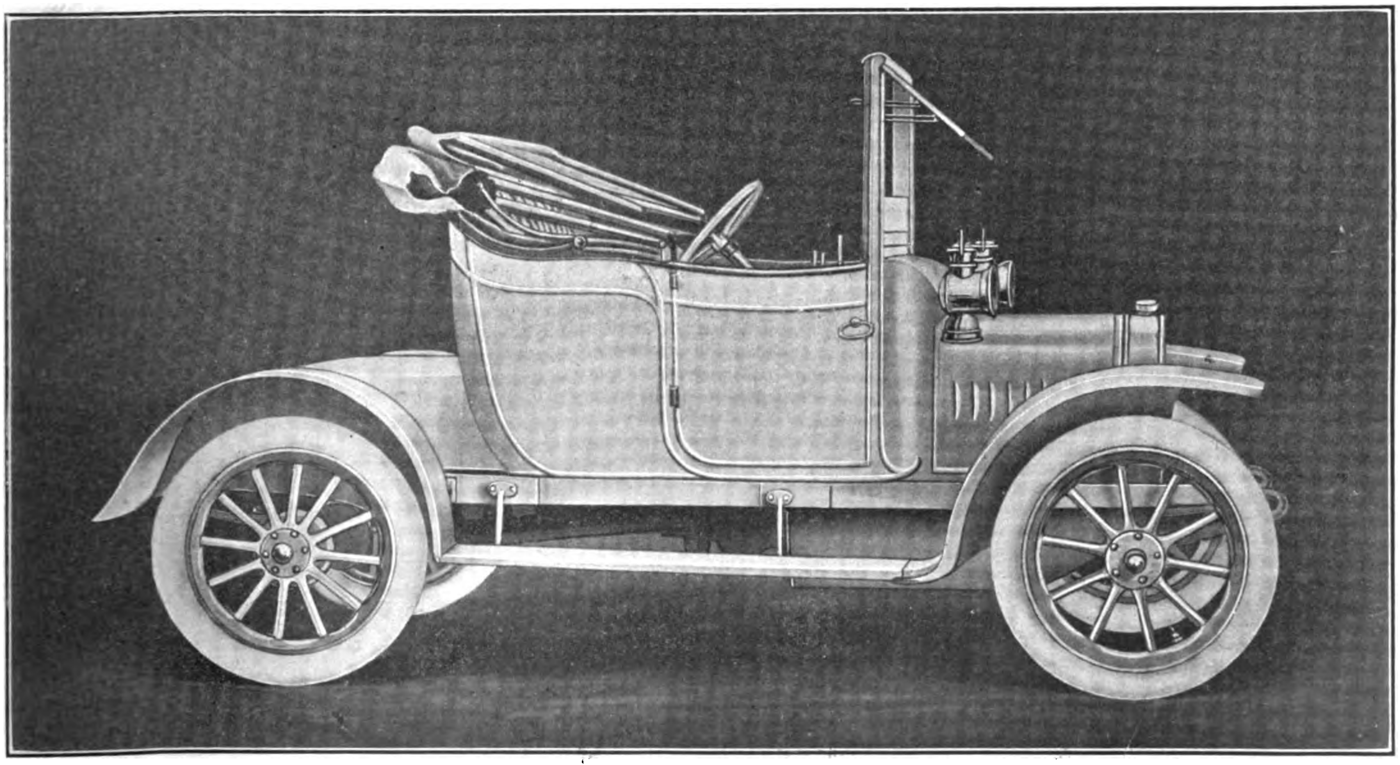
Engineering Section

SUGGESTIONS FOR A DOCTOR'S CAR—NEW LIGHT-WEIGHT METAL—CARE AND REPAIR OF TIRES—BATTERY TROUBLES AND HOW TO REMEDY THEM—TIMING THE MOTOR, ETC.



SUGGESTION OF A BODY FOR DOCTOR'S SERVICE, SHOWING THE TOP AND CURTAINS UP



SHOWING THE DOCTOR'S RIG WITH THE TOP DOWN—THE FORE DOOR PROTECTS, BUT, BEING DESIGNED "DUTCH," MAY BE REMOVED

DOCTORS are sufficiently numerous and such good prospectives that some makers of automobiles get out special models of automobiles for them, but, considering their needs, it is believed that the subject will stand further consideration. The body work as shown on the title page of the "Engineering Section" of THE AUTOMOBILE this week, is offered as a good possibility. This body is so designed that it may be opened up for fine weather service, and when the conditions are inclement, it may be closed up. The control is "in-side." A body such as this, on a chassis that will stand continuous road work, should answer the purpose, but it is not recommended that a cheap makeshift will suffice for the intended work. Doctors must be taught to select good automobiles; they may know how to cure the sick and close the eyes of those who become wearied of the world, but when it comes to the selection of automobiles, it is believed that the skill of the doctor must give way to the practice of the mechanician.

There has been quite a little dissatisfaction in this field, and some doctors labor under the impression that automobiles are not quite up to the standard they recognize. This is due entirely to an attempt to make a small runabout accomplish the work of a full-fledged automobile.

New Light-Weight Metal

DURALUMIN IS THE NAME OF A NEW TYPE OF METAL THAT IS SAID TO HAVE THE STRENGTH OF STEEL AND THE LIGHTNESS OF ALUMINUM

DURALUMIN belongs in the aluminum alloy family, having over 90 per cent. aluminum in its composition, but the contents vary somewhat, there being two alloys known as Nos. 1 and 2, and the illustrations as here presented are of some of the forms of this metal. Fig. 1 shows sections, A being an odd-legged angle, B shows a T, and C is a channel section. The dimensions of these sections may be varied to suit the different requirements, it being the case that this alloy submits to rolling and has the strength and characteristics of rolled metal. As an indication of the ability of this material to stand the drawing process, it may be stated that it is used in the manufacture of cartridge shells. It will be remembered that this is one of the most difficult processes in the metal arts, and it takes an extremely good grade of material to accomplish this purpose. Duralumin may be had in the various thicknesses and widths to which sheet metal is rolled, and offers a fair measure of rigidity, coupled with an excellent showing of strength, together with lightness. Fig. 2 presents a round bar of this material, which is bent around until the two extremities contacted with each other without showing sign of distress at the point B. Fig. 3 depicts several diameters of rolled bars, and a series of strips of various widths and thicknesses, all of which are offered as a further indication of the fact that this metal lends itself to the several processes by which steel is rolled, flattened out, drawn, and otherwise manipulated for commercial purposes. In fact, there seems to be no limit to the classes of work that can be done with this material.

The inventor of this metal is A. Wilm, of Berlin, Germany, and he states that the general composition of the same approximates 90 per cent. aluminum, and the balance is mainly composed of copper and magnesia. It is pointed out that the weight of aluminum is in the preponderance, and that the 10 per cent. which represents the alloys is made up of metal that is heavier than aluminum, and for the rest by metal that is lighter than aluminum. The result is that the new metal has substantially the specific gravity of aluminum, varying a little above and below, depending upon the exact proportions of the alloys. The appearance of the new metal is substantially the same as that of aluminum, retaining the bright color, resisting oxidation, and other atmospheric influences.

Technically speaking, the new alloy shows a marked difference in its characteristics, depending upon the proportions of the admixtures, it being possible to vary the tensile strength all the way from 50,000 pounds per square inch minimum up to 85,000 pounds per square inch maximum, and it will appear that this is a very formidable strength, considering the fact that this metal weighs about one-third of the weight of steel, size for size. Since this metal is very much higher in price than steel, it of course follows that it is only available for special uses where a minimum of weight and an adequacy of strength are the ruling considerations. If weight is no criterion, since steel may be had in all degrees of strength, above and below the strength of this material, and at a very considerable reduction in the pound price, it follows that the steel would be given the preference. The fact remains, however, that there are a number of applications where light weight, accompanied by suitable strength, are the ruling factors and price is therefore almost a matter of no moment. It is for these classes of service that this metal is intended, and while it remains to be seen to what extent it will modify present practice in aeronautical endeavors, it nevertheless does prom-

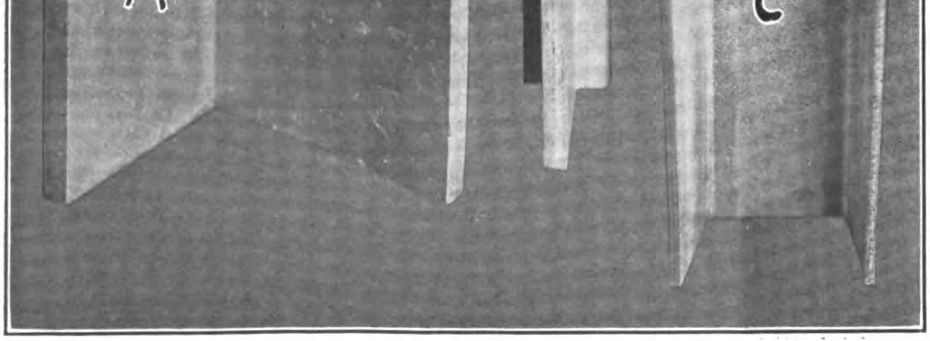


Fig. 1—A—Unequal-legged angle; B—T-section; C—Channel-section

ise more than a little, and it may be the ruling factor in this relatively new art.

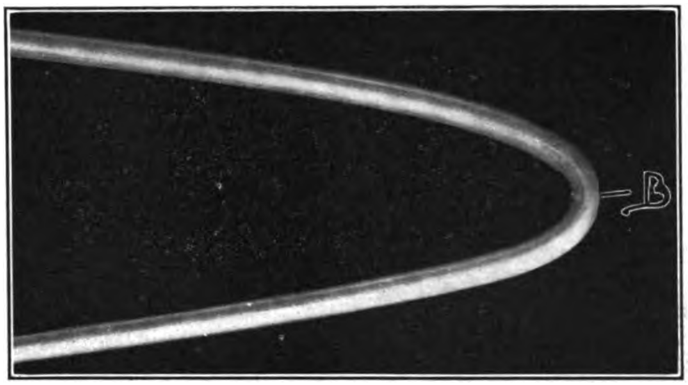

Fig. 2—Specimens of round bars and strips of this light, strong metal

It seems that this metal is being taken up abroad by the various military powers, and it is finding its way into many things where light weight and strength, coupled with endurance, take precedence over other considerations, as cost. The British government is reported as building a new large dirigible balloon, relying upon this metal for many of the important members in the structure thereof and among the well-known European firms that are producing Duralumin, Messrs. Vickers Sons & Maxim are mentioned. The specimens which were photographed for THE AUTOMOBILE were furnished by Marburg Brothers, the well-known engineers and importers, of 1777 Broadway, N. Y., and were exhibited by them at the Belmont Park Aviation Meet a few days ago for the first time in this country.

The approximate characteristics of Duralumin are set down as follows:

Specific weight. 2.77 to 2.84;

Melting point, 650° Centigrade;

Color, bright and silvery;

Not affected by sea water;

Not affected by atmospheric conditions;

May be rolled, drawn and lends itself to various processes.

Alloy No. 1 has physical properties as follows:

Specific gravity, 2.77;

Tensile strength, 50,000 pounds per square inch;

Elastic limit, 26,000 pounds per square inch;

Elongation 21 per cent. (length not stated);

Reduction of area 34 per cent.

The alloy No. 2 has physical properties as follows:

Specific gravity, 2.84:

Tensile strength, 65,000 pounds per square inch:

Elastic limit, 36,000 pounds per square inch;

Elongation, per cent. (length not stated). 18:

Reduction of area, 26 per cent.

Rolling has a marked effect on the physical properties of the alloy No. 2 as follows:

Tensile strength, 85,000 pounds per square inch:

Elongation (length not stated), 3 per cent:

Reduction of area, 10 per cent.

Heat Value of Fuel Gases

Gasoline and other available liquids and gases as used in internal combustion motors are measured for heat value in British thermal units, or in calories. The liquids, whatever they may be, have to be changed into gases to be available, and it is always well to keep in mind the heating value of these gases, for then it is possible to estimate the magnitude of losses when an exhaust analysis is available. The following are the values of the several gases:

ACCEPTED THERMAL VALUES OF GASES USED IN FUEL

Name	Compound Formulae	Thermal Value B.t.u. per pound	Thermal Value Calories per kilo
Hydrogen	H	62,100	34,500
Carbonic oxide	CO	4,476	2,487
Methane	CH^4	23,851	13,245
Acetylene	C^2H^2	21,465	11,925
Ethylene	C^2H^4	21,440	11,900

The heating value of carbonic acid is nil; it follows that it is necessary to burn each of the gases to carbonic acid or water (H^2O) in order to obtain all the heating value that there is in them respectively. Every compound that is composed of carbon and hydrogen will burn to carbonic acid, accompanied by the production of some water. For complete combustion under conditions that obtain in the combustion chambers of motors it is necessary to dilute the mixture with an excess of air in order that there will be a sufficient presence of oxygen to serve the practical end. It is not practically possible to get along with the theoretical right amount of oxygen when the same is mixed with over 80 per cent. of nitrogen, as it is in air; the trouble is that the oxygen is more or less covered up.

The British thermal unit, on which these calculations are based, is that quantity of heat which is required to raise the temperature of one pound of water 1 deg. Fahr. at 39.1 deg. Fahr.

Fig. 3—Depicting several sizes of rolled bars of Duralumin and some of the regularly made strip products

1910 Edison Storage Battery

THIRD INSTALLMENT—DEALING WITH WALTER E. HOLLAND'S PAPER AS PRESENTED BEFORE THE TWENTY-SIXTH ANNUAL MEETING OF THE ASSOCIATION OF EDISON ILLUMINATING COMPANIES, HELD AT FRONTENAC, THOUSAND ISLANDS, N. Y., SEPTEMBER 6, 7 AND 8, 1910

THE output of an Edison cell is determined by the capacity of the positive or nickel electrode, as the individual electrode curves of the Figs. 5 and 6 show. The company has found it best in every way to design the cell with a sufficient allowance of iron active material to give considerable excess capacity to the negative electrode.

Cells do not have as high capacity when new as after some weeks of use. The betterment comes from an improvement of conditions in the nickel electrode which is brought about by regular charging and discharging. Overcharging expedites this self-formation and is recommended by the company. Every cell manufactured is given three overcharge runs before leaving the factory, and this is always sufficient to bring the capacity up at least to the rating. The accretion of capacity continues for twenty, or more, runs, and no results can be considered typical which are obtained in tests made earlier than the twentieth run. The term "run" is used to mean a full charge and complete discharge.

The output and efficiency of a cell, working at ordinary temperature, depend upon three factors—the rate of charge, the amount of charge, and the rate of discharge. Figure 10 shows the relation of current output to current input when a cell is given different lengths of charge at 2-3, 1, and 1 1-3 times normal rate. It will be seen that for low inputs the efficiency is very high and practically the same for the different rates of charge. Further along the curves separate, the advantage being in favor of low-rate charging. Notice that the point taken as the normal input (210 ampere-hours for A4) comes pretty close to the sharpest part of the bend. Fig. 11 gives the characteristic curves with output and efficiency data for this normal input point.

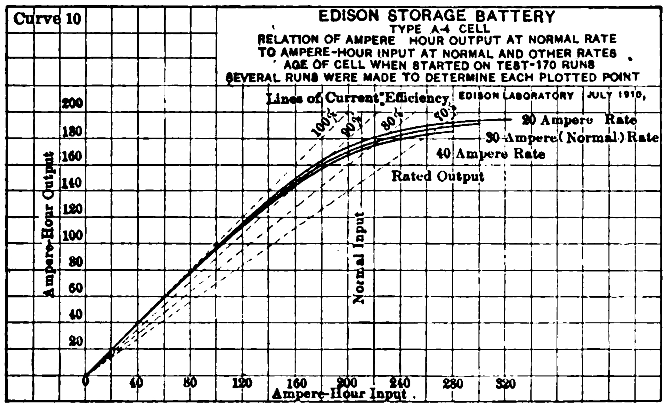

Fig. 10—Relation of ampere-hour output at normal rate to ampere-hour input at the same rate

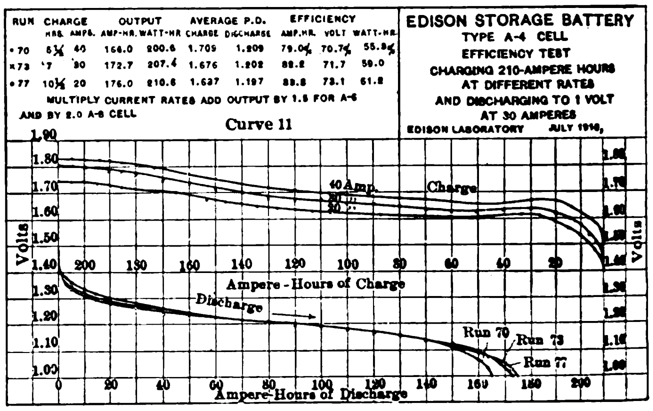
The relations of current and energy output and of current and energy efficiency to the length of charge at normal rate are summarized in the curves of Figure 12. These curves show maximum efficiencies on short charge of practically 99 per cent. in ampere-hours and 75 per cent. in watt-hours, while on normal 7-hour charge the efficiencies are respectively 82 per cent. and 58 per cent. It is often found advantageous (and economical, too) to work the battery at the lower efficiencies of a 9 or 10-hour charge, thus realizing exceedingly high output results.

Watt-hour efficiency is the product of ampere-hour efficiency and "volt efficiency"—the latter term being used synonymously with the term "coefficient of drop" to express the relation of the average voltage of discharge to the average voltage of charge. The volt efficiency depends principally on the rates of charge and discharge and does not vary much under ordinary conditions. Charging and discharging at normal rate, its value will be close to 72 per cent. for any length of charge not extremely short or long; and this figure therefore represents the practical limit of watt-hour efficiency for normal-rate working. The watt-hour efficiency on any normal-rate test may be calculated accurately enough for all practical purposes by taking 72 per cent. of the easily determined ampere-hour efficiency. Decreasing the current rate increases the volt efficiency, thus raising the limit of possible watt-hour efficiency.



RUN	CHARGE HRS.	CHARGE AMPS.	OUTPUT AMP-HR.	OUTPUT WATT-HR.	AVERAGE P.D. CHARGE	AVERAGE P.D. DISCHARGE	EFFICIENCY AMP.HR.	EFFICIENCY VOLT	EFFICIENCY WATT-HR.

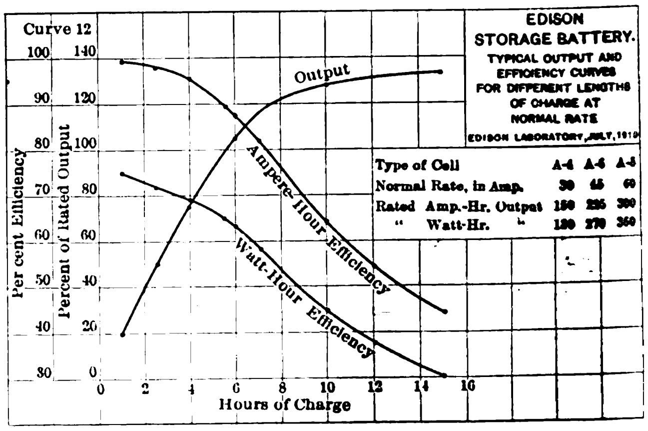
MULTIPLY CURRENT RATES AND OUTPUT BY 1.5 FOR A-6 AND BY 2.0 A-8 CELL

Fig. 11—Efficiency tests plotted to show results at different rates of discharge

The Edison cell has an air-tight cover, a valve being provided for the escape of gas. Practically no water is lost by evaporation, therefore, and the battery can be left idle for months without attention and there will be no danger of the solution getting low. Water is lost when a battery is working, however, and this results entirely from overcharging; for any current which is not used to effect the chemical changes at the electrodes goes



Type of Cell	A-4	A-6	A-8
Normal Rate, in Amp.	30	45	60
Rated Amp.-Hr. Output	150	225	300
" Watt-Hr. "	180	270	360

Fig. 12—Efficiency tests plotted at different lengths of charge at normal rate

to produce hydrogen and oxygen, the elements of water, which are emitted as gas. To replace this loss, pure water must from time to time be added. The figure of ampere-hour efficiency represents the proportion of a charge which goes to produce the desired chemical changes at the electrodes; therefore the balance is proportional to the loss of water. Thus from the curve, Fig. 12, we see that charging 7 hours at normal rate (210 ampere-hours input) the ampere-hour efficiency is 82 per cent. and charging 10 hours (300 ampere-hours input) it is 64 per cent. The loss of water therefore would be represented by 18 per cent. of 210 = 38 ampere-hours in the first case and by 36 per cent. of 300 = 108 ampere-hours in the second case—showing that a battery which is worked continually on 10-hour charges would require the addition of water about 3 times as often as one worked continually on 7-hour charges. This points to the possibility of reducing the amount of required filling to almost nothing in those cases where a battery can be worked on short frequent charges at high efficiency.

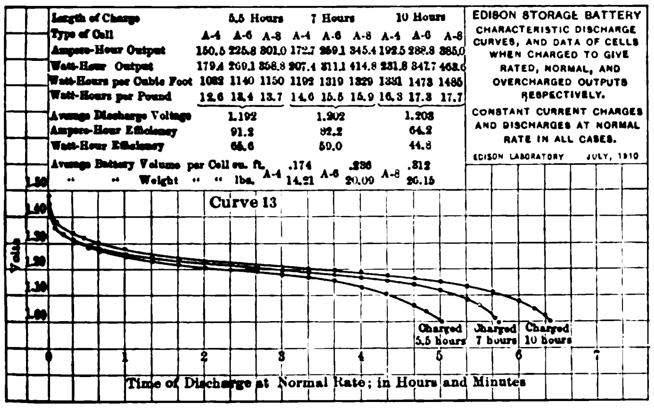


Fig. 13—Characteristic discharge curve of cells when charged to a given rate.

Fig. 13 shows characteristic discharge curves and data for a cell at its rated output, at its normal output and at its overcharge output. Note that only 5 1-2 hours' charge at normal rate is required to obtain the rated output, and the efficiency under these conditions is very high; while under the overcharge conditions exceedingly high output per unit-weight of battery is realized at a sacrifice of efficiency.

Although in most of the tests presented here the cells were charged at constant current, this was done only for the sake of convenience; and in practice it is really better to "taper" the rate in the familiar manner of charging lead batteries. This is of especial advantage where the time on hand for charging is limited.

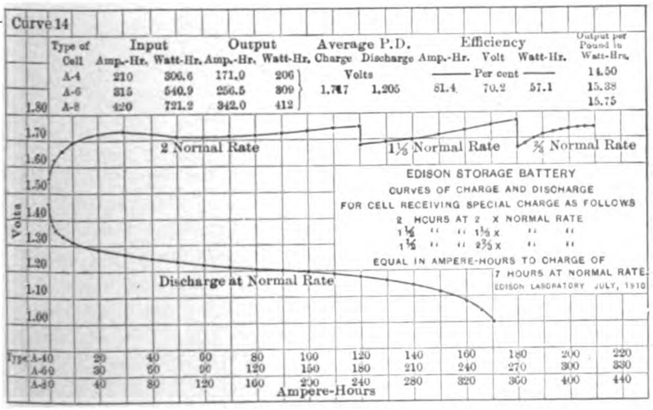

Fig. 14—Curve of charge and discharge for cells receiving special charges

Fig. 14 shows the result when the normal imput of a 7-hour charge is put in in 5 hours, by using higher rates early in the charge. The results are practically as good as in the case of the 7-hour charge. (See Fig. 11.)

Constant current discharges of the Edison battery at no matter what rate are found to give a quite constant output figure if carried to very low voltage (see Fig. 15), and differ only as to average voltage, this being higher or lower according as the I R drop in the cell (depending on the I valve) is little or much. The low voltage part of the curve cannot be considered useful, however; so the statement sometimes made that the ampere-hour output of the Edison battery is independent of the discharge rate is not strictly true. On the other hand, it would not be a fair test to terminate high-rate discharges at 1.0 volt or 0.9 volt, as is done usually in normal-rate tests, because this would not correspond to the same state of discharge; and the cell would start the next charge in a semi-charged condition, which would make the subsequent discharge abnormal. Also, it is possible to discharge at a rate so high that the very first volt reading will be lower in value than the above-mentioned regular terminating voltages. The author believes the fairest plan in this case is to discharge to successively lower voltage points as the rate is increased, each terminating voltage to be lower than the previous one by a valve corresponding to the average increase of I R drop in the cell resulting from the increase of current. Thus, if the "A-4" cell (whose average internal resistance, Fig. 9, shows to be .0037 ohm), is usually taken to 0.9 volt on a discharge at 30 amperes, the discharge should be carried 0.11 volt lower or to 0.79 volt when the rate is doubled to 60 amperes, because in that case the average increase of I R drop in the cell would be $30 \times .0037 = 0.11$ volt. If this plan be followed the amount of change of voltage from the beginning to the end of discharge will be practically equal at all rates, and the cell will be taken to a corresponding state of discharge each time.

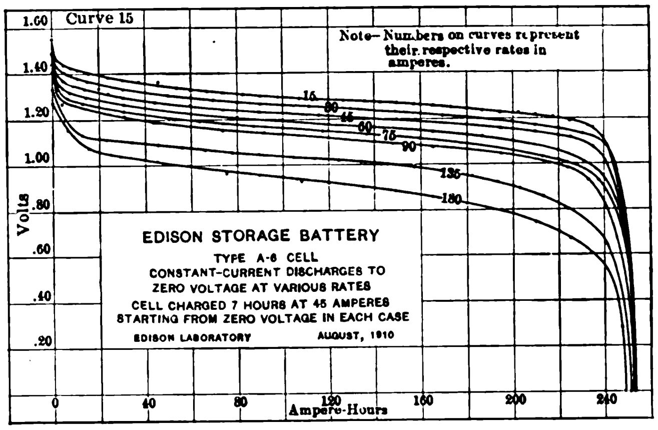

Fig. 15—Constant current discharge to zero voltage at various rates of discharge

Timely Tips for the Tyro. Remember—

That first and foremost comes the selection of the chassis. The easiest way to do this is for the purchaser to make up his mind what type of body he intends to have. The two parts are separate, and it is only a matter of a few bolts that fix the body to the frame that require changing. The next point is the topographical nature of the country that the car is mostly to be used in; for instance, it would be useless to have a heavy limousine on a light, low-powered chassis for hilly and indifferent roads, and equally unnecessary to have a 60-horsepower runabout for town work.

The length of one's pocket often determines the amount one is prepared to pay for the car, but where this is not a matter of moment a limitation of a few hundred dollars should not influence the choice. Experience of owners of cars is the best criterion, and if the buyer can come in touch with several of these direct he should be in a position to form an opinion that will enable him to secure the car that is in every way best fitted to the service for which it is intended.

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.SC., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE SECOND INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

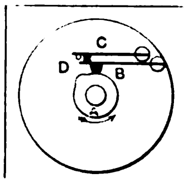

Fig. 6—Typical make - and - break system of contacts

PROFESSOR SPRINGER finds that the energy stored in a low-tension coil, such as is used for petrol engines with a maximum current of 1.3 amperes, is about 14 foot-pounds, *i. e.*, equal to the work done when 1 pound is lifted through 1.7 inches.

In order to illustrate the other system of ignition, namely, the high-tension system, I will make use of the same coil, but now only one set of windings will be connected to the battery, while the other set will be connected to the lamp. On making the battery circuit so as to cause a current to start in the coil, a current will be produced in the other set of windings, and the lamp will glow for an instant. On breaking the circuit containing the battery the lamp will again glow, but more brightly, indicating that an induced current is produced. If I break the current slowly, so that a visible spark is produced at the break, the lamp in the secondary hardly glows at all, showing that it is an advantage to get a rapid break of the current in the primary circuit. The reason why when one switch is opened slowly the current is only slowly reduced, is that even after the switch begins to open the current continues to flow, this flow being made evident by the spark. If, however, we connect a condenser to the two sides of the switch, when the switch begins to open, the condenser will commence to charge, and will thus, in a sense, absorb the current so that no spark is produced, and the decrease in the current in the coil will be very much more rapid, and hence the lamp in the secondary circuit will glow very brightly. The absence of the spark (at the point where the current is broken) produced by the condenser is also an advantage, in that the contacts will not be burned away in the way they are if a spark is produced.

In the case of the ignition of the charge in the engine, the break of the primary circuit may either be made by a cam, A, Fig. 6, which rotates at half the speed of the crankshaft or by a trembler.

In one form of make and break, as the cam rotates (Fig. 6) the spring D is lifted so that a platinum contact stud on the upper surface comes in contact with a stud on the lower surface of the spring C, thus completing the primary or battery circuit. When the cam rotates somewhat further the springs B and C both commence to descend and thus acquire a certain speed before the spring C strikes the pin D, when the circuit is broken. In this way a quick break is secured without the necessity for making the sides of the cam very steep, so that the wear of cam, and contact which it raises, is reduced to a minimum, thus insuring a maximum of efficiency.

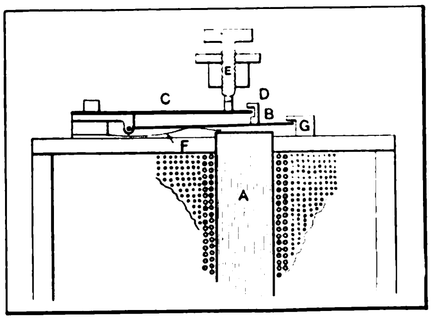

Fig. 7—Typical form of trembler mechanism

A diagrammatic section of a trembler contact breaker is illustrated very clearly in Fig. 7. The core of the coil A consists of a number of fine iron wires surrounded by a primary coil of thick wire of a comparatively few number of turns and a secondary coil consisting of a very large number of turns of fine wire. One end of the secondary coil is connected to the sparking plug and the other to the engine or frame of the car. The battery circuit is taken through some form of contact maker, usually called a commutator, to the screw E and thence through the spring to the other terminal of the battery. When the circuit is completed by the contact maker, which is rotated at half the crankshaft speed, the current passing through the primary of the coil magnetizes the core so that the soft iron plate B is attracted. This plate is normally kept up by a spring, F, but after it has moved a little way down and thus acquired some velocity the catch D strikes against the spring C and, pulling this latter down, breaks contact with E, so that the primary current is broken and a spark passes, due to the induced current in the secondary. The breaking of the primary circuit causes the core A to lose its magnetism so that it no longer attracts B, which being forced up by the spring F, allows the spring C again to touch E and thus completes the primary circuit, when the whole process is repeated.

The mean current consumed by a trembler coil as supplied with a motor car when the trembler is continuously buzzing may be anything up to 3 amperes, but a well-designed coil will work quite satisfactorily with .5 ampere or even less. A coil having a low-current consumption is a great advantage, since the batteries last so much longer, and the contact on the trembler does not burn away.

It will be noted that with the make and break first described we only get a single spark to fire the charge, while with the trembler we may get a succession of sparks, since the trembler continues to break and make the circuit as long as the contact is completed at the commutator. At slow speeds there is no doubt that we may in this way get a succession of sparks; at high engine speeds it is, however, very doubtful whether any trembler has more than time to give a single spark. I have in a great many instances carefully measured the speeds of the tremblers of a number of coils and find that a good trembler when well adjusted gives between 150 and 250 breaks per second. Taking as a mean 200 per second, the interval between successive sparks is .005 second. If the sector which makes contact on the commutator is 20 degrees, which corresponds to a rotation of the crankshaft of 40 degrees, the circuit is completed at the commutator for .0056 second when the engine is turning at 1,200 revolutions per minute. It is thus evident that for speeds greater than this there is only time for the trembler to break the circuit once and hence a single spark is produced just as in the case of a non-trembler coil. That this is a fact will be seen from some photographs which I shall show in a subsequent lecture. (Fig. 16.)

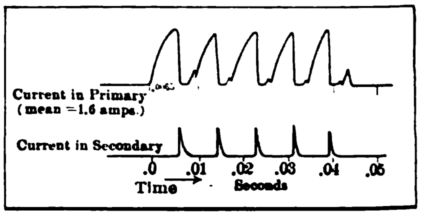

Fig. 8—Oscillographic record of current consumption

In Fig. 8 are shown the oscillograph records of the currents in the primary and secondary of a trembler coil, obtained by Professor Springer. The very rapid fall in the current in the primary when the trembler breaks the circuit and the correspondingly rapid rise in the current in the secondary when the spark passes in the spark gap will be noted. The spark gap was taken as a quarter of an inch, as it was in air, and would thus correspond to about the ordinary gap used in a spark plug when acting in the compressed gases in the engine.

There is one other system of coil ignition which has several points of interest about it. I refer to the Lodge system. The arrangement used in this system is indicated diagrammatically in Fig. 9. The terminals of the secondary of the coil, which is an ordinary high-tension coil, are connected to the inside coatings of two Leyden jars C and D. There are two spark gaps, one A between the inside coatings of the jars and the other B connected to the outside coatings, this latter is the gap in the spark plug inside the engine. When the trembler of the coil breaks the primary circuit the E.M.F. induced in the secondary causes the two jars to charge up, one with a positive charge inside and the other with a negative charge inside. At the same time the outside coatings become charged, one negative and the other positive. The charging of the jar continues till the rise in the potential of the ends of the secondary is sufficiently great to cause a spark to pass across the gap A. Now, when a spark has once passed through the air between the knobs forming the gap A this air becomes quite a good conductor of electricity and hence the two jars discharge through this conducting air, this discharge occurring extraordinarily quickly. The inside coatings having lost their charge, the outside coatings have their charges released and discharge across the spark gap B. Now, the peculiarity of the spark at B is that the release of the charges on the outside coatings is so rapid that the electricity will jump straight across from one point to the other of the spark gap B rather than go *round* even a low-resistance alternative path so long as it is longer and encloses a space so that a magnetic field would be set up if a current passed through the conductor. I can at once show this effect, for I will short-circuit the spark gap B by a piece of thick copper wire bent into a circle of about 8 inches diameter, when you notice that rather than go round this very low-resistance *détour*, the spark jumps the very high-resistance gap. This is the reason why, in the Lodge system, faulty insulation is less likely to put the plug out of action than in the ordinary system. Of course, if I short-circuit the spark gap A with the copper hoop, which corresponds to short-circuiting the sparking plug in the ordinary system, no spark occurs across the gap. The reason is that the discharge in the secondary of the coil is not sufficiently rapid, so that the current prefers to go round by the low-resistance path. If the spark gap B is short-circuited by a straight wire no spark will occur: the path along the wire being no longer than that along the gap, the discharge goes by the path of low resistance.

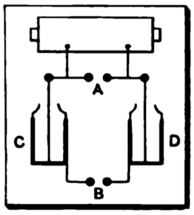

Fig. 9 — Lodge system of coil ignition shown by diagram

Having described at some length the principle on which coil and battery ignition systems work, I need only very briefly refer to magneto ignition. In the coil and battery system the current is derived from the battery; the magneto is simply an arrangement for replacing the battery by the E.M.F. induced in a coil of wire which is moved in a magnetic field. To show this effect I have a rough galvanometer on the table and a length of insulated wire connecting the terminals. If I take this wire and pass it between the poles of a magnet a small current is produced and a very slight momentary deflection of the galvanometer occurs. By suitably turning the passages of the wire I can get up a more noticeable swing. If I take two or three turns of the wire and slip them over one pole of the magnet I get a more noticeable deflection, while by taking a coil of about twenty turns the galvanometer is violently deflected.

A magneto for low-tension ignition consists essentially of a coil of wire wound on a soft iron spindle forming what is called the armature, which is rotated between the poles of a strong permanent magnet. The ends of the coil are connected to the make and break within the cylinder, just as in the case of the battery and coil, but here the coil acts as its own battery, owing to its motion in the magnetic field. When a high-tension system is used either a low-tension magneto may be employed to send the current through the primary of an ordinary trembler coil or the armature may contain both the primary and secondary windings so that no separate coil is required. The action in such a case is as follows: As the armature rotates a current is induced in the primary windings, the ends of which are short-circuited through a make and break. The direction in which the current induced in the primary of the armature circulates is such that it tends to keep the magnetic state of the iron core of the armature the same as it was when it stretched straight across between the poles of the magnet. When the core of the armature has got to a position about at right angles to the line joining the poles the current in the primary is suddenly interrupted by the make and break, which is opened by a cam rotated at half the crankshaft speed. As a result, the iron core suddenly loses its magnetism, for in the position it now occupies the magnet no longer tends to keep it magnetized and hence, just as in an ordinary coil, an induced E.M.F. is produced in the secondary, which causes a spark to pass at the sparking-plug points.

The performance of an engine is often tested by determining the amount of work it can do in a given time under certain given circumstances—as to speed, etc. Thus the engine may be put in a chassis, and the speed on the level and up certain hills may be noted and compared with the results given by similar engines, or those obtained with the same engine when some previous arrangement of valve setting or the like existed. The objection to this method lies in the fact that owing to variations in the road conditions, wind, and such like, the circumstances attending different trials on the road are never quite the same, and hence it is difficult to be certain that any change in the speed of the car obtained is not really due to such differences rather than to the alteration in the engine which is being tested.

If, in place of testing the engine in a car it is run on a test bed, much more reliable data can be obtained. There still remains the objection, however, that the brake horsepower thus determined depends on a large number of variables, such as the carburation spark advance, setting and size of valves, length of induction pipe, and the like, so that really to study the engine a very large number of separate tests have to be made in which each of these factors is varied, one at a time. Thus, to take the case of the timing of the valves, observations would have to be made at many different speeds, using different valve timing, which would involve making a number of different cam shafts. If, however, we were able to follow what goes on in the cylinder, noting the pressure on the induction, compression, firing and exhaust strokes, we could at once infer what would be the result of making, say, the exhaust valve open later, so that in place of making wild shots, more or less in the dark, we could alter the cam in the direction to get a better result. We thus see that any instrument which will enable us to determine the pressure in the cylinder at any point of the stroke will be of much assistance when we desire to study the performance of an engine. Such an instrument has been in use for many years with steam-engines, and is called an indicator. It is only, however, comparatively lately that it has been used to any great extent with petrol-engines,

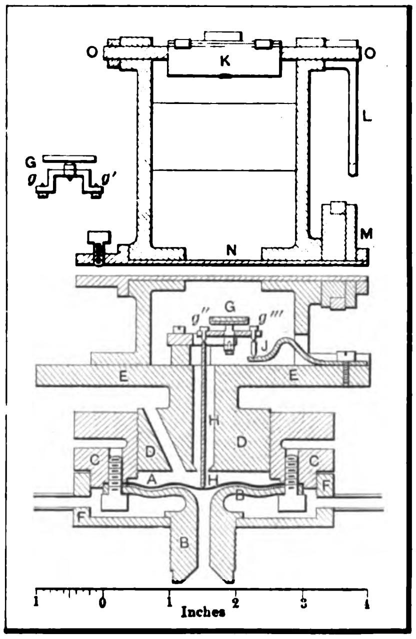

Fig. 10—Section of a manograph used for testing motors

the reasons being that the indicator, as used with a comparatively slow-running steam-engine, gave entirely unreliable results when used on a quick-running petrol-engine. This was due to the weight of the moving parts of a steam-engine indicator being so great that the tracing pencil was unable to follow the very rapid changes in pressure which take place in a petrol-engine. Thus, when an engine is running at 1,200 revolutions per minute, the whole working stroke only takes one-fortieth of a second, while with ordinary strengths of petrol-air mixtures the pressure rises 250 pounds per square inch in 0.003 of a second.

In order to obtain an indicator suitable for high speeds and rapid changes of pressure, the pointer of the ordinary steam-engine indicator is replaced by a beam of light reflected from a mirror, while the piston is replaced by a corrugated metal diaphragm, which plays the part of both piston and spring. The flexure of the diaphragm when acted upon by the pressure existing inside the cylinder is communicated to a very light pivoted mirror, and a spot of light reflected from this mirror by its movement indicates the pressure existing in the cylinder. Such an arrangement alone would give a spot of light which moved up and down along a straight line as the pressure in the cylinder varies throughout the cycle. In order to be able to obtain the pressure at any portion of the stroke, we require to give the spot of light a second movement, at right angles to the first, this movement to be an exact replica of the movement of the piston. In the indicator designed by the author this second movement is obtained by allowing the light, after reflection in the first mirror, to fall upon a second mirror, which is given a rocking movement, about an axis at right angles to the axis about which the first mirror can turn. The rocking movement of the second mirror is produced by a small crank and connecting rod, the crank being rotated at the same speed as the engine.

The actual construction of the indicator is shown in the sectional drawing (Fig. 10). The diaphragm, A, on which the pressure acts is made of steel, and for obtaining the whole diagram, including the working stroke, has a thickness of 0.65 mm. The diaphragm is clamped between two steel discs, B and C, the screwed portion of B being connected to the cylinder by means of a short water-jacketed pipe, the bore of which is 4 mm. A box, F, screws on to the ring, C, and cold water is kept circulating through the space enclosed, serving to keep the temperature of the diaphragm constant. It is of fundamental importance to keep the diaphragm cool in this way, since rise of temperature would decrease the stiffness of the diaphragm, and thus the deflection produced by a given pressure would increase so that the pressure scale of the instrument would be altered.

A concave mirror, G, is mounted on a small and light steel lever, which can rock on the points of two screws, g g', the movement of the diaphragm being transmitted to the lever by a light steel rod, H. The pointed screw, g'' is kept in contact with the rod, H, by the action of a strong spring on another rod, J, which presses against the point of a screw, g'''. By this construction the lever carrying the mirror, G, can rotate about an axis formed by the line joining the points of the screws, g, g', at right angles to the plane of the paper in Fig. 10.

Questions That Arise

CONCERNING THE BEST WAY TO STOP NOISES IN UNIVERSAL JOINTS DUE TO UNDER-LUBRICATION; DRIVING A SUPPLEMENTARY DYNAMO FOR ELECTRIC LIGHT

[261]—What is the best way to stop the noise of chattering universal joints?

The cause of noise in universal joints can usually be put down to under-lubrication, and this again through inaccessibility and getting oneself dirty in the operation. In cases where the cage does not revolve, a large grease cup might be fitted with advantage, so that it is connected to the cage by a flexible pipe and attached on the outside of the frame; then all that is required would be to give it a turn every day or so. When the cage, as is often the case, is made of leather it should be filled with soft grease every two weeks at least, if much driving is done, or say every 1,000 miles. Undue wear may result in a very bad accident if allowed to contine unchecked, as the parts become weak and may break. If the propeller shaft should drop out forward and sprag in the ground the result would be serious if it happened at any speed above 15 miles per hour. A method of guarding against such a thing happening is to fit to the car a device (Fig. 1) that would catch the shaft or torque rod should it become displaced.

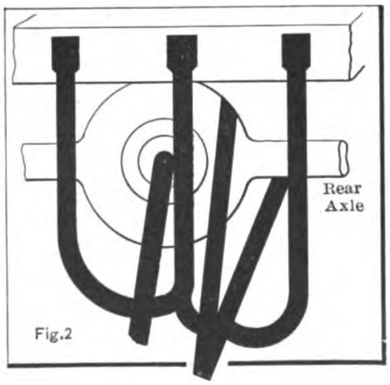

Fig. 1—Support to prevent propeller shaft and torque rod from dropping

[262]—How is it possible to drive a supplementary dynamo for electric light?

This is a question that often occurs to the autoist who would do away with oil lamps if he could find some means that would permit him to dispense with the perpetual charging of storage batteries. The dynamo naturally suggests itself but the method of attachment has to be considered. A method that can usually be employed on cars that have a fan belt drive will be seen in Fig. 2. Two belts can be carried on the car so that the fan can always operate and when the dynamo is required the short belt taken off and the longer one substituted. Before the installation is carried out the speed at which the dynamo should run must be taken into consideration and the pulley wheel for same made accordingly. It is necessary to have a storage battery fitted as well, as when the motor is stopped and the dynamo ceases to give off energy it is possible to switch over and keep the lights going till the motor is started again.

This is one of the plans that has been adopted with the Apple Dynamo for lighting, excepting that the belt is supplanted by a sproket chain. Properly installed the Apple idea works like a charm, but if an autoist undertakes to make the application after he gets his car, it is likely that poor workmanship will bring on a quota of noise, all of which can be avoided, however, by consulting the maker's plans and following them.

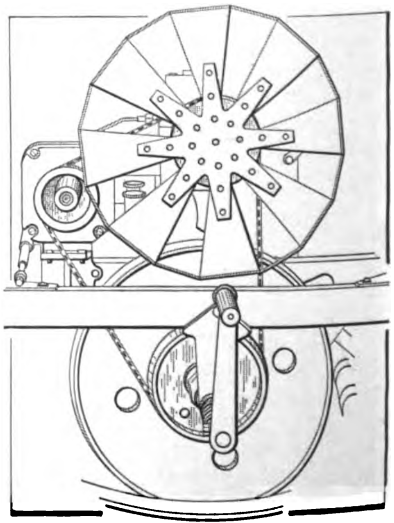

Fig. 2—Showing method of driving lighting dynamo

More Don'ts

A LITTLE COMMON SENSE; A BRIEF FOR SKILL; PRUNING SOME HANDICAPS, AND BRINGING THE MAKER AND THE USER INTO BETTER RELATIONS, ELIMINATING THE THINGS THAT ARE TOO TRANSPARENT TO BE TOLERATED

Don't undertake to be cook and steward of the club; other members may be willing to do some of the work.

Don't stay away just because the things that are being done are not after your suggestion; keep your ammunition in the locker until it is needed.

Don't shoot anyway unless the demand is pressing.

Don't use a pea-shooter when the time comes for action; get a gun.

Don't fall into the suggestion that new automobile legislation is desirable just because it is new; find out who is behind it and just why he wants you to help him pull chestnuts.

Don't forget who is responsible for undesirable automobile legislation when you go to the polls to vote—be sure and vote right.

Don't fail to support the legislation that is wise—vote for the man who is responsible for it.

Don't fail to advocate good roads; this is not to be construed as in favor of the expenditure of good money for bad roads.

Don't overlook the fact that some of the good money that went for roads was not expended as wisely as one would want.

Don't try to stop the building of good roads just because some of the work that has been done is not what you would want to directly pay for.

Don't fool yourself; you pay, if not directly, indirectly; put up a fight for what you pay for.

Don't overlook the fact that the fellow who is trying to "graft it" is a coward; scare him out; all that you have to say is boo!

Don't think that every patriotic citizen (?) is starving on the job; cut out the compensation (whatever it is), and the patriot (of a certain class) will abandon the work.

Don't forget that abandonment is not always a crime; it would be for the good of the service in some cases; try and find the cases.

Don't take it for granted that all public questions are being handled well; there are a few that might be in better hands; you may be able to help the situation along.

Don't go at it like a "bull at a gate or a cow in a china shop"; be practical.

Don't judge your possible buyer by the same standard that you set up for yourself; twins generally hail from the same family.

Don't imitate the rabbit who tried to imitate the roaring lion; the rabbit roared all right, but the coyote said that Br'er Rabbit was "good eating."

Don't suppose that there is no intrinsic merit to an institution that keeps on expanding despite the predictions of the croakers who key their voices to the point of cracking telling how a fact is not a fact.

Don't melt your jewels down to make a golden calf; just limit your purchase to a good automobile; one that can be procured with some of your small hoard; the cost of maintenance must also be considered.

Don't match wits with a man who desires to purchase an automobile; give him what he wants and let him go.

Don't chase after phantoms; land the customer who chases after you.

Don't copy the men who abandoned civilization and laid eggs that would not hatch; vitalize your business; deliver the goods.

Don't try to get the best of your customer; get his confidence; then hold it.

Don't throw your false teeth into a well and trust in the Lord to grow a new set of teeth; nor show your teeth to your customer after you get enough of his money to pay for one of your automobiles.

Don't pump on a tuneless organ; get some musician to key your argument up; sparkle; snap; pave the way with simplicity and decorate the scenery with truth.

Don't scald the hair off of a plain statement of fact; it looks better when it is protected from the Wintry blast.

Don't forget, if you want to catch fish, you must bait your hook; if you want to catch a particular kind of fish, you must tickle the fish's palate, not yours.

Don't fish for a customer for your kind of an automobile, using bait that would attract the discriminating notice of a skate; tell the prospect just what kind of an automobile you have to sell; it may be just what he wants; if you do not know how to tell him, engage some one who will be able to truthfully describe the car.

Don't pay a man to compile a "house organ" and let him palm off garbled material that he "crabs" from technical papers; your customers will have read the original and will know that you offer it second-hand; they might infer that your construction department has the same poor way of doing things.

Don't imagine that the customers whom you hope to entertain don't know the difference; if you think that they do not know anything, you do yourself the injustice of proving that they know more than you do.

Don't pay good money for a bad job; exact an equivalent; it may be had for the asking; be imperative.

Don't intrude on the privacy of a citizen; if a man does not ask you for anything, even a circular, there is no reason to believe that he wants it; if you thrust it upon him you gain his enmity; let him find out what you have; if it is what he wants you would have to put up a stiff argument to keep him from taking it away from you.

Don't despair of letting a man know what you have that he wants; put it under a plug hat on the sidewalk that he uses every day; when he comes along he will kick the hat and a swollen toe will do the rest.

Don't squander a plug hat that costs $10 trying to attract the notice of a buyer unless you have something worth while to sell.

Don't make the mistake of thinking that every one knows all about your business just because you think that you do; such a mistake merely proves that you are not well informed about your own affairs.

Don't get vexed if some one volunteers the truth; it may not sound good to you, but following it might pull you back off the road to ruin.

Don't overlook the fact that your argument may be a straightforward presentation of the facts as they appear to you and still be as one-sided as Patrick's financial prospects; send the argument to the carpet cleaner to be renovated and then try it on the dog.

Don't pay $2 a line for publicity and allow the publisher to make it appear in the paper as if it cost you nothing; the public will say, since it cost nothing, it is worth nothing, and the publisher will be getting you to pay for that which should be paid for by him.

Letters

DISCUSSING MATTERS OF INTEREST TO USERS OF AUTOMOBILES; INSERTING SPRINGS TO TAKE UP PLAY; SAFETY WHEN THE STEERING ROD DROPS; QUALITY OF LUBRICANT MUST SUIT THE SERVICE; TAKING OFF TIGHT WHEELS AND SPROCKETS, ETC.

Taking Up Play in a Propeller Shaft

Editor THE AUTOMOBILE:

[2,412]—I have a car fitted with live axle drive and the propeller shaft is fitted with double-ended cardan joints. It has lateral play back and front and now that the blocks are slightly worn there seems to be a clattering noise when running slow. Could you suggest a remedy to obviate this?

Albany, N. Y. PUZZLED.

We should suggest fitting new blocks and inserting springs as indicated in Fig. 1.

Gear Wheel Setting

Editor THE AUTOMOBILE:

[2,413]—I have an L-type motor with all the valves on one side and the magneto is driven by a gear off the front. While lubricating the timing case the other day—and to do this I have to remove the front plate—the magneto wheel came out. There are some center punch marks on the wheels. How should these be set for the magneto to fire properly? MAGNETO.

New York.

From the marks you should be able to retime the magneto, and to do this the condenser must be removed first in order to see when the armature leaves the magnets. Turn the magneto shaft so that the distance between armature and magnet after the break has occurred is 5-8-inch and the piston on top dead center; then insert timing wheel to mesh with the cam gear wheel.

Fig. 2 shows the gear wheels with the timing gear case removed; the center punch marks should mesh as indicated and as only the magneto wheel has been removed you should have no difficulty in properly replacing it.

To Prevent a Steering Rod From Dropping

Editor THE AUTOMOBILE:

[2,414]—While going over a bad piece of road the other day the steering rod of my car freed itself from the ball at the end of drop lever. Could you tell me the cause of this and what to do to prevent it occurring again? R. A. E.

Yonkers, N. Y.

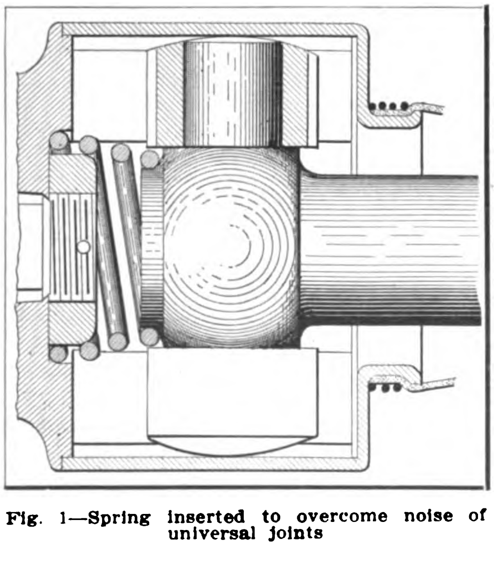

Fig. 1—Spring inserted to overcome noise of universal joints

The cause of your trouble is that the adjustment of the ball and socket joint is not tight enough and when a strong push is transmitted to the springs inside by an obstruction on the road's surface these springs allow the jaws of the socket to open and permit the rod to fall. The remedy is to adjust the springs tighter or have a small amount of the socket ends ground off to allow a better purchase of the ball, but sufficient clearance must be allowed so that when the arm works backwards and forwards it does not touch.

A strap placed in the manner indicated in Fig. 3 will keep the bar from dropping on the road and thereby damaging it and preventing the car from proceeding until the repairs have been made. It should also prevent the rod dropping.

Quality of Lubricant Must Suit the Service

Editor THE AUTOMOBILE:

[2,415]—Please advise what kind of oil you consider best for the motor; also please give me the address of some manufacturer of Panhard oil. FRED B. NEWINS.

Patchogue, N. Y.

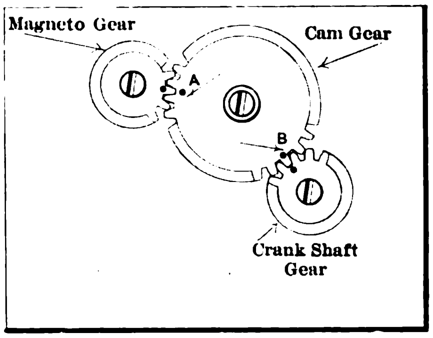

Fig. 2—Sketch showing marks on timing gear wheels

This question is sufficiently incomplete to make it desirable to comment upon the views as therein expressed. If the oil is to be used for cylinders of internal combustion motors, this fact should be taken into account; if the service demanded of the motor in a given case is in the summer time, the oil should be relatively viscous: but if the service is to be rendered during the cold winter months, a somewhat thinner lubricant should be selected. On the other hand, if the oil is to be employed in the transmission gear, some account should be taken of the character of the service it must render if satisfaction is to be realized. Likewise, it would be worth while taking into account the kind of oil that would best lubricate a live rear axle, and so on. But if the motor is of the air-cooled variety, rather than of the water-cooled type, surely this fact should be taken into account. And so it may be said all along the line. The first thing to fix upon is the duty that the oil must perform, and then select the kind of oil that is efficacious for that purpose. The idea of buying 80-cent cylinder oil to use in a 20-cent bearing should go extremely well with the type of automobilist who kicks about the cost of maintenance, but exhibits rare intelligence in making the cost as high as possible. There are probably a considerable variety of brands of lubricating oil that might even be purchased at from 20 to 30 cents per gallon, in barrel lots, that would be entirely satisfactory for the lubricating work that must be done in all the joints of an automobile, excepting in the cylinders. These relatively low-priced products, however, should be purchased from the oil vendors who make a specialty of dealing in automobile lubricants, in order that resinous products or other concoctions might be avoided. When it comes to the lubricating oil, tell a reliable oil house what kind of a motor it is that is to be lubricated, and reducing it to a question of cylinder oil, be careful to state definitely the actual facts as they are, and the chance of going wrong will then be reduced to one in a hundred, which is a sufficiently small chance to permit a man of intelligence to cope with it successfully. The address of the manufacturers of Panhard oil will be found by consulting the index to advertising pages of The Automobile, or The Automobile Trade Directory, but it should be possible to get any of the standards brands of lubricating oil at the nearest dealer in automobile supplies.

Baumé Degrees to Specific Gravity

Editor The Automobile:

[2,416]—Can you inform me how to turn Baumé to specific gravity? Metric.

Montreal, Canada.

$$\text{Specific gravity} = \frac{145}{145 - {}^\circ\,\text{Baumé}} \text{ at } 60^\circ \text{ Fahrenheit.}$$

e. g. 15.0 Baumé—1.115 specific gravity.

Length of Spark Plug Gap

Editor The Automobile:

[2,417]—Some time ago I set the points of my spark plugs at 1/64th inch and found that the engine did not run as well as when they were set at 1-32d inch. One or two of the cylinders seem to miss occasionally. Could you tell me the reason for this? H. L. Long.

Richmond, Va.

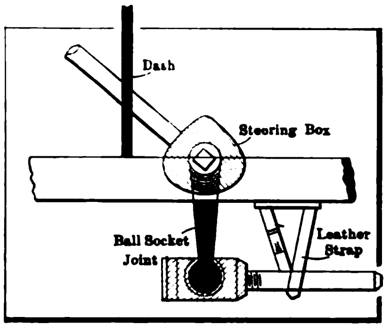

Fig. 3—Strap to support steering bar in case of accident

The cause of the misfire is not so much due to the plugs as the mixture. The spark that one sees when the plug is held outside the cylinder is much attenuated when under compression, and unless the mixture is good the current that bridges the gap is not sufficient to cause an explosion, whereas the 1-32d is. A slight variation of the mixture might prove the running of the motor.

How to Remove Tight Wheels and Sprockets

Editor The Automobile:

[2,418]—What is the best method of removing the rear wheels of my car? They are keyed to the shaft and I have no wheel remover. I have tried striking blows on the inside of the wheel with a hide hammer, but the action does not improve the paint and, furthermore, does not remove the wheel. A Subscriber.

Trenton, N. J.

A method of removing wheels is shown in Fig. 4, and the method of application is as follows: Remove the hub cap and fix some stout rope around four of the spokes as near the brake drums as possible. The lifting jack is then unscrewed to its smallest lift; place it with the head against the end of the axle, but if it does not touch owing to the size of the hub cap, insert a block of hard wood, as shown in illustration. Secure the rope round the base of the jack and unscrew, and the wheel should come off easily. The same method can be employed for removing chain sprockets.

Metal for Connecting Rod Bearings

Editor The Automobile:

[2,419]—I purchased a touring car in May, have run it 25,000 miles. About a month ago had to have the connecting rods on the crankshaft adjusted, I suppose on account of the bearings wearing and causing knocking in the crank case. the same trouble has come back and the machine is now at the agent's to be adjusted again. What is the best metal to be used for bearings on the connecting rods? They spoke of replacing with bronze. Which is the best make of bearing for this purpose? John P. Tull.

Philadelphia.

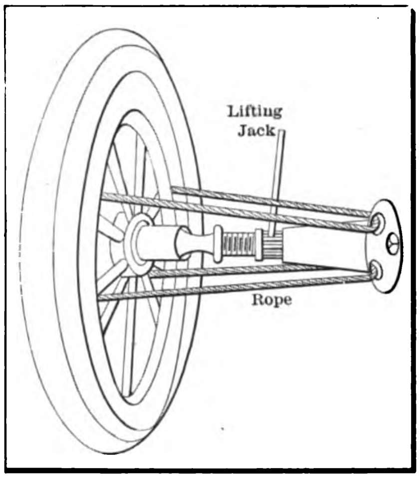

Fig. 4—Means of removing tight wheels and sprockets

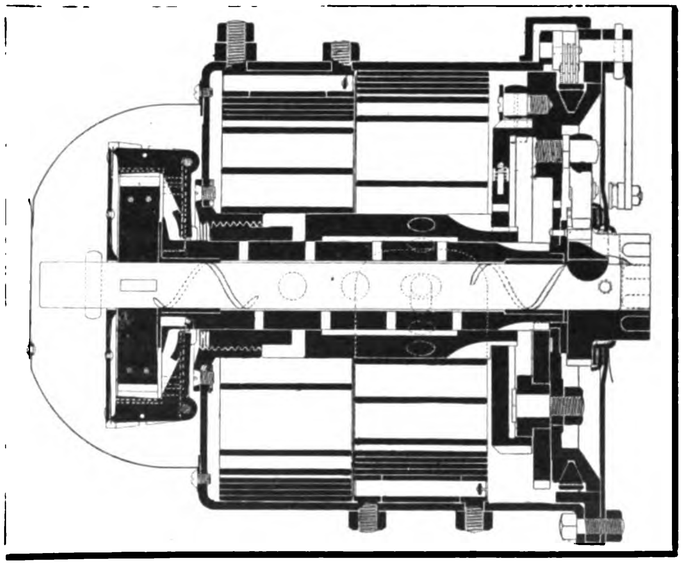
A very good metal for bearings, and one that should give satisfaction is Fahrig metal. The composition of this metal is substantially 90 per cent. tin and 10 per cent. copper. There is a very small amount of impurities in either metal, but not sufficient to materially alter these percentages. New metal must be used, otherwise the proportions cannot be correctly ascertained. This table shows some of the properties of Fahrig metal:

Crushing strength...........	38,500 pounds per square inch
Tensile strength.............	20,500 " " " "
Elastic limit..................	3,600 " " " "
Molecular temperature.......	1,000 degrees Fahrenheit
Anti-friction angle..........	77 degrees

In casting Fahrig metal it should be covered with charcoal and heated to a dull red before "teeming."

Automatic Starter Shown at Belmont Park

One of the devices that attracted unusual notice at the automobile exhibition at Belmont Park was the automatic starter which was being demonstrated by the Auto Improvement Company of New York. The starter belongs to the flux spring variety, and the details of the same are brought out in the cross-section here given, showing two flat steel springs of the coil variety, lying alongside of each other in a dust-proof case. The shaft takes the place of the ordinary starting crankshaft and does the work just as it would be accomplished by a chauffeur in the ordinary process of cranking. the only difference being that the effort is due to the energy stored in the flat springs, thus making it unnecessary for the driver to exert himself.



Cross-section of automatic starter shown at Belmont Park

BRAKING TRUCKS WITH THE EXHAUST—DETAILS ON CASEHARDENING—FATIGUE OF COLD-ROLLED MATERIAL—PENETRATION OF QUENCHING EFFECTS—WHEN IRON DOES NOT RUST—CAST ARMOR PLATE—ESTHETICS OF ENGINEERING—WRITING ON GLASS

A motor brake, recently patented, is employed on the trucks turned out by Gräf & Stift, A. G., a Vienna manufacturing concern. The principle is similar to that used for reversing the motor in several American marine power plants, the camshaft being adjustable longitudinally by means of a shifter fork, and the exhaust cams are arranged with truncated cone extensions at one side leading to a circular cam of the same radius as the non-eccentric portion of the main cam. At any point in the cycle the exhaust tappet roller may thus be let down so as to throttle or completely block the exhaust, accordingly as the shaft is shifted part of the width of the cone or its entire width. The device is said to work satisfactorily, offering the advantage that all organs transmitting the braking effort are engaged gradually.—*Der Motorwagen,* Oct. 1.

Strength of a casehardened shell, according to Leon Guillet, the well-known metallurgical specialist employed in the laboratory of De Dion et Bouton, is independent of the carbon content of the steel below the shell, the core. The best casehardening results he obtains in practice, however, from a steel not exceeding 12 points of carbon, 30 of manganese and 30 of silicon. A steel of this composition has a tensile strength, annealed, of less than 38 kilograms per square millimeter (about 39.596 pounds per square inch) and an elongation of 30 per cent. The best cementation compounds are at present (1) a mixture of 40 per cent. charcoal and 60 per cent. carbonate of barium, which operates through the carbon monoxide developed by the heat, (2) a mixture of ferrocyanide of potash and dichromate of potash, and (3) a mixture of 10 per cent. of common salt with 90 per cent. of charcoal. The latter is found very effective, though its chemical reactions are still obscure. It is important for the value of a compound that it does not cause concentration of carbon in the surface film of the work but penetrates well, so that brittleness of the surface and subsequent heat treatment may be avoided. Pieces intended for wear and impact may be hardened to a depth of 1-2 to 8-10 millimeters; those exposed to steady pressure should have no less than 1 millimeter to 1 1-4 millimeters thickness of the shell. In practice there is a distinction between casehardening at low temperature (850 degrees to 900 degrees Centigrade) and at high temperature (1,000 degrees to 1,050 degrees Centigrade, rarely 1,100 degrees), and the distinction is justified by the corresponding difference in the subsequent heat treatment. Steels cemented at 850 degrees are cooled to 750 degrees and then quenched. Those cemented at higher heat require two quenchings, first at 1,000 degrees in water, serving to give the core the finest possible grain and the toughness which goes with fine grain, secondly at 750 degrees to give hardness to the shell. These rules rest on the following principle: The brittleness of a steel grows with the temperature and the duration of the heating, provided this temperature is above that of the lowest transformation point. To remove the brittleness, the steel must be reheated to above the highest transformation point and then slowly cooled. But in the case of very mild steels cooling in water has the same effect. By the double quenching, all free cementite in the hardened shell disappears, if the latter is not thicker than 2 1-2 millimeters and, besides, the core becomes perfectly homogeneous. However, if the carbon of the steel is not at least 12 points (a "point" being 1 per cent. of 1 per cent.), the core becomes hard and brittle. On the other hand, the manganese must be less than 30 points, to keep the shell from getting too flinty. The grain of a fracture, which is often looked to for deciding the quality of the cementation, depends mostly on the manner of fracturing.—*Revue de la Métallurgie,* July.

When iron and steel are maintained at heats from 65 degrees to 800 degrees Centigrade the ferrite grains very rapidly develop a formation of coarse crystals, as observed by Stead. This fact is now supplemented by the observation that the formation of coarse crystals is particularly rapid if the material has been cold-rolled or drawn. One half of a bar of soft steel was drawn to a thin wire and then subjected to a temperature of 650 degrees to 800 degrees, at the same time as the unworked half of the bar. After both had cooled, the drawn material showed much larger crystals at fractures than the unworked piece, and microscopic examination corroborated the test. The effect of the crystalline formation is much less noticeable at tensile tests than at impact tests on nicked bars. Many heretofore mysterious fractures are explained through the facts mentioned. —G. Charpy in *Comptes Rendus de l'Académie,* Aug. 1.

Data on the penetration of the hardening effect with different quenching mediums formed the subject of a paper recently read by Mr. Grevet before the Society of Mineral Industry. The author started from the assumption that the action of a quenching liquid must depend on three factors, (1) the conductivity of the liquid, which decides the surface hardness produced in any given steel, (2) the size of the work, and, (3) the conductivity of the steel, which jointly decides the relations between surface and core hardness. He undertook experiments for determining by test the surface hardness and the core hardness reached in an assortment of bars of plain carbon steel varying in diameter from 12 to 60 millimeters, and quenched with cold water, oil, boiling saturated brine, and with air, and presents the results in tabulated form. He also gives diagrams of the penetration in chrome-nickel steels of different compositions.—*La Technique Moderne,* September.

Pure iron does not rust, hence almost pure iron (from electric furnaces) is used for tinplate by an American company whose claims to special merit on this ground met with skepticism in Europe until the Chemical Society in London had listened to a paper on the same subject from which it appeared that pure iron and pure water in combination gave rise to no oxidation.—*Proc. Chem. Soc.,* June 29.

To write on glass, use an aluminum pencil.—Chemical Notes in *La Technique Moderne,* September.

Considering the enormous cost of rolled armor plate, under all circumstances the heavy additional cost of establishing new producing plants when the armor plate must be of the caliber required for the Dreadnought type, the world will have to come to cast plate hardened on both sides, which can be made without new installations and is more readily turned out in the suitable shapes.—From article by Victor Tilschkert in *Oest. Z. f. Berg. und Hüttenwesen,* Aug. 6, 13 and 20.

"The real architect of this age is the engineer," says Joseph A. Lue, among other striking remarks with regard to buildings and bridges appearing in a recently published book entitled "Esthetics of Engineering" (*Ingenieur Aesthetik*). And, referring to the failure of modern architects in not producing works of artistic merit, embodying the spirit of the present age, but continuing to "rob the art treasuries of the past," he holds that this result is only natural when the architect or artist is not trained also as engineer and when the engineer has experienced no development of his artistic insight. "Modern civilization is not reflected in our architecture," he says, "but in our vehicles, automobiles, ships, trains. When the question is of the real style of this age, here is where it is found. There is need of bringing art and engineering nearer together, as they were once."—*Technik u. Wirtschaft,* September.

Troubles of Battery Ignition Systems	How to Fix Battery Ignition Troubles
(a) Run down battery.	(a) Charge four-volt batteries to 4.3 minimum.
(b) Broken plug.	(b) Fit new plug or if porcelain broken fit new one.
(c) Dirty plug.	(c) Clean with gasoline and tooth brush.
(d) Points of plug too far apart.	(d) Set to between 1-32 inch and 1-16 inch.
(e) Points too close.	(e) Open slightly with blade of penknife.
(f) Bad earth wire.	(f) Clean around both and scrape wires.
(g) Short-circuited wire.	(g) Replace wire by new piece at once.
(h) Short circuit in coil.	(h) Send coil to makers.
(i) Burnt condenser.	(i) Caused by batteries of too high voltage. Return to maker.
(j) Short circuit in timer.	(j) Clean out pitted oil and refill with fresh.
(k) Bitted contacts of platinum trembler blades.	(k) Clean with fine file, perfectly level.
(l) Timer roller jumping contacts.	(l) Due to worn fiber; take off timer and have it turned true.
(m) Weak spring on timer.	(m) Fit new and stronger spring or shorten.
(n) Loose connections.	(n) Go over all connections once a month and fit lock nuts.
(o) Chafed wire.	(o) Fit new wire and secure same with staple.
(p) Sulphated terminal of battery.	(p) Clean; finish with fine emery paper; when the battery is not in use cover terminals with vaseline.
(q) Battery will not hold charge.	(q) Plates buckled or loose paste causing short circuit; test specific gravity.
(r) Short circuit between coil and plug.	(r) Poor insulation or broken wire inside; fit new wire.
(s) Water or damp in coil.	(s) Put coil wrapped in flannel in slow oven; more a job for coil expert.
(t) Faulty windings.	(t) Beyond owner's controi; return to makers.
(u) Trembler contacts give off metal one to the other.	(u) Voltage too high for coil; change poles of battery.
(v) Faulty switch.	(v) See if it insulates properly; look for crack in vulcanite.
(w) Loose platinum points.	(w) Have them resoldered with silver.
(x) Unusual buzz inside coil.	(x) Probably due to faulty insulation of the windings.
(y) Wrong adjustment of platinum contact points.	(y) Adjust with least clearance to give a high-pitched tone.
(z) Broken terminal on coil.	(z) Buy a new coil.

Care and Repair of Tires

SECOND INSTALLMENT, ILLUSTRATING PROFESSIONAL METHODS OF REPAIRING; DISCUSSING THE BEST WAY TO OBTAIN THE MAXIMUM RESULT

TAKING further advantage of professional methods, Fig. L presents two operations, one of which, A, involves a sectional repair, and B shows the vulcanizing being done on a section of a tire. This illustration indicates that a section can be put into an outer casing, no matter how badly it is damaged, provided, only, that the fabric is in good condition. Fig. M shows the wrapping process. The tire is mounted on a shaft S, and is being wrapped by cotton fabric F, which is the final operation before placing the same in the vulcanizing kettle. The spindle S has a loose pulley P1, upon which the belt B1 runs, excepting when it is desired to rotate the shaft S, in which event the belt is slid over onto the pulley P2. The device is almost primitive in its simplicity, requiring nothing but the standards and a piece of cold rolled shaft with the spiders S2 and S3 upon which the tires are mounted when they are ready for the wrapping operation. It would almost pay the private owner of a car to provide such facilities in order that he might undertake his own repairs, but in the absence of such utensils, it is a question as to whether or not it would be feasible to try to do the work.

When the tires are wrapped they are then placed in the kettle K1, hanging on the hook H1, after which the cover C1 is put into place and bolted tight against the gasket G1, when steam is turned on and the vulcanizing process begins. The steam is generated in the boiler B1, maintaining the same at about 45 pounds per square inch, which corresponds to a

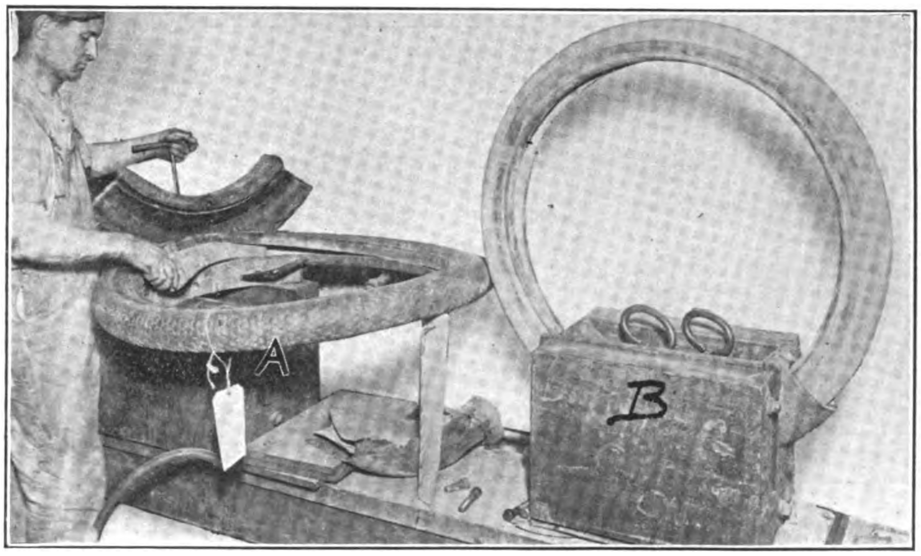

Fig. L—Depicting the Method of Curing an Outer Casing after a Sectional Repair; also Showing the Method of Procedure in Making the Repair

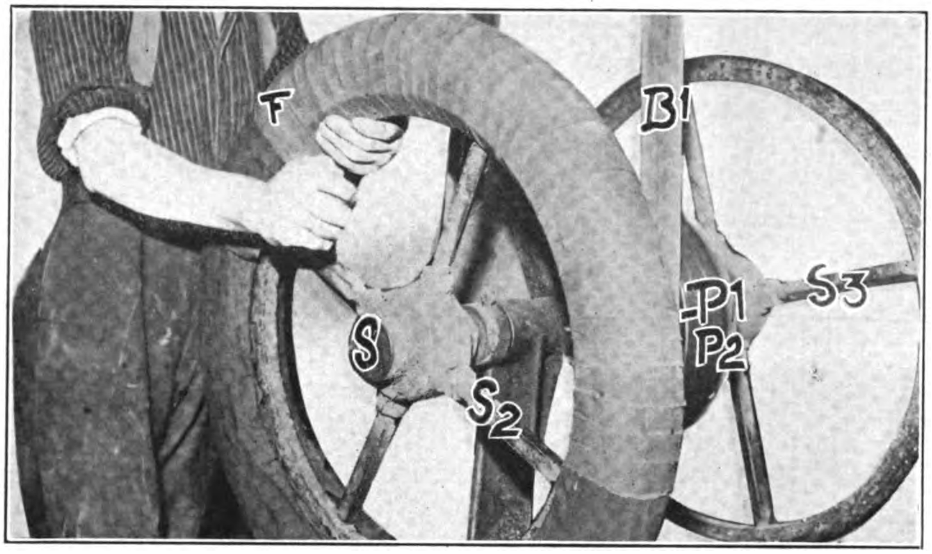

Fig. M—Wrapping the Outer Casing after the Repair Is Completed Prior to Placing the Same in the Vulcanizing Kettle

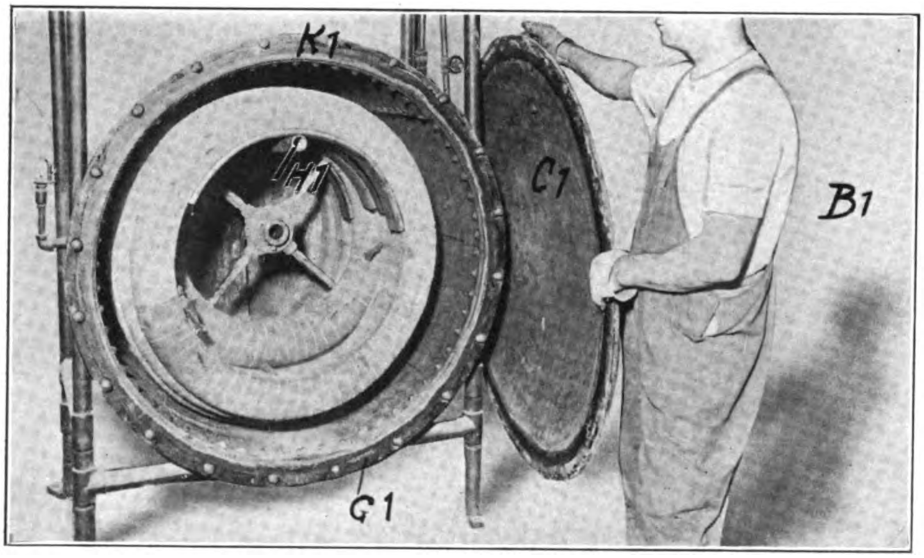

Fig. N—Showing the Vulcanizing Kettle Open and the Wrapped Outer Casings Resting on a Hook Within the Cover about to Be Bolted on

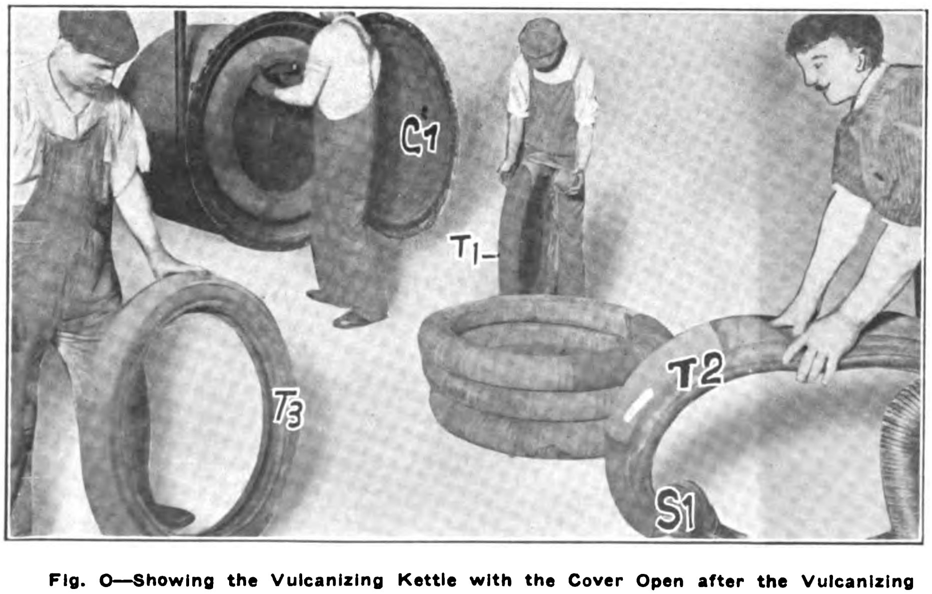

Fig. O—Showing the Vulcanizing Kettle with the Cover Open after the Vulcanizing Process Is Completed and the Wrapped Tires Being Removed Therefrom, Some of Which Are Being Unwrapped, the Spring Being Taken out and the Finished Job Ready to Go Back to the Owner

temperature of 274.3 degrees Fahrenheit, at which temperature a kettle cure is realized in 45 minutes, 20 minutes of which are allowed for the equalization of temperatures.

If a hard cure is desired the steam is raised to 55 pounds per square inch, which corresponds to a temperature of 286.9 degrees Fahrenheit, and the time allowance is increased to 1 1-4 hours, 25 minutes of which is the allowance for equalizing temperatures. If a semi-cure is desired with the steam pressure at 55 pounds per square inch the full time allowance is 45 minutes, 25 minutes of which is taken in the equalization of temperatures. It will be understood that vulcanization will take place over a wide range of temperatures; if the temperature is relatively low the time required to bring about a more or less complete state of vulcanization will be relatively long. In hastening the vulcanizing process it is necessary to avoid going beyond a certain temperature; 275 degrees Fahrenheit is an approximate safe maximum, and the novice in undertaking to make repairs, if he uses an electric vulcanizer, must so regulate the temperature that it will not rise beyond the safe point.

When steam is employed as the source of vulcanizing heat the steam pressure can be maintained at substantially 55 pounds per square inch without danger of serious fluctuation, and this will be particularly true if the steam boiler is large enough and the volume of water therein contained is sufficient to prevent rapid fluctuations in the pressure, it being the case that the greater the volume of water the longer it will take to vary the temperature of the same, hence the less marked will be the pressure changes in a given time.

But when an electric vulcanizer is used it is possible to raise and lower the temperature at a rapid rate, and in order to avoid these rapid changes in temperature it is necessary to watch the vulcanizing heater until it has attained its maximum temperature, regulating the flow of current from time to time until by the thermometer it can be shown that the heat condition has reached a stable level and will remain at that point throughout the balance of the process. There are two conditions that interfere and tend to cause heat fluctuations, one of which lies in the change in resistance of the electric heater for temperature variations: the resistance in ohms of the conducting wires in the heater increases considerably with increasing temperature, and the flow of current in amperes must be adjusted to suit this change in resistance, all of which takes a little time, because it takes time for the heater to rise to a stable level, and the inexperienced autoist is likely to overlook this condition and go away from the vulcanizer before it is safe to do so. The remaining factor lies in the inaccuracy that is inherent in the average thermometer. It is extremely important that the electric vulcanizer purchased and used for this class of work shall be provided with an accurate thermometer, by means of which the autoist will be able to determine the real temperature that exists during the vulcanizing process. It is not uncommon to find commercial thermometers that will give false readings of 10 or 15 degrees at this range in temperature, and it will be apparent to any one that if the safe temperature is 275 degrees Fahr, a difference of 10 or 15 degrees, or say 290 degrees Fahr., if made the working temperature, spells failure.

When the kettle is open, after the vulcanizing process is completed, the tires are removed therefrom as shown in Fig. O, with the cover C1 removed; one of the tires T1 is having the wrapping undone, another of the tires T2 is having the spring S1 removed and a third tire T3 is shown in the completed state. Fig. P shows a pair of tires after they were repaired, in which the case C1 has a patch P1 and the case C2 has a patch P2. The work is extremely well done, and a tire repaired in this way should give a good account of itself, but the amount of service to be expected depends absolutely upon the condition of the old fabric. There should be no question at all about the quality of the new patch; it will be good if the fabric used is of a good grade, and if the repair rubber is of the right quality. But the new patch depends for its utility upon the quality of the old fabric to which it is attached. If the new patch is to make good the ills of a blow-out, the first question is, What caused the blow-out? If it is on account of rotten fabric, and the condition of decay is general throughout the whole tire, the same rotten fabric will blow out again, perhaps in a new spot, but more likely at the junction of the new patch and the old fabric. If, on the other hand, the tire is relatively new and the fabric is in good condition, the repair will be dictated on account of damage done by some means, not assignable to tire rot. This patching process, under the circumstances, is really one to be applied to a tire that is in good condition excepting for the result of good usage, the assumption being that the tread may be damaged at one or more points by cutting or otherwise, but that the fabric in the remaining part of the tire will be stout and in fettle to do further work, so that the patch will have something to hang on to, in which event it is worth while to consider repair cost.

Inner tubes are legitimate subjects for repairing up to the time when the rubber compound shows a general condition of checking and a marked falling off in the elasticity of the rubber. Fig. Q shows a tube at A with the repair tissue T1 ready for the vulcanizing process; at B after the repair part is inserted and rolled

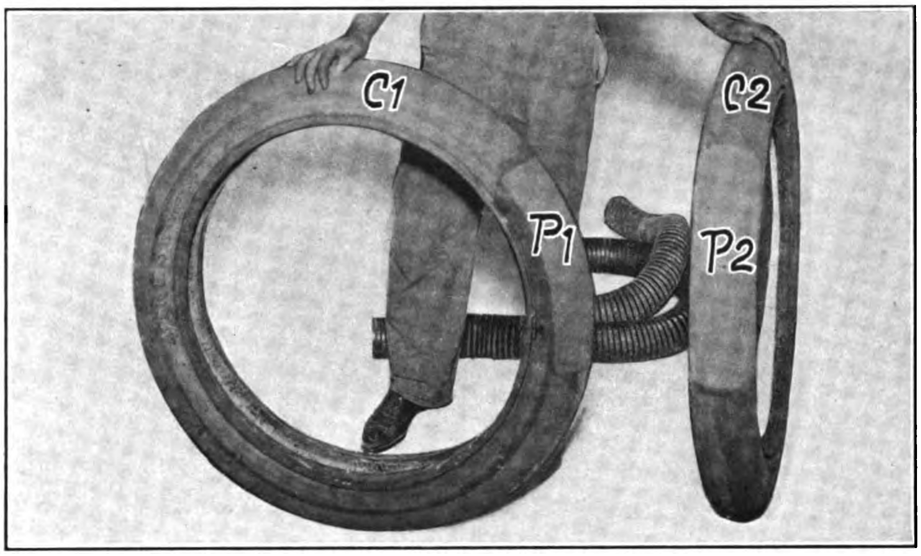

Fig. P—Presenting a Pair of Patched Tires, Showing How Well the Patches Are Made

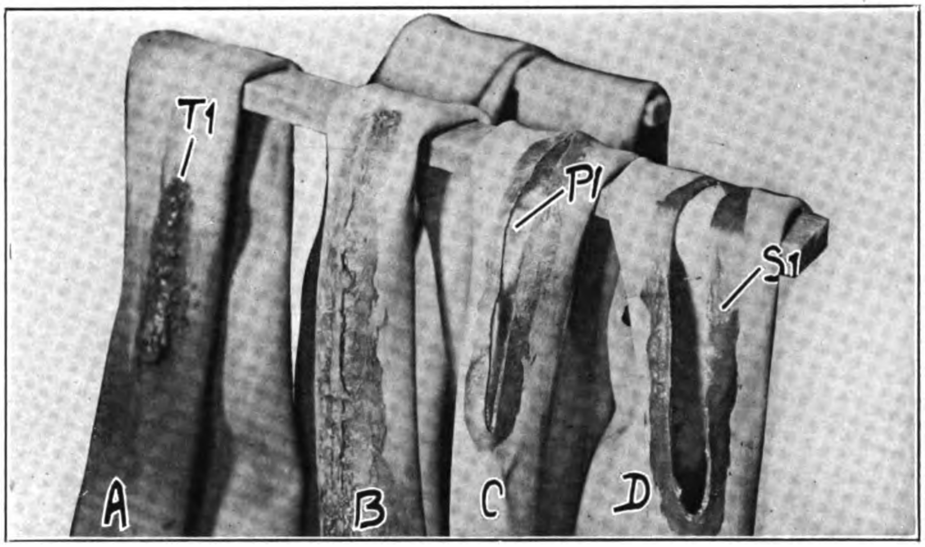

Fig. Q—Four Operations in the Patching of Inner Tubes. A—Ready for the Vulcanizer; B—The Tube Rolled Down; C—The Patch Inserted; D—Ready for the Patch

Fig. S—Inner Tube with Patching Completed Inspected and Ready to Go Into Vulcanizer

down; at C with the repair part P1 inserted and at D with the edges of the opening solutionized at S1 all around. Prior to solutionizing, it is necessary to cut away all the damaged rubber, making the opening as large as may be, provided the remaining rubber is sound. The surfaces are then sandpapered down, removing the exterior coat, and when the body of the rubber is in sight it is then roughened, after which it is cleaned, using benzine or other rubber solvent for the purpose, and it is then solutionized, and it is important that the solution employed be of a character of rubber gum that accords with the quality of the rubber of which the tubes are made. There is almost no limit to the extent to which inner tubes can be repaired provided they are in good condition from the point of view of the quality of the remaining parts of the tubes, assuming that the operations are performed with care and that the vulcanizing process, which must invariably follow, is properly done. Fig. R shows the operation of working vulcanizing gum into a hole in the tube. The average amateur does not take the necessary pains in performing these operations; with him it is enough to stick a piece onto the tube to be repaired, exerting a little hand pressure and clamping it down with a clothes pin, hoping, perchance, that a little dirt, some grease, a bit of a patch and a jab of gum will adhere to the tube and keep the wind in—it will not.

When the inner tubes are properly patched, and it can be seen by a careful inspection that the patch is well stuck to the surfaces all around, it may then be vulcanized, as shown in Fig. S.

Timing the Motor

DISCUSSING THE RANGE OF TIMING IN MOTORS AT VARIOUS SPEEDS; PRESENTING A CHART OF SETTINGS OF VALVES TAKEN FROM ACTUAL PRACTICE

It is proposed in a series of diagrams to explain the methods of timing employed in a number of well-known motors. The small dots indicate the positions in degrees to the dead center at which the different operations take place. The variations of the timing operations are primarily due, as the curves indicate, to the increased maximum speed of some motors compared to others, and while some motors can be made to run better by a different setting of the valves, allowing them to open or close earlier or later, as the case may be, nevertheless, the two primary considerations that the autoist has to consider are the opening of the exhaust and the opening of the inlet valves. The actual shape of the existing cams will not permit any variation of the settings once those mentioned have been determined.

From the charts a mean timing for all motors can be found, and this is represented by the following:

Lag of inlet valve opening	degrees, 12.16
Lag of inlet valve closing	degrees, 25.32
Lag of exhaust valve closing	degrees, 5.8
Lead of exhaust valve opening	degrees, 46.20
Advance of ignition in degrees	31.15

The point that varies more than any other is the lead given to the exhaust valve opening and, as above mentioned, the lag of closing of this valve is governed by the opening. One is immediately confronted with the question of overlapping of the exhaust closing and the inlet opening. The faster a motor turns it is logically to be expected that the exhaust will require a greater lead, but in practice this is not always the case, as the excess pressure caused by the greater speed is overcome by larger valves and larger ports in the original design. An example of this can be found in high-speed motors overcoming excessive back pressure by fitting two and sometimes three exhaust valves to each cylinder. The only type of valve that can be reckoned with other than the ordinary poppet valve is the sleeve type as fitted to the Knight motors. In this case the two valves are open at the same time for a period of 20 degrees. Inlet opens at dead center, exhaust closes at 20 degrees after dead center. Exhaust opens at 55 degrees before lower dead center on the firing stroke and the inlet closes 45 degrees up on the compression stroke.

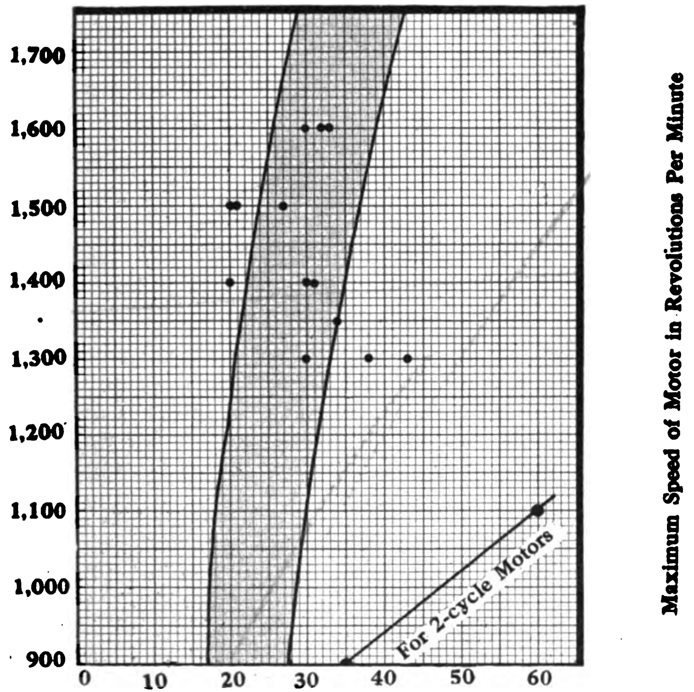
It would seem that it is advantageous to close the exhaust valve after the piston has arrived at the top dead center for the reason that there is bound to be some pressure, however small, left in the cylinder, and by leaving the valve open for a few degrees better scavenging will result. As an example of a motor in which the exhaust closes on dead center and the inlet opens almost immediately after, what takes place?

The entire pressure of the exhaust has not been expelled and there still remains a small amount in the cylinder. The moment the inlet opens this pressure seeks an outlet through the intake manifold, causing a strangulation of the incoming gases; but if a larger amount of time is allowed to transpire the remaining exhaust pressure will be reduced and a small vacuum produced instead; then the incoming gases will be sucked up faster and the continuation of this effort will be felt during part of the compression period, accounting for an increased lag of the inlet valve closing. So much for when the valves are not open at the same time. The question then is, What happens when the two valves are open at the same time? The flow of gas in the exhaust manifold does not cease immediately and the continued flow from the cylinder can be expected to follow that in the exhaust manifold. Further, in opening the inlet valve before the exhaust the former is brought to the position of being nearer full open when the exhaust closes than if it were to open afterward, obviating any back pressure and doing away with any vacuum.

Chart for Determining the Proper Timing of 4-cycle Motors at the Several Working Speeds

Instead of dealing with the five functional conditions (a) opening of the inlet valve, (b) closing of the inlet valve, (c) opening of the exhaust valve, (d) closing of the exhaust valve, and (e) ignition of the charge, in a single chart, it is so contrived here that each of the functional parts may be handled separately, with the expectation that it will lesson the complication involved and enable the average autoist to obtain a better understanding of the benefits to be derived.

The ignition chart shows a range of between 17 and 23 degrees advance at 900 revolutions per minute of the crankshaft, increasing to a maximum of 38 degrees at 1,700 revolutions. As a rule the ignition is subject to variation at the will of the operator, and all that is necessary is to remember that the higher the speed the greater the advance should be, keeping within the limits as here given. In the remaining diagrams an attempt is made to indicate approximately how the opening and closing of the valves should be regulated according as the speed is high or low, but it must be remembered that the design of the motor will have an influence upon the performance in view of a given valve setting, and in adjusting the valves some account should be taken of the characteristics of the motor. As a rule, the maker of a given motor will indicate just what is the best setting of the valves, but even then the charts as here given will tell the user how to proceed in case it is desired to experiment, with the intention of obtaining a better result if the same is feasible at all.



Advance of Ignition in Degrees

Bateye as Chauffeur

OLD WALT, ENVIOUS OF THE SUCCESS OF SECOND-STORY WORKER IN NEW FIELD, TELLS DETAILS OF HOW A FINE JOB WAS LANDED

"FLAHERTY," exclaimed Old Walt, wiping his mouth with the back of his hand and approaching the café proprietor, "this chauffeur game must be a beaut.

"I have been thinking since yesterday of passing up the old hack and settling down to a glittering existence as a chauffeur. You recollect I showed you that piece in The Automobile some time ago about the fellow who advertised for a chauffeur and specified that the applicant must have all the qualifications of a college professor, butler, stevedore and a few other callings? I was discouraged when I read that piece, because I knew I could never fill the bill, but since I met a fellow who landed a job just about like the one the advertisement promised, I am on my feet again, sparring for wind and gathering myself for another punch."

"Don't you change," cautioned the proprietor as he felt for the hack driver's special bottle, "you're a good kebbie, but you'd be running a risk to switch the cut at this stage of the game."

"Well, just let me tell you about this duck who got the job," said Walt, pouring out a drink. "The ad called for about the same kind of a man as the one in the story in The Automobile, except that he didn't need to act as secretary to the boss. He had to be good and careful, and a mechanic, and willing, and know French, and act as valet and be ready to work any time. I read the ad and passed it up as too tough for me, but Bateye Wilson, who had just finished an 11-month job on the Island for that Harlem second-story enterprise, was the successful applicant. Bateye certainly knew mechanics. I never knew a man who could handle a ratchet drill with the grace of Bateye.

"He went up to the man who put in the ad and satisfied him that he was just what the doctor ordered. He got a license from Kansas City Riley, who took the examination in August for the whole gang and is doing pretty well now selling them. It is funny to hear Kansas City tell how he copped out those licenses, but as somebody or other says, that is another story.

"Bateye can talk all kinds of Greaser, and he found out in a minute that the Boss could not; so he was safe in spreading himself along that line. He had the most beautiful recommendations you ever saw, giving telephone numbers and a lot of other punk. He asked the Boss to 'phone and satisfy himself that he had worked for Mr. Van Payne or some one else. Bateye says it was worth a front seat in a $2 show to see the performance. The boss fell for the recommendations and called up Mr. Van Payne. For the time being—for the occasion, I might say—the leading role of Mr. Van Payne was taken by Slippery Casey, who was planted in the saloon which had the 'phone number given in the recommendation. He said a few kind words for Bateye and cinched the job for him by inviting the Boss to have dinner with him just as soon as he returned from Kamchatka, where he was going at 10:30 o'clock.

"That's about all. Bateye won't hardly look at me now when he is out joy riding with a bunch of glittering wit and beauty. He is getting "it" in bunches. He tells a friend of mine that the Boss only gets to use the car about twice a month. This is because it is in the shop most of the time Bateye is not using it personally and because Bateye says his hands are too tender to steer for the Boss, especially as long as the Subway is running and there is no real, pressing need of it.

"Bateye gets a healthy percentage on the repair bills and tire bills; has a royal time riding the girls and his friends and has the Boss buffaloed with a strangle-lock because of what he found out about him on the few trips he actually drove him."

"But why do you get sore on Bateye's luck?" said Flaherty.

"Me, I'm not sore on Bateye," said Walt. "All I want is to get a whack at that soft money myself."

Quick Nickel Plating

The Average Autoist Would Prefer Nickel-Plated Trimmings

ADJUNCT to the tumbling barrel method of burnishing brass work of automobile bodies, the latest method of nickel plating is worth trying. In this process all that is necessary is to prepare the rubbing powder and apply it, using a wet rag. The powder is compounded of:

Nickel ammonium sulphate	60 parts
Metallic magnesium	3 parts
Chalk	30 parts
Talcum powder	7 parts

The process is electrolytic; magnesium, being highly electropositive, forms the anode, while the surface to be coated forms the cathode. Due to the "local action" set up when this compound is applied to the metallic surfaces to be plated the nickel in the solution will plate onto the surfaces just as well as when the plating is done in the conventional way.

The metallic magnesium particles must be protected from oxidation, and this is accomplished by bathing the particles of magnesium in a bowl of any wax that will dissolve in gasoline, as resin. The wax will form a protecting coat over the magnesium, but when the plating mixture is being rubbed onto the parts to be plated, the wax will be detached from the surfaces of the magnesium particles so that it is not a detriment in any way. There is no other complication to consider, and the plating powder may be mixed and stored until it is desired for use.

Nut Quad Quits His Job

A Tale of Woe and a Quick Getaway

"FAKE!" yelled Nut Quad, "I will not go on in this way, trying to make the public believe that I go to the races and to the other events, gather the news, and then repair to the editorial *sanctum sanctorum* and divest myself of that with which I was invested in the shape of real facts and the live happenings of the day. Here I am trying to write a story of the Quaker City (Fairmount Park) event without a leg to stand upon; I was not there; you were not there; there wasn't anyone there from this punk joint, and when this sheet is driven out upon the street to live or die, survive or perish, it will go up against the real thing from another quarter of the globe, and the end will be as plain as the nose on your face.

"I'm willing to write a column around an idea as big as the dent of a gnat's heel, I am," said poor Nut Quad. "I don't mind poring over a cord of stale clippings day after day, I know they are cheaper than carfare; it's a cinch to say in the editorial column of the paper that we give the news; if you say it loud enough most animals will take it for Gospel.

"I've stuck like a cat in a tree that was being stalked by a bulldog, I have," said watery-eyed Nut Quad. "You strut around, beating a path in a circle, making a few softies believe that you are the real thing; you wouldn't make a good paper if you could do it for less money than you scatter to gather up this sheet."

Steel Bank Cars

ILLUSTRATING THE BELLAMORE ARMORED MOTOR CAR FOR USE BY BANKS IN THE TRANSFER OF FUNDS—EQUIPPED WITH PERFECT BANKING FACILITIES AND PROTECTED BY HEAVY BOLTS AND LOCKS

FUNDS must be transferred by banks, trusts and express companies by day and by night through all parts of congested cities, and heretofore it has been more or less of a serious problem with a considerable cost feature and a measure of safety that is barely up to the minimum requirement, with here and there an attack and a contingent loss. The Bellamore armored car as here illustrated represents the latest endeavor in the direction of filling this want in a more efficacious way. The plan takes into account the mobility of automobiles, coupled with the carrying capacity of an automobile truck, thus making it possible to build and mount upon the chassis a form of armored steel body that will permit of the transfer of funds and valuables generally with the same safety that now surrounds money as it rests in the vaults of the banks.

The new car is so designed as to possess substantially all the facilities of a first-class bank, with every safeguard against even a protracted effort on the part of those who prefer not to work for what they get. The windows, doors and other points of attack are protected by electric burglar alarms; the walls and roof are built of steel and the construction throughout is fireproof. It is anticipated that this new form of traveling bank will enlarge the field of bankers' operations, making it possible to deliver pay rolls under the most conservative conditions and to collect and transfer valuables, covering considerable distances, and doing all the work at a lower cost than that which is now suffered, counting, of course, the men who must be placed to guard those who are in charge of this character of undertaking.

The interior of the car has a banking room, including a large steel safe, the door of which is equipped with a heavy bolt-work system, with a Yale bank combination lock capable of 100,000,000 changes. A desk, or counter, extends for the full width of the car under the cashier's window. To the right and left underneath the desk is arranged a series of compartments which can be used for the storage of books and other articles necessary in the transaction of the business to which the car is devoted. The walls and floors are finished with polished hardwood. An electric lighting system is used; storage batteries provide the electric energy; the windows are fitted with bevel plate glass, and the doors are equipped with special duplicate key latch locks with alarm bells attached operated electrically from the batteries.

The driver occupies the customary position at the front, there being a separating wall between the driver's position and the bank proper, but, as the illustrations show, the driver is protected from the dangers of inclement weather by means of wind shields and side panels, so that while he is not expected to do more than drive the car, he is afforded sufficient protection to render his lot reasonably comfortable.

There are three distinct models of this car, each being designed for a particular service, and they range in price from $4,500 to $6,000. The motor car bank idea was taken up abroad some time ago, and it was found to be a profitable equipment, broadening the activities of the banks and adding very materially to the safety of operations at the same time. There is no reason why this idea should not thrive in the American money centers, and the Bellamore Armored Car & Equipment Company, of 286 Fifth avenue, New York, is making preparation to enter this business in a substantial way, and it has excellent promise of support from important banks.

Electric Refining of Steel for Automobile Work

In the electric furnace the tonnage per expenditure of electric energy is a matter that is receiving much attention, and it is more than likely that the maximum expenditure is not far from one ton of steel (2,240 pounds) per 1,000 kilowatts of electric energy, starting with the cold charge. This figure is reduced considerably under the best conditions, it being reasonable to expect an output of one ton of steel from the expenditure of 500 kilowatts of electric energy, referring to mild steel for the lower rate of energy consumption. In electric refining work, the consumption is considerably less than this figure, it being the practice in this refining work to melt down the charge in open hearths and then apply to the electric furnace to do the refining work. Much headway is being made in this field, and, as one of the activities that is bringing good results for the automobile, mention will be made of permanent magnet steel; electrically refined magnet steel is now looked upon as most efficacious for the purpose.

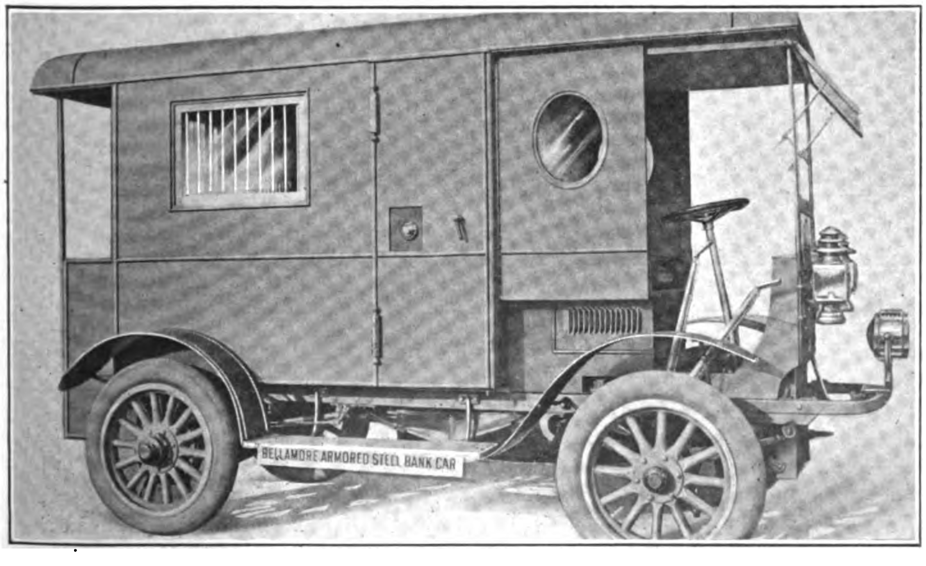

Fig. 1—Side view of a steel bank car, showing the driver's position, with wind shield, entrance to the bank and a combination lock for the door

T. E. Youmans

SAVANNAH, GA., Oct. 24—In the vortex of public interest at this time is the Savannah Automobile Club, because of its success in gaining the privilege of staging the second Grand Prize race for the international trophy of the Automobile Club of America. The club conducted the first race for the trophy, which was in the fall of 1908. It achieved notable success in its first effort. The race was run off without a hitch or accident to any spectator, and furnished a magnificent and spectacular struggle.

The profits derived from the race were enormous, but the funds were expended in civic advancement for Savannah rather than for the use of the club itself. As a matter of fact the club spent all it took in in advertising the city and its tributary territory in Georgia.

There was no renewal of the race in 1909, and this year the opportunity to stage the event close to New York caused the Automobile Club of America to sanction a race for the cup on the Long Island Motor Parkway. Owing to a storm of protest after the Vanderbilt Cup race the Long Island contest was abandoned, and at the instant when it appeared as if there might be no Grand Prize Race this year the Savannah Automobile Club sent a delegation of citizens to New York to make application to hold the race. This delegation presented its case so clearly and forcibly to the Contest Board of the Automobile Club of America that the race was transferred to Savannah.

Amid much rejoicing the news was received throughout the South, and before the delegation had reached home from New York with a sanction to conduct the race on November 12 work had commenced to repair the surface of the course to be used. The delegation was armed with authority from the Governor to promise military protection of the course to be used, and this promise had as much to do with the granting of the sanction to the club as any one factor.

The running of the Grand Prix in 1908 brought much credit to the club for its superb work in arranging the preliminary details and in administering the contest itself. It proved to be worthy of respect, and its performance on that occasion is the best evidence of its ability to conduct the coming race satisfactorily. The problem that confronts the club this fall is much more complex than the other, for the field in the big race will be considerably larger and the light car races for the Savannah Challenge Cup and the Tiedeman Trophy will undoubtedly attract big entry lists. Then again, the interest in contests of automobiles is much more intense this year than ever before, and vastly larger crowds will attend.

These will furnish the ground work of a fine puzzle, for the accommodations of the city are necessarily limited; its transportation facilities will be taxed to the limit and beyond; and every available space for housing and feeding the visitors will be subjected to a straining demand. But the club, city and State are determined to make the event a success and earnest efforts to apply a definite system are being exerted at present, with the result that it is promised that nobody shall suffer.

The successful administration of the 1908 Grand Prix race is not all that the Savannah Automobile Club has accomplished in a sporting way. It has projected and promoted a number of road runs, endurance tests and reliability tours. The first of these was given in 1909, when the club projected a run to Augusta. Road conditions at that time were lamentable, and the way to Augusta was exceedingly difficult to traverse.

To-day the difference in the condition of the roads is remarkable. The undertaking that required almost the life of the participants now is a pleasure trip of five hours. A year ago the club promoted a run to Atlanta, 300 miles, which resulted in numerous road betterments. Last April the club conducted a run to Jacksonville, Fla. This event marked the opening of the last link in the great automobile route from New York to the Florida winter resorts.

The club also has the distinction of conducting the first "Good Roads" convention ever held in Georgia, which was attended by over 300 officials connected with the making of good roads.

To-day the Savannah Automobile Club is one of the most virile motor organizations in the land. It holds a finger on the public pulse; it exerts a very real influence on proposed legislation and the construction of automobile laws; it shows an appreciation of the rights and wishes of others and devotes a considerable effort toward charity and the general application of justice. But while it has a full part in all these activities, and while it is undoubtedly a distinct influence in a social way and, as has been outlined all through this article, is a living factor in the sport of motoring, the chief object of the Savannah Automobile Club is Savannah.

Throughout the Old South, as well as the New South, civic spirit is the most potent of municipal and sectional forces. Georgians generally partake of this spirit, and Savannah is not one whit behind the great city of Atlanta in exerting it. If the Georgia metropolis can afford to dedicate an expensive speedway so that the name of Atlanta shall shine in the public prints and the public eye, Savannah can afford to spend the price of many a bale of cotton, many a cargo of lumber and many a carload of peaches to attract the same character of publicity.

And that is what Savannah is doing in staging the Grand Prix. It is a costly undertaking. The immediate results from it will be unappreciable. It is a big gamble, for in case of mishap there will be much criticism, and that is the last thing desired.

With all the foregoing in view the Savannah Automobile Club, aided by city, county and State authorities, has steadily gone about perfecting its plans for the big race. The course used in 1908 has been metamorphosed. Two big excrescences have been cut off and a third has been sharply modified.

Its length has been cut down to 18.5 miles, and through the lopping off of the extraneous part of the route the straightaways have been materially increased. One of these is fully eight miles long, allowing the racing cars to open wide and shoot along at their utmost speed.

Nobody in Savannah looks for anything but complete success.

The club is planning to build a home at Vernon View, a resort situated a few miles from Savannah. While a start on this project is still to be made, the intention to do so within a year is thoroughly crystallized. The club roster contains the names of many of the best and most influential citizens of Savannah. It includes the representatives of many of the proudest Georgia families, public officials and the best of the element that has come to Savannah from other sections.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, RACES, HILL-CLIMBS, ETC.

Nov. 19-26.......Oakland, Cal., Idora Park Snow, Under Management of Oakland Automobile Dealers' Association.
Dec. 1...........Chicago, Ill., First Annual Aeronautical Exhibition in the Coliseum.
Dec. 31-Jan. 7, '11.New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14, 1911...New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 14-28, 1911..Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, Third Regiment Armory.
Jan. 15-21, 1911..Detroit, Wayne Gardens, Detroit Automobile Dealers' Association.
Jan. 16-21, 1911...New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A. L. A. M.
Jan. 28-Feb. 4,'11.Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-Feb. 11,'11.Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Mch. 4-11, 1911...Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mch. 25-Apr. 8.....Pittsburg, Annual Show, First week, pleasure cars; second week, commercial trucks. Automobile Dealers' Association of Pittsburg, Inc.

Races, Hill-Climbs, Etc.

Nov. 3-5..........Atlanta, Ga., Speedway Meet, Atlanta A. A.
Nov. 5-6..........New Orleans, La., Track Meet.
Nov. 5-7..........Los Angeles-Phœnix Road Race, Maricopa Automobile Club.
Nov. 7-11.........Five-day Reliability Run of Chicago Motor Club, 200 Miles a Day.
Nov. 10-12-13.....San Antonio, Tex., Track Meet.
Nov. 11-12........Savannah, Ga., Road Race, Savannah Automobile Club, and Grand Prix, Automobile Club of America.

THE AUTOMOBILE

Vol. XXIII Thursday, November 3, 1910 No. 18

FOREIGN SUBSCRIPTION AGENTS
ENGLAND:—W. H. Smith & Sons, Ltd., 186 Strand, London, W. C., and all bookstalls and agencies in Great Britain; also in Paris at 248 Rue de Rivoli.
FRANCE:—L. Baudry de Saunier, offices of "Omnia," 20 Rue Duret, Avenue de la Grande Armee, Paris.
GERMANY:—A. Seydel, Mohrenstrasse 9, Berlin.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

ECONOMY in the use of fuel, such as automobile gasoline, while it is the problem for the automobilist in Continental Europe for the most part, has its echo in the United States, owing to the gradual increase in the gasoline quotations and the relatively slow advance in the direction of the use of benzol, alcohol and other synthetic liquid fuels. In the meantime, very little attention seems to be paid to the questions that will lead to the more complete combustion of automobile gasoline; there seems to be no notice taken of the fact that when a pound of hydrogen is wasted it is like throwing away 62,100 heat units, and when the fuel is burned to carbonic oxide but 4,476 heat units are turned to good account, leaving all the way from 18,000 to 50,000 heat units per pound as a valuable residuum, turned to no better account than to perfume the surrounding atmosphere to the disgust of the inhabitants. Every time the guardians of the peace are "sicked" onto automobiles on account of smoke, and the pungency of the odor that emanates from the exhaust orifice of a muffler, it is a sure sign that valuable fuel is being wasted and that the carbureter and the ignition system are asleep at the switch. When the fuel is burned to complete combustion, producing carbonic acid and water, the odor is burned, too, and the legal luminary with two rows of brass buttons, and the majesty of the law in the form of a locust stick is put out of a job. Under the circumstances the officer who is directed to enforce the law, instead of getting after malefactors is really preaching economy, and there is so much good sense in his form of preaching that his presence should be encouraged, and the automobilist who is so lacking in his sense of the fitness of things that he is willing to throw away 75 per cent. of his fuel would look better paying a fine for violating the smoke ordinance than he does when he deliberately and foolishly makes a heavy inroad on the available fuel supply.

* * *

ACCORDING to the information gathered by the Forest Service of the United States Department of Agriculture, bearing upon the growth and value of hickory, considering the excellence of the service rendered by this wood in the wheels of automobiles, there is every prospect of an ultimate shortage in the supply, unless an effort is made to prevent its waste, with something of a concerted movement, besides, leading up to hickory forestry as a commercial undertaking. Statistics are responsible for the statement that it takes substantially 50 years to grow second-growth shag-bark hickory to a diameter of approximately six inches, measuring at a point breast high on the butt of the tree. Even assuming that a four-inch butt would be satisfactory for wheel-work wood, it remains to consider that thirty years will elapse in the growth of the tree to this diameter. It will be a great misfortune if the hickory supply is drawn upon at so rapid a rate that a famine will result, and it will be something of a question as to just what material can be used efficaciously in the interim of 30 years or more, pending the growth of a new supply, assuming that the present available supply is exhausted before an effort is made to relieve the situation. The makers of automobiles should encourage the Forestry Service.

* * *

DOCTORS are good customers of the automobile, and many of them are numbered in the honor roll of the pioneers who put up with the vagaries of the earlier efforts of the makers at a time when it was a large question as to whether or not a man would ever get back without walking, if he started out in a car. Some of these doctors made automobiles of their own that were eminently satisfactory, and were the information they possess available to the designers of cars it doubtless would redound to the good of the industry. Here and there a doctor or two were wont to interject a series of ideals, and a few impossibles, failing which, they went away dissatisfied, and as a means for advertising the good that resides in automobiles they must be regarded as a lasting failure. There still remain a large number of medical practitioners who for one reason or another stick to the horse, but they are rapidly reaching the conclusion that a doctor can do more work and can better look after his patients if he takes less time getting to them. It stands to reason that a physician, if he is capable, will be the most valuable to his patient if the time interval between the call and the response is cut down to a point where it would be were the patient to live next-door. As a suggestion of a physician's car, THE AUTOMOBILE offers something this week, but it should be remembered that a comfortable body is entirely out of place on a running gear that is likely to give trouble on the road. A good running gear must accompany a good body to be entirely satisfactory in this service.

The Dealer and the Daily

DISCUSSING THE ADVERTISING PROBLEM WHICH CONFRONTS THE DEALER IN AUTOMOBILES; PROPER USE OF THE DAILY PAPER RECOMMENDED

GOOD advertising copy often draws the line between the success or failure of a business. How to write an advertisement sounds like "how to get rich quick." Some well-known principles govern in each case. Dealers who have made a success, hold views on this subject, as here briefly stated:

Don't buy space and write copy to fill it; write the advertisement and then buy the space for it.

Don't buy space in all the papers all the time. Write the advertising copy for a certain class of buyers and then select the papers reaching this class.

Don't write an advertisement for a standard financial paper reaching bankers, brokers, and financial interests, and insert it in the sporting edition of a paper making a specialty of sporting news.

Don't try to reach any class by circular. If the man's name is known, write him a letter. Where the name is not known there is only one other method that will reach all the possible purchasers in a given territory at a minimum expense; that way is through the daily newspapers.

The Best Rule for Using the Daily Newspapers

First: Take enough space to be noticed.

Second: Take that space often enough to keep the business before the people.

Third: Take up one point at a time and tell people why that particular point makes a car or an accessory the best for them.

Fourth: With an unanswerable argument, tell it straight out from the shoulder.

Fifth: Don't mince words.

Sixth: Don't apologize.

Seventh: Just carry the same natural conviction that tells in a face-to-face talk.

Eighth: Don't talk to the audience in bulk; just talk as if to one man.

Ninth: There is nothing that people like better than to listen to the man who knows he's right.

Tenth: The straight-out-from-the-shoulder right talk to one man makes people go clean down into their pockets and pull the money out.

Just Say It So That It Will Stay Said

The right story doesn't have to be clever English; it needn't necessarily be great literature. Let it be crude, raw, and unpolished; nevertheless, when a man hears of something in which he is interested—something he wants or needs, or maybe will want or need in the future—show him where he can get the best goods that he can get anywhere, and you're going to get his business.

Advertising is the making of a FAVORABLE IMPRESSION on a POSSIBLE BUYER.

Anything that makes an unfavorable impression, or no impression at all, on a possible purchaser, is waste, or worse.

And anything that makes any kind of an impression on non-buyers, those who cannot and will not influence purchasers of the things advertised, is pure loss.

Advertise to make that favorable impression on that possible customer—nothing else.

[Copy for the Financial Newspaper.]

Cut of Town Car.

A Conservative Automobile for the Conservative Buyer Ripened by Broad Experience.

With Just the Right Amount of Power for a Town Car, Flexibility is Pronounced.

The Wheelbase Is One Hundred Inches Exactly, Making the Turning Radius Right.

The Control of the Car Is Simple and Reliable, There Is Absolutely No Noise.

Weight Is Adjusted to Hold the Car to the Pavement, the Center of Gravity Is Calculated.

The Tire Equipment Is Economical and Satisfactory. The Body Is Made of Aluminum.

In Style and Durability of Finish It Is the Product of the Craftsman. The Comfort of the Owner Is Studied.

The Advantages Are Positive: An Open Car for Fine Weather; Closed When the Weather Conditions Are Inclement, and Equipped for Day or Night Service with the Best Lighting—Electric. The Best Ignition—Magneto, and the Best of Everything. An Automobile to Transfer the Banker to His Business in the Morning, the Banker's Wife on Her Duty Calls in the Afternoon, and the Banker and His Wife to the Opera in the Evening.

The Price is Low for the Quality at $5,000.

[Copy for Sporting Newspaper]

Cut of Roadster.

NET RESULT OF ALL THE RACING EVER DONE.

A POWERFUL ROADSTER.

Equipped with a 60-horsepower, 6-cylinder Motor Along Racing Lines, with Endurance Added, in a Chassis That Weighs Barely 2,000 Pounds, Making 3 Horsepower per Hundredweight the Only Limit to Speed Is That as Dictated by Prudence.

With a 4-speed Selective Type of Transmission Gear, and a Straight Line Drive, a Quick Get-away and Enormous Hill Climbing Ability, Puts the Owner in a Position to Say Good-bye to Dust.

It Is a Noiseless Machine, Made so by Duplicating Accuracy in the Best Equipped Plant That Money Can Buy, And the Use of Chrome Nickel Steel in Every Part of Any Responsibility Assures a Continuance of the Same Sweet-running Qualities That Come with the Car When It Leaves the Shop.

The New Torpedo Body Built to Cut the Wind, with a Smooth Exterior, and an Inside Locker for the Spare Tire, Is Made of the Latest Aluminum Alloy, Which Is Stronger than Steel, Bringing the Weight of the Whole Body down to 90 Pounds.

With a Long Wheel-base, a Low Center of Gravity, Precision of Fit of the Parts, and Delicacy of Control, There Is Nothing More to be Desired But Smartness and Flexibility, Which Are Natural Accompaniments of a Car of These Pretensions.

The Price Is $6,000—It Includes Everything.

Trucks Run 212 Miles

LONG ROUTE TRAVELED BY CARS IN CHICAGO-MILWAUKEE EVENT, THROUGHOUT WHICH ICY WIND SCATTERED CONFETTI AND DISPELLED COMFORT

CHICAGO, Oct. 31—Manufacturers of commercial motor cars had their inning in the West last week when a motor truck run to Milwaukee and return was held with the Chicago *American* in the promoting rôle, assisted by the Chicago Automobile Club and the Milwaukee Automobile Club. Originally it had been planned to make the competition the same as that which has prevailed in other affairs of this sort, but wind and weather prevented this and converted the test into an out-and-out reliability run with the economical features eliminated. The wind played such pranks with the confetti that many of the contestants lost the road at different points along the course so that the officials of the contest declared it would be unfair to figure the gasoline and oil consumption when the distances varied to such an extent. Therefore the awards were made on a road and technical examination basis.

Two of the fifty-one starters went through the test with perfect scores in both departments. One came in Class 1D for cars of 500 pounds and under capacity—the Brush. The other perfect score car was the Gramm, which won the 4,001 to 6,000-pound division. Thirteen of the contesting cars made perfect road scores as follows: No. 17 Brush, No. 6 Sears, No. 6 Cino, No. 15 Alden Sampson, No. 4 Buick, No. 11 International, No. 1 Overland, No. 37 Rapid, No. 31 Rapid, No. 34 U. S. Motor, No. 38 Grabowsky, No. 39 Mais and No. 51 Gramm. Surviving the technical examination with clean records were the No. 17 Brush, No. 6 Sears, No. 40 Kelly, No. 51 Gramm, No. 44 Rapid, No. 52 Alco, No. 50 Kelly, No. 55 Reliance and No. 54 Reliance.

Among the otherwise penalized entries which passed the technical examination unscathed were Sears, No. 6; Randolph, No. 28; Marquette, No. 22; Buffalo, No. 35; Kelly, No. 40; LeMoon, No. 41; Gramm, No. 51; Rapid, No. 44; Alco, No. 52; Kelly, No. 50; Reliance, No. 55, and Reliance, No. 54.

Good Automobile Driving

By J. B. Bartholomew, President of the Bartholomew Company

BEFORE leaving the garage the matter of gas supply, filled and well-trimmed lamps, water in the radiator, and lubrication are all looked into and known to be in good condition.

The tool kit is intact, the tires are examined to see that no tacks, nails, pieces of wire or other undesirable materials are attached thereto; the extra tire is in position, an inner tube is aboard to meet the case of tire trouble, and the tire pump is in good working condition and in place; the storage battery is properly charged, the car has been properly cleaned and polished, and any slight adjustments to machinery or brakes have been made, loose wire connections and loose bolts and nuts have been taken care of.

It is bad practice to sit in a car and allow the motor to run for an indefinite period. Stop the motor and start it when ready to go, thereby saving the gasoline and oil, besides unnecessary wear and tear on the motor.

All driving should be done at a speed with respect to road conditions and the speed ordinances and laws, and a good driver will never exceed the speed limit unless he is requested or instructed to do so, and then only on road conditions clear of other rigs, people or obstructions. The driver should watch the road and slow up for bumps and horses. If horses show skittishness, stop. At all times in passing horses the motor should be throttled down and the car coasting as nearly as possible.

Mufflers should not be cut out in places where it will excite the displeasure and criticism of other people.

Drive to miss all of the sticks, stones, bricks and other obstructions that are liable to damage the tires. Driving in street car tracks is bad practice, as fine particles of steel are apt to injure the tires.

Rubbish raked up in piles from yards should be avoided—it is apt to contain tacks.

In passing other rigs, observe the rules of the road. Never cut in close ahead of another rig. If you have a speedy car others will know it. If you have an exceptional hill climber, don't be afraid to give the other fellow a chance, and always remember that the driver who drives the car to please the customers, rather than to satisfy the crazy notions of his own, is the one that most people want to retain at the highest salary.

Final Report on Boston Truck Run

Boston, Oct. 31—The detailed technical report of the recent Boston *American* truck run has been issued. The report shows the cost of transporting a ton of freight one mile, total cost and its items and details. The report is as follows:

MANUFACTURERS' DIVISION

No.	Name	Weight Carried	Comput. Weight	Gals. G's'line	Pints Cyl. Oil	Total Cost	Cost per Ton Mile
	Class A—1000 Pounds and Less						
11.	Warren, Detroit,	1320	1000	9	1½	$1.53	.0248
47.	I. H. C.	1000	1000	11	9	2.32	.0386
3.	Hart Kraft	1040	1000	13½	8¾	2.71	.0450

1.	Autocar	3780	3000	11¾	8	2.38	.0132
17.	Rapid	2220	2000	10	8	2.10	.0175
40.	Gramme	4320	3000	20¼	5	3.55	.0196
	Class C						
43.	Frayer-Miller	5060	5000	21½	7½	3.91	.0130
	Class E						
49.	Mack	6160	10,000	20	21	4.51	†

---

*Road Penalty. 44—164 points. 19—38 points. 18—10 points. All others clean. †Did not carry full load.

Gasoline figured at a uniform rate of 16 cents per gallon.

Cylinder oil figured at a uniform rate of 50 cents per gallon.

Number of miles covered—One hundred and twenty.

A. M. C. M. E. A. Show

List of Exhibitors Swelled to 42; Will Open New Year's Eve

METROPOLITAN devotees of the motor will have ample chances to examine everything that pertains to the automobile at the trio of shows that will be held in New York in January. The A. L. A. M. exposition which will take place in two sections, each a week long, the first devoted to pleasure cars and the second to commercial vehicles or freight carriers, will be of much wider scope and detail than ever before. An unprecedentedly large collection of licensed cars will be shown amid all the splendor of Madison Square Garden in gala attire.

The independent show, which will be held at the Grand Central Palace from December 31 to January 7, promises to be a large and interesting exhibition. Mr. Longendyke, secretary of the A. M. C. M. E. A., announced late Wednesday afternoon that the application for sanction of the show, which had been made to the National Association of Automobile Manufacturers on October 18, had been refused. In speaking of the matter Mr. Longendyke said:

"We applied to the N. A. A. M. for sanction in order to outline our status as far as that organization is concerned. We did not feel that our application would be granted, but we determined to apply anyway. The holding of the show was never dependent upon the sanctioning of the event and it will be held despite the fact that sanction has been withheld.

"Our list of signed-up exhibitors to date includes forty-two distinct companies. I am confident that the list will be extended to at least 70 names. The list is as follows:

Abbott Motor Co.,	Detroit, Mich.
American Motor Truck Co., of Mich.,	Detroit, Mich.
American Motor Truck Co.,	Lockport, N. Y.
Atterbury Motor Car Co.,	Buffalo, N. Y.
Babcock Company, H. H.	Watertown, N. Y.
Bergdoll Motor Car Co., L. J.,	Philadelphia, Pa.

The Importers' Salon, at which the foreign cars will be shown, will be held at the Hotel Astor from January 2 to 7. The floor space of 11,000 square feet has all been contracted for except about 1,000 feet.

Al Livingstone, Auto Racer, Killed

Al Livingstone, one of the leading racing drivers in the employ of the National Motor Vehicle Corporation, was killed as the result of an accident on the Atlanta Speedway, Tuesday. Livingstone was giving his car a final try-out in preparing for the races now in progress, and was doing some fast work when his right rear tire blew out, and the driver was thrown thirty feet into the air, landing on his head. His skull was fractured, and he was dying when removed to a hospital. Mr. Livingstone leaves a widow.

Premier Car Finding Aeroplane Landings

With Ray McNamara at the wheel, a Premier 4-40, 1911 model, is now traversing the Western part of the continent, picking out locations for aeroplane landings from coast to coast, which may be used in transcontinental flights such as the one for which a prize of $50,000 was offered. There is nothing unusual about the trip save its purpose. The route is via Buffalo and Cleveland to Chicago, thence westward by the way of Davenport, Omaha, Kansas City, Trinidad, Santa Fé to Los Angeles.

Premier 4-40 Pathfinder in Continental Aviation Prize. Ray McNamara at wheel.

27 Clean Truck Scores

TWO-DAY RUN CONDUCTED BY NEW YORK "AMERICAN" PROVES INTERESTING TEST OF RELIABILITY UNDER CONDITIONS LIKE THOSE OF REAL SERVICE

SUCCESSFUL in every way proved the truck run conducted by the New York *American* Friday and Saturday of last week. There were 49 starters in the various classes of the contest, of which 27 completed the scheduled course with perfect road scores. One dozen of the gasoline cars were penalized for work on the run, and of these only four reported mechanical troubles. Only two of the electrics suffered mechanically.

The chief difficulty experienced in both classes of trucks was the shortage of gasoline and current, which accounted for nine penalizations, six among the electrics and three among the gasoline cars. Two gasoline cars missed the course and were disqualified; another missed some of the controls and the final demerited car suffered magneto troubles. The other electsics to lose their clean scores were charged with being late and failure to finish the route.

Alco, No. 16, clean score in Division No. 4

The run was about 65 miles a day for the transfer divisions and from 30 to 45 miles a day for the delivery divisions. The first day's course was laid out through the streets of the city to Westchester County and the second was on Long Island, past the aviation field and return. That nearly two-thirds of the cars finished the whole course without penalization is considered remarkable by the promoters of the run, and that only six out of 49 suffered mechanical troubles is very gratifying.

The officials are still figuring out the relative expenditure of gasoline, oil and current for the various entrants, and the winners of the sweepstakes and class events will be announced in due course. The summaries of the road work are as follows:

MANUFACTURERS' CARS (GASOLINE)

No.	Car	First Day	Second day
	Transfer classes—Division 1, 1000 pounds and under—		
1	Chase	0	0
2	Hatfield	0	0
3	Hatfield	0	0
4	Brush	Dis., wrong route	
	Division 2, 1001 to 3000 pounds—		
5	Grabowsky	0	Dis., taking oil.

Reeves Says A.L.A.M. Will Show in 1912

General Manager Reeves, of the A. L. A. M., in speaking for his association, stated Wednesday that the National Automobile Show of 1912 would be conducted at Madison Square Garden by the association. He said that he had heard some talk among the New York dealers about handling the show in 1912, but that the manufacturers had decided to hold the show themselves.

General Vehicle, No. 58, perfect in heavy electric class

Atlanta Lists Well Filled

NUMBER OF ENTRIES FOR COMING MEET PROMISES MAGNIFICENT SPORT DURING THREE DAYS, WITH BIG FEATURE AT EACH SESSION

ATLANTA, GA., Oct. 31—The Atlanta Speedway meet gets under way Nov. 3, and for three days there should be really good sport on the fast two-mile Georgia course.

When entries finally ceased, about ten minutes before the official closing time, there were 48 cars named for the three days' meet, and a brace of Fords will ask permission of all concerned to allow them to enter in the 250-mile free-for-all.

Special interest attaches, of course, to the three feature events of the meeting, one each day. The opening race will be a hundred-mile dash for the Coca-Cola trophy. This is for the 301-450 machines, and fifteen good ones are named. The list includes three Nationals, three Falcars, a brace of Pope-Hartfords, a Cole, a pair of McFarlans, two Marmons, a Halladay and a Wescott.

Nineteen cars have been named for the City of Atlanta trophy race, a contest at 200 miles for cars of 451-600 displacement. These machines are two E-M-Fs, three Pope-Hartfords, two Nationals, a Parry, a Halladay, a Stearns, three Abbott-Detroits, a Stoddard-Dayton, a Firestone-Columbus, a Simplex, and a pair of McFarlans.

In the 250-mile free-for-all more than half the cars at the meet are entered, twenty-six, to be exact, with prospects that two more machines will be allowed to break in.

Here is the list:

Number	Car	Driver
1	E-M-F	Cohen
2	Fiat "90"	Bragg
3	Fiat "60"	Stoddard
4	Pope-Hartford	Church
5	Lozier "4"	Mulford
6	Lozier "6"	Horan
7	National	Livingstone
8	National "6"	Aitken
9	National	Wilcox
10	National	Aitken
11	Marmon	Heinemann
12	Falcar	Geinaw
13	Simplex "90"	Church
14	Falcar	Hughes
15	Cole "30"	Endicott
16	Cole "30"	Edmunds
17	Pope-Hartford	C. Basle
18	Cole, 1911 Model	Endicott
20	Firestone-Columbus	McKinstry
21	Marmon	Harroun
22	Pope-Hartford	Disbrow
23	McFarlan	Kepler
24	McFarlan	Adams
25	Marmon	Heinemann
26	Wescott	Knight
27	Falcar	Pierce
28	Marmon	Dawson
29	Firestone-Columbus	McKinstry
30	Chalmers	Moss
31	National	Woodside
32	E-M-F	Witt
33	Parry	Phillips
34	Halladay	Harrell
35	Stearns	Rutherford
36	Simplex "50"	Beardsley
37	Abbott-Detroit	Monty Roberts
38	Abbott-Detroit	Mort Roberts
39	Abbott-Detroit	McIntyre
40	Marquette-Buick	Burman
41	Renault	
42	Stoddard-Dayton	Harding
43	Firestone-Columbus	McKinstry
44	Simplex "90"	Matson
45	Marmon	Heinemann
46	American	Wallace
47	Darracq	Kirscher
48	Knox	Kirscher
49	Benz	Kirscher

Hart Kraft, No. 29, unpenalized in New York American run

Milwaukee Club Selects Standard Bearers

MILWAUKEE, Oct. 31—The Milwaukee Automobile Club has elected officers as follows: President, Charles W. Norris; first vice-president, Oscar F. Fischedick; second vice-president, Dr. Louis Fuldner; secretary, Arthur C. Brenckle; treasurer, Lee A. Dearholt. Messrs. Brenckle and Dearholt were honored with re-election. The increase in membership since the last annual meeting has been very gratifying, and efforts will be made to still further add to the roll during the coming year.

Hatfield, No. 2, clean score in Manufacturers' Division 1

The club is in excellent financial condition and is now building a $15,000 club house near Milwaukee. This will be formally opened on New Year's eve. The third annual show will be held in February, it having been practically decided to again follow the Chicago passenger vehicle show.

Massachusetts State A. A. Elects Officers

BOSTON, MASS., Oct. 29—The annual meeting and election of officers of the Massachusetts State A. A. was held here Friday night at the Parker House. The following officers were reelected unanimously as a tribute to their efforts during the past year in enlarging the organization: A. D. Converse, Winchendon, president; J. P. Coghlin, Worcester, vice-president; James Fortesque, Boston, secretary and treasurer. Vice-President Coghlin was made chairman of the legislation committee; W. H. Chase, chairman of the good roads committee, and A. E. Lerche, chairman of the signs committee. The association now has a membership of 4,300 and it was reported that this figure will be largely increased during the next year.

Moisant Wins for America

IN THRILLING RACE AROUND STATUE OF LIBERTY HE BEATS GRAHAME-WHITE AND DE LESSEPS IN NEWLY PURCHASED BLERIOT MONOPLANE

Hamilton's machine patterned after the Curtiss type and equipped with a Christie motor of 110 indicated horsepower. The motor was not ready and the machine seldom flew

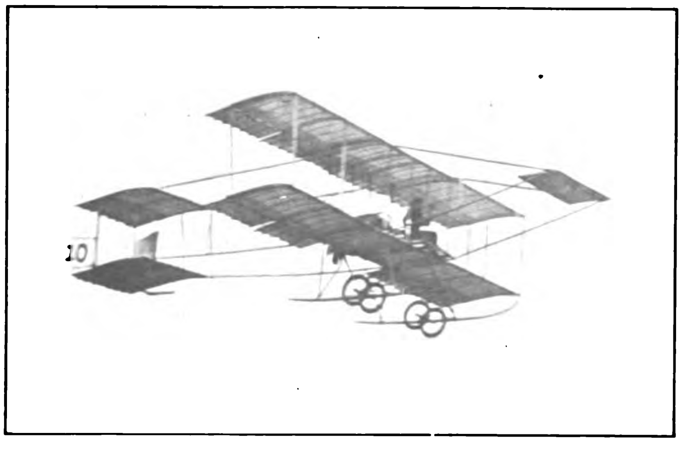
AMERICA, Britain and France divided the honors of competition in the International Aviation Meet which came to a close Monday evening after John B. Moisant in his hastily purchased 50-horsepower Blériot monoplane had won the great race from Belmont Park around the Statue of Liberty in New York harbor and return by less than one minute.

Grahame-White in a 100-horsepower Blériot apparently had the race won by his magnificent flight around the statue earlier in the afternoon and was receiving congratulations for England's triumph when Moisant was announced as a competitor. Count De Lesseps had made his trial and failed to equal the showing of the British aviator.

Moisant shot into the air with his motor buzzing like a wasp and, after reaching an elevation of nearly 3,000 feet, headed straight for the harbor across Brooklyn. In the teeth of a cold wind he flew the 16 1-2 miles a trifle over 50 miles an hour; made the turn with a short sweep and came back at the rate of well over a mile a minute. His total elapsed time was 34:38 84-100.

Grahame-White, by winning the Coupe Internationale d'Aviation, covering the 100 kilometer course in 1:01:04 3-5, in his high-powered Blériot, took away from America this trophy, which was won last year by Curtiss. Moisant was second in this event. But for an accident in which his Blériot was wrecked in the final round of the course, M. LeBlanc would have won, as he had a lead over the winner of over five minutes when he struck a telegraph pole. At the time he was making rounds of the course under three minutes and several of his circuits were considerably below that figure, establishing a new world's record mark of 2:44.32 for a single round of five kilometers.

The daily attendance at the meet was excellent and on the various days when feature events were carded the big stands, lawns and fields were thronged.



Harmon's Farman biplane operated by Grahame-White. Gnome motor. Large area. Small weight. Considerable lifting and altitude capacity. Small speed. Small ability for braving the wind. Always ready for flight in fair weather

One type of Blériot monoplane, head on. Other type has spreading tail. Gnome motor. Planes slightly curved near front edge. Slight warp. Rear control. Always ready. Medium stability in the wind. Medium weight. When built for carrying capacity has larger planes more curved

In the inclosure of the park on Sunday afternoon and gathered nearby at various points of vantage were fully 75,000 enthusiasts, and the reception given the American winner has never been equaled so far in the history of air contests.

The story that underlies the running of this race is one of the most romantic in the archives of sport. Moisant had been formally entered for the statue flight for several weeks and had a special racing machine all ready to take part. In starting Moisant's motor went wrong and his machine was smashed against a crippled biplane. He had only a few minutes in which to get another, and the only available machine was a new one belonging to LeBlanc, who was confined to his bed in a New York hotel on account of bruises received in the International Cup trials. By telephone the terms of the sale were arranged after LeBlanc had been assured that no French aviator had a chance to beat Grahame-White's time. Just within the limit the American made his start and won.

In a diminutive Wright aeroplane, Ralph Johnstone broke the world's altitude record on the final day of the Belmont Park meeting. His feat was accomplished late in the day. The machine, which has only 173 square feet of plane surface, was specially built to climb the air and in its preliminary trials under the handling of Orville Wright, it had demonstrated much facility in Pike's Peaking.

Johnstone made the first 7,000 feet of his record-breaking flight in twenty minutes, and then swung around in narrowing circles until he reached the height of 9,714 feet. Summaries:

Wednesday

Hourly distance—Latham (Antoinette), 17 laps; time 36:22 2-5.
Altitude—Hoxsey (Wright), 6.183 feet.
Cross country—Aubrun (Bleriot), 20 miles; time 28:08:75.

Thursday

Hourly distance—Latham (Antoinette), 14 laps; time 55:24.06.
Altitude—Brookins (Wright), 650 feet.

Friday

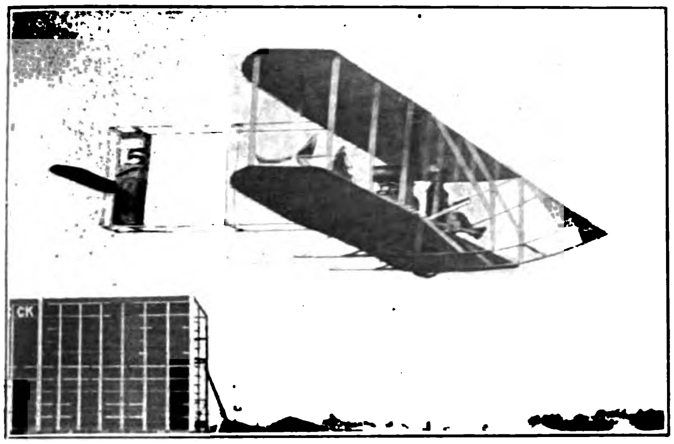
First hourly distance—Latham (Antoinette), four laps; time 14:25.
Second hourly distance—Latham (Antoinette), 12 laps, time 40:34.01.
First hourly altitude—Hoxsey (Wright), 6,705 feet.
Second hourly altitude—Parmalee (Wright), 3,636 feet.

Saturday

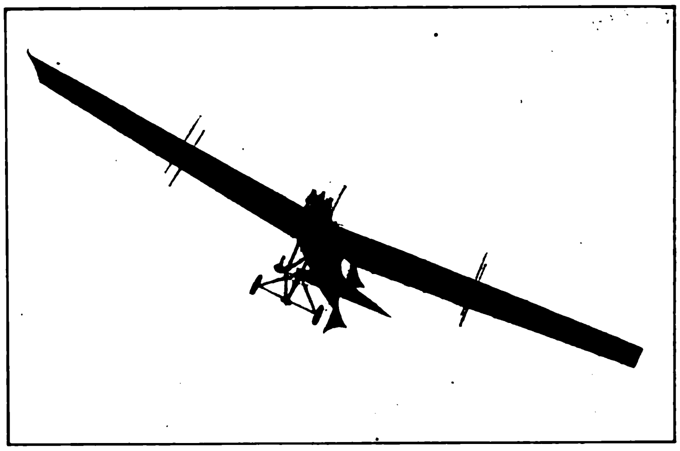
International speed race, 100 kilometers—Grahame-White (Bleriot), first; time 1:01:04:74; Moisant (Bleriot) 1:57:44:85.
First special altitude—Hoxsey (Wright), 5,146 feet.
Second altitude—Hoxsey (Wright), 4.644 feet.

Sunday

Statue of Liberty flight—Moisant (Bleriot "50"), first; time 34:38:84. Second, Grahame-White (Bleriot "100"); time 35:21:30. Third, De Lesseps (Bleriot), 41:56.25.
Hourly distance—Latham, 33 laps;
Altitude—Simon, 959 feet.
Monoplane race—Grahame-White, ten laps in 14:56:30.
Cross country (20 miles)—Radley, 20:05:60.
Aero Club distance event (two hours),—Moisant, 53 laps.
Special altitude—Johnstone, 9,714 (World's record).
Grand special speed contest (ten laps)—Grahame-White; time 14:34 2-5.



The normal Wright machine for rear control. Wright motor with direct injection of fuel. Great capacity for altitude. Always ready. Large area. Medium weight. Flies in higher wind than any other machine shown at the meet. Head resistance smaller and warp more pronounced than in earlier Wright machines.



Latham's Antoinette monoplane. Weight about 2500 pounds. Antoinette 16-cylinder V-motor, usually hard to get running well till heated. Long tubular radiator along sides of frame. Slight warp. Cannot turn sharply. Seldom if ever seen banked as much as photograph shows.

Flying for Prizes

BY MARIUS C. KRARUP—OBSERVATIONS BEARING UPON CONSTRUCTION FROM THE BELMONT PARK AVIATION MEET—MATURED AMERICAN FLYERS SHOW SUPERIOR INDEPENDENCE OF THE WEATHER

AT the Belmont Park meet, just closed, nothing which was new mechanically was successful, but refinements in design as well as minor differences due to the accidents of rule-of-thumb construction were shown to have a very pronounced influence upon the flying properties of the machines, especially on speed and stability.

Among the new features the most conspicuous were the small Wright flyers specially built to demonstrate speed and of the biplane type, the Curtiss monoplane with Curtiss motor, the Christie monoplane with two Christie motors and two propellers, both on shafts running axially through the middle of the machine, and the Hamilton biplane, built in close emulation of the Curtiss type, but equipped with a Christie motor of 110 indicated horsepower.

Among the events, the altitude flights performed by Hoxsey and Johnstone in full-sized Wright biplanes and their daring corkscrew descents under weather conditions which were sometimes very trying, indicated substantial progress, accomplished very largely, it seems, by eliminating the front elevating rudders and thereby rendering the control less sensitive and infusing more confidence in the aviator. An inspection of the machines indicated that the rear spars, and possibly the front spars as well, were more flexible than formerly, so that the machines were probably subject to a readier and more decisive control by warping of the main planes than the earlier machines in which the front elevating rudders were retained, and it seems that this is the feature through which a much improved ability to weather gusty winds of moderate strength or strong steady winds has been materialized. Their superiority over all other machines at the meet was in this respect marked. Their ability to "plane" down with the motor shut off and at dizzy angles, their course at times showing the lines and proportions of an ordinary corkscrew of steep pitch, was in itself plain evidence of three important refinements: (1) more pronounced warping, admitting of the sharp turns; (2) reduced air resistance from the non-supporting parts of the construction, brought about by the elimination of the front control and the more refined contours and dimensions of stanchions, spars and radiator, and (3) the increased confidence of the operator inspired by relieving him of attention to the too-sensitive front rudder, while yet placing his safety fairly independent of the motor power by virtue of the warp and the large area of the planes. The large and more or less flexible rear edges of the planes probably also contribute to their relative independence of the weather.

Other events of importance to the student of these forces which make or unmake flight, were the speed trials, including particuarly the flight from the aviation field to the Liberty statue and return, through which it was shown that identical machines differ greatly in speed capacity and that a machine driven by a 85-100-horsepower motor is not necessarily speedier than another machine of the same design but driven by a 40-50 horsepower motor. In the 36-mile flight around the Liberty statue only Blériot monoplanes were engaged. Grahame-White's, with a 100-horsepower motor, made the distance in about 37 minutes. DeLesseps, with a 50-horsepower motor, used about 6 minutes more, traveling at practically the same time and under the same wind conditions. Moisant, about one hour later, made the same circuit a little faster than Grahame-White, with a 50-horsepower motor and a machine so near alike to that piloted by DeLesseps that the eye could barely detect any difference, by a somewhat close comparison made at the sheds the following day. The wind, however, had changed a trifle in direction and possibly in velocity, as indicated by the position of a captive balloon floating above the statue. The difference of 6 minutes in the speed of Grahame-White and DeLesseps would correspond to about one-third greater propulsive power in the Grahame-White machine, a gain of one-sixth in speed, meaning about one-third more resistance overcome, in the case of machines of identical shape and dimensions. DeLesseps and Grahame-White are men of about the same size and weight, while Moisant is much smaller and the machine which he bought from Leblanc was no doubt adjusted to the weight of the latter, which is about the same as Moisant's. The mere difference in the loads, possibly amounting to 40 pounds, would, according to experience at previous meets, make a scarcely perceptible difference in the speed, but a different balancing of the machines might make a considerable difference, necessitating constant rudder action or a higher flying tilt in the machine least well balanced. The inspection seemed to indicate one slight difference between the machine of DeLesseps and Moisant. The angle of the planes with the main extension of the tail seemed to be 2 to 3 degrees larger in the DeLesseps machine than in the other. This angle serves the purpose of giving a certain degree of automatic fore-and-aft balance, since a rise of the wings immediately brings the under-surface of the tail into action for rear support. The smaller this angle can be made and yet serve its purpose, the greater the sustentation of the machine must be, other things equal, and the machine with the greater sustentation can fly at a smaller tilt, thereby meeting smaller resistance and gaining greater speed. Finally, the motors of the three machines may have been in different conditions of "tuning up," and the efficiency of the propellers may be different, the slightest variation of the curves of a propeller, such as may be caused by warping of the wood, having been found to affect the propulsion very noticeably, though the laws governing the action have not yet been defined. The fact that the motor power of Grahame-White's machine overcame only one-third more resistance than was overcome by DeLesseps' motor of one-half the power seems to find its readiest explanation in the difficulties in harmonizing propeller dimensions with the speed and power of the motor. Altogether the three performances give rise to a number of mechanical considerations which all designers of speed machines must take into account, even if the slight change of wind offers a facile explanation of the apparent discrepancies.

On one of the days of the meet Hoxsey and Johnstone, whom the spectators had become used to seeing disappear through the clouds to the sunny but cold regions above and suddenly reappear in the same manner after an absence of hours, were engaged in this sport while the wind was blowing at the rate of possibly 25 miles per hour, when the velocity of the wind began to increase, reaching perhaps 60 miles per hour, as estimated by Johnstone. Under these conditions the flyers could not hold their own, but drifted with the wind, while heading it and working against it at full motor speed. They were carried away from the field a distance of about 25 miles in one hour, showing that, as against the atmosphere, they were making their usual maximum speed of 35 miles per hour, while in relation to things terrestrial they flew backwards at the rate of 25 miles per hour—an entirely new experience in aviation for the simple reason that nobody before has flown in a wind of 60 miles velocity. At last Johnstone was compelled to risk a descent, as his gasoline was running very low and a planing descent without power was out of the question in the high wind. And he succeeded in making this descent through strata of atmosphere where the wind was not only strong but gusty as well, and landed near Middle Island, whence he flew back to Belmont Park the next day. As a 60-mile wind has never been known to stop a 30-horsepower limousine, incidentally stopping its motor, although the wind resistance encountered by a limousine is no doubt greater than that which the propulsion of a Wright biplane overcomes, Johnstone's experience suggests that the propulsive efficiency of propellers is very much smaller than that of a wheel rotating on a firm road. It is commonly figured that the automobile motor delivers about 70 per cent. of its power at the wheel rim, on the high gear, and as the much simpler transmission of the biplane should deliver at least as much to the propeller shafts, the loss in efficiency can be charged to the propeller only. This would be apparent from the mere fact that the highest speed of these biplanes in a calm does not exceed 35 to 40 miles, while that of the limousine of 30-horsepower easily reaches 50 miles on a smooth and firm road, if the gears permit it, but the experience of the two Wright fliers in being actually driven backward seems to bring the interpretation of the fact nearer to reality, emphasizing that the need in aeroplane construction should be sought in the direction of a propeller which will operate with the positive action of an automobile driving wheel rather than in the direction of motors with enormous power, expensive to maintain, as well as difficult to produce within the weight limits.

The small Wright speed machines shown at the meet and of which much had been expected, turned out to be biplanes, with very small plane areas. One of them had a wing span reduced to about 22 feet, or about half of the usual Wright dimensions, and was equipped with a new V-motor with eight cylinders, figured capable of developing 60 horsepower. The motor appeared difficult to get into working order and the accident to Brookins, when the latter was preparing to enter in the speed trials, was due to four of the cylinders ceasing to function and the rest being insufficient to keep the machine in the air. Its weight was said by Wilbur Wright to be about 920 pounds with the aviator and gasoline on board, and a ground speed of more than 40 miles per hour was required for starting it. Flown by Orville Wright, it showed great speed, according to the writer's timing, at least equal to that developed by the 100-horsepower Blériot. The other speedy Wright machine was operated by Ogilvie, of the English team, weighed about 750 pounds with everything up, spanned 26 feet with a width of 3 foot 6 inches, was equipped with the ordinary Wright motor and was said by its operator to require a starting speed of 40 miles per hour in a calm. The two machines must, therefore, be intended to start at very different tilts, the curvature of their planes being very much alike, while their weights and areas differ, as stated.

Terrific Speed in Grand Prix

EARLY PRACTICE OVER COURSE DEVELOPS REMARKABLE STORIES OF FAST TIME—FIELD WILL PROBABLY INCLUDE 21 FLYERS

SAVANNAH, Oct. 31—In addition to the entry list published in The Automobile last week, the Grand Prize entries now include a Sharp-Arrow, two Pope-Hartfords, two Oldsmobiles and a Stoddard-Dayton. There is a question whether the two Lorraine-De Dietrichs mentioned in the list last week will start, but there is a probability that such will be the case.

The course has been thoroughly oiled and rolled out and will be thrown open for formal practice to-morrow. The usual crop of reports of fast time made in unofficial spins have made their appearance. One of the entered cars is said to have turned a mile in Ferguson avenue at the rate of 106 miles an hour.

The Fiat team is quartered at Doyle's on Thunderbolt road; the Benz crew and cars are at the German Club; the Loziers will be quartered at the Thunderbolt Casino; the Marmons, Marquettes, Buicks and Roebling-Planche are at Fifty-second street and White Bluff road.

Already the city is beginning to feel the influx of visitors as nearly every train and ship brings in a handful connected in one way or another with the big race. Chairman Robert Lee Morrell, of the Contest Committee of the Automobile Club of America, and a delegation from that organization has reached this city. Mr. Morrell and his party were met by a committee from the Savannah Automobile Club and escorted to the Chamber of Commerce, where they were presented to Mayor Tiedeman, who turned over to them the administration of the race.

All the drivers who have been over the course unite in predicting a new American road race record in the Grand Prize. These predictions run all the way from 68 to 75 miles an hour, with the majority selecting about 70 miles an hour as the favorite figure. On account of the three stiff turns the general opinion is that the world's mark of over 74 miles an hour will stand.

There is little likelihood of any more entries than those already mentioned. The starters will probably number about twenty-one, although twenty-seven have been nominated.

Texans Race Three Days

FINE WEATHER AND BIG CROWDS COMBINE TO ADD TO THE SUCCESS OF THE DALLAS MEET, AT WHICH GOOD SPORT IS ENJOYED

DALLAS, TEX., Oct 29—Favored with large crowds, ideal weather and a track that was in first-class shape for fast auto racing, the three-day meet held under the auspices of the Dallas Automobile Dealers' Club on the mile track at the Dallas State Fair Grounds was brought to a close to-day.

The feature event on the last day of racing was the 50-mile free-for-all Dallas Derby. Four cars faced the starter in this event, as follows: Stoddard, two Cole cars, and a Cutting. The Stoddard started out at a fast clip to cinch the race in the early running, but a foul spark plug cost it the lead in the nineteenth lap. At this stage of the race the Cutting jumped to the front with a two-lap lead and held it until the fortieth lap, when engine troubles put it out of the running.

The Stoddard proved the winner and did the 50 miles in 56:10. Summaries:

FIRST DAY

Stock chassis, fast mile, 300 cubic inches and less—

No.	Car	Driver	Time
1.	Cutting	Clark	1:00 4-5
2.	Moon	Wells	....
3.	Cole 30	Endicott	....

Stock chassis, class B, 230 cubic inches and less—

No.	Car	Driver	Time
1.	Buick 10	Fred Malone	10:43 1-5
2.	Cole 30	H. Endicott	....
3.	Cole 30	B. Endicott	....

Class D, free-for-all, five miles—

No.	Car	Driver	Time
1.	Cutting	Clark	5:27 3-5
2.	Cole 30	H. Endicott	....
3.	Cole 30	B. Endicott	....

Stock chassis, class E, 600 to 450 cubic inches, 50 miles—

No.	Car	Driver	Time
1.	Cutting	Clark	52:38
2.	Moon	Wells	....
3.	Cole	B. Endicott	....

SECOND DAY

Free-for-all, handicap—

No.	Car	Driver	Time
1.	Stoddard-Dayton (scratch)	De Hymel	9:51 3-5
2.	Cutting	Clark	....
3.	Cole 30	B. Endicott	....

Free-for-all, class D

No.	Car	Driver	Time
1.	Stoddard-Dayton	De Hymel	1:02
2.	Moon	Wells	....
3.	Cutting	Clark	....

One hour, free-for-all, stripped chassis, class C—

No.	Car	Driver	Time
1.	Stoddard-Dayton	De Hymel	....
2.	Moon	Wells	....
3.	Cutting	Clark	....

THIRD DAY

Free-for-all, class E, State championship, mile trial—

No.	Car	Driver	Time
1.	Stoddard-Dayton	De Hymel	1:02
2.	Cutting	Clark (withdrew)	

Free-for-all, handicap, class B—

No.	Car	Driver	Time
1.	Cutting (scratch)	Clark	5:05 2-5
2.	Buick 10	Malone	....
3.	Cole 30	Endicott	....

Stock chassis, class B, 300 cubic inches and less, 10 miles—

No.	Car	Driver	Time
1.	Cutting	Clark	6:14
2.	Cole 30	B. Endicott	....
3.	Cole 30	H. Endicott	....

Stripped chassis, class E, Dallas Derby, 50 miles—

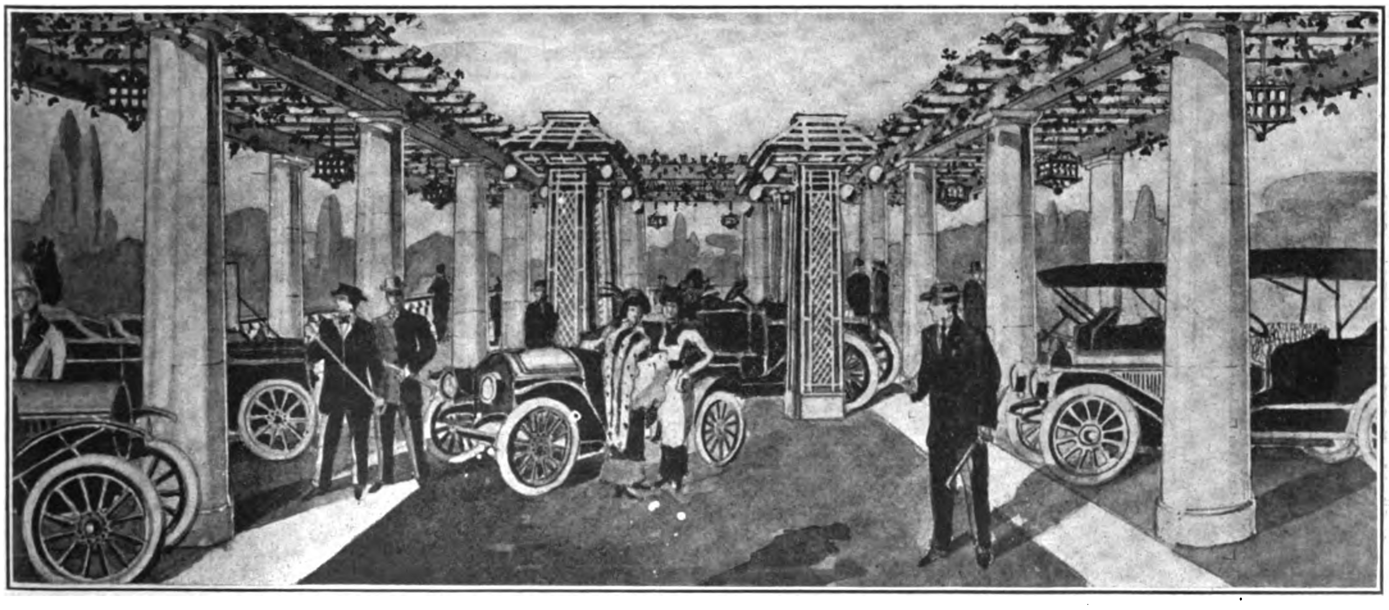
No.	Car	Driver	Time
1.	Stoddard-Dayton	De Hymel	56:10
2.	Cole 30	B. Endicott	....
3.	Cole 30	H. Endicott	....

Fitchburg Motorists Form Club

FITCHBURG, MASS., Oct. 28—A number of the prominent motorists of this city met last night and formed a motor club to be known as the Fitchburg Automobile Club. Addresses were made by several of the State officers. It is expected that more than one hundred motorists will join the club. It will become affiliated with the Massachusetts State A. A. The officers elected were as follows: F. O. Hardy, president; W. Powell, vice-president; G. Upton, secretary-treasurer. C. B. Smith was chosen representative to the State and national bodies. The following directors were also chosen: Henry McGrath, G. P. Grant, Jr., Gardner Hudson, F. R. Houghton and David Low.

Automobile Club for Haverhill, Mass.

HAVERHILL, MASS., Oct. 28—At a meeting held Thursday evening to form a permanent motor club at Haverhill to bear the name of that city, more than seventy owners of cars signed the roll. Then followed an election of officers with the following men chosen: W. W. Appleton, president; Dr. C. E. Durant, vice-president; F. S. Ball, secretary-treasurer; George E. Durgin, Dudley Hilliard, Elmer C. Bassett, Sam Jordan and John H. Bragdon, board of governors. Grant Fairbanks was chosen to represent the club at national and State meetings.



How the exhibition hall of Madison Square Garden will look after it is decorated in the style of an Italian garden for the Eleventh Annual A. L. A. M. Show, which is to be held January 7 to 12, 1911

Maxwell Wins Feature Race

FINISHED FIRST IN THIRTY-MILE EVENT OF MEET STAGED BY AUTOMOBILE CLUB OF WHITE PLAINS AT WESTCHESTER COUNTY TRACK

RUNNING with steadiness at high speed, a Maxwell car, No. 1, proved the feature of the race meet given Saturday afternoon at the Westchester County Fair grounds under the auspices of the Automobile Club of White Plains. The car finished first in the 30-mile event, winning from another Maxwell, an Allen-Kingston and two Mercedes, one of which has made creditable showings in two Vanderbilt Cup races.

The track was exceedingly trying to the heavy cars on account of its sharp turns and rough surface and the terrific strain on the right tires soon put them out of competition. The Maxwells, however, slipped along without trouble and were all alone at the finish on account of their light weight and the fact that no mechanic rode with either of the drivers.

A good crowd turned out to see the races, but wholesale scratching deprived the card of much of its interest. The best time trials were made by Mercedes, 4, driven by S. E. Wishart, 1:14 1-4; Allen-Kingston, 8, Ormsby, 1:21, and Maxwell, 1, 1:23.

The first race was won by Mercedes, 9, driven by H. Mendell, Jr., who covered the five miles in 7:09 1-2. Marion, 24, Thebaud, and Allen-Kingston, 8, Ormsby, also ran.

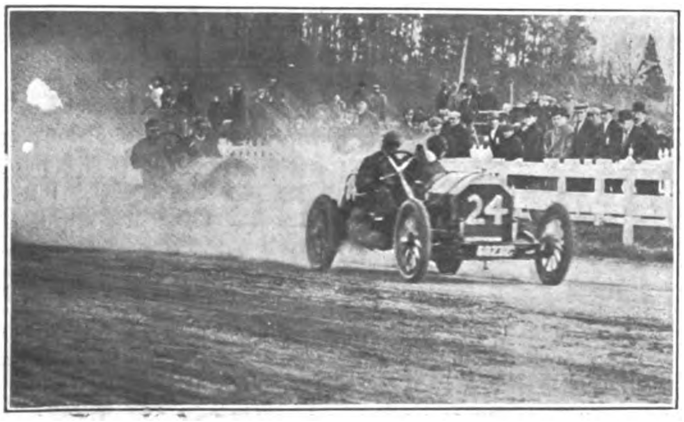
Maxwell, 1, Costello, had a cake-walk in the second, making the five miles in 6:44 1-5. Maxwell, 11, and Krit, 16, finished as named.

The third race failed on account of scratches and Mercedes, 9, and Marion, 24, contested in a match race, the former finishing the ten miles all alone after the Marion had suffered gear trouble. Chalmers, 18, was awarded the cup in the 20-mile event as the other contestants failed to show up. A 10-mile extra event was put on in its place and the Chalmers won the race from the two Maxwell entries.

The final number was the 30-mile feature event in which the two Maxwells, Allen-Kingston and the two Mercedes appeared at the scratch. Mr. Wishart's Vanderbilt Cup car jumped into the lead at the crack of the gun and within five miles had lapped the field twice when a gasoline feed pipe broke and the car lost five laps before temporary repairs could be made. In the meantime Maxwell, 1, had challenged the other Mercedes and had succeeded in getting to the front. From there to the finish the Maxwell remained in the van. Mercedes, 4, made quick repairs and started after the leaders but after four rounds was obliged to withdraw.

About the same time Mercedes, 9, swung into the stretch in trouble with its right tires and on the next round the Allen-Kingston drew out with the same trouble. The tires were worn almost to the inner tubes in each case. The Maxwells tin-canned along by themselves and completed the route in good order.

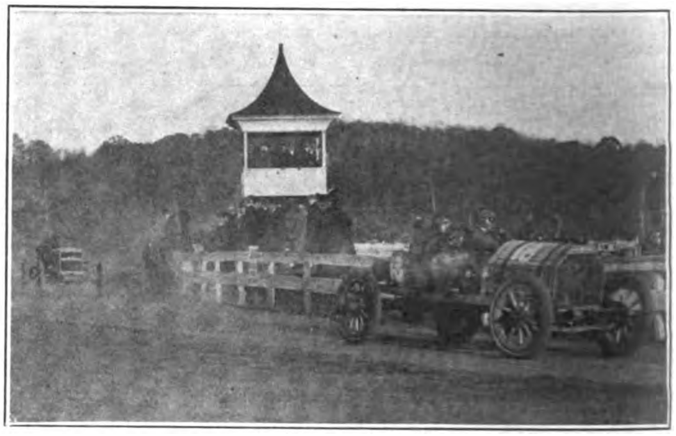
The track is thoroughly unfit for automobile races and the high speed made by Mr. Wishart's car courted fatal accident in every round.



Marion No. 24, which performed well at White Plains meet

Two Los Angeles Meets Announced

Two track meets, opening the Los Angeles motordrome for this season have been announced. The first of these will take place November 26 and 27, for which a varied program has been prepared. The first day will see six events decided. The first event will be mile speed trials; second, a pursuit race, restricted to four entrants; third, Class C, Division 3C, five miles; fourth, free-for-all, 25 miles; five, Class C, Division 2C, five miles; and six, the first hour of the Motordrome Endurance Derby of two hours, open to Class C. On the following day six more races will be held, mostly for larger cars.



Chalmers No. 18 leading in ten-mile event at White Plains

The second meet is a 24-hour race scheduled for December 25-26 for a Challenge Trophy and a purse of $1,500, divided into three moneys. Class C cars are eligible and special trophies will be awarded the winners in each of the divisions providing that there are two or more. The entry list is limited to 16. The meets are both fully sanctioned.

Newark Club Elbows Deep in Politics

Working with all its accustomed vigor and efficiency, the New Jersey Automobile and Motor Club is taking a prominent part in politics just at this time. The club is laboring for a decent automobile law in Jersey and has taken useful means of determining how each legislative candidate stands with regard to reasonable legislation on the automobile. The club has propounded a quiz to each candidate and has received replies agreeing to better laws from 79 of them so far. Essex County is the scene of m [illegible] ity and largely as a result of the club canvass, both the Republican nd Democratic candidates have been pledged to remedial legislation.

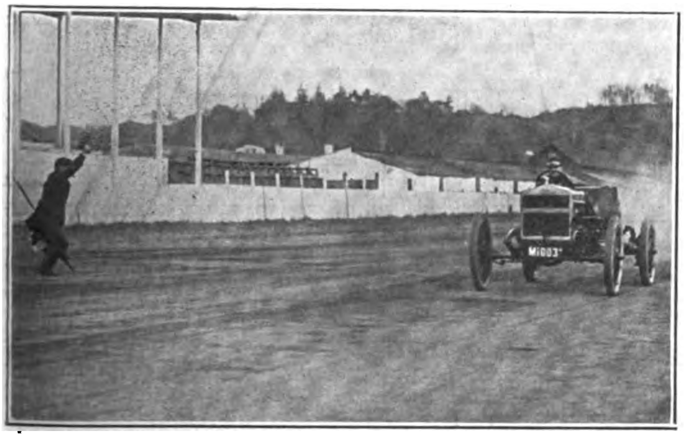
The club will take a distinct interest in the election at the polls. As its membership is tremendous, it will probably have a salutary effect.

Maxwell Wins Reliability Run

COMPLETES FIVE-DAY ROUTE WITH BUT 13 DEMERITS—AWARD PROTESTED BY ENTRANT OF WASHINGTON CARS

WASHINGTON, D. C., Oct. 28—For the second time this year a Maxwell, driven by H. E. Walls, won the sweepstakes in a reliability contest. The recent victory in the Munsey historic tour was repeated in the five-day reliability tour of the Washington *Post* to Richmond and return. A total of 13 points was marked against this car, three of them being for stalled motor and ten in the final examination.

The award was protested by A. G. Carter, entrant of one of the Washington cars, who claimed excessive penalties were laid against his car. Mr. Carter had an argument with B. B. Caverly, representative of the Contest Board, and the Washington entries were thereupon disqualified. The whole matter has been referred to the Contest Board for decision. The winners were Division 1A, Maxwell, B. Robertson; Division 2A, Buick, S. Mortimer; Division 3A, Maxwell, H. E. Walls; Division 4A, Washington, W. D. Arrison; Division 5A, Columbia, G. M. Wagner.



Maxwell on the starting line in White Plains time trials

The two Maxwells, two Washingtons and the Parry had perfect time scores. All the cars were perfect on the clutch test. The final examination report shows the following:

Buick.—Front wheels sprung three-quarter inch, 30 points; loose front gas lamp bracket, 2 points; time penalty, 52 points; road penalty, 15 points. Total, 99 points.

Washington.—Lost grease cup, left rear axle, 2 points; lost truss rod under rear axle, 25 points; foot brakes, 3 points; road penalty, 1 point. Total, 31 points.

Washington.—Loose left rear fender, 2 points; foot brake, 8 points; emergency brake, 10 points; road penalty, 2 points. Total, 22 points.

Columbia.—Two loose cap screws on exhaust and intake manifold, 2 points; one broken spring clip, left rear spring, 15 points; one broken truss rod under rear axle, 25 points; five leaves broken in right front spring, 25 points; five leaves broken in left front spring, 25 points; loose mud apron, 2 points; nut off transmission cover, 1 point; loose set nut on connecting link of throttle linkage, 1 point; brass binding on dash loose, 1 point; half inch of spread rear wheels, 20 points; foot brake, 46 points; hand brake, 26 points; road penalty, 22 points. Total, 211 points.

Maxwell.—Loose spark terminal, 1 point; loose yoke on steering column, 15 points; broken leaf in left front spring, 5 points; loose left hand short brake lever, 25 points; loose left front fender bolt, 2 points; one tappet rod spring loose, 1-2 point; one tappet rod spring lost, 1-2 point; one loose right hand front axle bolt, 2 points; two loose body bolts, 2 points; road penalty, 8 points. Total, 61 points.

Maxwell.—Fan belt off, 1 point; one lost cap screw from magneto distributor, 1 point; one loose cap screw from magneto distributor, 1 point; loose right rear fender, 2 points; tw[illegible]ent brake band brackets, 5 points; road penalty, 3 point[illegible] 13 points.

Parry.—Loose right front fender, [illegible] points; loose rear right fender, 2 points; bent left front fender, 2 points; left front spring leaves out of line, 2 points; right front spring leaves out of line, 2 points; base of steering column loose at dash, 15 points; gasoline strap loose, 2 points; brake band guide bent, 2 points; stud loose on transmission cover, 1 point; truss rod on rear axle loose, 5 points; loose muffler, 2 points; front axle bent back, 150 points; spread of rear wheels, 95 points; emergency brake, 17 points; time penalty, 58 points; road penalty, 205 points. Total, 562 points.

Washington.—Loose left fender, 2 points; loose strut rod under rear axle, 5 points; loose right front deck, 1 point; loose right front fender, 2 points; spread of front wheels, 5 points; foot brake, 3 points; tire penalty, 625 points; road penalty, 328 points. Total, 971 points.

Buick.—Loose steering column, 15 points; loose sprocket on jack shaft, left side, 50 points; distance rod nut, left and right side, 2 points; foot brake, 30 points; time penalty, 8 points; road penalty, 2 points. Total, 107 points.

The heavy penalties earned by the Washington and Parry were due to accident. The summary:

			Final Standing			
Name of Car	H.P.	Driver	Time	Road	Tech.	Tot'l
Maxwell, ...	30	H. E. Walls, ...	0	3	10	13

Santa Monica Road Races Announced

LOS ANGELES, Cal., Oct 31—Thanksgiving Day has been selected for holding the second annual Santa Monica Road races and the start will be at daybreak. The race is practically a triple attraction, for beside the free-for-all event there will be a light stock car and a heavy stock car competition which will precede the main contest.

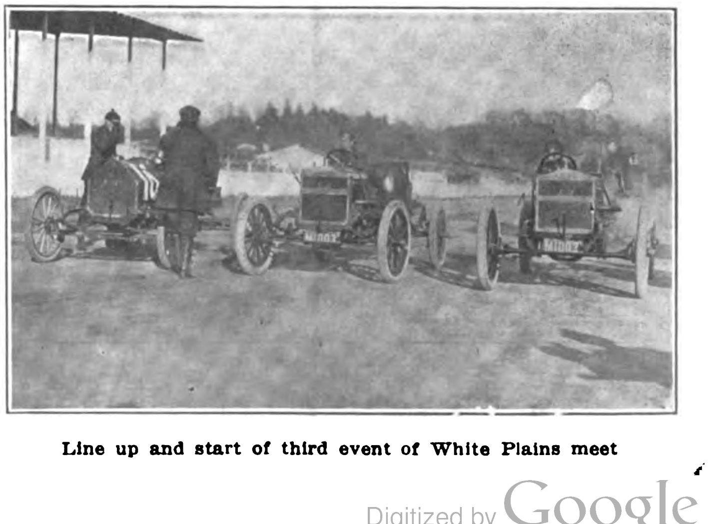
In the light car class the limit has been placed at 250 cubic inches piston displacement without minimum weight restrictions and the course is 12 laps of a circuit 8.4 miles long. The entrance fees will be divided among the first three to finish in the proportion of 70, 20 and 10 per cent. The winner will be awarded the Leon T. Shettler trophy valued at $600.

In the heavy stock car event, open to cars of 600 cubic inches displacement, the course will be 18 laps of the same circuit and the awards will be given on the same plan as in the foregoing. The Dick Ferris Trophy, worth $1,000, goes to the winner.

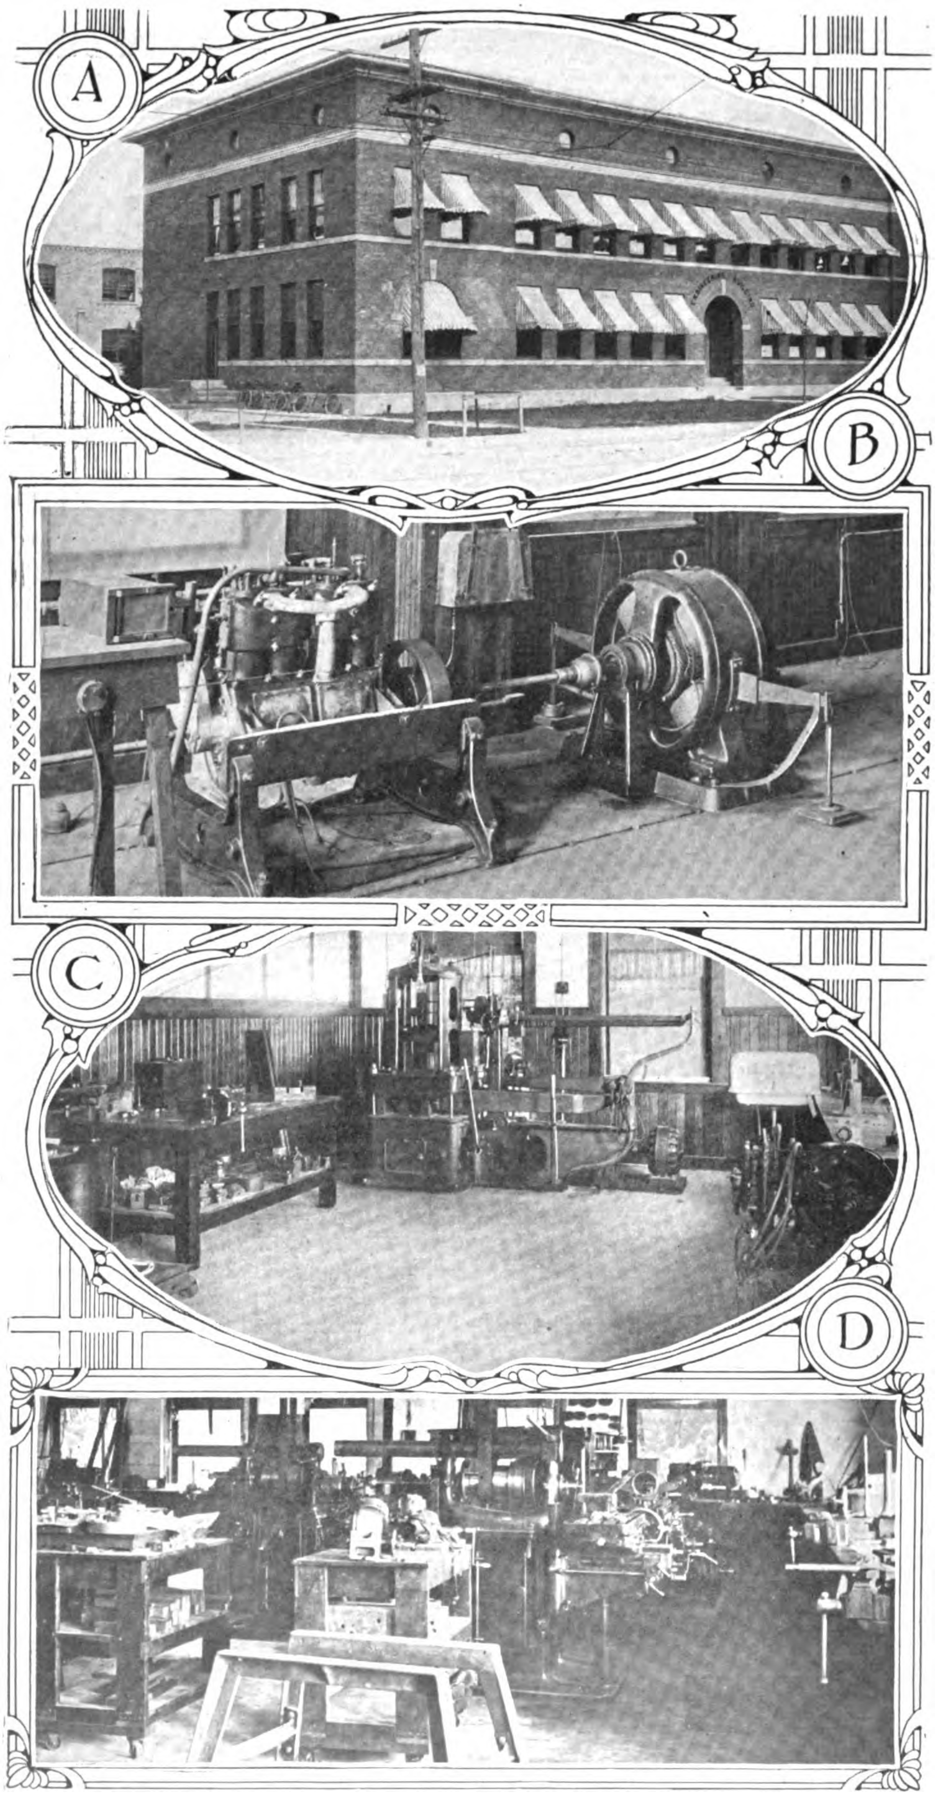
The main event is a free-for-all, 24 laps of the course and the prizes will be awarded according to the same plan.

The course is considered the fastest road racing surface in America. There are no difficult turns and no grades of any moment. In past contests light stock cars have made faster time than the big road locomotives that have competed in the Eastern cup races. This, of course, is due to the difference in the roads.

The events are sanctioned and will be conducted under the management of Dick Ferris.



Line up and start of third event of White Plains meet



The new Reo engineering building at Lansing, Mich., has been completed. It is three stories of reinforced concrete and has floor space of 31,200 square feet. The building is equipped with a particularly complete line of machinery capable of handling the smallest repairs or the construction of entire cars. Horace T. Thomas is in charge. A—View of engineering building. B—Motor testing laboratory. C—Material testing laboratory. D—Machine shop.

News of the Trade

DETROIT, MICH., Oct. 31—Saturday was moving day for the Hudson Motor Car Company. That is, it was the first of a series of moving days, for it will take all this week, it is expected, to complete the transfer of the company's stock and equipment from the old factory at Mack and Beaufait avenues to the magnificent new plant that has been under construction all summer out on Jefferson avenue and which is not yet completed. It is so near completion, however, that manufacturing operations can be carried on without hindrance and the officers of the company were anxious to move while the weather was still favorable.

A good start was made on the moving job, Saturday. The procession of motor trucks and vans started at 7 o'clock in the morning and continued without let-up all day. The parade was resumed this morning.

The new plant approximates a high form of modern motor car factory construction. Its ventilating, heating, lighting and sanitary arrangements are all strictly up-to-the-hour and are designed to give the maximum of comfort, safety and convenience. An instance of the consideration that has been shown for the employees is seen in the use of ribbed glass, which diffuses the light so that the glare of the sun cannot hurt the workmen's eyes.

Model Garage in Far Northwest

SEATTLE, WASH., Oct. 31—One of the most artistic, substantial and thoroughly fireproof garages in the Northwest has recently been completed at Baker City, Ore. It was erected by Albert Geiser, one of the most extensive property owners in that city, and will be occupied by him as the agent for the Buick automobiles in Baker County.

The building is centrally located on a lot 50 by 100 feet, built of natural stone, concrete floor and metal roof suspended by steel arches at a height of 20 feet.

Mechanical Engineers to Meet

Cement making, as it is affected by the rotary kiln, will be treated by Ellis Soper, of Detroit, at the New York meeting of the American Society of Mechanical Engineers, November 9. Charles Whiting Baker will deliver an illustrated lecture on the Panama Canal.

THE HUDSON COMPANY MOVES TO ITS NEW QUARTERS IN DETROIT—OTHER ITEMS OF INTEREST

The main building is 610 x 60 feet in dimensions, with one wing 410 x 60, and another 210 x 60. There is an office building, 180 x 52 feet. All the buildings are two stories in height, but are designed to carry two more any time it is found desirable. They are of reinforced concrete construction.

Sanitary drinking fountains are scattered throughout the buildings, while each of the employees will have a steel locker. The work benches are equipped with private metal drawers for the use of the bench hands, draftsmen, etc. Then there are rest rooms for the women, smoking rooms for the men and an employees' dining room.

Scores of devices for lessening the cost of production have been provided, and a great many of them have been specially designed by Howard E. Coffin, chief engineer for the Hudson Company, and designer of all the Hudson models. Among these features may be mentioned an overhead crane for conveying cars to the paint shop.

A 30,000-gallon tank, supported by a tower 135 feet high, affords fire protection. An automatic sprinkler system has also been installed.

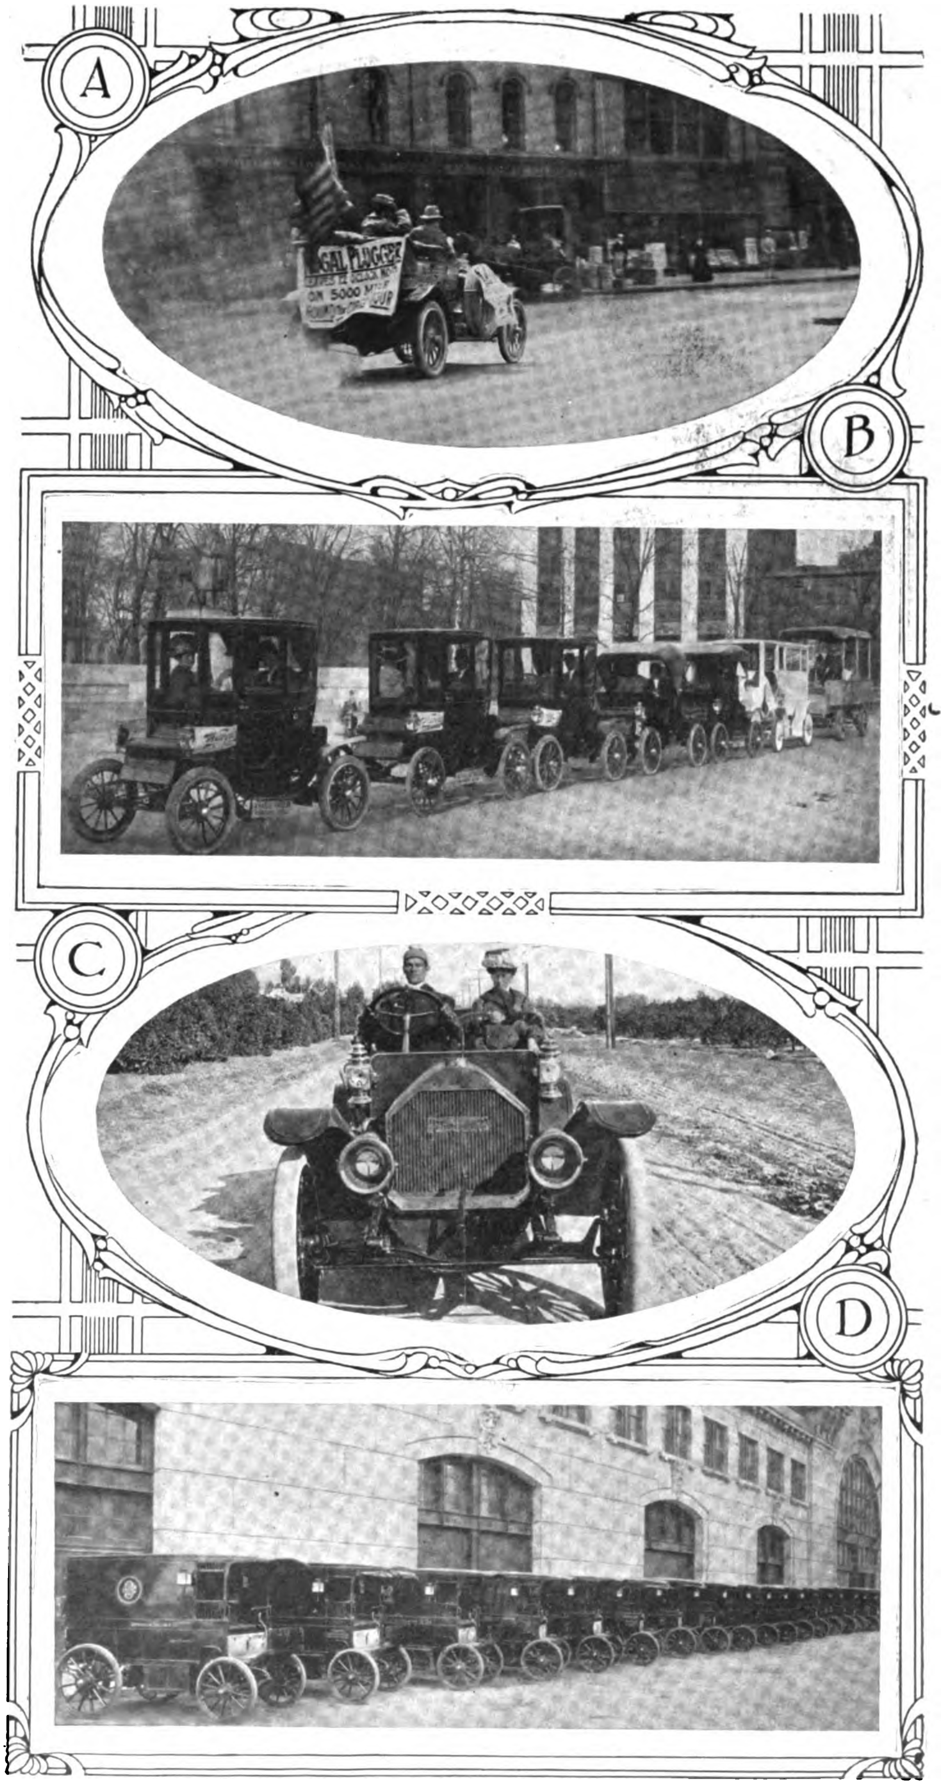
A feature of the plant is the experimental room, designed by and equipped under the personal supervision of Mr. Coffin. It has been termed a mechanic's paradise.

Larger Quarters for Studebaker

WILMINGTON, DEL., Oct. 31.—The Wilmington branch of the Studebaker Automobile Company, which is having a building erected for its use as an office and garage on Delaware avenue near Tatnall street, has decided to use all three floors of the building for its business, instead of only the first and second floors, as was the original intention.

Packard Company to Entertain

Celebrating the completion of factory additions which have been under construction for a considerable time, the Packard Motor Car Company will give a reception to the business men of Detroit November 3. For the convenience of the guests, the company will install a motor car service from the street car line to the factory buildings before and after the function.



A—The "Regal Plugger," that is now touring through the South giving a demonstration of its power and reliability. B—A string of electrics just turned out by the Waverley plant and ready for shipment. Motor Activities in Hoosier Capital

INDIANAPOLIS, IND., Oct. 31—The Cole Motor Car Company has recently increased its capitalization and will build approximately 2,000 cars next season. The American Motor Car Company will increase its output to 400 cars and other concerns will similarly increase production. Contracts for the new season are coming in quite satisfactorily.

A number of changes in the trade have been made during the last few weeks. The Ford Motor Car Company is planning to open a factory sales branch in North Capitol Avenue, succeeding the Ford agency, which has been held by the Gibson Auto Company.

Plans have been completed for the factory building of the recently organized Great American Automobile Company, which will manufacture commercial cars exclusively, near the Indianapolis Motor Speedway. The Cecil E. Gibson Motor Car Company will also soon establish a plant for the manufacture of commercial cars.

The 1910 season has been a success locally. Almost every dealer has disposed of his allotment and is booking orders for 1911 cars. It is estimated that local dealers have sold about 3,000 cars this season, and present prospects would seem to warrant the assumption that 1911 will see these figures increased to the extent of at least 50 per cent.

Fig. 3—Rear axle construction, showing a steel shell; large brakedrums and a stout bridge

Among the New-Comers

SOME time ago H. F. Kilbourn, president of the City National Bank, had a meeting with some of his Wall Street friends and it was then decided that good automobiles were too high-priced. The result of the meeting was that these gentlemen concluded to build their own automobiles and they engaged workmen and designers for the purpose, with the outcome that the first automobile is here. This car was made at the Brightwood plant at Springfield, Mass., and it is being demonstrated now in New York City to the edification of the men who braved the sea of possible failure in quest of a better automobile than can be made in the regular way.

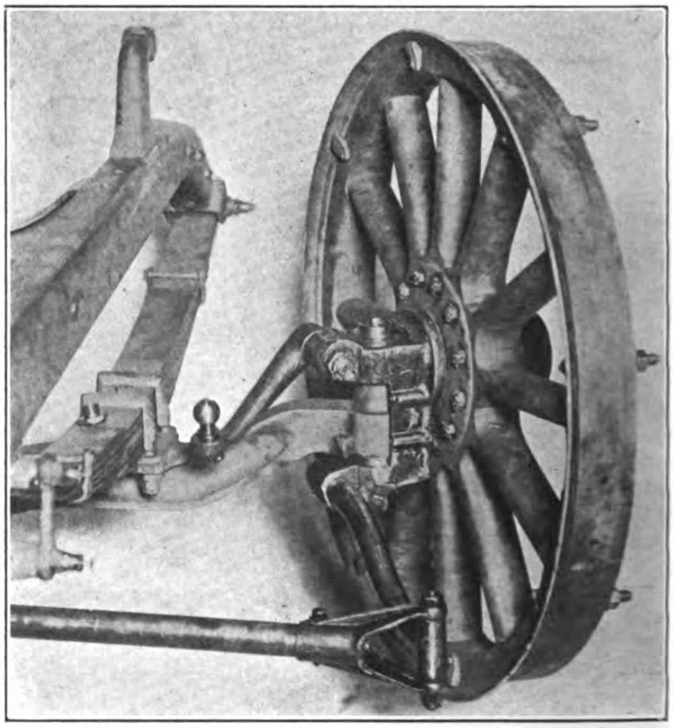

Fig. 2—Front axle and knuckle, depicting the steering arm and and cross-rod with liberal universal joints

The motor of this car is of the water-cooled, 4-cycle type, with cylinders cast in pairs, T-type, requiring two camshafts, and the crankshaft is centered on three bearings. Lubrication is by splash, with a pump to maintain a constant level. There is a tell-tale on the dash to tell the driver if the oil runs out. The cooling system comprises a honeycomb radiator, and water is circulated by a centrifugal pump, located on the exhaust side of the motor. A Stromberg, double-jet carbureter is used; the gasoline tank, holding about 20 gallons, is located back of the hind axle below the flush of the side bars. Ignition is by Simms magneto, using a separate high-tension distributor for the auxiliary (battery) system; the location of the magneto is on the right-hand side of the motor, which, by the way, is also the side that the carbureter is located upon.

The clutch is of the cone type with a leather facing. Transmission is through a selective three-speed gear, with an extra

ILLUSTRATING THE FIRST MODEL OF THE ORSON CAR; 100 BEING MADE FOR WALL STREET BROKERS; BANKERS ENTER AUTOMOBILE BUSINESS

speed change in the housing of the live rear axle. This is brought about by shifting the bevel pinion out of engagement with one of the two bevel gears used, and then engaging a second pinion with the remaining bevel gear—in other words, a double bevel drive is utilized.

The live rear axle is of the full floating type, with annular ball bearings, and the shell of the same is of drawn steel. The front axle is of the I-section alloy steel with thrust, as well as annular ball bearings in the knuckles. The brakes are of the internal expanding type in drums bolted to the rear road wheels. The side bars of the chassis frame are of the channel section with a 6-inch kick-up behind. The front springs are half-elliptic. The rear springs are of the three-quarter-elliptic type. Steering is by means of a ball-bearing worm and gear type. Control is to the top of the steering wheel, comprising spark and throttle levers. A pedal is used for acceleration. The wheelbase is 130 inches, and the tread is standard. The tire equipment is 920 x 120 millimeters front and rear. The weight of the car is said to be 2,750 pounds.

The body is a 7-passenger, fore-door type, with an overhanging cowl, presenting a good appearance, and the plan of the company is to ultimately make and sell automobiles of this design at $4,500 for the stripped chassis, and $5,250 for the automobile with body as described above.

The outcome of this project is being watched with interest, as it is the first instance on record where automobiles in quantities have been designed and built by others than those actually engaged in the business.

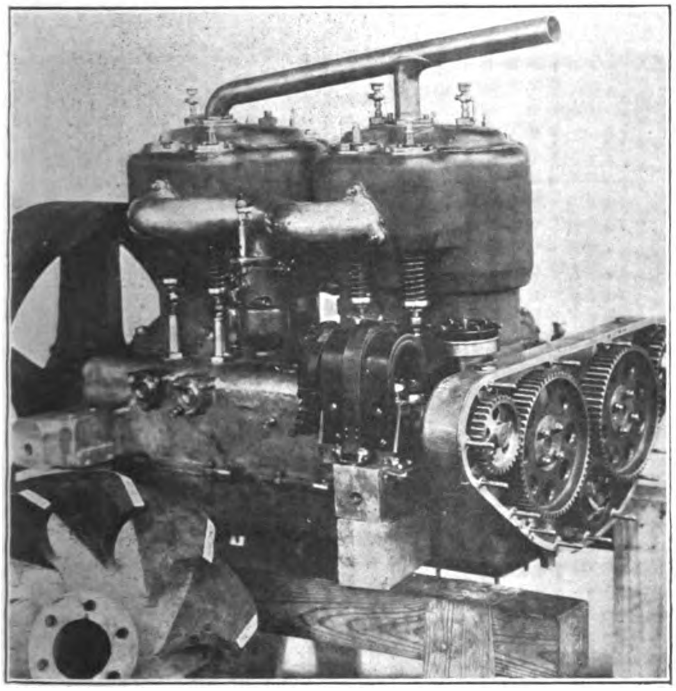

Fig. 5—Orson motor with gear wheel case removed and showing part of flywheel

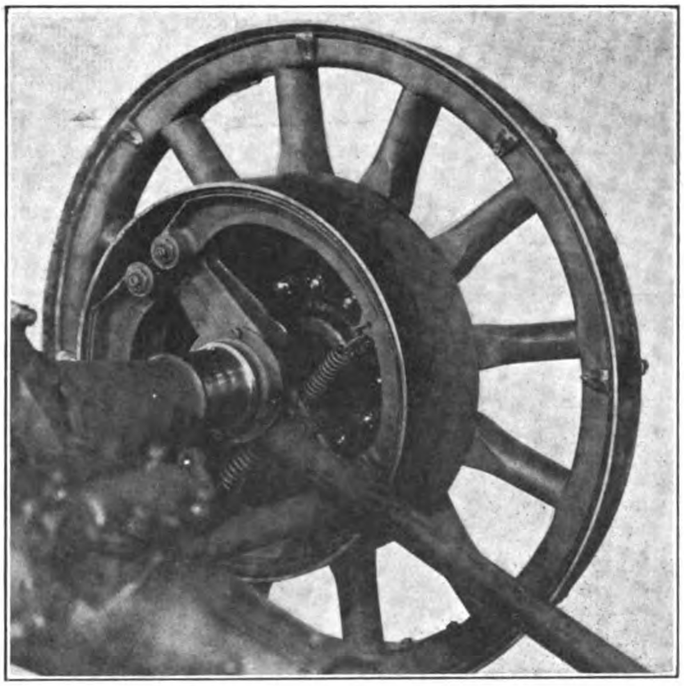

Fig. 4—Rear brake drum, wheel, and details of holding brake mechanism

Moon Company Declares 64 Per Cent. Dividend

St. Louis, Mo., Oct. 24—At the annual meeting of the stockholders of the Moon Motor Car Company, held at the factory Thursday, a stock dividend of 54 per cent. and a cash dividend of 10 per cent. were voted. The stockholders decided to increase the capitalization from $162,500 to $300,000, the increase to be effected through the stock dividend of $87,000 and the issuance of $50,000 treasury shares. The treasury stock was taken immediately by the stockholders.

Mt. Vernon Club to Race Election Day

Election day has been selected by the Automobile Club of Mt. Vernon on which to run off the postponed fall race meeting of the club at the Empire City track. The meeting was scheduled for Oct. 22, but rain prevented its being held on that date.

Rambler Organization Tells Its Story

Telling the story of the growth and development of the Rambler, the Thomas B. Jeffery Company has issued a special number of the Rambler Magazine. A feature of the issue is the part devoted to the dealers themselves. A complete announcement of the 1911 line is included in the publication.

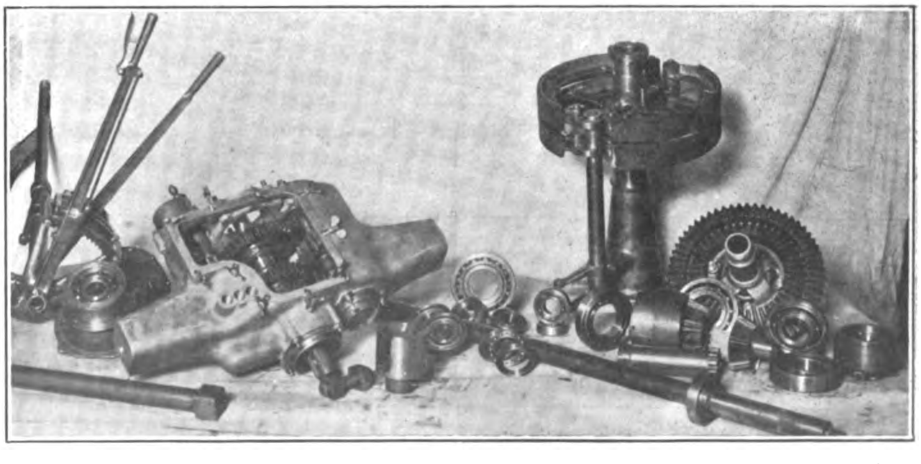

Fig. 6—Gear box assembled and parts of rear construction. Note double-bevel wheel for fourth speed

Prominent Automobile Accessories

GRAEF-ARTHUR STEERING GEARS

These gears are of the worm and nut type. By referring to Fig. 1 it is seen that the ball arm A is actuated by the rocking of the rocker-shaft B, by means of a long transmitting member C, pivoted to the eccentrically located stud-pin D on the long nut E.

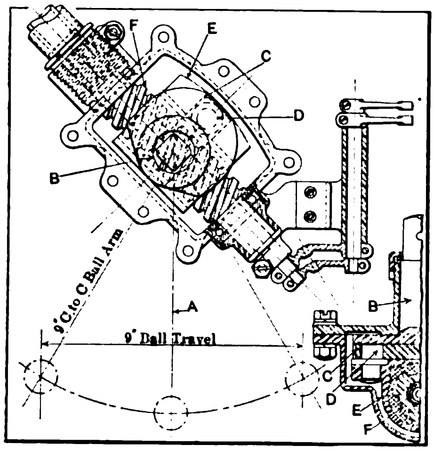

Fig. 1—Section in two planes of the Graef-Arthur steering gear, showing relations of the parts and nice construction

Ball thrust bearings are provided at both ends of the worm. Adjustment for wear and assembly is provided on the worm F and the rocker B. The full thread of the nut is in engagement with the rocker at all positions of the ball arm.

The wearing surfaces cover very large areas, while all the operating parts move in oil and are completely enclosed against dust, foreign matter and leakages.

The gear case is so parted and jointed that the natural strength of the box is not impaired and without sacrificing strength, as can be seen from Fig. 1. All parts are made of machine steel and steel forgings, excepting the case, its cover and brackets.

These gears are regularly made in two sizes; the smaller for cars up to 2,000 pounds in weight; the larger for cars up to 4,000 pounds in weight.

The small gear is fitted with outside control. The spark and throttle levers are located beneath the steering wheel.

Both designs operate upon identically the same principle, the difference being only in the size and disposition of parts and location of the control levers.

The gear is manufactured by the Cross Gear & Engine Company, of Detroit, Mich.

Fig. 2—Packard twin cable

CABLE FOR ELECTRIC IGNITION

The accompanying illustration (Fig. 2) of a twin cable presents one of a line of electric conductors as used in the arts, and in view of the high-tension current used in automobile ignition work, the Packard Electric Company, of Warren, Ohio, is paying particular attention to the requirement. The company recommends that a No. 14 cable be used for tail and side lamps, No. 12 for headlights, and No. 10 for the leads from the battery to the controlling switch. These cables (six in all) are made up in both single and duplex conductor styles, the cores of which are composed of No. 30 tinned soft-drawn copper wire, carefully stranded, thus assuring the greatest measure of flexibility. The insulation on these cables consists of one layer of high-grade rubber compound. The single conductors are protected by a single grade of fine glazed thread in fast color, in characteristic seal brown, striped spiral each way with red, and saturated with flexible enamel exactly the same as used on Packard cables for electric lighting work. The two-conductor styles are made by placing two rubber insulated cores side by side without twisting, and braiding over them a common covering composed of fine glazed thread in fast colors.

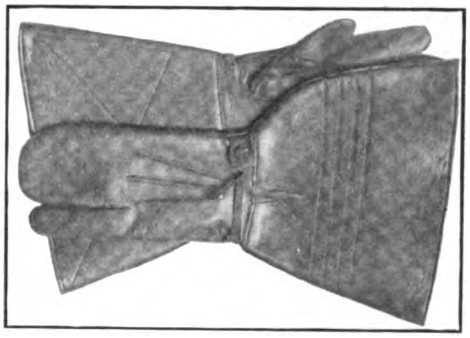

Fig. 3—"Rist-Fit" driving mittens

GLOVES FOR THE COLD WEATHER

It is all very well for poets to say—"Blow! Blow, thou wintry wind." Such sayings are easy to pen in mid-summer, when the breeze is a necessity of life; but had that same poet been alive to-day and driven in an automobile with the wind blowing off snow-clad fields his lay would have been otherwise—perhaps: "Oh, for a pair of warm gloves!" What a driver wants on a cold day is a pair of gloves to keep his hands warm and allow freedom of movement for the fingers. The Rist-Fit gauntlet mitten shown in Fig. 3 combines these qualities, being made of best leather and lined with eiderdown, fleece, lambskin or fur. The forefinger is made separate and permits free action while working.

VALVE STEM ADJUSTER

The silent operation of the valves of a gasoline motor is, to a great extent, due to the amount of clearance allowed between the push rod and the valve stem, and in cars that are not provided with adjustments after a certain amount of wear has taken place the owner wonders why the engine has become noisy; and not only this alone, but the power shows a falling off. The Apco valve stem adjuster (Fig. 4) can be fitted to any motor and the required amount of lift can be given to the valves by placing inside the cap small disks under the stems. The Auto Parts Company, of Providence, R. I., makes this handy device.

Fig. 4—Apco valve stem adjuster

PUNCTURE-PROOF INNER CASE

There has been placed on the market a tire protector that can be inserted in any make of tire between the casing and the inner tube and into the construction of which has been introduced armor-plate steel disks. It is known as the Jelco Atlas puncture-proof inner case (Fig. 5). It consists of a rubber cushion, three rows of steel disks placed over one another in a manner similar to the scales of a fish and vulcanized in the rubber. The usual inner tube can be used, but one of 1-in. small diameter is recommended. The J. Ellwood Lee Company, of Conshohocken, Pa., guarantee these bands as "positively puncture-proof."

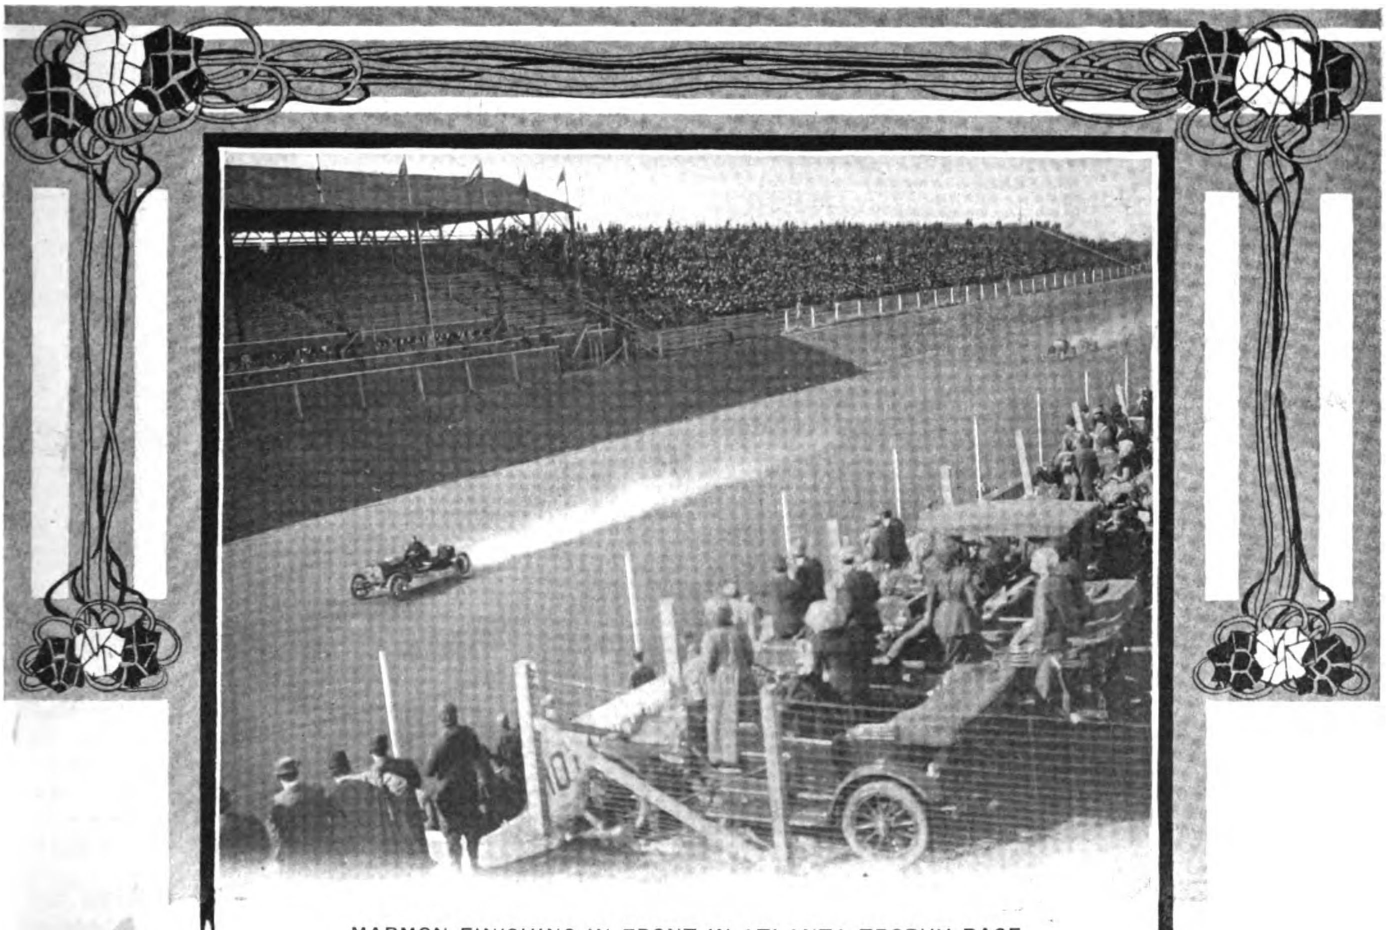
THE AUTOMOBILE

Great Races at Atlanta

THREE FEATURE EVENTS SUPPLY TRIO OF FINISHES NEVER EXCELLED IN CLOSENESS AND ABSORBING INTEREST IN HISTORY OF TRACK SPORT

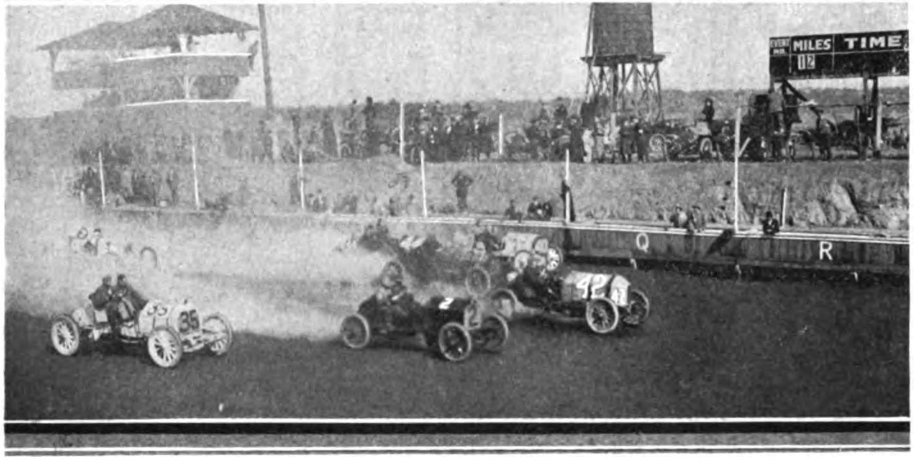


MARMON FINISHING IN FRONT IN ATLANTA TROPHY RACE

ATLANTA, GA., Nov. 7—When the checkered flag dipped for the last time this afternoon, the greatest race meeting ever held on the Atlanta Speedway came to a close. It was a complete success in every particular, even the financial end coming out neat or better.. From the sporting and utilitarian viewpoints the three days of racing could hardly be improved upon. The simon-pure stock car again demonstrated its improvement in a dozen hard driven contests, while the speedy special machines showed brilliant flights and spectacular finishes.

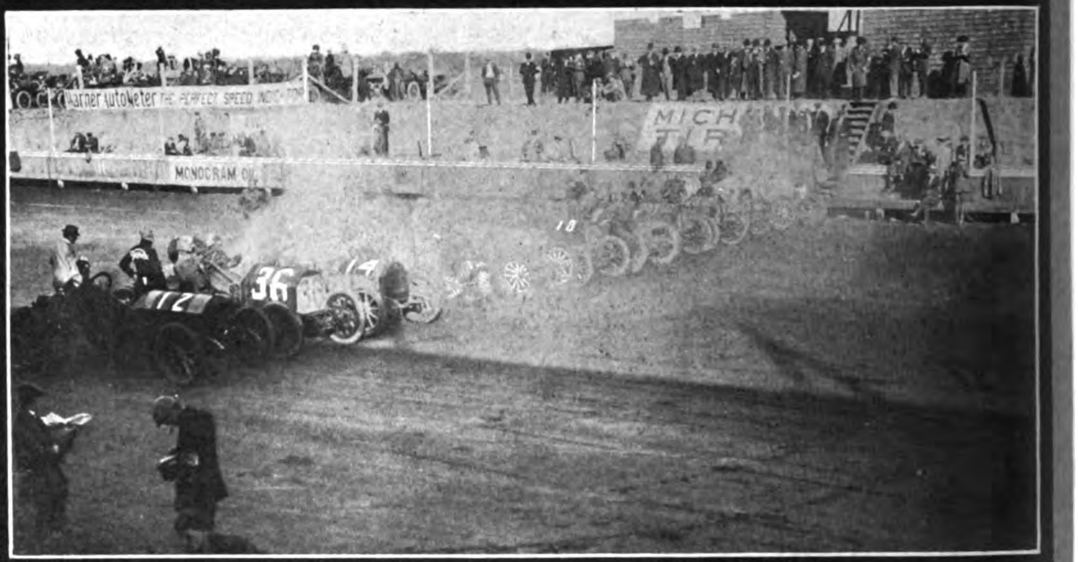
The program was so arranged as to give a big special event each day. The Coca-Cola Trophy race on Thursday at 100 miles was won in a stunning finish by a Falcar driven by Gelnaw. On Friday, the Atlanta Trophy race, 200 miles, was won in a neck and neck driven by a Marmon, piloted by Dawson, which finished 3 1-5 seconds ahead of a Lozier, driven by Mulford. On Monday the Speedway Trophy at 250 miles was captured by a Lozier with Horan at the wheel, with a Marquette-Buick (Burman) in second place.

These races were sharply contested from the drop of the flag



Stoddard leading Fiat, Buick, Simplex, Stearns and Lozier in Free-for-All

and proved wildly exciting to the spectators. The Coca-Cola race set a new mark for thrills. A Marmon driven by Dawson set the pace from the start and after making 49 rounds, or 98 miles, was over six minutes ahead of the Falcar (Gelnaw), which had been driven to the limit to keep pace with the Westcott (Knight), up to that stage of the race. The Marmon coasted down to the pits and stopped as the driver leaped out and feverishly went to work to discover the extent of the injury to his car. It proved to be the drive shaft that had twisted off at the right end of the rear axle where it carried a flange. The driver managed to replace the broken part and got started before the finish of the race, but in the meantime the Falcar had closed the gap and was well around the course on the last round. Driven desperately the Marmon was unable to make up the ground lost and the Fal crossed the tape in front. The Westcott was second, fifteen seconds back, while the Marmon squeezed in third, despite the misfortune.

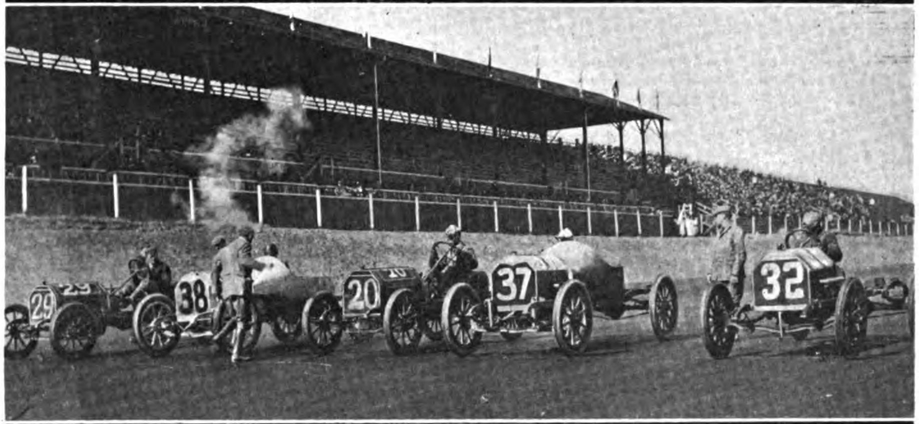


Falcar, Simplex, Falcar, Lozier pair, Cole, Marmon pair, McFarlan and Pope-Hartford

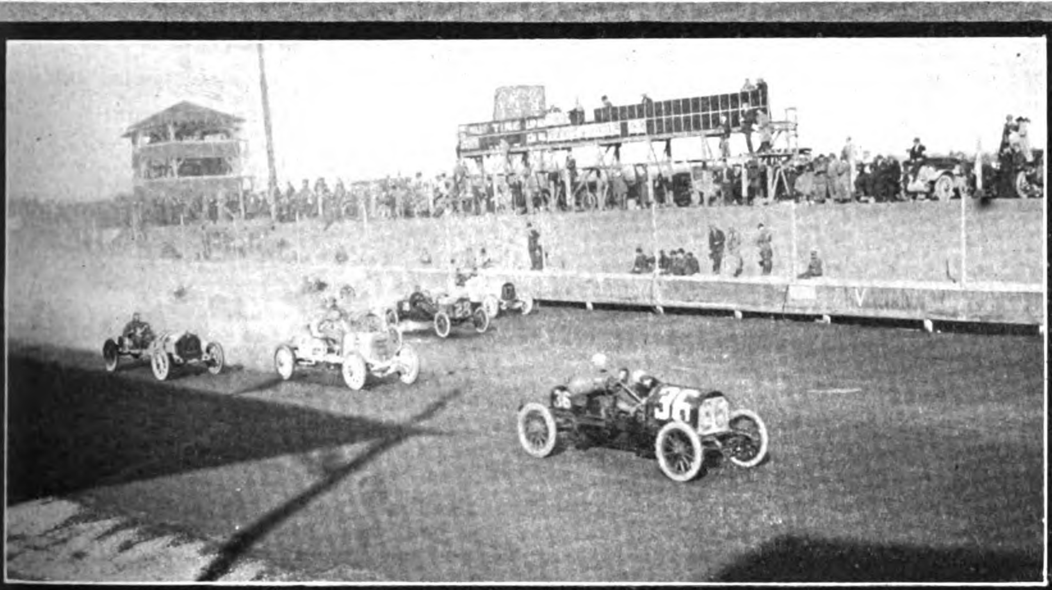
With stilled engines and bared heads during Livingston's dirge Winning Falcar in center with Marmon contender at left

The Atlanta Trophy on Friday furnished another degree of superlative sport when the Marmon nosed out a Lozier after a drive that lasted from the starting gun to the magpie flag. From one end of the race to the other these cars were never more than two minutes apart and for dozens of laps they lay alongside of one another, taking the turns wide open and shooting down the long straightaways at a terrific rate of speed. The steady Lozier, driven by Mulford cut out a fast pace in the early stages and at one time had established a lead of 80 seconds. This margin was gradually absorbed by the yellow car under the handling of Dawson, and when they came down the stretch locked together like a team, the crowd yelled with redoubled enthusiasm.

Successive tire changes caused the lead to alternate many times during the last quarter of the race, and at 170 miles the Lozier was leading by one second. Nine laps from home the Marmon pulled off the sensation of the contest when Dawson caught and passed his rival in front of the grandstand, leading by half a car length. For eight laps the yellow and white cars were practically neck and neck, but in the final round the Marmon inch by inch opened up a gap of several lengths. The right front tire of the Lozier lost its tread and the car gave a perilous slide near the finish, but the race was so close that Mulford would not stop. The Marmon continued to draw away, and at the end was about 50 yards to the good.



Abbott-Detroit and Firestone pairs and E-M-F in Event 9

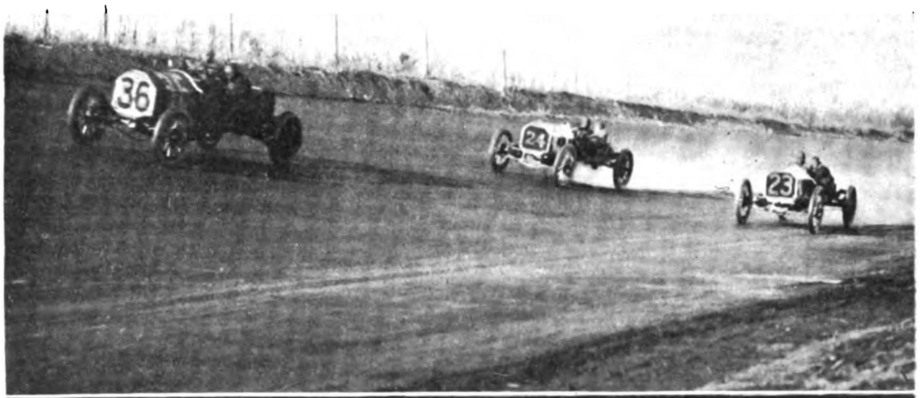


Simplex, Lozier, Falcar, Marmon and McFarlan at start of Atlanta Trophy

The free-for-all at 250 miles for the Speedway Trophy was the feature of the Monday's card. A six-cylinder Lozier, driven by Horan proved the winner in the exceedingly fast time of 3:26:15. A Marmon (Harroun) set the pace for fifty laps and looked all over a winner at ninety laps. A cracked cylinder stopped Dawson's car and a sheered pin on the magneto shaft of Harroun's, put that car out of the running also.

Marquette-Buick, driven by Burman, proved the contender at the end. Nine tire changes tell the story as far as the Buick was concerned.

The winner went to the front when the skyrocketing had subsided and



Simplex and McFarlan pair turning out of the back stretch won a gallant race rather handily. The rest of the card was abandoned on account of the lateness of the hour of finishing the grand prize.

An attractive card of class races was presented each day in addition to the feature events and their running proved to be stirringly spectacular. Not an accident of any moment marred the pleasure of the meeting although a number of cars plunged through fences and one went over the bank.

Rain intervened Saturday and prevented the carrying out of the program as originally planned, the card for that day being carried over until to-day. Naturally this hurt the attendance to some degree. The summary:

FIRST DAY

161-230 Cu. In., Class B, 12 Miles

Ready for the Grand Prix

BIG FIELD OF RACERS PREPARED TO LINE UP IN PREMIER AMERICAN SPEED CONTEST AFTER TWO LIGHT CAR CLASSES ARE RUN OFF

The much-coveted Tiedeman Trophy, which six small cars will compete for

SAVANNAH, GA., Nov. 7—With its lists full the Grand Prize, which is to be run off Saturday over a course which has been officially measured at 17.2 miles in circumference, promises to excel in every way the former running of the event, which took place here in 1908. When midnight struck Saturday, November 5, the entry lists of the race closed with a varied collection of racing automobiles, twenty-three of which have been announced to take part in the big race.

The entries for the race are as follows:

Car	Driver	Car	Driver
Fiat	De Palma	Lozier	Horan
Fiat	Nazzaro	Stoddard-Dayton	Harding
Fiat	Wagner	American	Wallace
Benz	Bruce-Brown	Pope-Hartford	Basle
Benz	Hemery	Pope-Hartford	Disbrow
Benz	Haupt	National	Aitken
Marmon	Dawson	National	Wilcox
Marmon	Harroun	Marquette-Buick	Burman
Roebling-Planche	Roebling	Marquette-Buick	A. Chevrolet
Sharp	Sharp	Marquette-Buick	Not Named
Alco	Grant		
Simplex	Matson		
Lozier	Mulford		

Such a collection is bound to produce a contest and the indications all point to several new records. All the drivers and cars that are to take part in the race are on the ground, with the exception of those engaged in the Atlanta races. Owing to a peculiarity of the Georgia law it is illegal to ship anything by fast freight on Sunday, and as a consequence several of the cars now in Atlanta will not reach the Savannah course until Wednesday, thus allowing the drivers very short time to familiarize themselves with the course.

Despite the fact that the elimination of several curves and detours has shortened the course materially, the Grand Prize race will be the longest ever run in America. Some exceedingly fast time has been reported. One of the Buicks made a round in 14:12, a Benz made a circuit in 13:55; a Fiat in 16:25; the Alco in 16:17 and others turned the course at various speeds.

A. L. McMurtry, chairman of the technical committee of the Automobile Club of America, commenced the examination of the cars to-night.

In the Savannah Challenge Trophy race, which will precede the running of the Grand Prize, nine entries have been received, as follows:

Car	Driver	Car	Driver
Marmon	Dawson	Mercer	Roebling
Marmon	Heinemann	Pullman	Not named
Falcar	Geinaw	E-M-F	Witt
Falcar	Hughes	E-M-F	Not named
Falcar	Pearce		

These cars will circle the course fifteen times, the winner to receive the handsome cup donated by Savannah and $1,000 in cash besides various accessory prizes. There is a sporting tinge apparent about the Savannah trophy entry list that has appealed to motordom with peculiar force. The Atlanta rivals at the head of the list will have another opportunity to decide as to superiority, while those in the middle and at the end are not disposed to yield a single chance to the others unless forced to do so.

The Tiedeman Trophy for smaller cars which will make ten rounds of the course has attracted a small but select field. The list is as follows:

Car	Driver	Car	Driver
Lancia	Knipper	Maxwell	Costello
Cole	Bill Endicott	Maxwell	Wright
Cole	Harry Endicott	Maxwell	Doorley

The Lancia, which met with accident in the Massapequa Sweepstakes over the Vanderbilt Cup course while well out in front, will endeavor to reverse the verdict in that race, which was won by Bill Endicott's Cole "30." Endicott does not agree that such will be the case, and the Maxwell trio firmly expect to win over both. Thus there is the groundwork for a spirited race, with everybody trying desperately to reach the tape first.

The ancient city of Savannah is filling with visitors. So far there has been little difficulty experienced by anyone in obtaining accommodations, but the near future holds out the promise of cramped quarters for the late arrivals.

The stands are practically completed and will easily accommodate 40,000 spectators, and the course is as perfect as it can be made in the limited time that has been allowed for such work. As the drivers have grown more accustomed to the turns it has been found that only one is really difficult; the others may be taken at nearly 60 miles an hour. The straightaways seem capable of allowing the extreme speed limit of modern automobile construction.

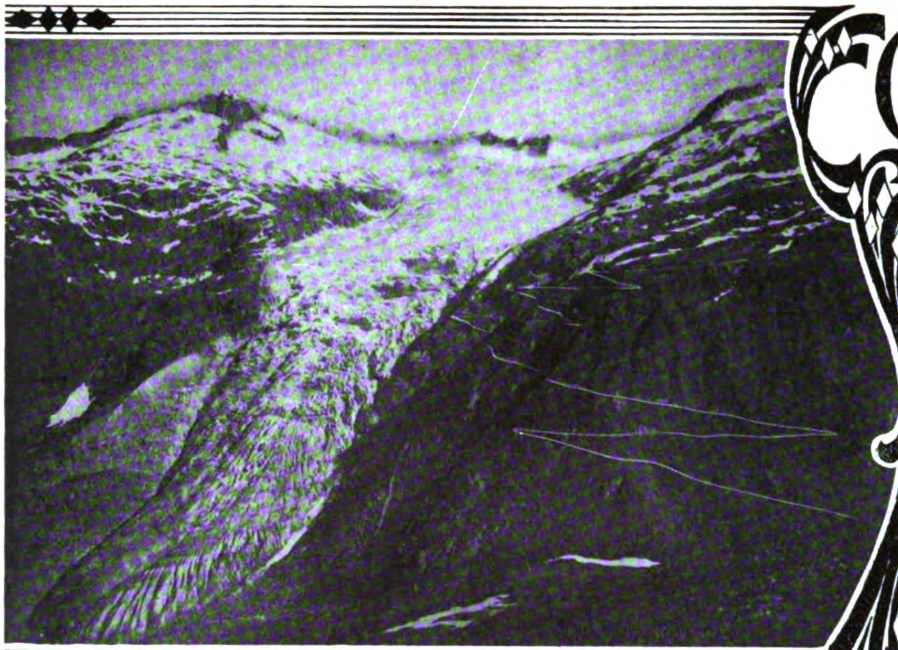
Opening Alps



The zigzag road through Furka Pass, the Rhone Glacier to the left. Mont Saleve, in the ascent of which the automobile beat the funicular railway

SWITZERLAND, the "Playground of the World," has proved itself during the past season to be wonderfully attractive to the automobilist. In comparison with the attitude of the government and people in other years toward touring parties, the position assumed by State and individual this year has proved welcome in more ways than one.

Only a few years ago cabled reports of barbarities on the part of the peasant folk and the authorities as applied to American motorists were common, but this season the whole proposition has been altered. Where only a few years ago it was unlawful for the motorists to so much as enter some of the cantons, to-day all but one invite the traffic, and in the course of another year the roads of the single outstanding canton will be opened to some extent.

One of the accompanying pictures, which shows a bit of highway between Davos and Filisur, emphasizes the real underlying reason for the hostility of the Swiss peasantry against the automobile in times past and accounts for many of the stringent road rules of the land. As will be seen, the roadway is built out from the wall of a precipitous gorge and is rather narrow as judged by the American standards. The roadbed is delightfully smooth and well kept and on its outside edge a retaining and guard wall has been erected to hold up the road and prevent vehicles from plunging into the chasm below.

This is part of an exceedingly tortuous road, winding along the side of the gorge for many miles. The turns are abrupt and the passing of two swiftly moving vehicles on one of these turns is quite a nice little problem. At the rate of thirty miles an hour such a passing is a desperate gamble at the best and a tragedy at the worst. Consequently, the Swiss countryman decided long ago that the tragedy was unnecessary and ruled out the automobile in a large part of the Republic. Latterly, however, this general adverse legislation has been modified and the present status of affairs has resulted from a better understanding on both sides and some mutual concessions.

The road rules of Switzerland are still detailed and stringent. Speed limits are low and the regulations provide for more detailed protection of life and property than do those of America or of other States of Europe. It cannot be said that the automobile is really popular in any part of rural Switzerland, but it can be said with truth that only in recent years has the motor car been safe in numerous other countries and localities. In fact, to-day it is not quite a pleasure trip to try to cross some of the parishes of lower Louisiana on account of the hostile attitude of a considerable portion of the populace.

But the Swiss are great respecters of the law, and the law now reads that motoring is not a crime, and consequently if the tourist keeps strictly within the letter and spirit of the law he is safer in the Swiss mountains than he would be in the hands of a pack of Louisiana "Red Bones."

Last year when the Grisons canton was opened up to motor travel there was some popular hostility, which has now subsided in that locality. One of the first motorists to essay any remarkable record breaking in the Grisons district was Dr. Douglas Fawcett, of San Francisco, Cal., and Paris, France, who climbed to the

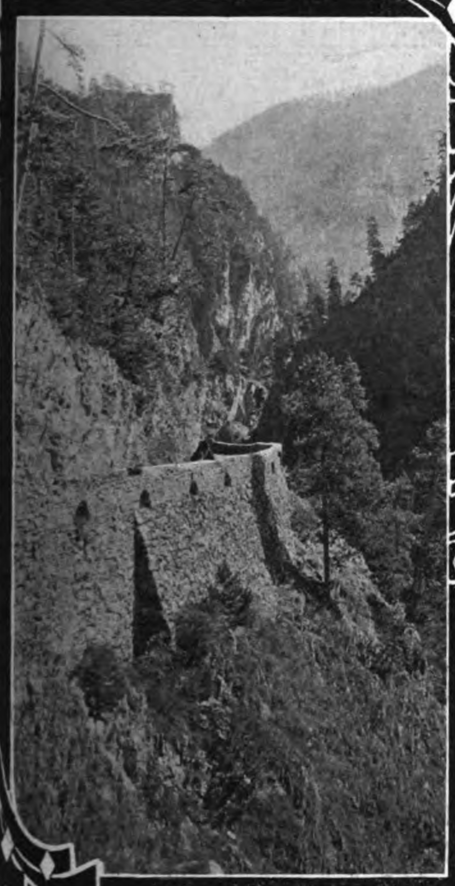
To The Auto



Between Davos and Filisur, the road built at great expense
The floor of the Valley of Chamounix between Les Praz and Aiguille du Dru

top of the Gornergrat Peak in a 50-horsepower automobile. The average gradient of the climb was slightly more than 20 per cent. and spots where the machine had to climb better than 30 per cent. were common enough. The peak of the Gornergrat is shown in one of the accompanying illustrations.

During the past Summer a novel race to the summit of Mont Saleve, shown on this page as a perpendicular bluff of majestic proportions, was run between a small touring car and the funicular railway. Saleve is 4,290 feet high, and prior to this event had never been scaled by an automobile. So dangerous is the mountain regarded to be that the project was discountenanced by the authorities at first. Four men met death on the mountain this year through falls and avalanches, and nobody had any idea that the car would be able to make the ascent.

But when the actual trial was made the automobile went up the grades and reached the summit on low gear and finished a trifle over half an hour ahead of the railway train. The return trip was even more perilous, but with careful driving it was accomplished without accident.

The other pictures show a scene in one of the Swiss valleys; a vivid illustration of a highway midway between the floor of the valley and the heights of the Alps and the third depicts and outlines the marvelous Furka Pass, with the famous Rhone Glacier on the left. Along the road, that seems but a tangled thread in the picture, motor tourists are now enabled to pierce the very heart of the Swiss mountains with all the comfort they might enjoy from a spin along Riverside Drive.

A Strange Case

Just Goes to Show That Men Are Willing to Risk Other Men's Funds

NOW that the automobile has most thoroughly supplanted the horse up to the limit of the ability of makers of automobiles to place them at the disposal of users, those who are charged with the spending of the "ratepayers" fund in England propose to expend a vast sum of money in the breeding of horses for use in the British army. The latest report from "over seas" says that the "service" is to be provided with mounts of a special breed, the money-spenders claiming that the present mounts are mongrels. From a modern point of view, horses in the army should have one value that automobiles cannot lay claim to: should rations run out, the troops may eat the horses. Looking at it from still another angle, it is all they can do, whereas, with automobile transportation, they could go to some place and take what they want by way of food. The great point to be borne in mind is that men seem to have the faculty of making cost if other men pay the score. The point is adequately illustrated in the method that obtains in New York City: if a street is to be torn up for the purpose of putting down sewers, etc., it is first repaved, but no sooner is the new pavement down than the sewer contractor comes along and pulls it up again.

Engineering Section

DEVOTED TO THE DISCUSSION OF ENGINEERING PHASES OF AUTOMOBILING, INCLUDING DESIGNING AND CONSTRUCTION FEATURES OF PRODUCTS, AND INFORMATION TO AUTOISTS

DEPICTING THE METHOD OF HEAT-TREATING STEEL TO BRING OUT KINETIC QUALITIES, USING SALTS OF METALS FOR THE BATH, AT WOOD'S PLANT

THERE is nothing to be said for the manufacturing of automobiles that is of greater importance than the methods that have to be employed in the bringing out of the desired qualities in the parts of kinetic responsibility in cars. The time was when it seemed to be good enough to utilize cold-rolled steel even for jackshafts and such other parts as the automobilist must depend upon in the transmission of the power of the motor to the point of contact of the driving wheels with the ground. It is slowly being felt that cold-rolled steel is subject to fatigue at an alarming rate.

Even the best grades of steel to be rendered fit must be subjected to specific forms of heat-treatment, the desire being to bring out (a) great surface hardness when this property is needed, (b) good surfaces for bearings where plain journals are employed, (c) accentuated shock-withstanding qualities at every point, (d) free cutting characteristics during the manufacturing processes, and (e) good service when the automobiles are placed in the hands of the users.

Some of the older methods are being proven as inadequate, failing utterly to accomplish what their sponsors claimed for them, and the dawn of broad knowledge, which is peeping up over the hill, is indicating the way to better automobiles, requiring a more careful selection of material, taking into account the peculiar demands of the service, and the fact that roads, unlike steel rails, introduce conditions which have to be met in a new way.

Imprint Method of Testing

TESTING TIRES TO DETERMINE THE AREA OF CONTACT AND THE EXTENT OF DESIRED INFLATION—TESTS MADE AT THE HUDSON GARAGE, NEW YORK

USUALLY the questions of the care of tires are handled without reference to the area of contact of the tread with the ground, but, as a matter of fact, this point leads to a field that is rich in result. In a series of tests that were conducted on a special tire-testing machine, at Chicago, Illinois, under the direction of F. J. Newman, chief engineer and shop manager of the Woods Electric Company, it was found that flexure and its manifestations, as well as the damage done by it, also the power taken in doing this damage, were all represented in the area of contact of the tire with the ground, and it is suggested here that automobilists look into this phase of the subject just a little, it being the case that any one can make the imprints and observe the effect of pressure, also the extent to which the area of contact is altered as the pressure is raised or lowered.

While this form of testing will naturally demand a large amount of investigation ere it will lead to anything very tangible as a general proposition, the fact remains that, under conditions of a single set of tires of a fixed size, on a car of a given weight, so many of the factors are on a fixed basis that the result of observation will lead to good and beneficial results. When an automobilist learns, in this way, just what the area of contact should be, it will be a simple matter for him to make a check imprint occasionally, and, by so doing, find out how the tires are holding out. If the fabric is not stout enough, or if there are other structural changes, all of these conditions will be reflected in the changing area of contact.

At all events it is a good idea for every automobilist to become acquainted with the source of his greatest expense, and by observation learn how to limit cost and obtain a better return for it.

In making imprint tests it will of course be true that the shape of the tread and the thickness of the material employed therein, together with the flexibility thereof, will have a marked bearing upon the area of the imprint, particularly when the tire is new. On this account it will not be possible to make valuable comparisons of the various types of tires, one with the other, and the data, to be of value, must be confined to comparisons involving a given shape and make of tire. Nevertheless, observations along this line, if they are made at reasonably regular periods, measured in miles traveled rather than in time, will have the virtue of showing the rate at which the material of which the treads are made disintegrates, it being the assumption that the initial rigidity of the material is desirable, and that as this rigidity falls away in service, it is a sign that internal work has had its effect upon the molecular relations, nor will it be far-fetched to reach the conclusion that changing molecular conditions are but a sign of deterioration. If this contention is not right, and the reverse holds, it is equal to saying that the tires are not good when they are new, and that they improve with age. If there is anything in this phase of the story, every automobilist in the land will be pleased, but experience proves to the contrary. Even if it is difficult to arrive at any definite conclusion from imprint tests and observations, there still remains the advantage that must come if the autoist pays more attention to his tires than is now the case, and certainly investigations along these lines will compel that measure of attention that is bound to result in a more intimate acquaintance with what is a serious problem; but let the intent be to conduct all investigations without trying to foresee how good or bad they are, since knowledge comes with intimacy, and the latter is the child of investigation.

Fig. 2 (A)—34 x 4 Goodrich tire with damaged cut caused by striking the curb, inflated to 80 pounds per square inch

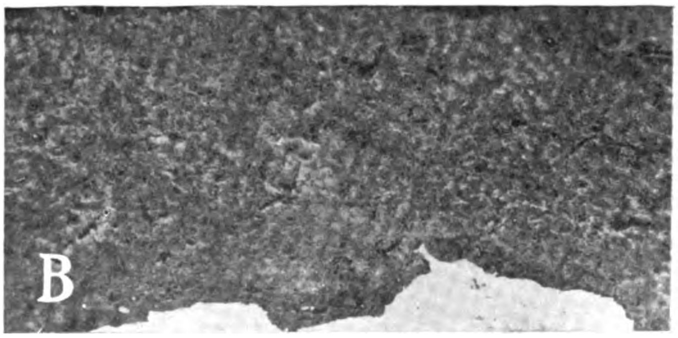

Fig. 2 (B)—The same tire inflated to 40 pounds per square inch

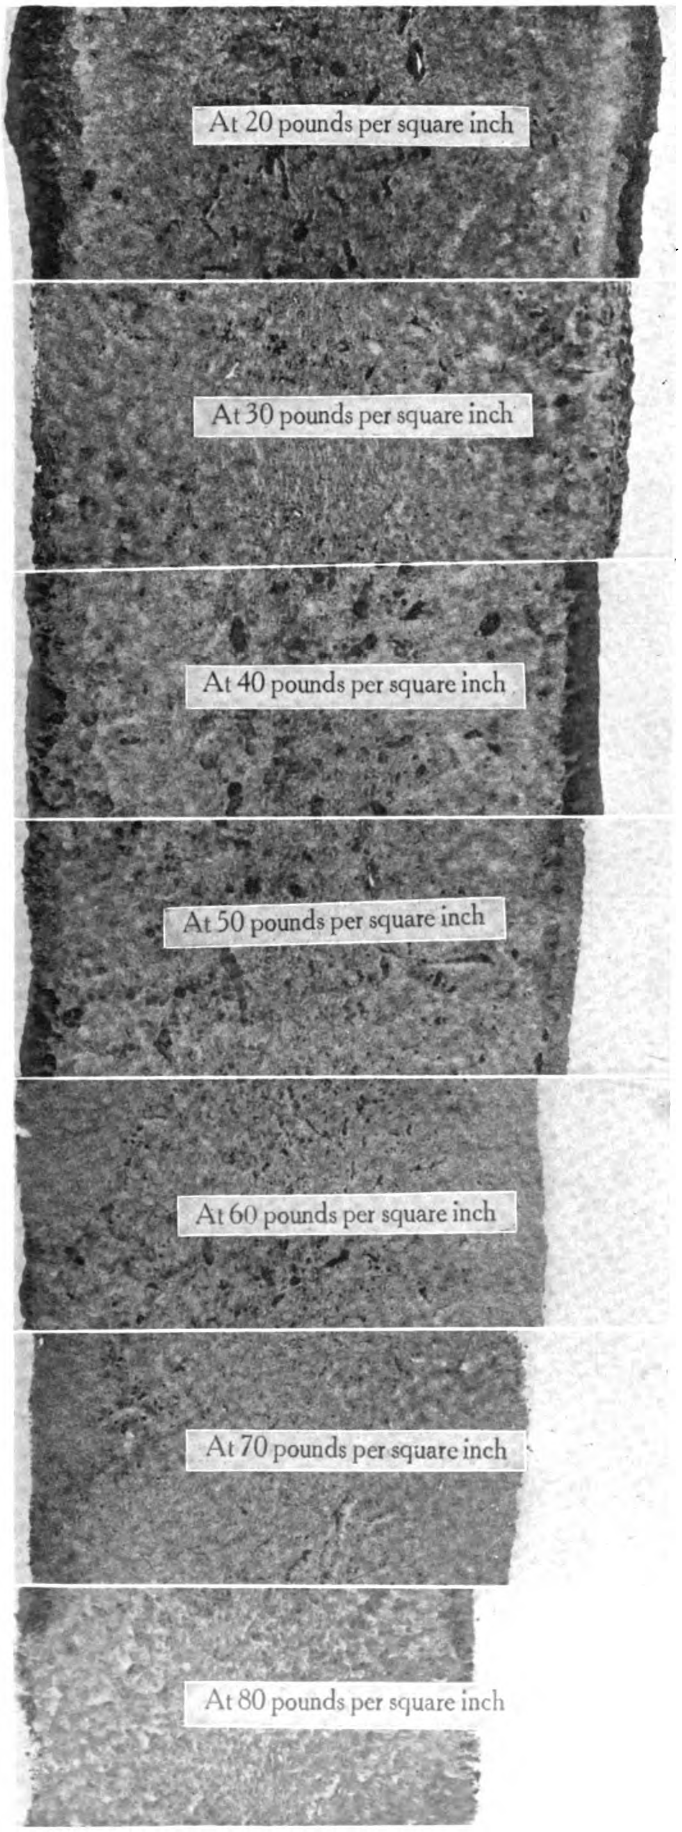

Imprint of a 36 x 4-inch tire under different pressures, showing the width of the tire-contact on the ground for the several pressures

Out of 13 tires recently tested at a public garage for pressure, irrespective of size, but one, 36 x 4 1-2, showed correct pressure, viz., 90 pounds per square inch. Of all the tires tested, the condition of this one was the worst; but the mileage obtained from it was 5,000 miles, and in comparison with those that had run only from 1,000 to 2,000 miles it compared very favorably. There were no signs of deep cuts and the tread was worn evenly, and considering that the car was of 50-horsepower, with a heavy limousine body, it is but fair to the tire to presume its longevity is in great degree due to the proper pressure being maintained.

The two following tables show the amount of flexure of the tires taken promiscuously, as compared with the size of the tire at the top:

TESTS ON REAR WHEEL OF EMPTY SEVEN-PASSENGER, SIX-CYLINDER TOURING CAR FITTED WITH 37 X 5 PLAIN TREAD TIRES

Pressure in pounds per square inch	Measurement of tire on top in inches	Measurement of tire at bottom in inches
105	4 9-16	4 1-16
100	......	4
90	......	3 7-8
80	......	3 13-16
70	......	3 25-32
60	......	3 3-4
55	4 1-2	3 3-4
50	......	3 11-16
40	......	3 5-8
30	......	3 7-16
20	......	3 1-8
14.7	......	2 13-16

The extreme widths of the tire at the pressure that the tire was found to contain, viz., 55 pounds, measured with a pair of calipers, were as follows: Top, 5 5-16 inches; side, 5 1-4 inches; bottom, 4 3-4 inches.

TESTS ON FRONT AND REAR WHEELS OF LIMOUSINE FITTED WITH 36 X 4 1-2 TIRES

Pressure in pounds per square inch	Front Tire		Rear Tire	
	Top	Bottom	Top	Bottom
90	4 1-16	3 3-8	4 1-16	3 3-8
80	......	3 1-4	......	3 5-16
70	......	3 7-32	......	3 1-4
60	......	3 3-16	......	3 3-16
50	......	3 1-8	......	3 1-16
40	......	......	......	2 7-8
30	......	......	......	2 5-8
20	......	......	......	2 3-16
14.7	......	......	......	1 13-16

The extreme width of the tire at the lowest pressure, viz., 14.7 pounds, was: Top, 4 5-8 inches; bottom, 5 15-16 inches.

Storing Tires

If the Car Is Not To Be Used for the Winter Store the Tires

SOME automobilists prefer not to drive in the Winter time, and in order that the car will be in good order when Spring time comes they remove the tires from the wheels, and after washing them, making all necessary repairs, and wrapping them up, put them away in a dark, damp place. Tepid water and castile soap are used for washing; repairing is done in the most careful way, remembering to heal up every little wound so that mildew cannot get at and bite the fabric. The inner tubes are also fixed, and when everything is in shipshape the inner tubes may be put back into the outer casings and slightly inflated to remove all creases, laps and folds, having a care not to employ a pressure of more than just enough for the intended purpose. With the inner tubes stored in the outer casings, the next thing is to wrap the tires in burlap, putting a wrapping of black oilcloth over the outside, and with stout twine binding the wrapping sufficiently to prevent the seams from opening up and letting in the light. The tires, in this shape, may be stored in a reasonably cool, damp cellar, in the darkest place that can be found. Keep well away from the furnace, if there is one in the cellar, but it will not be necessary to fret about the dampness. All tire-makers store rubber in dark, damp vaults, and there is no reason why tires may not have the advantage of this treatment, provided there are no little wounds upon the surfaces such as will expose the fabric and allow the mildew pest to enter and feed upon the cotton, of which this fungus growth is very fond indeed.

A word while on the subject of testing tires: See that the test gauge fits the thread of the valve and that it clears the brake drum of the rear wheel, as in several cases where tests were being made it was impossible to take the pressures on this account. The gauge fitted to the pump does not give the pressure in the tire, as it registers the force exerted to overcome the valve and not the pressure actually in the tire. The gauge must be actually fitted to the valve so that the pressure in the tube can blow out directly into the gauge when the small pointer inside the gauge presses the valve down. This does not take place with the tester fitted to the pump, and in one or two instances it was found to be about 20 pounds above.

In making these tests the length of contact around the periphery of the tires was, of course, shown. For convenience the lengths were eliminated, thus making it possible to show seven points in one example and eight pressure conditions in the other, giving the width of contact only. It is the firm belief that the peripheral length of contact is of value when making observations in general, it being the expectation that area of tire-contact is the figure that is wanted in the long run. It is just possible that some good will come from noting not only the width, but the area of tire-contact as well, comparing the one with the other, and, perhaps, making a set of charges in order to see how the values increase with increasing pressure and how they relate to each other as well. In the testing machine made to work on this principle the results show very clearly.

Tires and Pressures

Too Much Importance Cannot be Attached to Right Tire Pressure

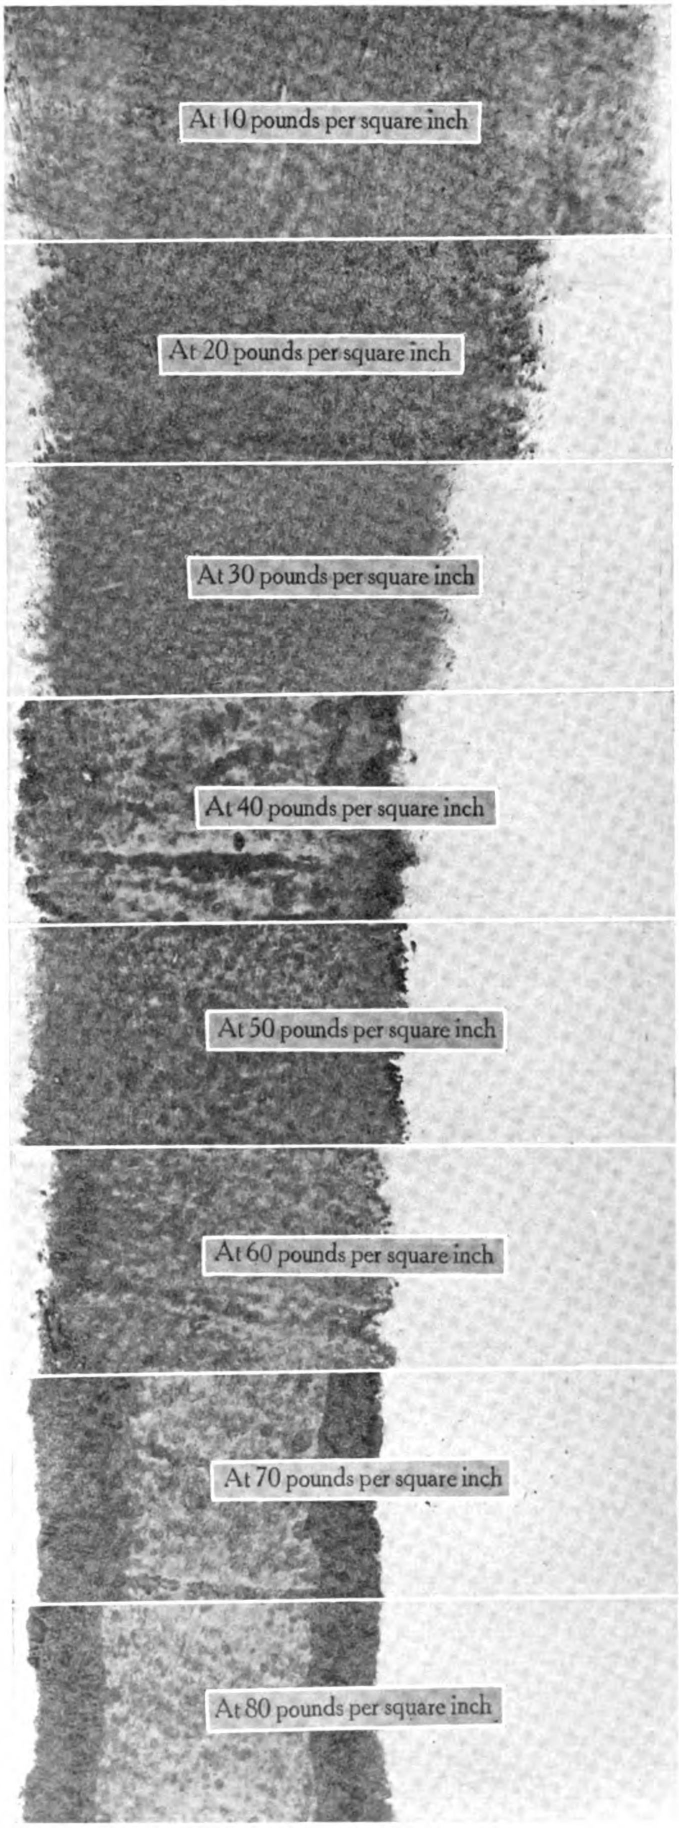
THE first point to take into consideration is the weight of the car, and this is a matter that seldom occurs to the owner. By weight is meant the complete weight of the car loaded with full equipment of passengers, tools, luggage and full tanks Even before the question of sizes of tires is considered this should be found out and a certain margin for safety allowed in case additional weight is carried from time to time.

The way to ascertain the weight is to place the front wheels on the scale first and the rear wheels afterward to find what weight is carried on each axle. This amount halved will give the proportion each wheel has to carry.

The following table shows the weight a given size tire is made to carry and the pressure to which it should be inflated:

Diameter of tire in inches	Maximum allowable weight on wheel	Air pressure in pounds per square inch
2 1-2	225 pounds	50
3	350 "	60
3 1-2	600 "	70
4	750 "	80
4 1-2	1000 "	90
5	1000 "	90 to 100
5 1-2	1200 "	100 to 105

If the flexure of one tire is greater than another for the same pressure it is as well to reduce the pressure of the highest to correspond with the other to equalize the flexures. There is danger of extra tire depreciation if one tire is blown up stiffer than another and it has been found in practice that this is likely to be true even with equal pressures.

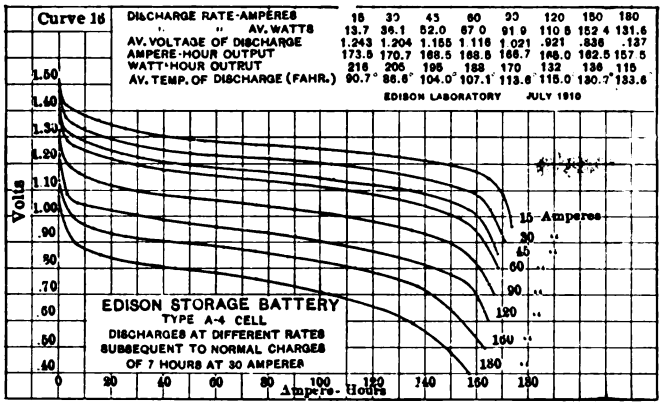


Imprints of a tire under different conditions of pressure, showing how the width of contact decreases with the increasing pressure

1910 Edison Storage Battery

FOURTH INSTALLMENT—DEALING WITH WALTER E. HOLLAND'S PAPER AS PRESENTED BEFORE THE TWENTY-SIXTH ANNUAL MEETING OF THE ASSOCIATION OF EDISON ILLUMINATING COMPANIES, HELD AT FRONTENAC, THOUSAND ISLANDS, N. Y., SEPTEMBER 6, 7 AND 8, 1910.

IN Fig. 16 is shown a series of tests made according to the plan outlined in last issue. It will be seen that the ampere-hour output now decreases very slightly as the discharge rate is increased, but, as before, most of the loss is a voltage loss. The variation of ampere-hour output, average voltage, and watt-hour output with discharge rate is shown in Fig. 17 where normal values of these are each taken as 100 per cent.



DISCHARGE RATE-AMPERES	15	30	45	60	90	120	150	180
" " AV. WATTS	13.7	36.1	52.0	67.0	91.9	110.6	152.4	131.6
AV. VOLTAGE OF DISCHARGE	1.243	1.204	1.155	1.116	1.021	.921	.836	.137
AMPERE-HOUR OUTPUT	173.5	170.7	168.5	168.5	166.7	165.0	162.5	157.5

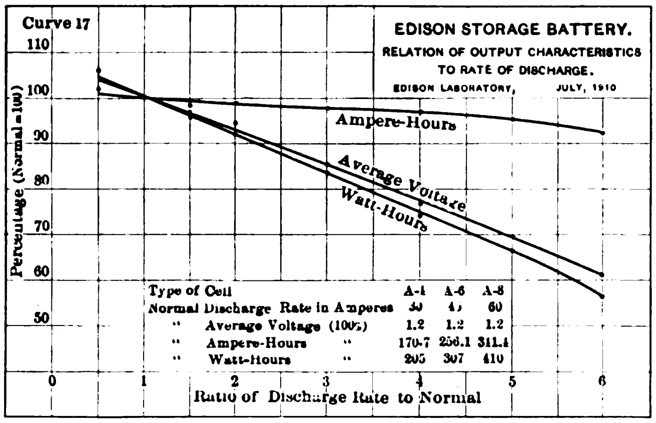
EDISON LABORATORY JULY 1910

Fig. 16—Discharges at different rates subsequent to charging at normal rates

In judging of the relative merits of storage batteries of different classes there are two appropriate bases of comparison as to output—the basis of weight and the basis of volume. In all non-stationary service such as automobile or car propulsion, car-lighting and so forth, high output per unit-weight of battery is all-important, while the space which a battery occupies, if not ridiculously great, matters little, amounting to a question of vehicle design. In Fig. 18 is given the energy output at different rates of power delivery calculated for one pound of Edison battery; and the same referred to one cubic foot of battery is given in Fig. 19. The figures are based on the total weight and maximum volume—that is, the required volume of battery compartment—of a complete battery of a standard number of cells. These curves were derived from the normal-charge tests shown in Fig. 16. It is not the purpose of this paper to make comparisons, but those who have reliable data on lead batteries are invited to plot in comparative curves made on the same basis. They will then see that the Edison battery has an immense advantage in weight over the best lead batteries, while in volume it matches them pretty closely.



Type of Cell	A-4	A-6	A-8
Normal Discharge Rate in Amperes	30	45	60
" Average Voltage (100%)	1.2	1.2	1.2
" Ampere-Hours "	170.7	256.1	311.4
" Watt-Hours "	205	307	410

Fig. 17—Relation of output characteristics to normal rate of charge

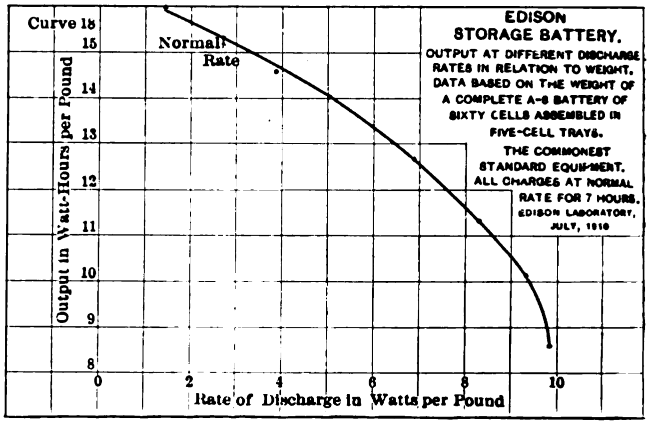


Fig. 18—Output at different discharge rates in relation to weight of battery

The effects of changes of temperature on the behavior of a storage battery are so varied and numerous that a book could be written on this subject alone. Many tests of the Edison battery have been made to determine these effects and an extensive series of temperature tests is now being carried on at the Edison Laboratory; but the subject can merely be touched upon here, and later, in all probability, an entire paper will be devoted to it.

So far, it has been determined that, in general, the cooler a battery is kept the longer will be its life; and that heat during charge is more detrimental than heat during discharge. As regards immediate output, the highest results are obtained by charging cool—say at a cell temperature of 75 to 85 degrees Fahrenheit—and discharging hot, that is, at 120 to 130 degrees cell temperature. The output will be reduced if charging is done at a cell temperature of less than 50 degrees F. or more than 105 degrees F., or if a battery is cooled to a low temperature during discharge. The Edison battery appears to be affected in about the same degree as the lead battery by low temperatures.

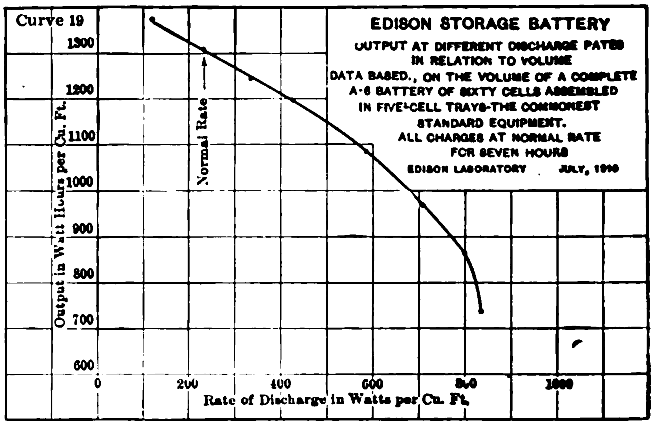

Fig. 19—Output at different discharge rates in relation to volume

and the salvation of both in cold weather lies in the fact that they are self-warming. It is a providential arrangement that the internal resistance of a cell becomes greater as the temperature decreases, because on this account the generation of heat within a battery is greatest when the battery is cold and automatically decreases as its temperature rises.

An interesting but not at all surprising characteristic of the Edison battery, which probably is common to storage batteries in general, is the fact that the rate of loss of charge during idleness varies with the temperature at which it stands, the loss being slight in the cold and greater as the temperature increases. Fig. 20 shows the results of two series of tests in one of which the cells after charge were immediately put in an ice box to stand, while in the other case the cells were left to stand in a room whose temperature averaged close to 75 degrees F.

The sturdiness of the Edison battery has often been summed up in the statement that it is "fool-proof." And so it is—but there *are* idiots! Therefore the company does not feature this quality, but rather insists on careful handling of the battery at all times. Nevertheless, we have made many "fool" tests for our own satisfaction, and there can be no harm in showing the results of some of these to sensible men. The curves are self-explanatory and will be presented with little comment.

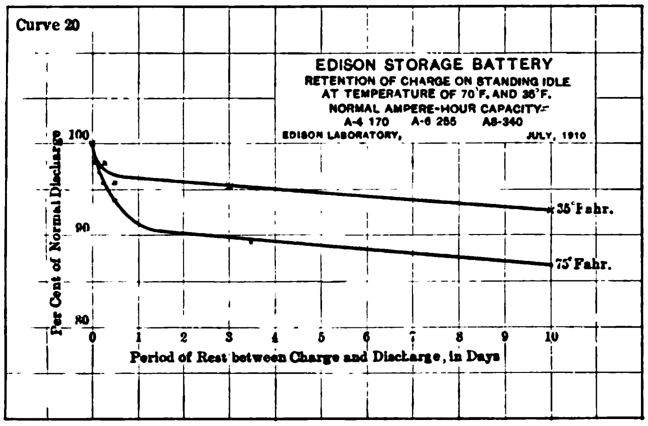

Fig. 20—Relation of charge on standing idle at different temperatures

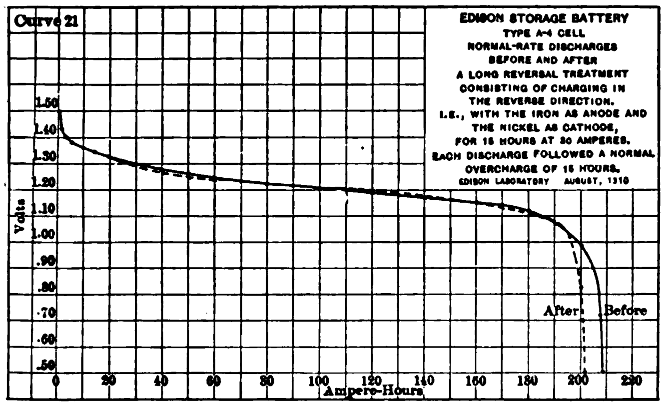

Fig. 21—Normal-rate discharges before and after a long reversal

Fig. 21 shows that no injury results from connecting up a discharged cell with the polarity reversed and charging in the reverse direction at normal rate for 15 hours.

Fig. 23, contrary to all reason and theory, demonstrates that even carelessness in regard to keeping the plates covered with solution does no immediate damage to a cell. However, this should not be taken to mean that such treatment if persisted in would not ultimately do harm.

Fig. 24 shows successive discharges of a cell following a period of standing with the solution entirely removed. The cell was discharged before emptying the solution and afterward was left for two weeks with its filling aperture open. This permitted of enough air getting in to discharge the reserve capacity of the iron electrode by direct chemical oxidation, and consequently it had to be built up again before the cell gave a normal discharge curve. It took five normal-charge runs to do this, as Fig. 24 shows, but could have been accomplished at once—it has been found in other instances—by giving a long overcharge.

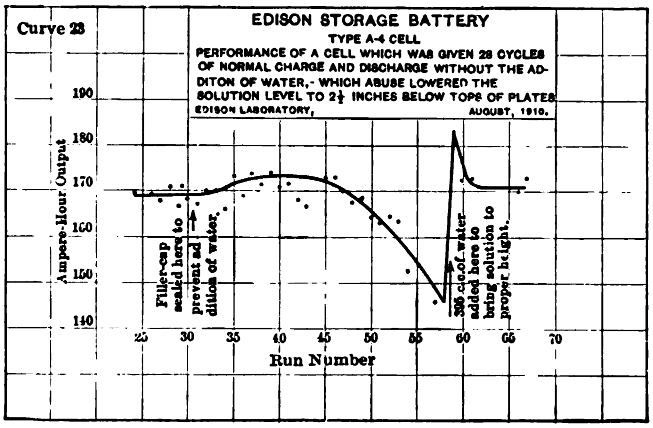

Fig. 23—Performance of a cell that was given 28 cycles of normal charge

The effect of time upon a battery is not always satisfactory, but it is one of the particular claims for the Edison type of battery that it will remain in good order when out of use and it may be put back into service at a moment's notice, this, too, without any doctoring or hospital treatment whatever. In other words the Edison battery can be set aside and forgotten in any state of charge or discharge for a practically unlimited length of time without fear of injury. Fig. 25 shows comparative discharges of a cell before and after it had stood six months in a totally discharged condition.

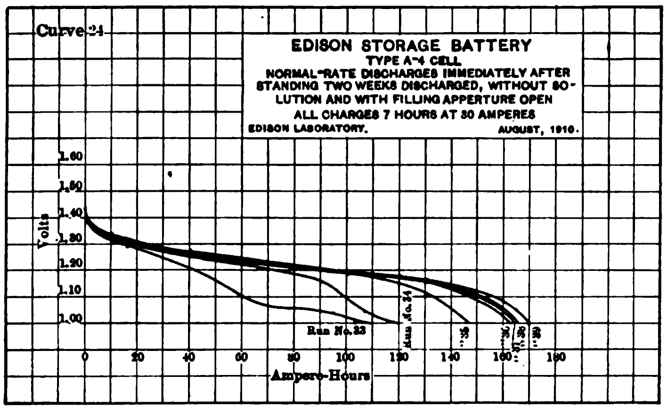

Fig. 24—Normal-rate discharges immediately after standing two weeks

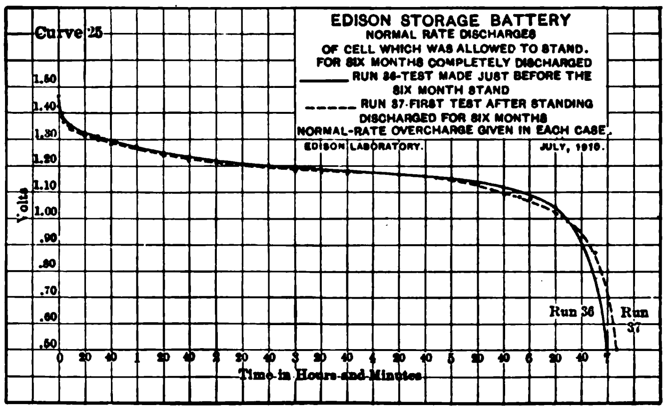

Fig. 25—Normal-rate discharge of a cell which was allowed to stand for six months

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.SC., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE THIRD INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

THE light from an arc lamp, A (Fig. 11), passes through a lens, B, which forms an image of the crater on a small hole in a diaphragm, C. The light which passes through this hole falls on the concave mirror, G, and is reflected back on to the plane mirror, K, which is placed at an angle of 45 deg., and an image of the hole, G, is then formed either on a ground-glass screen, D, or on a photographic plate. The mirror, K (Fig. 10), is mounted on an axis, which is given a reciprocating motion by means of the lever, L. The end of this lever is joined by a short connecting rod to an eccentric, M, attached to the shaft, N. This shaft is rotated at the same speed as the crankshaft of the engine, and hence the spot of light is given a to and fro movement in a direction at right angles to that in which it moves owing to the changes of pressure, this to and fro movement representing, on a reduced scale, the actual movements of the piston.

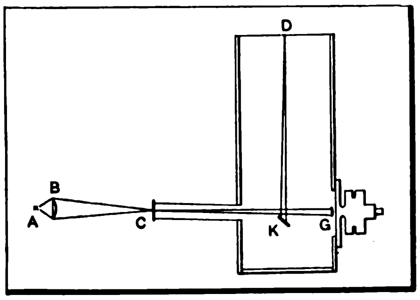

Fig. 11—Section of the Manograph showing the beam of light striking the poised mirror

By making the connecting rod which joins the lever, L, to the eccentric, M, bear the same ratio to the throw of the eccentric as does the length of the connecting rod of the engine to the stroke, the spot of light exactly reproduces the motion of the piston, and no correction on account of the finite length of the connecting rod becomes necessary.

The shaft, N (Fig. 10), is driven at crank shaft speed by a light bicycle chain, the movement being transmitted through a phase-adjusting device shown in Fig. 12 (*a*). The sprocket, A, is mounted on a shaft, B, which carries at its other end a bevel wheel, C. This wheel transmits the motion, through an idle wheel, to the shaft, F, which is directly coupled to the shaft, N, of the indicator. The shafts, B and F, can be rotated with reference to one another by rotating the axle, G, on which the bevel wheel, D, is mounted. One end of this axle is carried by the block, K, which can turn freely about B and F, while the other end is held in a fork attached to the plate, H. This plate can be rotated with reference to the plate, J, being held in certain definite positions by a pin, I, which drops into a series of holes in the plate, J. The plate J is itself capable of being rotated through a small angle between two adjusting screws, L, Fig. 12 (*b*). The phase is first roughly adjusted while the engine is at rest, so that the spot of light is at the end of its travel when the piston is at the end of the stroke. Then the engine is started and the spark retarded, so that the charge is fired after dead-center, and by means of the screws, L, the diagram is adjusted till the portion representing the top of the compression stroke, and the first part of the working stroke, is as shown in Fig. 13 (*a*). If the phase is too much advanced, so that the spot of light reaches the end of its movement before the piston reaches the top of the stroke the diagram obtained is as shown in Fig. 13 (*b*). If the phase is retarded then the diagram is as shown in Fig. 13 (*c*).

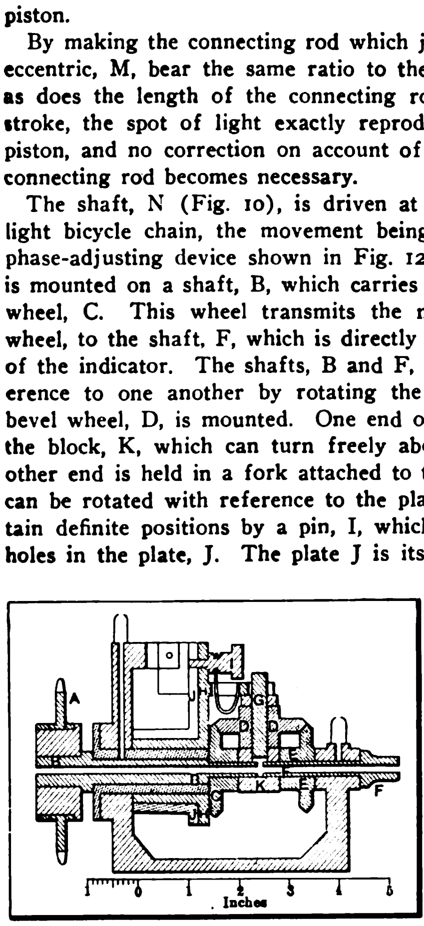

Fig. 12 (a)—Cross-section of the phase-adjusting mechanism of the Manograph

The correct adjustment of the phase is of very great importance. Thus, if the phase is 6 deg. out of adjustment, the diagram obtained in a certain engine was found to be such that the mean effective pressure obtained came out as 100 pounds per square inch, while the corresponding value from a diagram in which the phase was correct was 89 pounds per square inch.

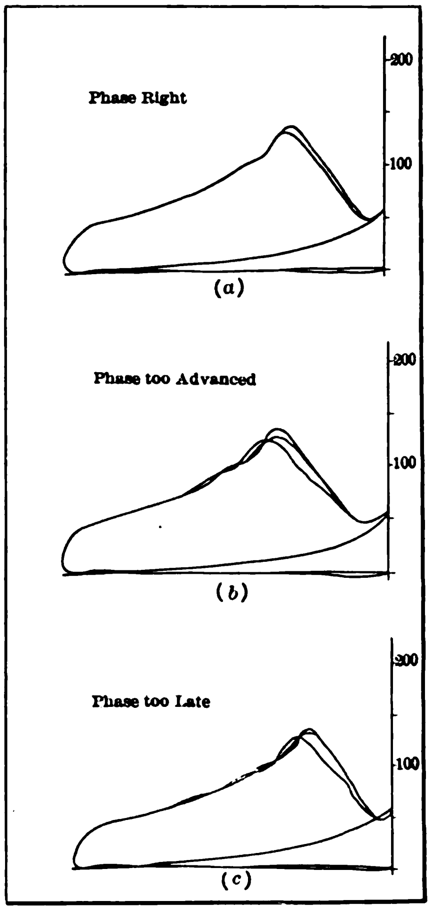

Fig. 13—Manograph cards under different conditions

Two examples of diagrams obtained with this indicator are given in Fig. 14. In addition to the full diagrams obtained with a thick diaphragm, two diagrams are given obtained with a thin diaphragm, so as to show the exhaust and induction strokes on an enlarged scale. These diagrams are taken from a four-cylinder engine, the bore of the cylinders being 85 millimeters and the stroke 120 millimeters. In each diagram the induction stroke is indicated by a single arrow head, the compression stroke by two, the working stroke by three, and the exhaust stroke by four. It will be noticed that while at a speed of 840 revolutions per minute the pressure in the cylinder at the end of the induction stroke is very little below atmospheric pressure. at the speed of 1,300 the pressure at the end of the induction stroke is about 2 pounds per square inch below atmospheric pressure. This shows that while at the lower speed the cylinder has time to get filled up by the new charge, this is not the case at the higher speed. The rapid rise in pressure at the end of the exhaust stroke at the higher speed is also to be noticed. This is produced by the gases in the exhaust manifold flowing back into the cylinder, or at least the further escape of the gases from the cylinder being prevented, caused by the rapid rise in pressure in

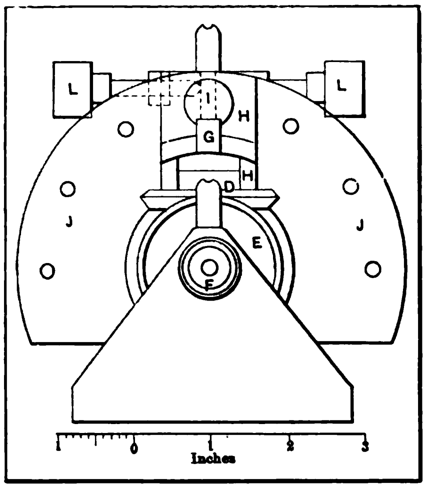

Fig. 12 (b)—Diagrammatic illustration of the phase-adjusting mechanism

the exhaust manifold due to the sudden entry of the exhaust gases on the opening of the exhaust valve in another of the cylinders. It is probable that if there was a separate exhaust pipe for each cylinder, so that the commencement of the exhaust of one cylinder would not thus prevent the free exhaust at the end of the stroke of the preceding cylinder, the filling up of the cylinder would be greatly improved, and hence the power developed by the engine increased.

In Fig. 15 are shown some indicator diagrams taken from a small single cylinder two-cycle engine (bore 3.25 inches, stroke 3.25 inches). In the figure the two upper diagrams are taken from the cylinder, the top diagram in each case corresponding to a mixture poorer in petrol than the middle one. The bottom diagram in each figure is taken from the crankcase, in which the charge is slightly compressed before being transferred to the working cylinder.

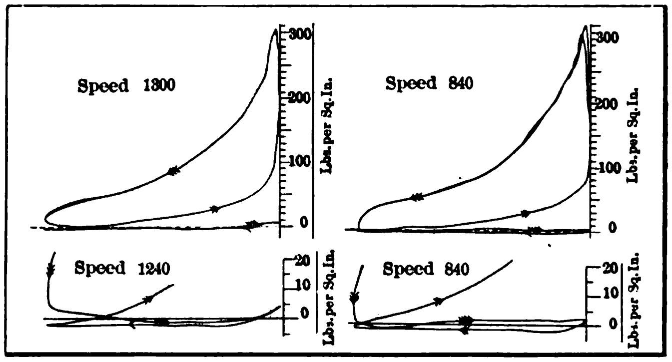

Fig. 14—Examples of indicator cards using diaphragms to obtain certain results

At a speed of 600 revolutions per minute it will be observed that, owing to the uncovering of the exhaust port the pressure in the cylinder sinks to atmospheric some little time before the end of the stroke. Further, the crankcase diagram shows that the fresh charge is able to fill up the crankcase very nearly to atmospheric pressure during the time the third port is uncovered by the lower part of the piston. At a speed of 1.500 revolutions, the pressure in the cylinder does not fall to atmospheric till very nearly the end of the stroke. Further, it will be noticed that the maximum pressure attained, and the mean effective pressure, is considerably less than at the lower speed. The crankcase diagram shows very clearly that the fresh charge has not time to enter from the carbureter, so that on the down stroke of the piston the pressure does not rise to atmospheric till more than half the stroke is complete. Further, when the inlet port is uncovered by the piston the pressure in the cylinder is still greater than the pressure in the crankcase, and hence some of the burnt gases blow back into the crankcase, causing a marked rise in pressure. It is evident, from the diagrams, that the chief cause of the decreased mean effective pressure in this engine at high speeds is that the charge has not time to get into the crankcase, and that if a larger port, open longer, were employed, the engine would have greater power at high speeds.

What Is Hardness?

Prof. Turner Divides Hardness Into Four Separate Classifications—How to Measure It Is a Problem

HARDNESS is a physical property that many physicists have endeavored to define to the satisfaction of themselves and their confreres with but limited success. Turner states that hardness has four distinct qualities, i. e., tensile hardness, cutting hardness, abrasion hardness, and elastic hardness. It has been found that relative hardness varies with the method in vogue for its determination, and last Summer, when the Society of Automobile Engineers was meeting at Detroit, the Shore scleroscope was illustrated, and its use propounded concomitant with an attempt to elucidate the property called hardness, but it can scarcely be claimed that the audience was much impressed with the clearness of the definitions that were propounded.

It is all very well to state that a piece of metal is of a certain hardness; this is as much as to say that under certain conditions it will offer a certain resistance to (a) penetration by another body, (b) permanent deformation, (c) abrasion, and (d) elastic deformation, with, perhaps, other manifestations that might well be classified with hardness, so called, as when two or more of these conditions are set up simultaneously.

This is an extremely important subject in automobile work; balls for ball bearings, for illustration, should resist deformation and the races in which they roll should resist penetration. But the bearings of crankshafts should resist abrasion, and elastic deformation is but the prelude to a broken crankshaft. Certain metals offer especial advantages in one way or another, and alloying has for its object the fortifying of the metal against the pressures that are exerted to overcome hardness. Heat treatment is intended as a means for inducing various degrees of hardness—the field is rich in unknown quantities.

British Exports and Imports

Show Increase for First Nine Months of 1910 Over 1909

THE English automobile journals have lately been looking with astonishment at what they term the "American Invasion," and the figures issued by the Board of Trade department of the Government clearly show an increase in the demand not alone for home consumption but likewise for export purposes.

The number of cars imported for the first nine months of the present year is 8,352 (this number includes chassis), which is 1,833 more than the corresponding period of last year; and 2,673 cars and chassis were exported, being 872 more. The value of imports was $19,248,500, being $2,464,500 more than last year, and the value of exports was $8,777,000, being $3,487,000 more.

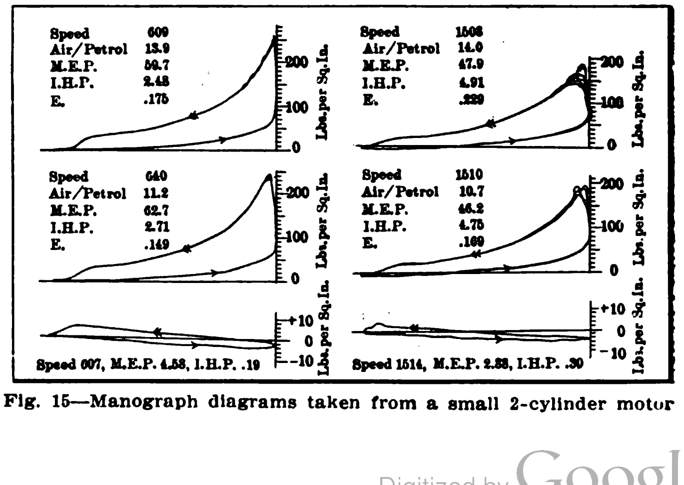

Fig. 15—Manograph diagrams taken from a small 2-cylinder motor

To Prevent Freezing Trouble

Drain All of the Water Out of the System

BUT the water cannot be drained out unless there are drain openings at all the low points, or if the system is designed on the hydraulic grade principle there must be a drain cock at the lowest point. All modern automobiles are so designed that the radiator, water-pump, piping and fittings are sloped in such a way that when the drain cock is open at the low point, which may be either the pump or the radiator, all of the water will run out. The only danger to be encountered in these modern automobiles, so built, lies in the stopping up of the puny little drain cock that is sometimes employed. It is not uncommon to see unfortunate automobilists in quest of a hairpin which they hope will be small enough to pass up through the diminutive orifice of the drain cock by means of which they hope to dislodge the accumulation of slime that gets in the way of water, and ultimately ends in the disruption of some part of the automobile, when the entrapped water freezes and swells up in consequence. If makers of automobiles persist in violating the ethics of good designing in this way, the fact that water occupies more space when it is congealed, than it does in liquid form, is much to be regretted.

Fig. 4 shows a form of goose-neck piping out of the under-side of the radiator, and the way to avoid freezing trouble is to put a drain cock in the makeup at the lowest point in the goose neck. Fig. 5 presents a suggestion of a centrifugal pump that has the intake in the bottom, thus making it self-draining, so far as the pump is concerned, but the pipe will lead off to a low point somewhere; a drain cock must be put in the pipe at that low point. Fig. 6 is an illustration of a really bad job; the water inlet is up for a considerable distance above the low point of the water jacket of the cylinder. The only thing to do is to put a drain cock in at the lowest point—broken cylinders are high-priced, but they do not rank as luxuries. Fig. 1 suggests a pipe leading from the low point in the water jacket, sliding off to a self-draining point, thus protecting the cylinders from water pockets, which, when properly named, are called ice-houses. Fig. 2 shows a drain cock in the bottom of the radiator, which is there for the purpose of draining out the water residuum, which must always be figured upon when the water outlet is above the bottom of radiator. Fig. 3 is a suggestion of a centrifugal pump showing the water inlet and outlet above the bottom line, suggesting by dotted lines a quantity of water trapped in, which will freeze in a little while on a cold day, and when the motor is started the pump will be torn asunder unless a safety universal joint is used between the pump and the drive; but even if a safety joint is used, it still remains to put in a drain cock, due to the uncertainty of automatic devices as safety joints—they generally work when it is not desired to have them do so, and, like safety devices on elevators, they usually fail to work at the propitious moment.

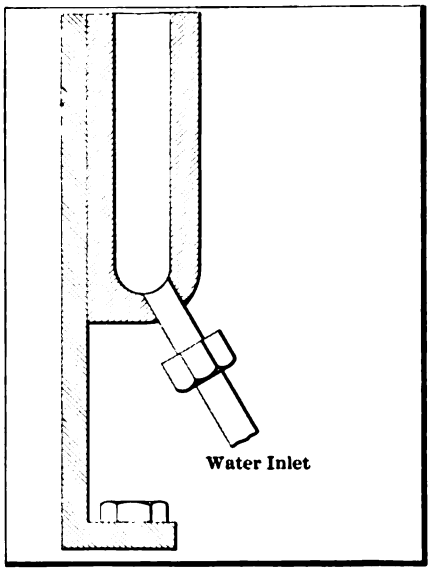

Fig. 1—Proper place for a drain cock in the jacket of cylinders

Letters from Subscribers

Fails to Allow for Varying Ability of Designers

Editor THE AUTOMOBILE:

[2,420]—Please explain in your columns the relative advantage of a 4-cylinder, 4-cycle motor, 5-inch bore and 4¾-inch stroke, and one 5-inch bore and 5½-inch stroke. Which would develop the most power at 1,000 revolutions per minute? At lower speeds, which would develop the most power? Which would run the fastest when developing, say, 30-horsepower? Would one be classed as a high-speed motor, and the other a slow-speed motor?

ARTHUR G. MINCHIN.

Newark, N. J.

There is no possible chance of any one giving the answer to any of the above questions. As a general proposition, the motor with the largest displacement will deliver the most power. It is not unusual to see a 4-cylinder 4-cycle motor with a 4-inch bore delivering more power than can be obtained from a 4-cylinder 4-cycle motor with a 5-inch bore. The difference lies in the differences in design. A good designer can get more power out of a given displacement of a motor than will be possible in the case of a designer with less skill. Some designers go in for high weight efficiency, others for high thermal efficiency, and more for a modification of the respective qualities, with the idea of producing good average results. It is not fair to compare motors of different design, because each designer may have obtained exactly what he went after. In service, the needs depend upon the character of the work to be done. In racing work, for illustration, what is wanted is maximum power and minimum weight; the designer does not care a hang how much gasoline the motor will drink up. For general touring service, the aim is to realize a sufficiency of power, moderate weight, and a high thermal efficiency. Finally, in relation to the power that may be expected from a motor with a given displacement, it should be understood that there is no method of figuring by any empirical formula as yet devised that will come within a reasonable estimate of the facts as they will be obtained by making a real practical test. It is highly improbable that any of the em-

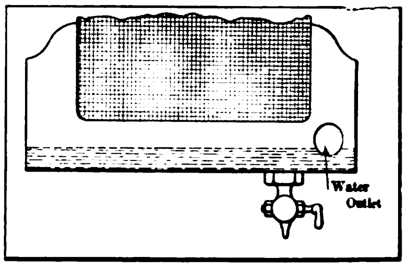

Fig. 2—Drain cock in the bottom of the radiator when the water is taken out farther up

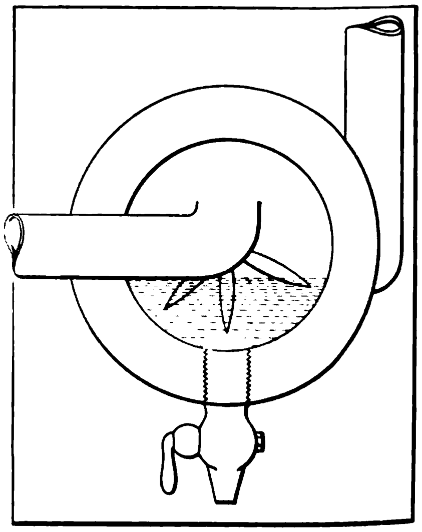

Fig. 3—Drain cock in the bottom of the centrifugal water-pump when the water connections are above the low point

OWNERS OF SMALL GARAGES ASSUME FIRE RISK; LACK OF FUNDS SOMETIMES THE CAUSE; TRUSTING TO LUCK IS COMMON PRACTICE—BY JAS. S. MADISON

becomes effective after the gasoline (or oil) has been burnt up, to prevent the spread of the flame. Each small garage should therefore have as a part of its equipment several buckets constantly filled with water and kept in definite places; also a bucket or two of clean, fine sand. The latter will, when thrown upon a small gasoline fire, smother it.

But the best means of subduing such a fire is by means of chemical fire extinguishers. There are two classes of these on the market—the "dry" extinguisher, which consists of a metal tube, tin, zinc or copper, about 36 inches long and 2 or 2 1-2 inches in diameter, containing dry, powdered ammonium acid carbonate, also called ammonium bicarbonate. These extinguishers after being filled are hermetically sealed by having the top, through which a hook projects, soldered in carefully, but lightly. They are usually kept suspended from a stout nail or screw at any convenient point on a wall or door jamb. If occasion arises for using them they are given a sharp downward jerk, which pulls off the top; the contents are then sprinkled generously on the incipient fire.

This dry powder on being heated even slightly decomposes into ammonia, carbon dioxide and water vapor. These are gases which are not only non-combustible, but excellent extinguishers in that they surround the burning object and thus exclude the oxygen of the air, which is one of the necessary factors in all combustion. They may be purchased in the market at from 50 cents to $3 each, depending upon the size. If the owner prefers he may make one himself if he has the ability to use a soldering iron. If not, the local tinner will make the tube and the chemical, ammonium bicarbonate, which must be *dry* and finely *powdered*, can be purchased from or ordered through any reliable drug dealer.

The best device, however, is the other type of chemical extinguisher, that which is universally used, and consisting of a copper vessel holding three or more gallons of water containing the proper amount of sodium bicarbonate—baking soda—dissolved in it. The upper part of the vessel contains a glass bottle partially filled with concentrated sulphuric acid, which does not come into contact with the soda solution until at the moment when the extinguisher is to be used; it is then turned upside down, which causes the chemicals to be brought together. This results in the generation of large volumes of carbon dioxide gas, which saturates the water and forces it under great pressure out of the rubber hose attached to the extinguisher.

As pointed out above, water is not a good agent with which to fight a gasoline fire, but the water coming from this extinguisher is highly charged with carbon dioxide—it is essentially a carbonated water, such as is served at soda fountains, minus the flavoring syrups. This renders it an effective extinguisher.

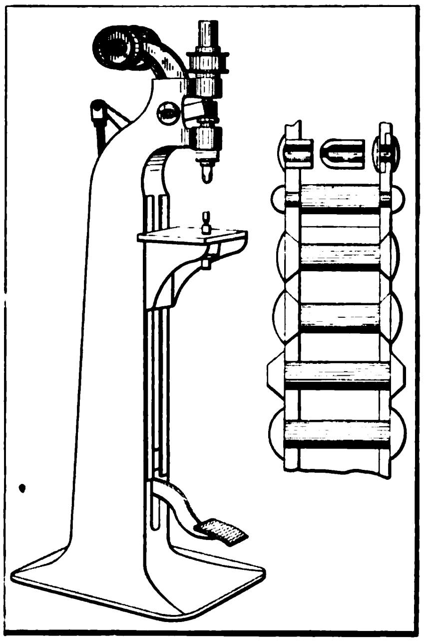
Another excellent means of subduing a gasoline fire is offered by the steel cylinders filled with carbon dioxide or carbonic acid, as it is more popularly called, under great pressure, which the motorist often carries in his car or keeps in the garage for inflating tires. If the cylinder be taken out near the fire, the gas turned on and the current of gas directed against the source of the fire satisfactory results will be obtained in nearly every case. One must be careful not to confuse "air bottles" filled with carbon dioxide with "air bottles" filled with compressed air, which are also used for inflating tires. To use the latter in subduing an incipient fire would be a fatal mistake. A current of air directed against it would only increase the conflagration in the same manner that a strong wind aids in the burning of a building.

Rotary Riveting

Riveting That Is Done in the Ordinary Way Is a Noisy Operation

GRANTING that workmen must tolerate all the little inconveniences of their calling, even assuming that they ultimately become accustomed to anything, as when a boiler-maker acquires deafness sufficient to enable him to be happy in a boiler shop, the fact remains that the quality and quantity of the work done in a plant depend upon the environment to a considerable extent; imagine the writer of this article trying to think in a boiler shop, or alongside of a battery of indefatigable riveting machines of the kind that strike a blow every second, every blow making a sound that would put a Gatling gun to shame Necessity was said to be the mother of invention. Would that mother would spank the men who employ the class of riveters that strike a hammer blow! Such noises are neither pleasant nor profitable. The illustration here given of spinning the heads on rivets has the dual advantage of doing the work 120 times faster than the old way, and the further argument that accompanies noiseless performance. It is the same old story in new garb; the silent performer does the best work. This machine is known as the Grant rotary riveter, made by the Grant Manufacturing Company, of Bridgeport, Conn., and it is capable of doing riveting of every class on a basis so efficaciously that the range of work is all the way from the riveting of sprocket chains to the most complex shapes in a structural steel establishment. The principle of riveting by this process is very simple; the rivet is placed in the usual way and the "work" is then set up on the platen of the rotary riveter with the head of the rivet in the lap of the female tool. The male spinning tool is then brought into contact with the end of the rivet to be headed over. Rotary motion is imparted to the male tool and the metal of the end of the rivet is rapidly spun down, making a riveting job that has appearance as well as security.

In a visit to the plant of the Diamond Chain Company, Indianapolis, Ind., some months ago, the Editor of THE AUTOMOBILE observed that all the riveting was done on special forms of spinning machines, and every automobilist is able to testify to the efficacy of the work done in these chains. The form of riveter as here shown is for general service, but the principle may be utilized in a hundred different ways, and the work may be done hot or cold. The spinning tools may be of any generic type of tool steel, but for hot work it is desirable to select 25 per cent. tungsten steel. Tool steel of this character will hold its hardness even up to a dull red heat. When the heading over is done by spinning the necessity for hot working is eliminated; the metal is spun down and it will run into the space equally all around, ending in a snug fit, and holding the riveted members closely embraced. This scheme of riveting should lend itself to many classes of work utilizing electric motors in the driving when portability is desired. The quality of the work is fully as good as that which is done by the old way.



The noiseless rotary riveter—a godsend in the shop

Treating Tire Wounds

Not a Few Autoists Go About It Without Judgment

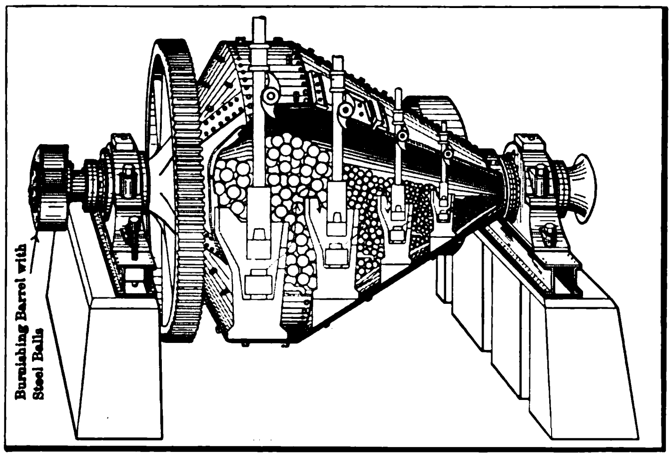
WHEN it comes to the proper handling of punctured tires, some autoists fail utterly on account of their lack of knowledge of rubber and the way that it has to be handled in order to obtain the best result. It is the practice among these automobilists to take a stick and jab it into the wounds after they become large enough to accommodate this savage instrument, without putting them to the trouble of whittling the end down to make a point, and after tickling the wound a little, they then spill a large quantity of rubber cement into, and around the wound, allowing just enough time for the cement to harden before they take to the road and hike it for a mile in just a little more than a minute. It matters very little just what speed the car is made to travel; the rubber is raw as it is dissolved to make cement, and it will not stay in the place where it is put.

Steel Ball Burnishing

A Process of Burnishing Brass Parts by Means of Steel Balls in a Tumbling Barrel

BRIGHT work, as brass and bronze parts on automobile bodies, must be brought to a high polish before it is lacquered, and the cost of polishing is rather too high to expect that good result can be a normal expectation on low-priced cars, unless some quick way can be contrived, by means of which the burnishing may be accomplished in bulk. The illustration here given of a conical tumbling barrel is of interest because it is used with good success in this class of work. The barrel is provided with an opening through which the parts to be burnished are put together with a quantity of steel balls and some ivory soap and a quota of water. The barrel is then rotated at a speed of about 60 revolutions per minute.

There must be enough of the steel balls in the tumbler to prevent the parts to be burnished from battering each other; the rule is to place two pails of steel balls per pail of parts in the barrel, then add a pail of hot water per pail of parts, and 6 ounces of ivory soap is also added per pail of water; put the soap into the hot water before it is placed in the barrel. The sizes of balls used range between 1-16 and 1-14. A special grade of steel balls is made for this work, but in some of the plants where automobile brass parts are burnished by this process the ordinary steel balls of the market are used with good success. This method of burnishing is far from new; it has been used in England for a great many years in the jewelry trade, and the finest kind of burnishing work is done in this way. The process is available for almost every class of work.



Burnishing brass parts by means of steel balls in a tumbling barrel

Don'ts for the Autoist

Don't disregard the prime selling point in salesmanship; show the purchaser how the transaction will redound to his advantage; make sure that it will be to his advantage and then it will be to your advantage also.

Don't anchor a high-tension magneto to a low (in need of attention) sparkplug; spend another dollar and lift the imbroglio.

Don't sing a song of harmonious relations of units in the automobile that you are demonstrating if it is accompanying your music with a display of 57 varieties of noise; either silence the automobile or shut up.

Don't pick out the one weak point in the construction of the car that you are trying to market and call it the best; were the prospect to accept your version, the cars as a whole would rate below the sea level at the ebb of the tide.

Don't let your fraternal connections interfere with your judgment when you are selecting an automobile; if the demonstrator belongs to the same lodge that you acknowledge, make the best of it under the circumstances, but select a good automobile just the same.

Don't let your chauffeur who has the itch purchase the tires that you require for your automobile; a bribed servant is a bad egg.

Don't place yourself in the position of the armless man who purchased gloves because they were cheap; the prudent selection of accessories will reduce the cost of automobiling a mile and a half.

Don't crow about being out of school if you do not know that merit is the automatic finder of the man whom you must reach and convince before you can make a sale.

Don't sink to the level of the dunce who never learned that capital is in the hands of the conservative man; present a conservative proposition.

Don't thoughtlessly cause trouble or expense; if you subscribe to a paper that advertises corsets and automobiles, and you want a catalogue of both at the same time, don't send the letter which is intended for corsets to signal information to the maker of automobiles; it costs quite a sum to attend to such matters.

Don't wait for trouble to come to you, and then sneak out the back door.

Don't treat your automobile as you do your watch; the oil used in lubricating the watch will stay in the jewel cups for two years.

Don't consider that you use watch oil in the bearings of your automobile, and that a single application of oil is all that you will have to apply.

Don't wait until the power plant shows that it is not big enough to overcome friction before you find out what an oil can is for.

Don't act on the suggestion that a surfeit of poor lubricating oil is equal to a small quantity of good oil.

Don't spill oil all over the surfaces of the car and take it for granted that it will penetrate into the journals.

Don't try to dissolve mud out of the oil holes and expect oil to go through and do its work besides.

Don't forget that grit will pass through a mighty small crevice.

Don't overlook the dual purpose for which lubricating oil is used; it keeps grit out, and it keeps the bearings from seizing the journals.

Don't take it for granted that an automobile will last forever just because it is new when you buy it.

SOME INJUNCTIONS IN FAVOR OF TELLING THE TRUTH; ARGUING AGAINST PROCRASTINATION; REMINDERS OF THE VIRTUE OF TIMELY PREVENTION

Don't forget that it is the bearings (as a rule) that wear out first.

Don't try to persuade yourself into believing that the bearings will last long if they are overworked and underfed; you would fag out yourself under such conditions.

Don't feed the bearings on sand; it gives them indigestion.

Don't try a table d'hôte dinner on the bearings; they have the likings of an Eskimo and are rather fond of blubber.

Don't forget that the Eskimo is uncivilized and takes his blubber raw; bearings are somewhat more refined, and have a taste for refined blubber.

Don't think when reference is had to blubber that it is a license to use animal oil in automobile work; the animal fats are acid-producing materials.

Don't forget that every form of acid will etch the polished surfaces of the balls and races of the bearings.

Don't read about ball bearings and not learn that half the value lies in the polished surfaces of the balls and raceways.

Don't overlook the efficacy of grease as a seal for bearings by means of which the bearings are protected, but the form of protection comes with using enough grease so that some of it will traverse out from the bearings, thereby heading off the influx of foreign matter.

Don't start off on a tour with a quart of lubricating oil promising yourself that you will stop at convenient points along the road and gather in a new supply as the occasion requires—there may not be any convenient points.

Don't take a whole week finding out the name of the brand of oil that you feel sure will protect your automobile from the ravages of time, and then go on the road with just enough of it to put in your eye, knowing full well that you will have to patronize a wayside garage and pay good money for whatever it affords, whether or not it is the lubricant you require.

Don't start out with an insufficiency of lubricating oil, travel 10 miles in the direction of no supply, discover that the oil is all gone, and then drive the automobile for the same distance with the bearings dry, promising yourself that it will be given a flood of oil when you get to the place where they keep it. The right thing to do is to tie the car to a convenient fence-post and hot-foot it 20 miles for the oil you require.

Don't whine about the upkeep of your car if it costs too much to maintain; the main reason why it breaks down is because you give it your choicest brand of neglect.

Don't forget that a car will run four times as long using one-quarter of the customary supply of oil if you take the trouble to dab the oil onto the bearings instead of over the outside.

Don't go around looking for a carbon remover until you have reduced the flow of lubricating oil to that which will serve for its intended purpose, thus limiting the accumulation of excess carbon to the minimum.

Don't be surprised if you succeed in so regulating your lubricating oil that it will do its intended work without precipitating an excess of carbon to foul up the piston rings and the combustion chamber surfaces.

Don't compel your motor to join you in the smoking habit; if you like it, smoke your head off; the motor and the public have more refined characteristics.

Don't buy stock at par in a mystery; if the lubricating system is so mysterious that you cannot make it out, sell.

Electrical Heat

A Formula That Will be of Value in Vulcanizing with the Current

THE amount of heat that will be delivered up by the electrical current will be directly proportional to the actual (hot) resistance of the (resistance) wires of the vulcanizer, as measured in ohms, and to the square of the current in amperes. The algebraic expression for this delivery of energy may be stated as follows:

Let,
W = energy in watts;
I = current in amperes;
R = resistance in ohms;
When,
$W = I^2R$.

This expression will be of no service to the automobilist more than to show him that there is no guess work about electric vulcanizers. The heat is available in quantity sufficient for the intended purpose, and all that the automobilist will have to do is to use it.

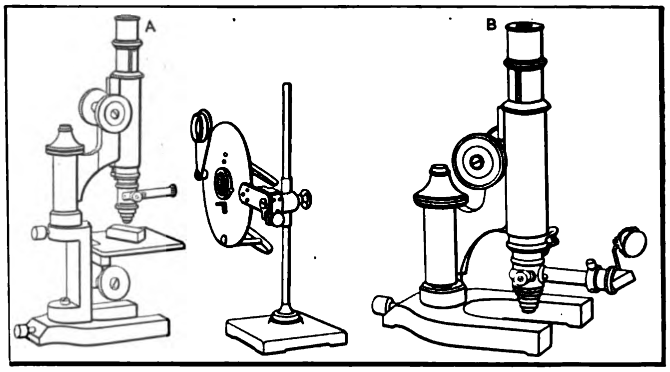
Metallography

Metallographical Problems Demand the Employment of Micro-Instruments of Precision and Simplicity

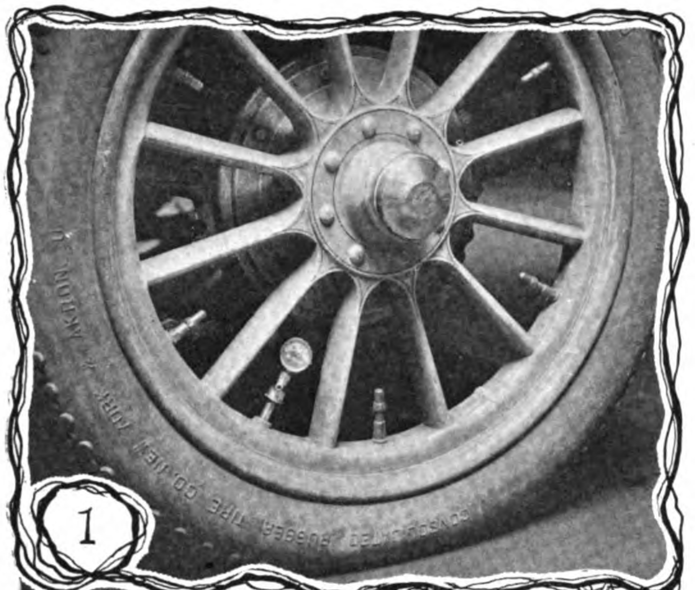
FORMERLY it was contended that metallography, through the use of the microscope, was a process for the metallographical expert, confining research to the advanced laboratory. To-day it is recognized that even a small brass foundry, if it is to turn out advanced work, must be equipped with a microscope of such design and construction that the foundry-man will be able to view the structures of the metals turned out and observe if the composition is suitable for the puropse.

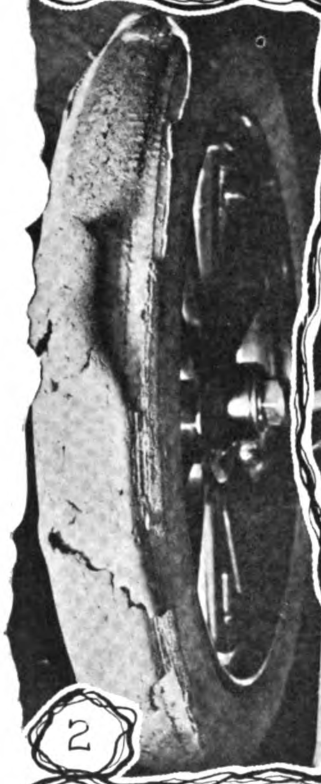
It is due to the work of Dr. William Campbell, the well-known metallographical expert, and professor of metallurgy at Columbia University, that Ernst Leitz, of Wetzlar, Germany, with a branch at 30 East Eighteenth street, New York City, is in a position to place at the disposal of factory experts a form of microscope that is now being looked upon with favor.

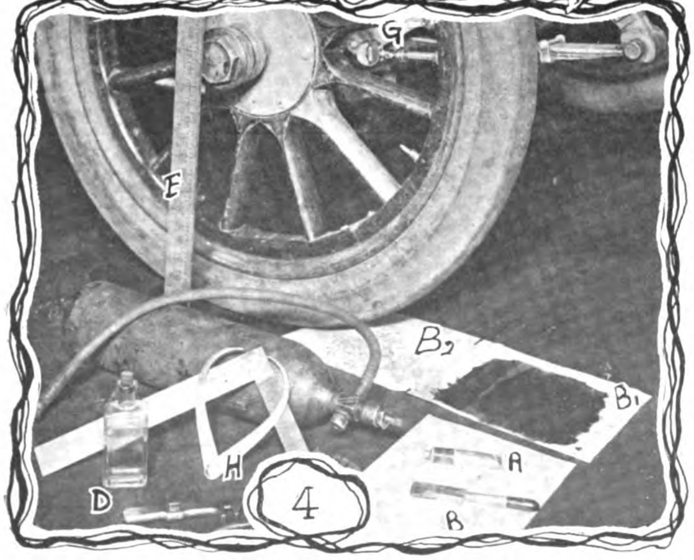
The Campbell instrument, as shown here, is mounted at (A) for laboratory research, employing the new opaque illuminator using a special form of illuminating stand, which is designed to afford perfect uniformity of the illuminated field, and a most powerful objective. The stage is adjustable by means of a rack and pinion so designed as not to disturb the relative position of the vertical illuminator and the source of light. There is a fine adjustment on the top of the column. The device for inclining has the virtue of maintaining parallelism between the surfaces to be examined and the front lens of objective. The instrument is arranged at (B) for the examination of large metal surfaces; in this form it is best suited for the man in the shop.



Microscope for Metallograpnic Researcn
(A) For laboratory work; (B) For examining large metal surfaces







Care and Repair of Tires

FLEXURE is a large factor in tire depreciation. If it will be remembered that fungus growths make the heaviest inroads on the strength of cotton fabric, it remains to observe that flexure is the next greatest damaging feature. No tire will flex excepting to swallow up road inequalities if it is big enough for the car on which it is placed, provided it is sufficiently inflated.

No tire is big enough for any car unless it can be inflated to roundness under the load. No matter how much pressure is put into a tire, it will not inflate to roundness unless it is big enough. There is no remedy that will be efficacious if the tires are not big enough. The autoist who puts his money into a car that is provided with insufficient tires will scarcely have to bother about how to keep his tire bills down; it will not be worth while—the bills will go up anyway. But if the tires are large enough to sustain under the load, then, in order to prevent flexure, they must be properly inflated. One of the strange things from the point of view of the autoist of limited experience is that a tire with an air pressure of perhaps 20 pounds per square inch looks almost as well inflated as one that is laboring under a pressure of 90 pounds per square inch; looks are deceiving, even in tires. In the meantime, a tire that is insufficiently inflated will flex out after a few hundred miles of running, whereas a tire maintained at a pressure of 90 pounds per square inch for a six-inch diameter size will run some thousands of miles, depending upon the quality of the tire and other considerations besides the question of air pressure.

The illustrations here offered were taken from actual life, and have for their object partly the education of the man who wants to know, but for the most part as information for the man who thinks he knows. Some of the illustrations portray a condition of tire abuse. Fig. 1 shows a 36 x 4 1-2-inch tire under a pressure of 30 pounds per square inch. The tire expert of the staff of THE AUTOMOBILE held the car up as it was leaving a garage, asked the chauffeur what he was running in his tires, and was answered, "About 65 to 70 pounds." The staff man, being a little keen on tires, put a gauge on them and found the one here illustrated to be inflated to 30 pounds pressure.

Fig. 2 is another tire that was found on an automobile in a garage, the latter being far from clean, with a good many dollars' worth of oil floating around the floor, and the appearance of the tire shows that some of this oil came into contact with the tread of the tire and succeeded in accomplishing the destruction noted. Fig. 3 shows a tread bruise, due to a slanting blow, as a car was being turned around in the street, the wheel coming into contact with the sharp edge of the curbstone. The tire, as a whole, was in good shape; its record showed 2,000 miles of travel, and a prompt repair in this case should add 2,000 miles more to the life of the tire.

Some inquiry seems to have shown that the average chauffeur is very willing to inflate his tires if the owner will furnish a bottle of carbonic acid for the purpose, as shown in Fig. 4. The chauffeur will even know how much pressure there will be in the tires if the owner will furnish a gauge by which he can record the same. In one garage, the other day, it was found that out

Fig. 1—A 36 x 4 1-2-inch tire under a pressure of 30 pounds per square inch. The chauffeur said that the pressure was from 65 to 70 pounds per square inch

Fig. 2—What happened to a tire that was soused in lubricating oil, of which a great quantity lay on the garage floor

Fig. 3—Inflating a tire with carbonic acid, opening the needle valve slowly, watching the gauge to avoid over-inflation

Fig. 4—Showing the simple forms of implements with which much valuable information can be obtained about tires

THIRD INSTALLMENT ILLUSTRATING PROFESSIONAL METHODS OF REPAIRING; DISCUSSING THE BEST WAY TO OBTAIN THE MAXIMUM RESULT

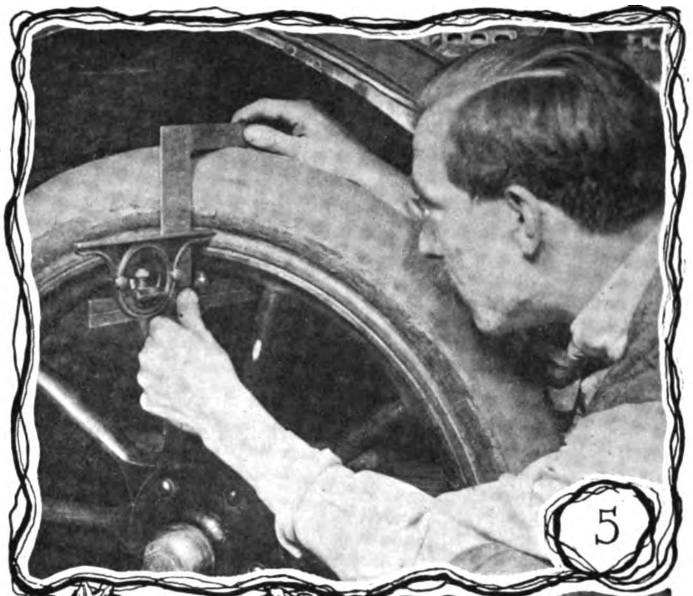
of ten automobiles but one carried a tire gauge. The particular chauffeur who was so fortunate as to be provided with the necessary facilities was making a good record for his owner. The question of the efficiency of carbonic acid for inflating purposes is one that has been debated from time to time, and while it is true that this compound has a finer molecular structure than atmospheric air, hence is more difficult to keep in, the fact remains that carbonic acid gas does stay in the inner tubes with sufficient persistence to serve the practical end, and the Editor of The Automobile, desiring to obtain the opinions of tire makers, wrote to them some time ago, and without exception they stated, "There is nothing about carbonic acid that will injure either rubber or fabric." Since this acid comes in convenient form, and makes tire inflating work more of a pleasure than pumping does, the fact that the tires have to be inflated a little more frequently is a matter of small moment. Tire gauges, as they come from abroad, are marked off to read in kilograms per square centimeter; the American gauges are marked off to read in pounds per square inch. The following is a table of equivalents by means of which the gauges that are marked "kilograms" may be interpreted in pounds per square inch:

Kilograms per square centimeter	Pounds per square inch
1	15
2	29
3	43
4	57
5	72
6	86
7	100

In the investigation of tire conditions in actual practice, the "staff man" used the simple implements as shown in Fig. 4, in which A is a tube of Prussian blue, B is a brush, and D is a bottle of turpentine. When a little of the blue is toned down with turpentine to a painting consistency, and spread over a piece of white paper, if the paper is laid upon the floor at a smooth point, and the wheel of the car is permitted to pass over it, the Prussian blue will transfer to the tread of the tire, after which by substituting a clean sheet of paper B2 and rolling the blue portion of the tire over it, an imprint will be made which shows the area of contact of the tire with the road.

Referring to Fig. 6 of a method of measuring the radial diameter of the tire section at the point of contact and at a diametrically opposite point, it will be observed that the difference in the radial diameter of the section may be found, and when this difference exceeds 3-5 of an inch it is claimed by some tire experts that the tires are either not inflated or they are not big enough for the car on which they are placed. In this connection, it may not be out of place to state that the man who wants to buy an automobile should insist upon it that demonstrations be made with precisely the same diameter tires as those that will be on the new automobile.

Fig. 7 shows the process of measuring a tire to find out how much it squashes down, due to weight, and while this operation is normally not a necessity, it is nevertheless one that might well be performed by the autoist who wants to know whether the tire equipment on the automobile he has his money in is big enough to keep him out of the poorhouse. Fig. 8 shows another operation in the measuring problem, which will explain itself.



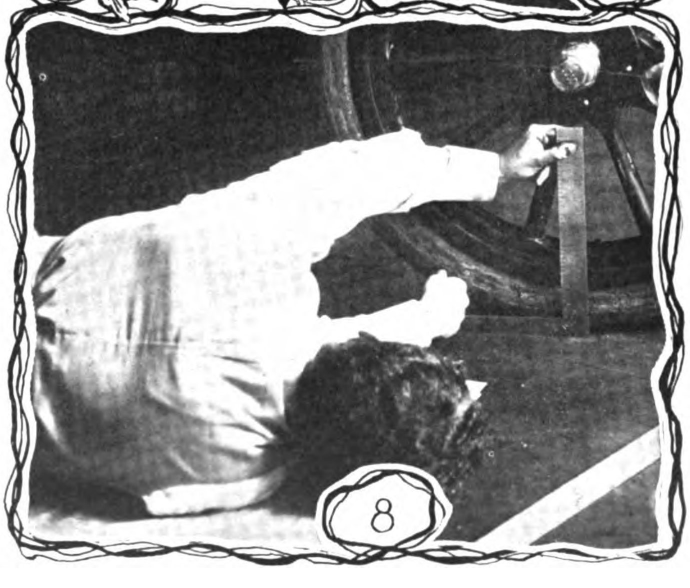


Fig. 5—Measuring the sectional diameter of the tire at a point opposite the point of contact to find the difference

Fig. 6—A good tire with a bad bruise which was brought about by trying to turn the car around in a narrow street without backing up

Fig. 7—Measuring the height of the tire from the floor in getting at the amount of flexure

Fig. 8—Measuring the distance from the point of contact of the tire to the rim to see how much the tire squashed down

Speed with Security

BY MARIUS C. KRARUP—A FOUNDATION FOR UNIFORM AUTOMOBILE LAWS BY WHICH HIGH AVERAGE SPEED BECOMES ALLOWABLE THROUGH SUPPRESSION OF NEEDLESS CAUSES OF TRAFFIC DISTURBANCE (FIRST INSTALLMENT)

Suppose there are 18 well-defined causes of traffic disturbances and all regulation, as prescribed by law, is directed against two of these, one being excessive speed and the other sheer mechanical incompetence of drivers (which is rare and not easily regulated), while among the 16 remaining causes many are of the highest importance, though not as yet generally understood, does it not stand to reason that intelligent action for the removal of these 16 neglected causes of trouble should bring about a condition of the traffic so hedged with security that speed regulation may be left to the individuals best able to judge the situation in each instance? The writer proposes a commission of specialists to formulate the requirements and draft a bill on which the legislators of all States may agree by reason of total absence of class bias from its provisions and also the suitability of these provisions for being completely enforced everywhere without hardship to any good citizen or class of citizens.

THOUGH automobile associations have existed for a number of years and have worked together with legislatures in drawing bills for the regulation of automobile traffic, the much desired condition under which all the States of the Union look upon the requirements in the same light and express them in the same words still bears the aspect of a utopian dream. May it be that these requirements have never been set forth without complication with class interests or that, such as they are in the fitness of things, they clash in some irreconcilable manner with true statesmanship, and the problems of the clash lead to many different solutions? An analysis penned with toleration toward divergent views and with frank effort for bringing under consideration all the factors really involved should go a little way in the direction where unity lies. On the other hand, to be too serious and to weigh with petulant insistence every little thing which may disturb somebody's peace of mind or which may tax a granny's ability to keep step with the procession of the world would seem to be superfluous, as even a casual glance at the traffic conditions brought about through the widespread employment of automobiles reveals a number of factors which legislators have apparently never considered and which in themselves are important enough to warrant viewing the subject under a new angle. And from this angle a set of regulations may be the upshot in which the legislators of all States can concur, if the automobile associations do their part in taking united action, laying their case before the Uniform State Law Commissioners at Washington, perhaps, somewhat on the lines which have been followed with regard to road improvement. Assuming that the object of regulation of traffic is in all cases the furtherance of tranquil conditions under which nobody's rights will interfere more than is necessary with the rights of others, the possible causes of disturbance which are to be removed may be divided into five classes, those originating with (A) the driver, (B) the vehicle and its makers, (C) pedestrians and other traffic members, (D) the State and its officials and (E) public opinion as vented in the public press.

A.—The driver may be of (1) an insolent disposition and constitutionally inclined to run roughshod over those upon whom he looks down as inferior beings or as persons unable to defend themselves. He may be (2) inebriated and thereby temporarily deprived of decency, common sense and the full use of his physical faculties. He may be (3) permanently deficient, having poor sight or hearing or being subject to nervous collapse in emergencies.

B.—The vehicle may (4) possess peculiarities affecting the driver's actions and faculties. It may be (5) faulty in its control elements. It may be (6) of appearance so odd as to scare horses or it may be (7) used in districts where any automobile scares horses or temporarily upsets the judgment or ruffles the temper of the drivers of other vehicles. It may (8) possess certain peculiarities through which its speed or the direction of its motion fails to be accurately or quickly perceived by the average person participating in the traffic.

C.—Pedestrians and drivers of vehicles in the traffic, including drivers of automobiles, may be (9) insolent and inclined to make trouble. They may stubbornly insist that the slow member of the traffic has as good a right to all of his slowness as the automobile driver has to some of his speed. They may be (10) inebriated. They may be (11) deficient, having poor sight or hearing, or both, or being subject to nervous collapse in emergencies. They may be (12) unaccustomed to the sight of automobiles.

D.—The State, through its officials, including legislators and magistrates, road supervisors and police, may be (13) poorly informed (14), venal or biased, with all the results flowing from such a condition in the way of bad laws, poorly enforced laws, exasperation of the traffic members, including the automobile drivers, contempt for all regulation, tricky legal quibbling on technicalities. The State may be (15) poorly organized for the enforcement of law.

E.—The public press which voices and shapes public opinion may be (16) following false channels, catering to class interests or failing to spread information of essentials when these lie beyond the horizon of the average reader and when an explanation of them would need to be carefully worked into intelligible form and occasionally repeated in other forms in order to become appreciated.

Among all the considerations mentioned, only those pertaining to the automobile as a vehicle are new in kind, but all of them are raised to a new potentiality through the speed of automobiles. It is therefore not illogical that speed has been the principal subject for regulation in the past. But the logic, while not bad, has been incomplete and one-sided. Speed in itself is universally desired. Even the most conservative prefer to travel at the rate of 40 miles per hour or faster in a railway train. The object of regulation should not be to kill speed, but to render it harmless and to subdue those too much infatuated with its charms, so that they will subordinate it to more important or urgent considerations when circumstances so require. The highest speed consistent with the safety of traffic and the tranquillity of the majority of citizens—and with some allowance for the peculiarities of those who are weak and incompetent—is the best. The object of regulation should therefore be that of raising speed to the maximum which may be attainable with safety and to remove all those special causes mentioned in the foregoing through which speed becomes a source of danger instead of an absolute advantage, and through which, therefore, the necessity arises for reducing speed.

Probably it will be generally admitted that this fundamental viewpoint has not been represented in legislative debates. The keynote in these was in the beginning frankly suppressive on one side and defensive, almost apologetic, on the other. Persecution, while it has been eaten down by its own corrosiveness in course of the years, is still only thinly veiled. All that remains of this unjust feeling of animosity against a form of transportation which is destined to become universal may probably be entirely removed when the progressive camp adopts as its slogan the suppression of all factors in the situation which tend to make traffic unsafe and insist on the other hand on receiving the benefit which such removal will justify in the way of increased speed and freedom from artificial restrictions.

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FOREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[263]—How do you test the front wheels to see that they will take the proper position for running straight ahead?

Place the wheels in position for running straight ahead. Push the car far enough forward to see that it runs in a straight line. Measure between their tires (or rims) at the back part of the wheel at the same distance from the floor as the center of the hub of the wheel. Use a stick cut to the right length and mark the spots on the wheels between which the measurement is taken. Then push the car forward until the front wheels make half a revolution and measure again between the spots previously marked. The spots will be at the front of the wheel after pushing the car forward. The distance between the spots should be the same as before.

Do not push the car backward just before measuring between the wheels, since that will give them a position different from that of running forward if there is any lost motion in the parts.

[264]—What effect has wear in the distance (transverse) rod upon the position of the front wheels?

It allows the wheels to spread apart in front, so that each has a tendency to run forward toward its own side of the road. This causes a side slipping of the tires and wears them out rapidly. The distance rod connects the knuckles which support the front wheels. It runs across the car parallel to the axle.

[265]—How do you clean a transmission chain and put it in running order?

One link is removable. It has pins fitted with screws or cotter pins which can be easily withdrawn.

Remove from the sprockets and place in gasoline or kerosene a few hours until the grease is cut free, then take it by the ends and run it back and forth through the gasoline to work out the dirt. Hang it up to dry and then submerge in a good machine oil, moving it about to allow the oil to work in around the pins, then apply a grease, such as axle grease, to retain the oil and prevent as much as possible the entrance of dirt and grit.

[266]—How can a broken chain be repaired?

Extra links and pins should always be carried for this purpose. If none are at hand, a short piece of large wire or a wire nail may be used temporarily for a pin. When using such a makeshift for a pin, care must be taken not to rivet it down so as to grip and bind the links together. This repair on the road is not easy in the absence of the proper links.

Wire may be used to replace a link by winding it over the pins to be connected. The pins must be kept at the proper distance apart to correspond with the pitch of the chain, else it will not run on the sprockets. The use of wire in this manner is difficult and only worth while under great necessity.

[267]—How should a double-chain drive be adjusted?

So that the distance between the driving and driven sprockets (between centers) is the same for both road wheels (on both sides of the car).

The distance between the two sprockets over which one chain runs can be measured by a stick cut to suitable length. This distance can be adjusted by means of the threads and nuts on the radii rods which run forward near the extremities of the rear axle, outside of the spring perches.

One of the chains may be tightened more than the other where the distance between sprockets is the same, as above, but this is preferable to an adjustment to make both chains equally tight if they are of different lengths. The latter adjustment tends to make the chain climb on the teeth of the sprocket wheel.

[268]—How can a band brake be relined?

Remove the old lining, which is generally fastened in place with rivets, and replace by another with new rivets. See that the band has an even curvature, either the same in diameter or slightly larger than that of the drum.

Copper rivets are better than those of harder material such as rivet iron. The lining should be countersunk for the rivet heads, so that they will not rub against the brakedrum. The drum is apt to be cut by a rivet which rubs against it, especially if the rivet is of hard material.

[269]—What materials are suitable for brake linings?

Woven cotton belting (cotton web), woven asbestos with a wire gauze woven in the asbestos, leather, wood fiber, etc. Copper and brass are satisfactory under some conditions, more especially when the brake is lubricated.

[270]—How would you put a new leather on the cone of a friction clutch?

Remove the old leather carefully and use it as a pattern for cutting out the new one. Trim the new leather to uniform thickness. A harness-maker can do this readily in a suitable machine.

Fasten one end of the new leather in place on the cone with rivets. Wrap the leather around the cone and cut it a quarter of an inch or so short, while holding it in place by hand. Rivet the other end in place. The remaining rivets can now be put in. The leather should fit snugly when pressed into place as the rivets are put in. Copper rivets in deeply counter-sunk holes are suitable.

If the leather is found to be too thick after being put in place, it can be turned down in an ordinary engine lathe (machinist's lathe).

It is not actually necessary for the clutch leather to be all one piece. Two pieces can be used with entire satisfaction. More rivets are required, however.

[271]—How do you adjust a loose bearing of the plain journal type?

Remove one of the shims, if any are used, and tighten the box till it just moves freely on the journals when there is no oil on it. (Shims are thin pieces of metal placed between the cap and body of the box.) It is far better to adjust with a little shake than have a pinching fit.

[272]—How can a cracked casting such as the metal shell around the water-jacket space, or some housing, or casting of the car be repaired?

There are various processes which can be applied according to the conditions of the case. Some of these are brazing, welding with oxy-hydrogen flame, oxy-acetylene flame, etc. Repair can also be made in the foundry in some cases by pouring molten metal against the broken part so as to melt part of it away and fuse the liquid metal into the remainder thus forming a complete piece. Another method is to put sal-ammoniac solution in the crack when the metal is iron or steel. This causes rust, which closes the crack more or less effectively. It may be remembered that sal-ammoniac is used in ordinary dry batteries. This method is a last resort.

It is advisable to consult those who make such repairs as a business.

A cracked water jacket can sometimes be successfully repaired temporarily by rubbing into the crack a cement made from yellow oxide of lead and glycerine, making sure that the latter is free from water.

Digest

Novel Disc-Valve Motor; Electric Lighting System; and Other Matters of Interest

A new idea in gasoline motors designed by Lieut. Blood appears in the *Automotor,* and an experimental single cylinder with a 4-inch-bore and 4 1-2-inch stroke has been made to demonstrate the principle.

As our illustrations show, the special feature consists of a flat disc having a single port cut through it, this disc fitting between corresponding ports above and beneath, through which the explosive mixture is admitted from the carbureter, and the exhaust gases are allowed to escape to the silencer. The disc is caused to revolve at half the speed of the crankshaft by means of bevel gearing—which could, of course, be replaced by skew gearing—and the disc has a ground face top and bottom, fitting closely upon the cylinder head beneath and the jacketed cylinder cover above.

Dynamo for car lighting—Of late great attention has been paid to the question of supplying illuminant for the car at night and the most favored types are acetylene and electricity. The reason that acetylene has a larger following than electricity is due to the compact form in which it is now put up, the necessity of frequent charging of storage batteries and the attending costliness of this latter operation. A dynamo permanently fitted to the car and driven by it avoids all charging drawbacks and is clean, compact and, if properly handled, always ready for service.

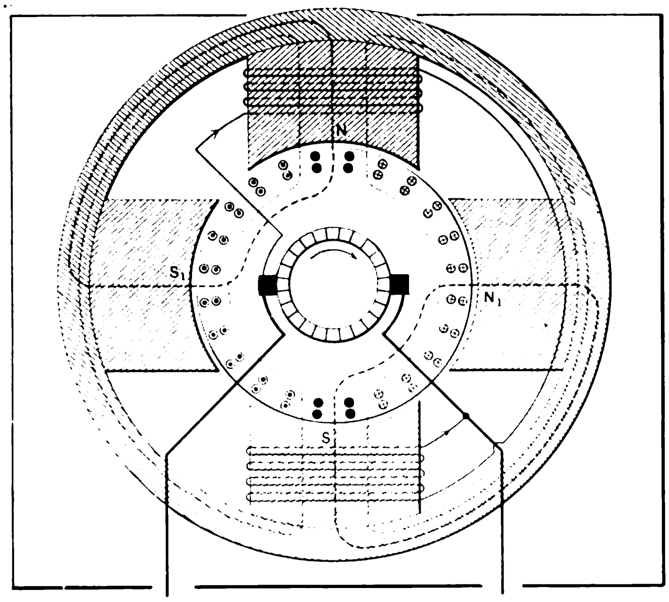

Fig. 7—Section through the dynamo showing the four poles and method of planting inductors in the laminæ of the armature

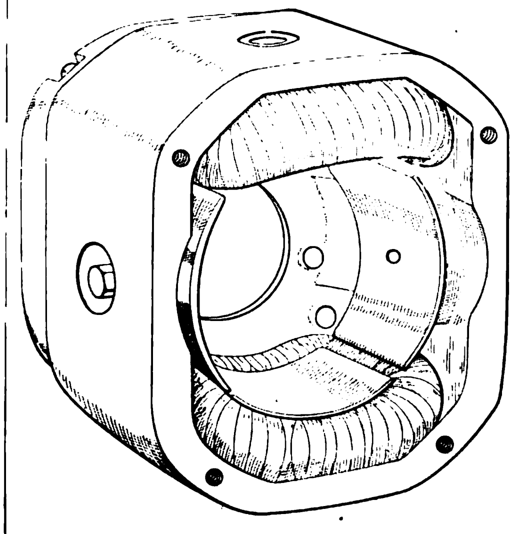
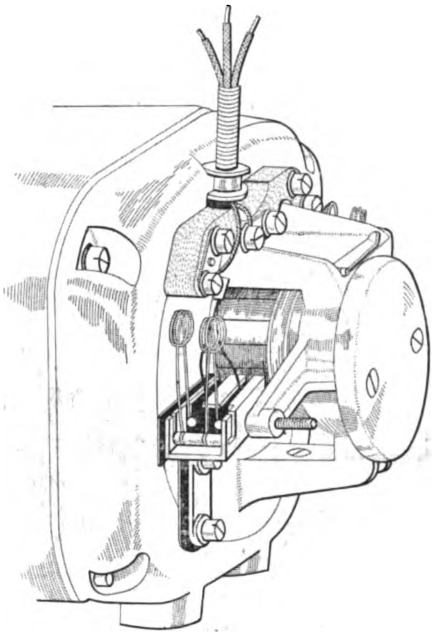
The dynamo here illustrated, the C. A. V., made by C. A. Vandervell, of Acton, England, has four magnet poles—two ordinary ones N1 and S1 and two subsidiary ones N and S. The latter are excited in the usual manner by means of their windings, but the former are unwound. The armature is drum-wound and the windings are helically staggered, so that those immediately under the subsidiary pole pieces are in communication with the brushes on the commutator ring, and the magnetic flux from their two windings passes diametrically from one subsidiary pole to the other and dividing right and left returns through the frame of the machine as clearly indicated by the dotted lines in Fig. 7.

The collecting brushes are of sufficient width to continually cover two of the commutator sections, and thus they short-circuit certain coils, which are represented in Fig. 7 by eight black dots.

These short-circuited coils instead of being in a neutral magnetic zone as in the case of the ordinary dynamo are situated in a region of great magnetic activity, as they are cutting the lines of force produced by the subsidiary coils N1 and S1. The short-circuit currents produced by these coils "cross magnetize" the armature and set up a magnetic flux at right angles to that of the subsidiary poles, which effect is greatly enhanced by the presence of the unwound ordinary poles.

In consequence of this the previously existing magnetic flux is "distorted" and instead of pursuing the path already traced by these dotted lines and passing from one subsidiary pole to the other through the armature it now passes only halfway through the armature and turns aside, as shown by the thicker dotted lines, thus having a quadrantal path. This change of flow takes place gradually as the speed of the machine begins to rise. While this effect is being accomplished, however, there is another force at work, for the coils of the armature which are not short-circuited are producing current in the usual way, and this is being collected by the brushes and delivered either to the batteries or the lamps as the case may be. Further, this working current has a magnetizing reaction which directly opposes the magnetization





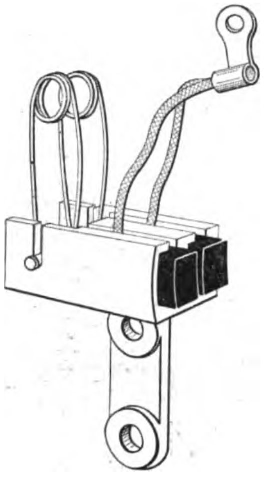


Fig. 4—Field piece with polar extensions. Fig. 5—Commutator end, showing the brushes. Fig. 6—Details of the brushes and holders

of the subsidiary poles, and as the demagnetizing reactions increase proportionally with the speed, the natural tendency of the output of current to increase also with the speed is directly opposed, the result being that there is a constant generation of current.

Three types of C. A. V. dynamos are made; first, 6 volts, 5 amperes, to be driven at from one and a half times to twice engine speed; second, 12 volts, 5 amperes, to be similarly driven; third, 12 volts, 5 amperes, to be driven at engine speed. The first type is suitable for light cars, and especially cabs, for which it seems to be eminently suitable. The dynamo is contained in a dirt, water, oil and dust-proof case, weighing only 16 pounds, and having in larger sizes dimensions of 11 inches x 7 inches x 6 inches can readily be installed on almost any car.

In Fig. 4 is given a sketch showing the disposition of the main and subsidiary poles in the frame, while Fig. 5 is an illustration of the armature end, brushes, etc. The latter are shown in detail in Fig. 6. The brushes themselves are a special grade of carbon and are contained in slides, where they are pushed against the commutator by means of the springs shown. They are connected up to the insulated bridge indicated by dotted shading in Fig. 5, where they are placed in communication with the switchboard through the main cable.

Supplanting Rubber

At Eight Sets per Year Pneumatic Tires Will Have to Go

AUTHENTIC data bearing upon the life of pneumatic tires is difficult to obtain. Just how many sets of tires an automobile will wear out in twelve months depends, of course, upon the sizes used considering the design, power and weight of the automobile; the miles traveled per year must also be figured in, and the character of the roads over which the automobile goes will influence tire life. Then, there is the personal equation to consider, also the skill of the owner, and the extent to which the needs of the tires are looked after. At all events it has been claimed that eight sets of pneumatic tires may be worn out in a single year by an automobile. There is one great compensating factor that must not be forgotten; the tires, not the automobile, wear out. In many attempts to substitute solid for pneumatic tires, the reverse has been true, that is to say, the automobile suffered instead of the tires. The tire that is to put the pneumatic *hors de combat* must last longer than the pneumatic; cost less to the user and not shorten the life of the automobile. Inventors might as well keep these details in mind while they go about the great task.

Aluminum Castings

Strength Depends Upon Thickness and Shape of the Castings

WHEN the strength of aluminum is being investigated it is necessary to take into account the shape and thickness of the casting as well as the mixture and the quality of the work done in the foundry. It is on this account that test proofs attached to the castings do not offer a means of determining the true strength of the metal. As a general proposition the strength of cast aluminum varies as follows with the thickness of the castings:

Thickness in inches	Relative tensile strength in pounds per square inch
0.10	108
0.20	100
0.30	98
0.40	94
0.50	90

In every attempt to eliminate sound by adding to the thickness of the aluminum walls, it is at the expense of strength of the metal as measured in pounds per square inch.

German Automobile Imports and Exports

For the first eight months of the present year up to the end of August the import of cars and parts has shown a slight increase in value over the same period in 1909, the figures for 1910 being $1,927,250, as compared with $1,741,000 in 1909. The exports, however, show a much larger increase. The value of cars and parts exported for the first eight months of this year shows a large increase over last year, the figures up to the end of August, 1910, being $4,897,500, and for the same period of 1909 $1,861,100.

A series of technical dictionaries, on the Scholmann system giving the equivalents of technical terms in English, French, German, Italian, Spanish and Russian, are published by R. Olden-Bourg, Munich and Berlin. Whenever practicable the terms are also illustrated in the most universal language; that is, by drawings. The latest volume deals with iron-concrete construction.

Auto Club of Syracuse

HISTORY OF ORGANIZATION THAT HAS GAINED THE NAME OF "LIVE WIRE" BY ITS ACTIVITY IN MANY USEFUL LINES OF MOTORING

SYRACUSE, N. Y., Nov. 7—There are fifty-seven automobile clubs in the State of New York and there is not one among them which more clearly answers the definition of a "live wire" than does the Automobile Club of Syracuse. It is a club of achievement. Pioneer in the road sign movement now being taken up by clubs all over the country, strongly influential in the making of legislation, standing firmly for the compliance by all drivers with the laws fixed by the community for their control, a potent force for improved highways, putting forth special efforts for the convenience of tourists, the Automobile Club of Syracuse is for the automobile from A to Z.

The club was organized June 12, 1901, T. D. Wilkin being its first president. There were not many more than members enough "for a quorum." The first club run was held that year to Pleasant Beach, a nearby resort.

The club flourished until at the expiration of the term of the second president, Willett L. Brown, there were nearly 100 members.

The Syracuse club organized the New York State Automobile Association, which now has a membership of over 5,000. The club now has a membership of well over 600 and is taking in twenty and thirty at a meeting.

The early meetings of the club were held at The Yates, but with the growth of the organization permanent quarters were required, so some three years ago rooms were secured in the S. & A. K. building and Miss Grace Tickner was placed in charge as office manager.

Three months ago the Automobile Club of Syracuse removed to the Onondaga and has handsome permanent offices therein on the mezzanine floor overlooking the lobby, fitted with mahogany furniture and fixtures, forming a most attractive resort for the tourists who make the Onondaga their headquarters.

The present officers of the club are H. W. Smith, president; H. P. Denison, first vice-president; Dr. C. M. Ryan, second vice-president; Forman Wilkinson, secretary and treasurer, Miss Grace Tickner is office manager. The directors are B. E. Watson, C. C. Bradley, Jr., J. William Smith, A. T. Brown, and W. L. Brown. The club is regularly affiliated with the American Automobile Association as well as with the New York State Automobile Association.

"All roads lead to Syracuse," is the slogan of the club, and the organization has helped in no small degree to make the city the busy center it is. In the aggressive campaign, never-ceasing, that is waged for members, the following reasons are given why men should join the club:

"This club stands for organized opposition to unjust and discriminatory legislation affecting automobile interests; for the improvement of our streets and highways; for the observance of the State automobile law and city vehicle ordinances, and for the furtherance and protection of all legitimate interests of automobile owners."

The club's deeds back up its words all around, and in no field more thoroughly than in that of legislation. From 1906 to 1909 about twenty bills each year, taxing and restricting motor vehicles, were introduced in the State Legislature. If one ran only an electric the passage of the L'Hommedieu bill would have made it cost from $5 to $7 annually in taxes. The New York State Automobile Association, in fighting these measures, had no more spirited member than the Syracuse club. And in 1909 the Syracuse organization was one automobile club in the State that fought to defeat the Allds-Hamm bill, this measure having been favored by the State organization and fifty-seven other clubs. Governor Hughes backed up the Salt town judgment by vetoing the bill.

A work in which the club is profoundly interested is the locating of route and danger signs within a radius of fifty miles around Syracuse. They are being placed north as far as Watertown, south to Cortland, east to Oneida Castle and Richfield Springs and west to Auburn and Weedsport. The Automobile Club of Auburn intends to vigorously prosecute this work next season, just as the Rochester and Buffalo clubs are now doing, following the lead of Syracuse.

The signs are made to last, being composed of sheet steel, enameled in white with dark blue letters. Besides route and distance signs, there are "dangerous hill," "danger," "railroad and trolley crossing" signs. "Gasoline for sale here" signs are now being distributed through the countryside for tourists' convenience, and everything is marked as erected by the Syracuse club.

In 1909 over 600 road signs were placed. This year there were over 700. The club now employs two or three men constantly in placing these signs. It has been the ambition of the club in this sign work to so wholly post Syracuse and environs that tourists will need to visit the club headquarters merely for a social call. And this ambition is being realized.

The club has taken the liveliest interest in the good roads movement. Last year among other donations, it raised $350 to help complete repairs to Free Bridge at Cayuga Lake.

The club is, first and foremost, a business organization, and the social part comes later, though there are delightful times at the banquets which are held at the annual meetings. For a long time the organization had too much business afoot to hold club runs, but a new era was established in July of this year, when the sociability run for the B. E. Watson trophy was held to Rexford Falls and return. Nearly a hundred machines participated and such a success was it that it was determined to repeat it next year.

Since its inception the Syracuse club has had annually an "orphans' day," when the little inmates of city institutions for the parentless have been taken upon enjoyable outings.

In January of this year the club started its official monthly paper, *The Spark Plug,* a snappy publication that is flourishing.

The Syracuse club has had a lot to do with the success of the two shows the Syracuse Automobile Dealers' Association has held and has lent its efforts toward this end without stint.

There are two road signs prominently shown through this section which are positively unique and Secretary Wilkinson is the "composer." Both are signed by the club. One, at the entrance of a town, on all the main highways, reads, "Please drive carefully through this town." At the exit of the town the autoist is confronted with a pleasant "Thank you."

All in all a "Live-Wire" club like that of Syracuse is worth infinitely more than all the dead ones that ever died. For had they been like that of Syracuse they wouldn't have died.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, RACES, HILL-CLIMBS, ETC.

Nov. 19-26	Oakland, Cal., Idora Park Snow, Under Management of Oakland Automobile Dealers' Association.
Dec. 1	Chicago, Ill., First Annual Aeronautical Exhibition in the Coliseum.
Dec. 31-Jan. 7, '11	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14, 1911	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 14-28, 1911	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, Third Regiment Armory.
Jan. 15-21, 1911	Detroit, Wayne Gardens, Detroit Automobile Dealers' Association.
Jan. 16-21, 1911	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A. L. A. M.
Jan. 28-Feb. 4, '11	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-Feb. 11, '11	Chicago Coliseum. Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 24-27	New Orleans, La., Annual Show, New Orleans Automobile Club.
Mch. 4-11, 1911	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 25-April 1	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mch. 25-Apr. 8	Pittsburg, Annual Show, First week, pleasure cars; second week, commercial trucks. Automobile Dealers' Association of Pittsburg, Inc.

Races, Hill-Climbs, Etc.

Nov. 7-11	Five-day Reliability Run of Chicago Motor Club, 200 Miles a Day.
Nov. 10-12-13	San Antonio, Tex., Track Meet.
Nov. 11-12	Savannah, Ga., Road Race, Savannah Automobile Club, and Grand Prix, Automobile Club of America.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

TEACHING the automobilist how to take care of his tires, in view of the cost to him if he fails to do so on his own account, would seem to be like carrying coals to Newcastle. Unfortunately, there resides in the tire situation a complex problem, the nature of which remains to be understood; nor can it be claimed that those who should know most about the situation are taking overmuch time in the exposé of the same. If a task is to be performed, and it remains undone, despite a pressing necessity, the natural inference is that the master of the job is as yet in the coming. In the meantime, rather than to float with the tide, it would seem to be a better plan to struggle with the "beast," with the expectation that if he cannot be mastered, he may be winded. THE AUTOMOBILE makes a special effort this week, opening up a new line of thought and presenting to the owner a system for the investigation of his tires that will help him to arrive at fitting conclusions from time to time, and permit him to locate defects in the tread long before they would be noticeable, as a matter of direct observation. The imprint method of investigating the condition of tires requires nothing more than a few strips of paper, a modicum of Prussian blue, and a little time.

* * *

OWNERS of automobiles make a great mistake when they assume that articles in a technical paper are too technical for them to bother with. The word "technical" is much abused. Its proper definition should be given as follows: "A terse explanation of the use of a mechanism." Much of the matter that passes current as "technical literature" is, of course, a mere jumble of meaningless words; they being valueless, the author attempts to bolster them up by the application of algebraic formulæ, and it is no wonder that those who are busy enough making their automobiles go decline to waste any time upon "word jumbles"; but when technical literature, so-called, is limited to a clear and understandable statement of the underlying facts, the man who desires to limit the cost of operating his automobile can well afford to throw his prejudice away and exercise his common sense. Every fact ceases to have a technical significance as soon as it is generally understood; the only reason why it is regarded as technical is because its proper understanding is not broadly disseminated. There is no more simple way of describing a thing than to clearly state the object of its existence, how it is made, and how it must be operated to obtain the good there is in it. If this is technical literature—and it must be—it remains for the automobilist to expend a dollar's worth of time reading it, so that he can save himself a thousand dollars'.

* * *

WHAT is speed? History proves that when security is realized to the fullest extent, the question of speed dies out. Four thousand years B.C., when men were prancing around on "Shank's mares," the first war chariot was an adequate illustration of speed in the absence of security. It was not a case of the chariot going very fast so much as it represented the inability of men to get out of the way. A few years ago when horse-cars were relegated to the scrap pile, and the "trolley-car" came into vogue, there was ample evidence of speed without security. To-day there is hardly a man who would consider himself as doing anything but wasting time were he to utilize the services of a trolley-car when within striking distance of a subway train. When the automobile first attracted the notice of the public and racing cars made the excellent speed of 20 miles per hour, the public at large persisted in the belief that a racing driver would have to keep his mouth closed, on the ground that if he opened it the wind pressure would be so great that he would not be able to close it again. Racing drivers have since discovered that they have good control of their facial muscles when riding at something like a mile in 28 seconds. In the meantime, there is scarcely a citizen in America who would not invite an automobile to whip up the speed were it traveling at any pace under 20 miles per hour. When the whole situation is adequately canvassed, the conclusion is reached that speed with safety is not a fixed quantity. Safety comes with the better understanding of the public, and the perfection of the braking mechanisms, so that speed may be notched up from time to time as the public learns how to "step lively," and the controlling systems employed show greater capabilities.

* * *

"STAND-PATTERS," those who are in favor of "automobile legislation" of the character of which the Callan Law is a working specimen, also the type of Law that the automobilists of the State of New Jersey groan under, may now go to grass. The automobilists who have heretofore trusted their "good friends" (who also make a good living out of it) are wearied of "framed" legislation. What the situation demands is honest treatment; nor is it to be supposed that honesty, cut on the bias, will suffice.

Standardization Work

Iron and Steel Division of S. A. E. Committee on Standards Meets and Fixes Specifications; Division on Pyrometers to Meet; Aluminum and Copper Alloys to be Considered Soon

IRON and Steel Division of the Standards Committee of the Society of Automobile Engineers met last week at the offices of the Society, 1451 Broadway, New York, the following being present: Howard E. Coffin, president of the society; Henry Souther, W. P. Barbá, E. L. French, M. T. Lothrop and Coker F. Clarkson, secretary.

The division took up consideration of the specifications for materials for automobile construction. As a result of the meeting, the standard form of specimen used in testing automobile materials will probably be changed; and instructions as to the use of the test-specimens and testing machines will be issued.

Specifications for recommendation to the society, of the following steels and irons were taken up in detail and acted upon: .15 carbon steel, .25 carbon steel, .45 carbon steel, .80 and .95 carbon steel (primarily for springs), .20 carbon 3 1-2 per cent. nickel steel, .30 carbon 3 1-2 per cent. nickel steel, .30 carbon chrome nickel steel, .20 carbon chrome nickel steel, .45 carbon chrome nickel steel, .15 carbon chrome nickel steel, .20 carbon chrome vanadium steel (primarily for case-hardening), .45 carbon chrome vanadium steel, silico-manganese steel, valve metals, steel castings, gray iron castings, malleable iron.

The following points will be considered at the next meeting of this division: pyrometer and heat control; description and definition of heat-treatments. tabulation of physical results of heat treatments.

A standard order of statement of the different elements in the metals will be recommended, something as follows: (1) carbon, (2) manganese, (3) silicon, (4) phosphorus, (5) sulphur, (6) chromium, (7) vanadium. The elements are now given in the forms of various laboratories and mills in many different ways, and standardization will eliminate much confusion and loss of time.

This week two other divisions of the S. A. E. standards committee are holding meetings at the Society's office. These divisions are those on aluminum and copper alloys, constituted of F. W. Cooke, Thomas J. Fay, George M. Holley, Wm. H. Barr, H. W. Gillett, J. J. Aull, Geo. W. Dunham, R. S Fretz. and S. P. Wetherill, Jr.; and on plain, ball and roller bearings constituted of H. W. Alden, David Fergusson, W. P. Kennedy, A. P. Sloan, Jr., W. A. Frederick, Henry Hess, Elwood Haynes, A. L. Riker and Howard Marmon.

Steel Corporation Moves Up

American Patent Rights of the Héroult Process for Electrically Refining Steel Purchased

WHEN the question of the electric refining of steel was first broached as a scientific possibility, those who devote themselves to commercial work said that it was a laboratory trinket with the remotest, if any, commercial possibility. In the course of time the Héroult process of steel-making was perfected abroad, and in the last few years electrically refined steel has been taking the place of crucible steel for the better class of work, and with a better understanding of the questions of cost, and the possibilities of the electric furnace, commercial steel makers have revamped their views to a mervelous extent. It was in the Spring of 1896 that real practical work began in some of the German mills involving the electric furnace, and we now learn that the United States Steel Corporation has just purchased the American patent rights of the Héroult process, although it is fair to state that electric furnaces are in use at the present time at the Gary plant of the steel corporation. Some of the notable advantages of the electric furnace in steel making were pointed out in THE AUTOMOBILE from time to time, and of late the evidences indicating the fine quality of this fabric have been so overwhelming that those who watched the questions of quality of material were constrained to believe that something should be done in America in order that it would be possible to keep abreast of the progress that is being made in foreign lands. The purchase of the Héroult patent rights and the introduction of this successful system of steel refining represent a distinct inclination on the part of American steel fabricators to keep pace with the times unless perchance the patent papers are filed away in a stout safe and electrically refined steel by this process, if it is to be had at all, must be imported from Germany.

A.L.A.M. Meeting

Col. Charles Clifton Enters on Seventh Annual Term as President of Association of Licensed Automobile Manufacturers

COL. CHARLES CLIFTON, who has served the A. L. A. M. as its chief executive for six terms, was unanimously re-elected to that office at the annual meeting of the association Thursday. All the other officers were re-elected as follows:

S. T. Davis, Jr., vice-president; L. H. Kittredge, secretary; George Pope, treasurer, and Alfred Reeves, general manager.

The Executive Committee is composed of the following: Charles Clifton, S. T. Davis, Jr., Thomas Henderson, Hugh Chalmers and Herbert Lloyd.

The Association Patents Company, a subsidiary of the A. L. A. M., chose the following officers: Charles Clifton, president; Thomas Henderson, vice-president and Alfred Reeves, secretary and treasurer.

Reports read at the meeting showed that trade during the past year has been 100 per cent. greater than it was in the preceding year. Conservatism in manufacture is to be the keynote of 1911, according to the association.

A resolution was passed to have the Licensed Dealers' Association of New York co-operate and affiliate with the manufacturers in the National Automobile shows in future.

The meeting was the largest yearly gathering of the organization ever held, forty-three members being present as follows: James Joyce, American Locomotive Co.; John S. Clarke, Autocar Co.; O. Y. Bartholomew, Bartholomew Co.; Frank Briscoe, Brush Runabout Co.; G. A. Lambert, Buckeye Mfg. Co.; W. C. Leland, Cadillac Motor Car Co.; C. C. Hildebrand, Chalmers Motor Co.; H. W. Nuckols and Herbert Lloyd, Columbia Motor Car Co.; M. S. Hart, Corbin Motor Vehicle Corp.; C. G. Stoddard, Dayton Motor Car Co.; B. A. Becker, Elmore Mfg. Co.; G. H. Stilwell, H. H. Franklin Mfg. Co.; E. H. Broadwell, Hudson Motor Car Co.; G. A. Matthews, Jackson Automobile Co.; Alfred N. Mayo, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Co. of America; H. A. Lozier, Lozier Motor Co.; F. F. Matheson, Matheson Motor Car Co.; Horace DeLisser, Maxwell-Briscoe Motor Co.; Wm. T. White, Mercer Automobile Co.; Wm. E. Metzger, Metzger Motor Car Co.; Rufus Walker, Jr., Moline Automobile Co.; Geo. M. Dickson, National Motor Vehicle Co.; C. C. Hanch, Nordyke & Marmon Co.; M. J. Budlong, Packard Motor Car Co.; L. H. Kittredge, Peerless Motor Car Co.; Charles Clifton, Pierce-Arrow Motor Car Co.; George Pope and A. L. Pope, Pope Mfg. Co.; H. O. Smith, Premier Motor Mfg. Co.; R. E. Olds and R. W. Owen, Reo Motor Car Co.; Geo. J. Dunham, Royal Tourist Car Co.; G. E. Mitchell, Alden Sampson Mfg. Co.; R. H. Salmons, Selden Motor Vehicle Co.; F. B. Stearns, F. B. Stearns Co.; Wm. R. Innis, Studebaker Automobile Co.; W. White, Waltham Mfg. Co.; John N. Willys and Geo. Bennett, Willys-Overland Co.; Thomas Henderson, Winton Motor Carriage Co.; Alfred Reeves, general manager.

S. A. E. Growing

Society Elects 22 Members at Meeting held recently

THE following were elected, last week, members, associates and juniors of the Society of Automobile Engineers:

Ludlow B. Alexander, Bosch Magneto Co., New York City
Clement Booth, Standard Roller Bearing Co., Philadelphia, Pa.
Arthur Clayden, Editor "The Automobile Engineer."
Clarence H. Froelich, Velie Motor Vehicle Co., Moline, Ill.
J. H. Gould, McCord Mfg. Co., Detroit, Mich.
Julian A. Halford, W. A. Wood Auto Mfg. Co., Kingston, N. Y.
Robert Jardine, Royal Tourist Car Co., Cleveland, O.
Frank M. Stinson, Locomobile Co. of America, Bridgeport, Conn.
Walter Wardrop, Editor "Power Wagon," Chicago, Ill.
Henry A. Bugio, Philadelphia Steel & Forge Co., New York.
Victor W. Kliesrath, Bosch Magneto Co., New York City.
Charles E. Lozier, Columbia Steel Co., Elyria, O.
Hugo C. Mootz, Ohio Motor Car Co., Cincinnati, O.
Joseph W. MacKay, Wetherill Finished Castings Co., Philadelphia, Pa.
Francis Miller, Bellevue, Campbell Co., Kentucky.
Carl E. Pearson, National Coil Co., Lansing, Mich.
Milton Rupert, R. D. Nuttall Co., Pittsburg, Pa.
Robert Skemp, American Sheet & Tin Plate Co., Pittsburg, Pa.
Arthur Brandes, Ohio Motor Car Co., Cincinnati, O.
Lee H. Hazard, Velie Motor Vehicle Co., Moline, Ill.
Arthur L. Myers, McCord Mfg. Co., Detroit, Mich.
Lawrence R. Moran, Hudson Motor Car Co., Detroit, Mich.

Few Penalties in Chicago Run

29 Starters in C. M. C.'s 1000-Mile Contest

MOLINE, ILL., Nov. 7—The first day of the Chicago Motor Club's 1,000-mile reliability, which started from Chicago this morning, brought about the penalization of three cars out of the twenty-nine that started. Lewis Strang, in the Case, drew fifty points because a pin sheared off the magneto coupling. Randall in one of the two Hupmobiles got one point for a carbureter adjustment and Brown in No. 1, Abbott, was penalized three points for adjusting a push rod.

Considerable tire trouble was experienced. The roads in the main were good. To-day's run was 193 miles, and to-morrow's will be 205 miles with the night stop at Quincy. Score to date:

1—Abbott-Detroit	Brown	3 points
2—Haynes	Irby	Perfect
4—Cunningham	Emery	Perfect
6—Halladay	Daubner	Perfect
7—Haynes	Williams	Perfect
8—Henry	Padley	Perfect
9—Imperial	McKersher	Perfect
10—Glide	Cassell	Perfect
11—Abbott-Detroit	Robins	Perfect
12—Cino	Donnelly	Perfect
	IN THE ROADSTER CLASS	
100—Falcar	Vansicklen	Perfect
101—Midland	Nulling	Perfect
102—Grout	Hallser	Perfect
103—Hupmobile	Randall	1 point
104—Moline	Vandervoort	Perfect
105—Lion	Bloomstrom	Perfect
106—Moline	Wycke	Perfect
107—Case	Jones	Perfect
108—Imperial	Wells	Perfect
110—Speedwell	La Chappelle	Perfect
111—Halladay	Caument	Perfect
112—Staver	Montclamier	Perfect
113—Staver	Duif	Perfect
114—Case	Strang	50 points
115—Krit	Hambermicht	Perfect
116—Brush	Lincoln	Perfect
117—Haynes	Wagner	Perfect
118—Hupmobile	Hearn	Perfect
119—Moline	Salisbury	Perfect

In the October 6 issue of THE AUTOMOBILE it was stated that the Model O Pullman is equipped with 34 by 4 tires. The correct size of tires used in that model is 34 by 3 1-2.

Short News of Interest

—The American Motor Sales Company, Erie, Pa., has secured the agency for the "Thomas Flyer" in that territory.

—An agency for the Cartercar has been opened in Philadelphia. The Johnston Motor Car Co., 326 N. Broad street, secured the agency.

—James C. Clinton, of Detroit, has been appointed manager of the Louisville branch of the Studebaker Automobile Co. He succeeds Daniel T. Patton, who resigned.

—The Liberty Automobile Tire & Supply Company, of Pittsburg, has secured Earley Singel, formerly of the H. H. Franklin Company, of Syracuse, N. Y., for general manager.

—The Roy Thompson Automobile Company, 122 East Seventh street, Cincinnati, distributers of Warren-Detroit automobiles, will move soon to 117 East Seventh street and will open a repair shop.

—Recent incorporations of interest to the automobile world are: Detroit Metal Forming Company, $25,000; Bennett Axle & Transmission Company, $150,000; Auto Brass Manufacturing Company, $6,000.

—At the annual meeting of the Louisville Automobile Dealers' Association the following officers were elected: Prince Wells, president; E. G. Reimers, vice-president; Hubert Levy, secretary and treasurer.

—T. A. Davies and Harry W. Smith have taken the agency for the Lozier car in Seattle. C. S. Cummings, until recently manager of the Metropolitan Motor Car Co., will be associated with them in an advisory capacity.

—H. T. Boulden, of the Franklin Agency, in Cincinnati, has been appointed district manager for the Franklin Company. Mr. Boulden will have supervision of all the Franklin agencies in Southern Ohio, Indiana, Kentucky and Tennessee.

—Gimbel Brothers' New York establishment has installed a system of electric delivery and transfer trucks, including thirty-six of the former type and thirty of the latter. The cars are all Studebakers equipped with Westinghouse motors.

—The E. J. Welch Auto Co. of Fitchburg, Mass., is about to open a new garage. The building is two stories, fireproof, and has floor space of 15,000 square feet. The company will handle several cars and a full line of parts and accessories.

—The Firestone Tire and Rubber Co. has issued a booklet covering full instructions as to the use of its quick detachable and demountable rims. The booklet is illustrated with numerous cuts to show each step in the process.

—The H. J. Koehler Sporting Goods Company, distributors of the Hupmobile in New York State east of Buffalo and throughout New England, will open December 1 a salesrooms in Boston at 1074 Boylston street. The new branch is to be managed by W. H. Shutt.

Receivership to End

Creditors Petition Court to Sell Matheson M. C. Co. to Matheson Auto Co.

THE receivership under which the Matheson Motor Car Co. has been operated since last July is likely to be raised on Saturday, when a petition in which more than 90 per cent. of the creditors of the concern have joined to sell it in bulk to the Matheson Automobile Co. of New York is returnable to the Circuit Court of Luzerne County, Pa.

Should the court entertain the petition and grant it, the receivership would terminate automatically, as the subject-matter would pass into the hands of an operating company.

BRIEF ITEMS CULLED HERE AND THERE FOR QUICK READING—INTERESTING ALIKE TO MAKER AND USER

—N. H. Miniter, formerly of the Factory Sales Corporation and the Eiseman Magneto Company, has been appointed special factory representative of the Stromberg Motor Devices Company at Chicago.

—The Cumback Motor Company, of Detroit, has been incorporated with a capital stock of $100,000. R. A. Bailey is president and treasurer; R. O. Cumback, vice-president and manager, and W. S. Bailey, secretary. The company will manufacture a light delivery truck of 1,000 pounds capacity.

—W. E. Roby, who has been connected with the tire business in Minneapolis since automobiles have become a prominent factor in Minneapolis' life, has made known his intention of retiring from the Diamond Rubber Company's Minneapolis branch. The change will take effect January 1, 1911.

—The Findlay Motor Company of Findlay, Ohio, gave a reception Friday at the factory which the people of Findlay and adjacent cities attended in considerable numbers. The first of the Ewing motor trucks made by the company was on display. The car was the same that will be shown at the Palace show in New York.

—The Avery Company, Peoria, Ill., makers of the Avery truck, tractors and other agricultural machinery, has completed an addition to its plant, comprising two buildings, aggregating over 1000 feet in length and 200 feet wide and two stories or more in height. These buildings are designed for machine shops and new machinery is now being installed.

—The Marshall Oil Co., Marshalltown, Iowa, have just taken possession of their new office building, which is one of the finest of its kind in Iowa. The building is of pressed brick, with stone trimming; two stories in height, and so arranged that every desk has ample sunlight and every modern convenience. The company puts out the French Auto Oil and other brands.

—The Thomas high gear car which recently completed a 2000 mile trip through the East, with all the transmission gears eliminated with the exception of the high and reverse, started as a non-competing car in the big 1000 mile reliability contest of the Chicago Automobile Club. The car was used to carry press representatives and members of the Technical Committee.

—The highway between Fairmount and Camillus, N. Y., which has been closed the greater part of the Summer, is now open to automobilists, affording a splendid macadam drive all the way to Auburn. It has been announced that just east of Chittenango a new road on the Genesee turnpike will be opened at once, this being the natural course for tourists going east.

A. M. C. M. E. A. Show

Eight Companies Added to List of Exhibitors; Fifty in All Now on the List

EIGHT additional motor car companies signed contracts during the past week for space to exhibit at the A. M. C. M. E. A. show at the Palace, Dec. 31 to Jan. 7. The list includes the following: C. Baeder Co., New York agents for the Lexington Motor Car Co.; Crawford Automobile Co., Cunningham Sons and Co., Coleman Motor Car Co., C. W. Kelsey Mfg. Co., Oliver Motor Car Co., Victor Motor Truck Co., Roader Car Co.

The total list to date consists of 50 concerns. Active preparations to arrange the building for the exhibition are being carried on and a comprehensive scheme of decoration has been adopted. The promoters announce that about a dozen more manufacturers have agreed to participate but their contracts have not reached headquarters as yet.

Garden Being Fixed Up

100,000 Feet of Floor Space Barely Sufficient for 83 Members and Accessory Makers

NEVER before since the big automobile shows began to be held in the Garden was there so much space available for exhibition purposes as for the forthcoming show. Nevertheless, every inch of the 100,000 feet has been allotted. The preparatory work for the big show is progressing rapidly. Even those most familiar with the old Garden and its multitude of exhibitions will be amazed at the wondrous transformation. Several months ago contracts for the steel construction, which will be equal to that of a good-size building, were given out together with other contracts for decorating, sign-making, carpenter work, etc. The skeleton steel construction will be erected entirely independent of support from the walls of the Garden. Only the wood floors of the galleries and crossbeams will be connected with its walls. The big steel girders which will support the galleries will rest on forty grillages, of steel and concrete. Each grillage will uphold a load of forty tons. These grillages were laid under the floor of the big show building last summer to allow the concrete sufficient time to mature. In all more than 200 tons of steel will be used. If stood on end, one on top of another, the steel columns would reach an altitude of 2,000 feet. One hundred thousand feet of lumber will be used in the construction throughout the building. Two monster freight elevators will be erected to hoist the cars to the galleries.

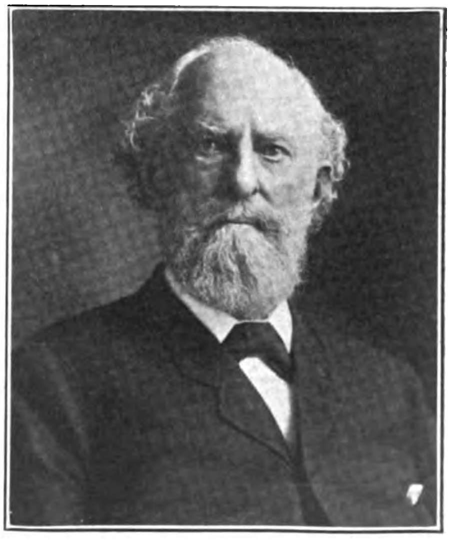
Importers in A. L. A. M.

Licenses granted to Daimler and Hotchkiss Import Companies and Morgan Truck

LICENSE under the Selden patent has been granted to the Daimler Import Co., of New York, the concern that brings in the Mercedes car. Similar action has also been taken by the A. L. A. M. with regard to the Hotchkiss Import Co., which handles the Hotchkiss, and to the R. L. Morgan Co. of Worcester, Mass., manufacturers of trucks.

Corbin, Captain of Industry, Passes Away

Philip Corbin, president of the American Hardware Corporation of New Britain, Conn., died at his home Nov. 3, aged 86. Mr. Corbin was intimately associated in every progressive line of endeavor of New Britain and was the founder of the Corbin Motor Vehicle Corporation, among a dozen other large enterprises. Of late years he had not taken an active part in the administration of any of the companies he fostered except the hardware concern. He was a native of Connecticuit and worked his way from the station of farm hand to the position of a captain of industry through his earnestness, persistence and ability. The funeral was held Monday, during the hours of which business was practically suspended in New Britain.



The late Philip Corbin

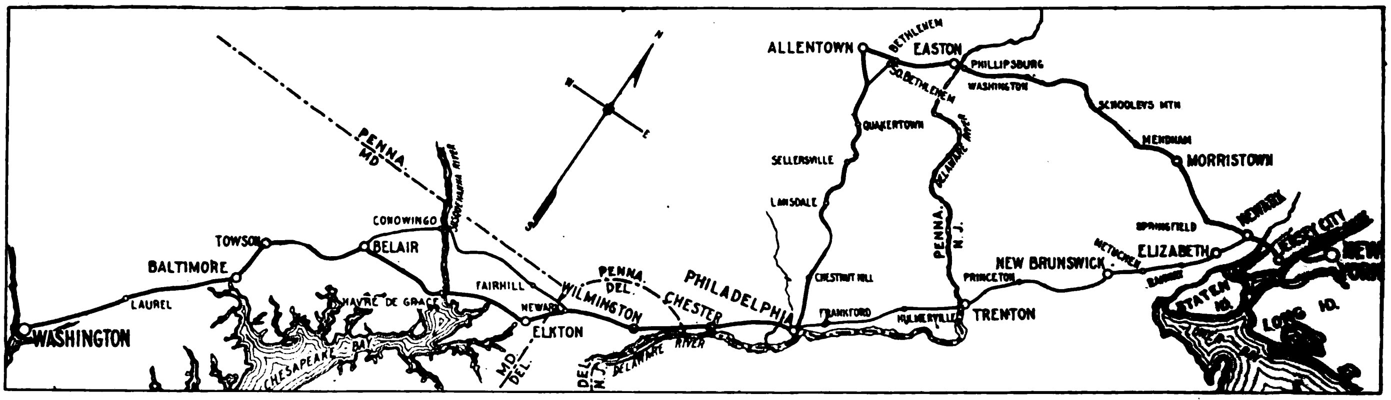
From Metropolis to Capitol

BY HENRY MACNAIR—NEWS OF THE ROAD, AND THOUGHTS INSPIRED BY A RECENT MOTOR JOURNEY

TRAVEL by automobile without accelerating one's think-motor to a correlative speed is like trying to take a snapshot on a wet plate—one gets merely light-struck, so to speak, and carries away no sharp, clean-cut picture of the things worth seeing along the way. Most of us from environment or heredity or want of propelling force have not reached the dry-plate stage, where we are capacitated to receive impressions when traveling at focal-plane speed, yet the introduction of the hand-book or "Baedeker" feature into The Automobile Blue Blook has not been made without hope of appeal to the mental wet-plates of the tonneau. Not only should this feature prove of great interest to the ever-increasing multitude of motor tourists but it will be a "first aid" to those who wish to prepare their mental films to a high degree of sensitiveness before venturing among unfamiliar sights and scenes.

Among the interesting trips which will be featured in next year's Blue Book is that from New York to Washington. There is much of interest to be seen in the journey, if one can forget the unfriendly stretches of bumpy roads beyond "Mason and Dixon's Line." Presuming that time is not a factor, Philadelphia is approached in a rather roundabout way, in order to get the best of everything. Leaving via Twenty-third street ferry we pass through Jersey City and across the "meadows" of marsh and sedge grass into Newark. The few blocks of cobblestone—the *bête noir* of city travel—are soon passed and we are on a stretch of macadam which leads through Morristown, where the immortal George spent the winter of '79, and all the way over picturesque hills and along winding brooks to the Delaware. Part of this road is brand new and is finished in the most approved style of the road builder's art. At the forks of the Delaware river we cross a toll bridge (not forgetting that our New Jersey numbers are good only in New Jersey) and enter Easton, which is the site of Lafayette College and a manufacturing center. The visitor's interest will be further aroused at Bethlehem, an ancient Moravian village settled by Count Zinzendorf in 1740. A swing around the city past the old academy and church buildings is of interest and also a side trip across the Lehigh to South Bethlehem where Charles M. Schwab's Bethlehem Steel Company has its magnificent plant. In Allentown, a few miles on, is a monument commemorating the saving of the old Liberty Bell.

Philadelphia, the Quaker City, next invites our attention, but regrettably is one of the few American cities whose hotels hold out no welcoming hand to visiting motorists. It rests its claim for notability, among other things, on its Independence Hall. where rests the Old Liberty Bell, and on its glorious Fairmount Park. Our route out of the city is over the Schuylkill and out to Darby over some very much neglected streets with never a sign to welcome the coming or speed the parting motor guest. When the smooth road is finally reached the keen edge of enjoyment is dulled by the mile-apart toll-gates reaching to Wilmington, where we cross the historic Brandywine. Here is the famous Dupont Powder Works, and here, too, the old Swede's Church dating from 1698, recalling the first Swedish colony in America. From Wilmington magnificent macadam stretches to Newark, where Delaware, more progressive than Pennsylvania or Maryland, permits the wayfarer to go untaxed. Just beyond Newark we cross the "Mason and Dixon's Line," and at the gateway of the South we are welcomed by the worst 20-mile stretch of our journey, which, we were told, is "very bad when wet and worse when dry." Fortunately we encountered it when at its best, being neither too wet nor too dry, but nevertheless breathed a sigh of relief when the mighty Susquehanna came in view. Crossing on a transformed railway bridge with a heavy enough toll ($1) to make us appreciate its worth, we enter Havre de Grace and enjoy the best meal of our trip at a little inn, whose modest charge of 50 cents warms the cockles of our heart toward the man who has not put up his prices on the long-suffering motorist. By leaving the Old Pike at a village called "Fork," we take a pretty "valley road" to Towson, and thence on the inevitable toll-road into Baltimore, whose distinctive features are its Washington Monument, the residence of Cardinal Gibbons and Johns Hopkins University, ranking with the universities of the Old World. Baltimore has an unbroken record of peace, having been only threatened by attack during the Revolution and lying outside of the theater of combat during the Civil War. On the other side of the scales is the memorable conflagration of 1904, which devastated an area of 150 acres and caused a property loss of $17,000,000. Baltimore, of course, has its churches, its parks, its libraries and its manufactures, but it would take days to explore its list of interesting points. We, therefore, leave its old monument in our rear and take a circuitous route, necessitated by street conditions, to Relay. Only five miles of jouncy road mars our trip as we pass through some quaint old villages into Washington, where we circle the Capitol and go up Pennsylvania Avenue to the "White House," the real center of things Washingtonian, though, of course, L'Enfant laid out his splendid network of broad driveways with the Capitol as a center. However, Washington is another story, and after a rest at the really good hotel of the city, the tourist will be ready to explore its many points of beauty and historical interest.



Map of the route "From Metropolis to Capitol," crossing four states, also showing direct New York-Philadelphia connection

Among the Makers

JOHN W. STODDARD COMMANDS APPRECIATION OF EMPLOYEES; PHILADELPHIA GETS AN ELECTRIC COMPETITION; MANGANESE SERVES A VERY IMPORTANT PURPOSE

DAYTON, O., Nov. 7—John W. Stoddard, who recently retired from the presidency of the Dayton Motor Car Company, was presented with an ornate bronze tablet by the employees of the three factories comprised in the plant as an appreciation of his kindly relations with them for many years.

The presentation was made by Superintendent R. Thurston Houk and came as a surprise to Mr. Stoddard. The tablet contains a relief bust of Mr. Stoddard surrounded with appropriate symbols illustrating the various stages of his career; commencing with law books, running through agricultural implements and being completed with a touring car.

The tablet is inscribed "Presented to John W. Stoddard by the factory employees of the Dayton Motor Car Company in appreciation of his long years as a considerate employer and in recognition of those sterling qualities which have made him admired by all men."

Tablet presented to John W. Stoddard, founder of Dayton Motor Car Company, by his employees

Electrics to Run

Philadelphia "North American" Promotes Unique Competition

GRACEFULLY and quietly, after the order of electric automobiles, a column of about fifty contesting cars will leave from in front of the Philadelphia *North American* Building at 10 o'clock Friday morning for a tour of the streets of the Quaker City, comprising about 50 miles.

The run is the first ever staged for electric pleasure cars and will be conducted by the Quaker City Motor Club racing officials. The contest will have the roadability feature of secret time devised by Harry C. Harbach, secretary of the club. The referee will be R. E. Ross, chairman of the contest committee of the club, who has acted as referee in the Fairmount Park road race and other important sporting events. G. Hilton Gantert will start the cars and Paul B. Huyette will have charge of the timing.

No entrance fee is charged and the *North American* has offered two prizes, plates costing $150 each, for the cars most closely approximating the secret time. One of the prizes will be given to the male driver and the other to the woman driver who come closest to the time selected. It is expected that a dozen or more women will enter the competition, as half a dozen of them have up to this time stated their intention to drive cars in the contest, the driving of electrics being a popular pastime among Quaker City's ladies.

The course will be through the streets of the city and will take in some of the suburbs. From Broad street the way selected lies through Fairmount Park, Ardmore, Bryn Mawr and return by a different route.

The secret time will be determined by the contestants themselves. Each will write a time upon his starting card when given the word to go and these times will be added and divided by the number of contestants submitting estimates and the result will be the figures nearest which will lie the prizes. Secret checking stations will be established to prevent speeding in some parts of the course and loafing in others.

The entry list up to last Saturday night is as follows:

No.	Car	Entrant	Driver
1	Baker	Reamer & Haines	H. H. Kirkpatrick
2	Baker	Reamer & Haines	C. A. Haines
3	Babcock	F. W. Eveland	John B. Hill
4	Babcock	F. W. Eveland	Miss E. M. Cuddy
5	Detroit Electric	Thos. F. Grugan	Thomas F. Grugan

Steel Bronze

So-called Manganese Bronze is Devoid of This Element

MANGANESE, used in the melting down of the charge that enters into "steel-bronze," is eliminated in the furnace, but it does perform a valuable service since it distributes the iron content, preventing the same from forming into "shot" and rendering the metal unfit for its intended service. But when manganese is used the shot formation is aborted and the good steel-bronze resulting has physical properties as follows:

Physical Properties

Tensile strength in pounds per square inch	71,000
Elastic limit in pounds per square inch	38,190
Elongation per cent. in two inches	31
Reduction of area in per cent	30.4
Diameter of test proof in inches	2
Distance in inches between enlargements of test proof	1

Note.—The above is an average test of Parsons manganese bronze which was taken from the propeller hub of Monitor No. 7, U. S. N. Manganese bronze, so-called, is used quite extensively in automobile work. An example of an excellent application will be found in the crankcase construction of "Locomobiles"; they are of this metal.

Mayer Carbureter

In order to obtain a good understanding of the general appearance of the Mayer type of carbureter, reference may be had to Figs. 1, 2 and 3 of the respective sides of the carbureter and the same dissembled. The performance in service will depend as in carbureter work in general upon the harmony of relation of the carbureter itself to the motor to which it is applied, not forgetting that even the muffler may detract from the performance of the motor and effect the good working of the carbureter. In trying to arrive at a conservative conclusion of the good that resides in a carbureter the path is beset with difficulties, the magnitude of which can only be arrived at if the whole equipment is subjected to an exhaustive test, so that the service as rendered by the caurbureter will be gauged in the light of the handicaps under which it works.

The accompanying tests were made on a six-cylinder motor under conditions of back pressure due to the muffler used, of a strangling power to diminish the power of the motor to a quite noticeable extent, especially at the higher speeds at which power is given. The back pressure was 1 pound per square inch at 500 revolutions per minute of the motor, gradually increasing to 6.75 pounds per square inch at 1,500 revolutions per minute. This does not seem to be a large back pressure, but it is, nevertheless, due to the fact that it is a large proportion of the mean effective pressure, the latter being approximately 70 to 75 pounds per square inch in the motor cylinders and the ratio of back pressure to mean effective pressure under these conditions is not far from 12. In other words, this

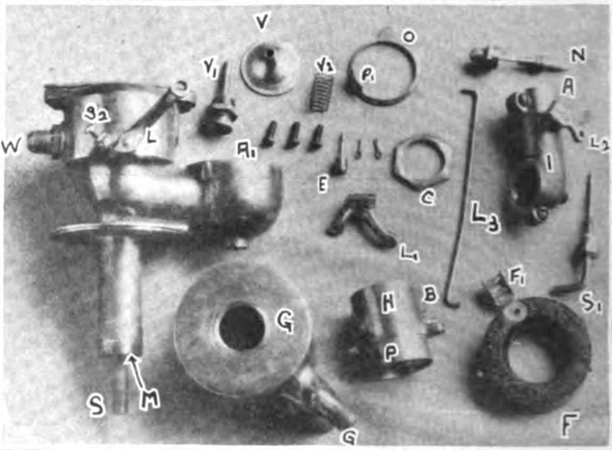
E—Float pivot pin. N—Needle valve. G—Gasoline inlet. C—Locking nut. S1—Jet adjustment. W—Water inlet. S2—Set screw for throttle adjustment



Carbureter in Parts

A—Air intake. A1—Supplementary air intake. N—Needle valve. L—Throttle lever. L1, L2, L3—Levers for closing air ports for starting. F—Cork float. F1—Float lever. E—Float pivot pin. C—Locking nut for float chamber. W—Water inlet. S—Jet. M—Air intake. G—Float chamber. V1—Extra air inlet adjustment. V—Extra air valve. V2—Extra air valve spring. O—Fixed supplementary air sleeve. P—Fixed supplementary air port. P1—Fixed supplementary air control cover. H—Supplementary air tube.

back pressure has a magnitude of substantially 1-12 of the mean effective pressure and it means that approximately 1-12 of the power of the motor is thwarted, due to back pressure. But this is not all. If the exhaust is impeded in its migration from the combustion chamber to the atmosphere the conditions of scavenging will be incomplete, and it is but a step from a state of incomplete state of scavenging to a condition of poor carburetion. The reason for this lies in the fact that however good the mixture may be as it comes from the carbureter if it is diluted by products of combustion it will fall below its normal level of value and the first thing that the average automobilist does is to blame it on the carbureter, forgetting the while that the gas as it comes from the carbureter is poisoned by the products of combustion that are kept from leaving the combustion chamber because a poor muffler serves as a cork, so to say.

The motor that was used in this test was of the six-cylinder, water-cooled, four-cycle type with a bore of 4 1-2 inches and a stroke of 5 1-2 inches. The motor had been run on the block for a sufficiently long time to reduce friction; it was then delivered to a well-equipped laboratory and tested out in conjunction with the testing of the carbureter as here referred to. The timing of the motor was as follows:

Exhaust valves open 40 degrees before center.

Exhaust valves closed 5 degrees after center.

Inlet valves open 7 degrees and 50 minutes after center.

Inlet valves closed 30 degrees after center.

Ignition was accomplished by a magneto with a maximum brake of 5 7-16 inches as measured on the circumference of the flywheel and during operation a mercury manometer was attached 1 foot from the end of the exhaust manifold with the result as follows:

R.P.M.	Brake Pull	H.P.	One Side HG Inches	Lbs. per sq. in. Back Pressure
400	75	71.1	1	.98
500	73	20.8	1½	1.48
600	73	25.0	2	1.96
700	71	28.4	2¼	2.2
800	69	31.5	2¾	2.7
900	65	33.4	3¼	3.2
1,000	62	35.4	3⅝	3.35
1,100	57	35.7	4¼	4.16
1,200	52	35.7	5	4.9
1,300	50	37.0	5½	5.4
1,400	43	34.4	6	5.88
1,500	42	36.0	6¾	6.6

The conclusions to be drawn are:

(*a*) The most favorable position for the break of the magneto is 6 7-8 inches on the circumference of the flywheel.

(*b*) That the valve timing within wide limits has a negligible effect on the maximum power.

(*c*) That the Mayer Model M carbureter gives the maximum power.

(*d*) That the aggregate power lost in driving the water pump, oiler and the interrupter is too small to be measured on the laboratory dynamometer.

(*e*) That to develop the maximum power the muffler must be taken entirely off as the cut-out does not afford a sufficiently clear passage for the exhaust.

(*f*) That the back pressure in the muffler is excessive, being a maximum of 6 1-3 pounds.

(*g*) That the compression is altogether too high (19 per cent.). The clearance volumes vary from 19 to 24 per cent. in different motors.

(*h*) That it appears possible by taking special care in the construction of the motor and having all the clearance volumes exactly the same (about 23 per cent.) and by devoting attention to the carbureter and the inlet manifold to secure an intimate mixture of fuel and air and a perfect charge distribution to boost the maximum horsepower up to 60.

Under the conditions as above indicated, including the conclusions drawn by the tester, the results obtained from the Mayer carbureter were uniformly good and as determined by tests, of which results are here given, that the performance under speed-changing conditions are thoroughly good, particularly if the proper size of carbureter is selected, taking into account the characteristic of the motor, remembering that what will do in one case may not do so good in another.

M. A. M. Elects 2-Dozen

Membership Growing Rapidly; Importance of Close Association Being Recognized

TWENTY-FOUR new members elected to the Motor and Accessory Manufacturers at a recent meeting of that organization. This brings the total roster of the association up to 200 members.

The names of those just chosen are as follows: Apple Electric Company, Borne-Scrymser Company, Carpenter Steel Company, Chicago Telephone Supply Company, Covert Motor Vehicle Company, Crucible Steel Company of America, Dover Stamping & Manufacturing Company, Eisemann Magneto Company, The Ferro Machine & Foundry Company, Frost Gear & Machine Company, Isaac G. Johnson & Company, The Kellogg Manufacturing Company, The Miller Rubber Company, Newark Rivet Works, Reichenbach Laboratories Company, Russel Motor Axle Company, A. Schrader's Son, Inc., The F. W. Spacke Machine Company, Standard Thermometer Company, The Stein Double Cushion Tire Company, Stevens Manufacturing Company, The White & Bagley Company, The Willard Storage Battery Company, and O. W. Young.

Demountable Solid Tires

Torrilhon, in France, Makes Demountable Solid Tire Application

AFTER demountable rims in connection with pneumatic tires have become a common appliance, the French firm of Torrilhon has sought to give the same convenience to commercial vehicles employing solid-rubber tires. The demountable rim carrying the rubber bandage has a series of oblong steel studs on its inner face. The fixed rim carries two circular grooves cut at intervals to receive the studs on the dismountable rim. The central rib dividing the two grooves on the fixed rim is a little shorter at one end of each of its sections than the two others. Thus when the demountable rim is placed in position it is given a slight circular movement to bring the studs in a locked position between the two outer ribs, effectively preventing all lateral motion. In each of the spaces left free after the rim has been placed in position is slipped a steel key, the inner extremity of which is provided with a heel received in a depression provided for it on the face of the fixed rim. A nut is screwed onto the outer end of the key and secured by a split pin. The wheel has been supplied by the Torrilhon company for some of the omnibuses in service in Paris.

French Economy Results

Fuel and Lubricating Oil Determinations of the French Military Trials

COMPLETE official figures on fuel and lubricating oil consumption in connection with the French military trials have just been issued by the Automobile Club of France. Unlike last year's event the trials were not really a competition, there being no classification according to merit, and all being capable of finishing in the winning class. It was necessary to fulfill the army requirements for regularity and economy, but no opportunity is given of differentiating between the best and the worst of the vehicles fulfilling those requirements. Thus, although the same firms were represented and the vehicles had undergone little change, it is not possible to make close comparisons with the results obtained a year ago.

The event was a regularity and fuel economy test over a distance of 1,570 miles, the fuels used being gasoline, benzol and alcohol. At the head of the following table will be found the two vehicles which, in their respective classes, proved to be the most efficient last year. It is interesting to note that the average distance covered on a gallon of lubricating oil by the sixteen successful vehicles is 142 miles. The explanation of the high oil consumption of certain trucks, particularly the Panhard, is that last year two vehicles were put out of business through stinting of oil, with a desire to figure well on the economy test. This year the drivers took no chances, especially as there was nothing to be gained by ultra economy.

The vehicles averaged 9.7 miles to the gallon of gasoline, 10.4 to benzol, and only 8.2 on carburetted alcohol. In making comparisons it should be remembered that no important changes could be effected on the carbureters to suit the different fuels. It was impossible to change the jet, regulate the air, the amount of heat, or the weight of the float, but it was not possible to substitute a different carbureter for each fuel. The trials were held in satisfactory weather, and generally over good roads.

Fuel Consumption of 16 Successful Trucks in French Military Trials

			Lubricating Oil 1570 Miles		Gasoline 560 Miles			Benzol 560 Miles			Carburetted Alcohol 450 Miles

*1909 Winner.
Useful load includes weight of body.

Use of Benzol Abroad.—The growing use of benzol as a fuel for motors in France, checks the demand for gasoline and should redound to the advantage of American automobilists. The fact remains that benzol is a good prospect for American consumption.

Bergdoll "30" for 1911

NINE DISTINCT BODY DESIGNS ARE INCLUDED, THE IDENTICAL CHASSIS SHOWING MANY FINE POINTS OF DESIGN

THE Louis J. Bergdoll Motor Company, of Philadelphia, is making its real debut in motor car manufacture. The Bergdoll "30," which is making its 1911 bow to the public, is the result of two years' experimental work, and embodies in a popular-priced car all the practical features and advantages of the best foreign and domestic development. Fifty-odd taxicabs that were turned out by the company last year have been run an average of 8000 miles. The company gives a broad guaranty of material and workmanship with every car turned out of its well-equipped factory.

Bergdoll bodies are constructed on the popular straight-line style. The standard finish is in Richelieu blue with pin striping of turquoise. The running gear is done in primrose yellow and the upholstery and fittings are of adequate style and construction. A special feature of the car is the extra provision that is made to insure plenty of leg-room, the long body lending itself to this phase.

The most important mechanical factors in the Bergdoll "30" may be described briefly as follows: The motor has four cylinders of reverberatory air-furnace iron, cast en bloc to secure lightness, compactness and satisfactory water-jacketing. The cylinders are 4 by 4 1-2 inches, thus indicating horsepower of 25.60. The intake valves are of large size and are located in the heads of the cylinders with exhausts at the sides. The crankshaft is of nickel-steel, heat-treated and tested to five times the stress of usual service conditions. The connecting rods are drop forged with long bearings of Parsons white bronze, with sheet-metal liners for taking up wear.

Throughout the motor, transmission and running gear, large annular ball bearings are used and in following out this idea of big bearings in the construction of the Bergdoll, the fact may be noted that at each end of the crankshaft bearings of greater size than those usually recommended by manufacturers are to be found.

The system of lubrication is automatic, maintaining a constant level for splashing oil in the crank chamber, with an overflow into a reservoir below. A continuous supply of oil is carried to the engine base by a pump operated by camshaft. An ingenious partition in the engine base prevents excess oil at either end while traversing a grade. One filling is said to be sufficient for 300 miles. The supplementary system includes oil and grease cups throughout the chassis where required.

The carbureter is automatic and practically fool-proof. It is of the single-jet type with auxiliary air inlet, needle valve and air valve being adjusted to insure a mixture for the varying speeds. Warm water from the circulation passes around the mixing chamber. Strained gasoline is carried to the carbureter through a seamless copper tube.

The crankcase is of cast aluminum, the upper half of which contains the cylinders, crankshaft bearings, oil pump, magneto, water pump and unisparker. The lower half forms the oil reservoir.

The clutch is of the multiple disc type and the transmission, which is selective, gives three speeds forward and reverse. The circulatory system is founded upon a centrifugal pump, which passes the water through the cylinder jackets to the Livingston radiator of cellular type.

Worm-and-gear with ball-thrust bearings is the style of the steering gear. The column is of wide diameter, with control levers on top of a 17-inch wheel. One advantage claimed for this type is that a quarter rotation of the mechanism will bring a new section of the gear into action, thus increasing the life of the whole steering system.

Guaranteed springs are rather novel in motor car construction, but the Bergdoll company specifically covers this element of the car. The springs are of chrome-vanadium steel, semi-elliptical in front and three-quarter elliptical in the rear, which are said to secure easy riding and durability.

The axles of the Bergdoll are somewhat out of the ordinary. The front axle is an I-beam section in one piece, heat-treated, drop-forged with two large annular bearings at each spindle. The entire weight at this point is carried on a ball three-quarters of an inch in diameter, placed at the top of the vertical column of the knuckle.

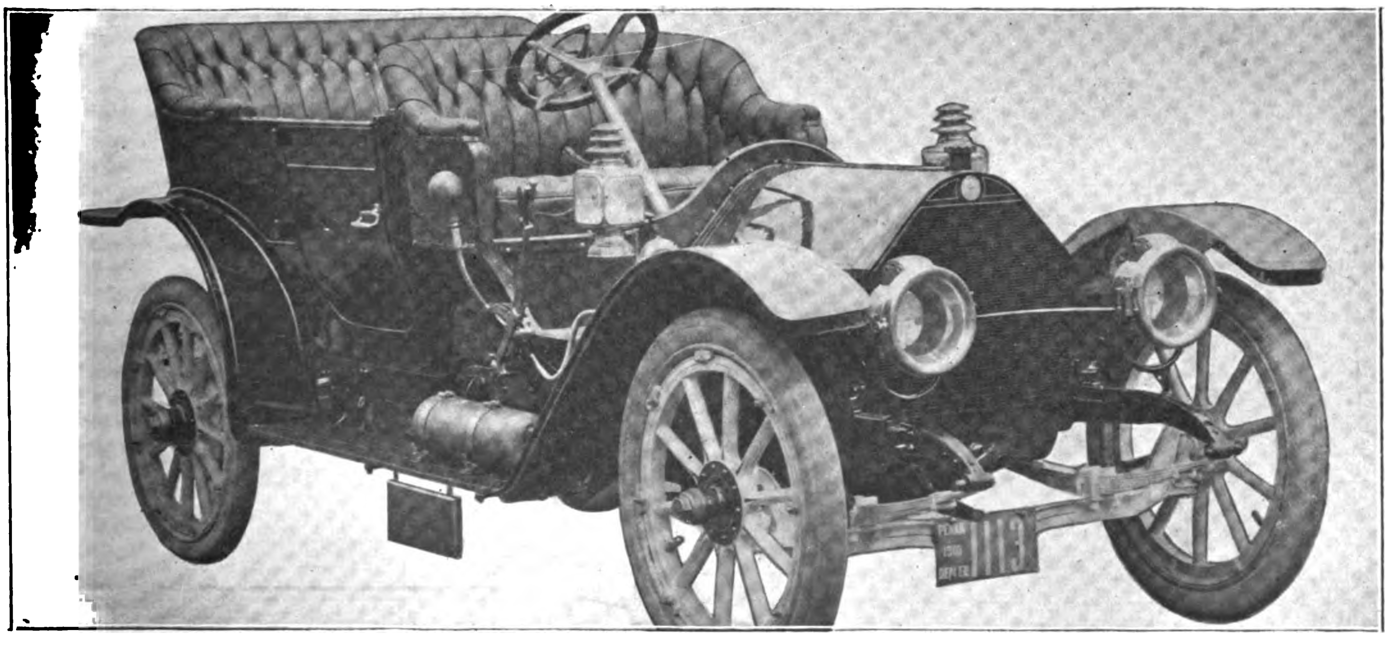

Fig. 1—The Bergdoll "Thirty" touring car, possessing fine lines and built for comfort

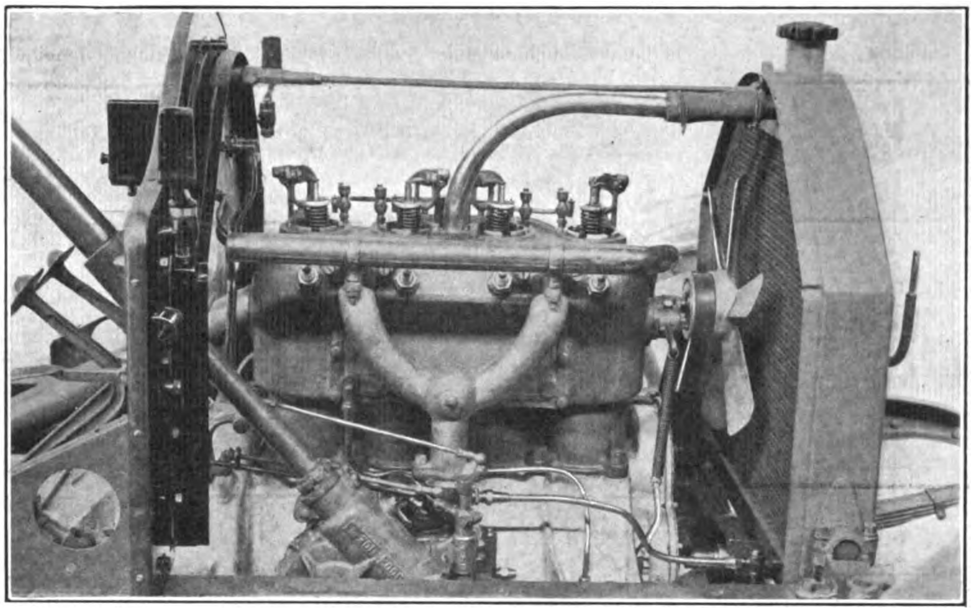

Fig. 2—Showing the inlet side of the Bergdoll "Thirty" Motor

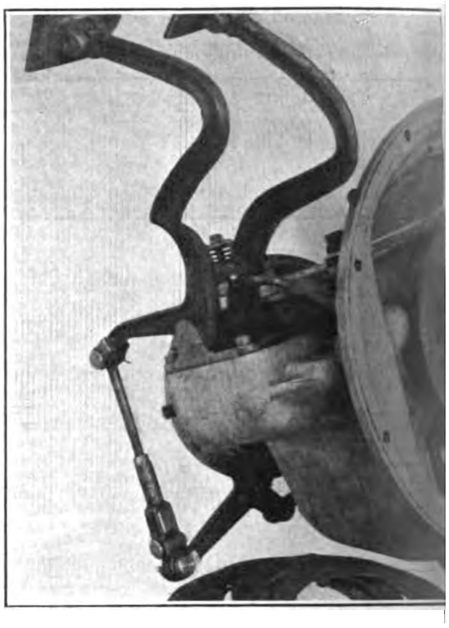

Fig. 3—Illustrating the mechanism

The rear axle is of full-floating type, with a housing of pressed steel in a single piece the entire length of the axle. A large cover over the rear part of the housing allows easy inspection of the pinion shaft and gear, differential and bevel gears and other mechanical parts. The shafts and gears of various kinds are made of 3 1-2 per cent. nickel-steel, appropriately heat-treated. Ten large annular ball bearings and three thrust bearings are used in this axle. The gear ratio is 3 11-14 to 1.

Cold-pressed steel, twenty to thirty point carbon, is the material from which the frame is made. The foot brake is located on the driving shaft behind the transmission. It is of the contracting type, with 3-inch face band, lined with Thermoid. The emergency brake is internal expending and self-equalizing. Both brakes are double-acting.

The car is equipped with artillery wheels, 34 inches in diameter. The hubs and brake-drums are bolted to the alternate spokes of the rear wheels. Continental tires and Continental quick detachable and demountable rims are used on all Bergdoll cars.

Ignition is by two systems. The new Atwater-Kent uni-

sparker with coil and batteries is supplied as the regular equipment, and Bosch magneto and an independent set of spark plugs are furnished as special equipment. Both systems are high tension. In the uni-sparker insulated wires carried in tubes along the top of the motor connect the device with the spark plugs. The magneto wires are laid through vertical brass tubes.

chassis.

Continental quick detachable, demountable rims; Continental tires; Livingston cellular radiator; Schwartz artillery wheels, the double ignition system; Gray and Davis lamps and the compact rear axle construction are some of the points emphasized by the makers of the Bergdoll, in introducing the car, and steel alloys are used in the parts subjected to greatest strain.

The factory of the company is located at Thirty-first and Dauphin streets and has a floor space of 115,000 square feet. The painting and finishing departments are downtown.

The officers of the company are as follows: Louis J. Bergdoll, president; E. C. Johnson, vice-president; William E. Haupt, second vice-president; Charles A. Bergdoll, treasurer; Philip S. Malickson, secretary.

Delco Ignition System

SHOWING THE UNITS OF THE IGNITION SYSTEM; ILLUSTRATING ITS APPLICATION ON A CADILLAC MOTOR AND DESCRIBING ITS WORKINGS

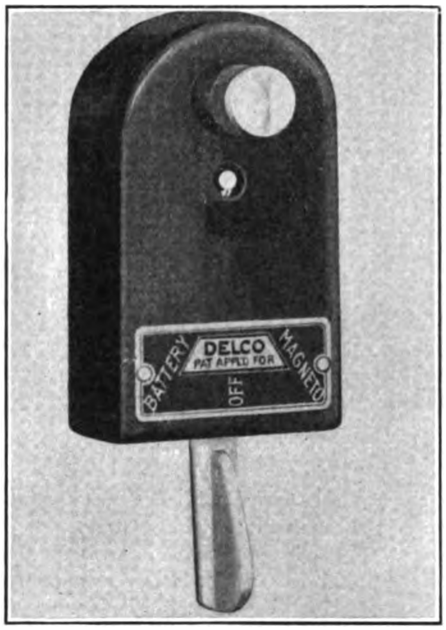

Fig. 1—Delco switch equipped with a mechanical lock and with easy-starting device

REFERRING to the illustrations, Fig. 1 is the dashboard switch which provides a means for throwing in either the battery or magneto, and a neutral position for opening the ignition circuit. Fig. 2 presents the scheme of installation of this system as it applies to a Cadillac motor, in which the details of the relay are shown in Fig. 3, and those of the distributor are plainly set forth in Fig. 4. Fig. 5 shows the distributing coil.

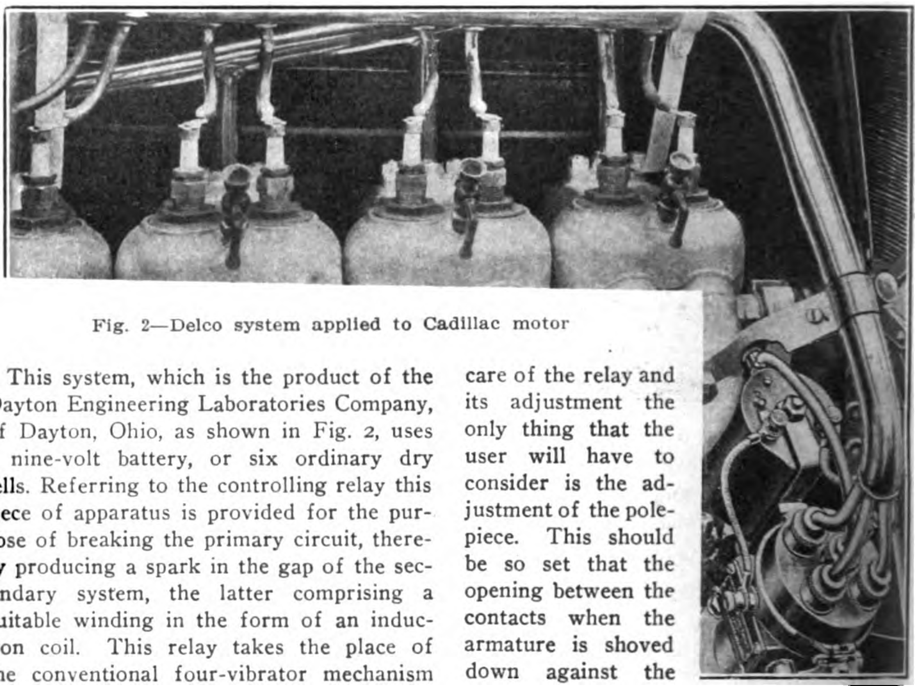

Fig. 2—Delco system applied to Cadillac motor

This system, which is the product of the Dayton Engineering Laboratories Company, of Dayton, Ohio, as shown in Fig. 2, uses a nine-volt battery, or six ordinary dry cells. Referring to the controlling relay this piece of apparatus is provided for the purpose of breaking the primary circuit, thereby producing a spark in the gap of the secondary system, the latter comprising a suitable winding in the form of an induction coil. This relay takes the place of the conventional four-vibrator mechanism as employed in the standard multi-coil systems, and its proper function is that as ordinarily performed by a master vibrator. The difference between this controlling relay and the regular form of master vibrator lies in the fact that with the master vibrator there are a series of sparks, whereas in the controlling relay there is but one spark for each contact of the commutator. In this system there are no moving parts excepting in connection with the relays, and it is pointed out by the maker that in the care of the relay and its adjustment the only thing that the user will have to consider is the adjustment of the pole-piece. This should be so set that the opening between the contacts when the armature is shoved down against the pole-piece will be equal to about the thickness of one sheet of book paper, a matter of perhaps [illegible] inch. A simple way of fixing upon this necessary adjustment is to screw the pole-piece outward, that is, in the direction opposite to the hands of a clock until the motor stops firing, then go the other way four or five notches.

A condenser is used just as in other systems, it being located in a protected position, requiring no care.

THE AUTOMOBILE

Bruce-Brown Wins Grand Prize

BY MARGIN OF A SECOND—MARMON ANNEXES SAVANNAH TROPHY, AND KNIPPER CAPTURES TIEDEMAN CUP

The Winning Car

Governor Brown, of Georgia, and Mayor Tiedeman, of Savannah, congratulating Joe Dawson, of Marmon fame and winner of Savannah Trophy

SAVANNAH, GA., Nov. 12—David Bruce-Brown, driving car No. 15, won the Grand Prize of the Automobile Club of America in the closest finish ever recorded in a road race, here or elsewhere. The distance was 415.2 miles, the longest race of its kind ever run, and his time was 353 minutes 5 seconds and a small fraction. Six out of the fifteen starters completed the full course, while nine fell out at one stage or another and from varying causes.

Bruce-Brown drove a wonderful race. His first ten laps were done between 14 and 15 minutes, and most of them varied only a few seconds one way or the other from 14:20. He conserved the life of his mount better than the other drivers, and simply sailed along at a very fast pace from one end of the race

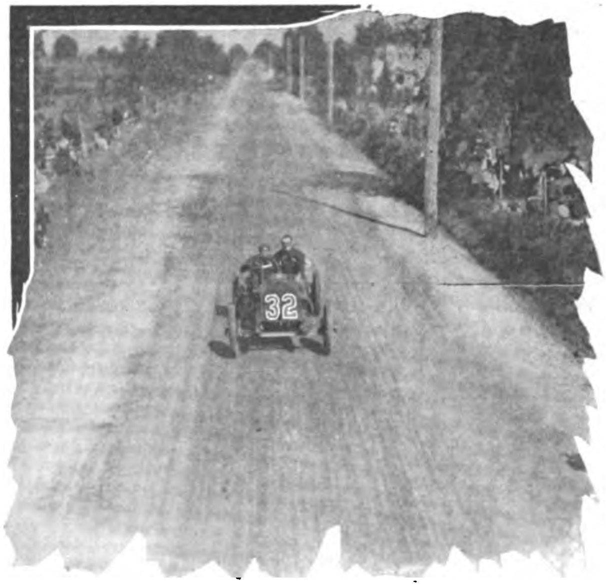
Grand Prize Marmon which made good showing



One of the perfect stretches, showing small Marmon

to the other. His first lap was done in 14:28, his fastest 14:01, slowest 20:30, and his final round in 15:12.

It was a beautiful exhibition of steady driving at high speed and the winner did not show in the lead until the twenty-third lap when he was left out in front by the cracking of a cylinder in De Palma's Fiat. Prior to that time he had maintained a place close to the pace, but did not once show in front until it was time to win.

The rate of speed of the winner was 70.55 miles an hour, a new American road record, but failed to equal that of the Florio course.

Hemery jumped into the lead at the start, with Marquette-Buick (Chevrolet) a close second and Fiat 16 (Wagner) third. The Fiat and the Marquette-Buick changed places in the second round. This order was maintained through the third lap. Tire trouble gave the Buick a setback in the fourth and Bruce-Brown stepped along into third place behind Wagner. There was no change in the order in the fifth, but in the sixth Haupt displaced Bruce-Brown for third honors. Nazarro's Fiat, going at a perilous rate of speed and making the fastest lap of the race, closed on the leaders, finishing only 52 seconds behind. Wagner, Fiat 16, was a close third. They ran the same way in the eighth. A stop at the pits for fuel and water lost the lead to Hemery and Wagner's Fiat took up the running for two laps with Nazarro second and Bruce-Brown third. Haupt was coming with a rush and when Wagner was forced to stop at the pits he pushed to the front in the eleventh lap with Nazarro second and Bruce-Brown third.

At this stage of the race four cars were out of it on account of mechanical troubles and in the thirteenth lap Haupt met with mishap while leading the field. His car became unmanageable while traveling at high speed and shot off the course, turning a somersault and projecting the driver and his mechanic into a clump of bushes with terrific force. The yielding character of the bushes broke the fall of the men and neither was seriously hurt. Precisely what caused the trouble is problematical as the car was badly jarred by the accident.

This left Nazarro in front and De Palma, coming with a swoop, ran into second place with Bruce-Brown third once more. From then to the sixteenth round the order remained the same. Nazarro stopped in the seventeenth and De Palma succeeded to the lead, a few seconds ahead of the Italian pilot, upon whom Bruce-Brown was closing.

For the next five laps De Palma held his advantage, Nazarro going out with a broken chain after disregarding the white flag of the technical committee. Bruce-Brown was a close second until half-way through the twenty-third lap when De Palma's car cracked a cylinder and retired. At the end of the twenty-third round Bruce-Brown was in the lead by less than two minutes from Hemery, with Burman's Buick third. Hemery drove fast in the last lap and only failed to catch Bruce-Brown by a matter of 1:42 seconds. The Buick was third, Lozier (Mulford) fourth, Lozier (Horan) fifth and the sturdy Marmon (Dawson) sixth.

The Fiats, of which so much was expected, failed to finish. Nazarro made a prominent showing, covering 18 laps before succumbing to a broken chain. Wagner's car turned turtle in the seventeenth and De Palma cracked a cylinder when apparently in winning shape.

Haupt's Benz also succumbed while leading in lap 13. The Pope-Hartford pair both fell out with mechanical troubles, one suffering from valve trouble and the other with an engine difficulty. The Alco entry did splendidly as far as it went, running very evenly lap after lap. While it was not prominent at any stage, Grant was evidently pursuing the same tactics as he had used in his two winning Vanderbilt races and but for stripping his gears might have proved a factor.

The two light car races which were run on Friday resulted in victories for the favorites. Marmon 36, handled with much skill by Dawson, won the Savannah Trophy race from end to end. The race was 16 laps of the 17.3-mile course and Dawson made every post a winning post. He was sharply pushed in several stages of the running but always managed to swing past the stands with some sort of a margin. The time of the winner was 4:23:39.98 for the 276.8 miles, about 62 miles an hour. The Mercer entry which finished second driven by Washington A. Roebling II ran a gallant race. Mr. Roebling drove to get the most out of his mount and several times had the veteran Dawson doing the prettiest the Marmon could in order to keep ahead. The Mercer also made more than a mile a minute. A Fal, driven by Hughes, was a good third, having experienced considerable tire trouble. Another Marmon was running at the end and two Fals dropped out in the ninth round, one of them having been very prominent up to that mark.

The Tiedeman Trophy race at 11 laps for cars of 161-230 displacement was taken by the Lancia entry (Knipper). This car led all the way and won by a comfortable margin from E-M-F 45 (Witt), the car that showed great speed at Atlanta in its class. Three Maxwells finished the whole journey without mechanical troubles of any kind and were going about as fast as the winner at the end. Another E-M-F, No. 41, and the Cole pair, Nos. 43 and 47, did not finish.

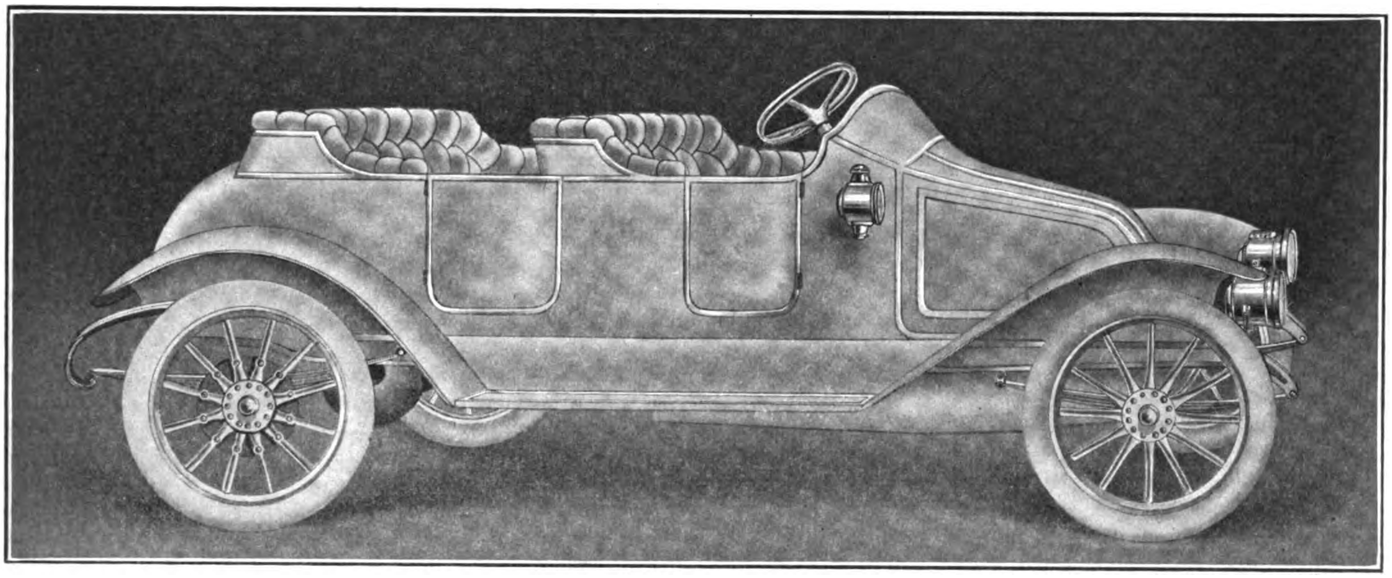
EDISON NICKEL-IRON STORAGE BATTERY; SULPHATION OF LEAD-LEAD BATTERIES; EFFECT OF THE COLD ON CAPACITY; STYLE IN ELECTRIC VEHICLES



SUGGESTION OF A TOURING ELECTRIC AUTOMOBILE WITH THE BATTERY LOCATED UNDER THE HOOD IN FRONT

ELECTRIC vehicles capable of going 100 miles are as readily obtainable as a pound of sugar or furniture for a house; they have all the virtues of the same able electric motors that are so advantageously used on trolley cars and the heavy trains that so enjoyably transport millions of citizens from their homes to their places of business and back again day after day with scarcely ever an interruption of any kind. The motors are noted for their great torquing ability, speed-changing facility and ease of control. Speed is but a matter of gear ratio, power has no limit placed upon it, and longevity is at home in this form of equipment.

What seems to be most in need is the suitable placing of a battery large enough to furnish all the current that will be needed in the propulsion of the automobile, and a type of car that will compare favorably with gasoline automobiles for that class of customer who prefers comfort, even luxury, letting the price come as it may. There are now available all the types of electric vehicles, excepting those of the more pretentious touring types, and with batteries that are capable of furnishing the requisite quantity of current; it is suggested that the last prop be knocked out from the clumsy procrastinator who stands in the way of a wider range of use of the electric vehicle.

In the design of a touring type of electric vehicle, there are many points to be considered, but there is no ground for assuming that all the good work that has been done on gasoline types of automobiles should be disregarded in the newer work. The place where the motor resides in gasoline cars has been selected because of its accessibility, and the constant loading effect it has on the front end of the automobile. These reasons hold equally in electric work; the battery, as the source of power, should have the place of honor, and in the "suggested" model as here presented the battery is located under the hood, the latter being of the type that can be raised in order that access may be had to the battery.

This particular car is of the shaft-drive type, the motor coming just where the transmission gear would be in a gas car. In an electric vehicle the motor does two things, it takes electric energy from the battery and transforms it into its mechanical equivalent and it also serves as the speed-changing unit. The motor would take up no more room than is required for a transmission-gear system, nor is it more necessary to have access to the motor than it would be to get at and work upon the transmission gear. This is proven by the sturdiness of the motors that work so well under trolley cars.

Back of the motor the construction would be precisely the same as that for a gas car; the reasons for having it similar are just as they normally stand—the chassis, in view of the road conditions, speed, load to be borne, etc., being the controlling element. There may be many reasons why some other form of automobile will better serve the intended purpose, but the point that is here being made is that the electric vehicle should be on a more graceful basis than it is; automobilists should not have to go against their inclinations and tastes when they attempt to take advantage of the favorable and enjoyable characteristics of the electric method of propelling automobiles.

Electric Cars in Road Run

COLUMN OF THIRTY-NINE PLEASURE VEHICLES START IN PHILADELPHIA "NORTH AMERICAN" EVENT THROUGH QUAKER CITY STREETS

PHILADELPHIA, Nov. 11—Ranging along a mile or more of highways in Philadelphia and adjacent counties, a column of 39 electric pleasure cars paraded for 50 miles to-day in the first run ever given exclusively for this class of automobiles. The run was promoted by the Philadelphia *North American* and at 10 o'clock the head of the column of contesting cars was set in motion from in front of the home of the big newspaper.

The cars moved away from the starting line without the sputter and noise that always accompanies the start of a gasoline car event and at intervals of 10 seconds, thus the contestants were always in sight of one another.

Officials of the Quaker City Motor Club had charge of the administration of the run and acted with their usual precision and skill. R. E. Ross was referee; G. Hilton Gantert, starter, and Paul B. Huyette had charge of the timing and scoring.

In the column were twelve Woods cars, three Bakers, three Babcocks, nine Detroits, four Studebakers, one Clark, six Waverleys, and a Rauch & Lang. Nine of the contesting cars were driven by women, all of which finished the whole course.

The way was laid out through North Broad street to Fairmount Park, over part of the course of the Fairmount Park Road Race to Ardmore and Bryn Mawr. Stop for luncheon was made at the Merion Cricket Club on the Lancaster Pike, where an hour's control was established. A delightful buffet luncheon was served in the balcony dining room of the club.

The return trip was made early in the afternoon, the cars checking in at the North American Building between 3 and 4 o'clock. There were originally 41 entries in the run, but two cars failed to start. One of these had been shipped by freight and was lost in the maze of 27 freight depots of which Philadelphia can boast.

Of the 39 that participated, all but three completed the full course. The roads selected embraced every variety of good road possessed by Philadelphia as well as short stretches of highway that could not be so designated. There were five considerable hills on the way, one of which was about 10 per cent. gradient and another a very long 4 per cent. rise. In Fairmount Park the little hills are numerous, but no account is taken of them because the surface of the roadways was so perfect.

All the way on the out trip the contestants faced a stiff northwesterly wind which proved so strong that in places it was difficult to coast down a gentle grade.

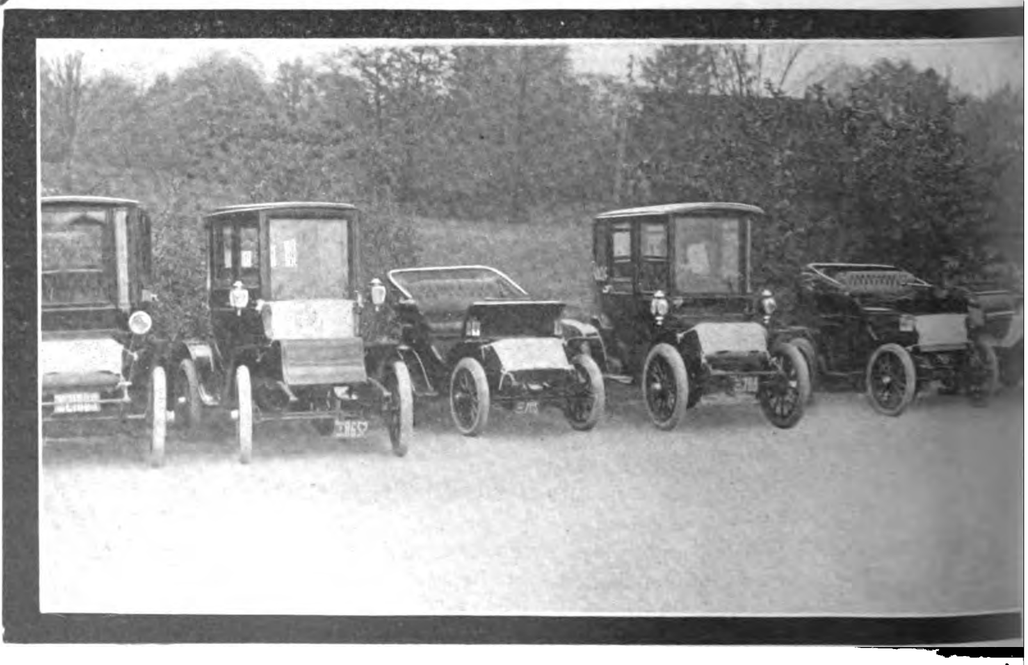
Throughout the trip the cars demonstrated their sturdy qualities as hill climbers and from one end of the run to the other the long line of electrics attracted much attention.

The prize winning and losing had nothing whatever to do with the performance of the cars. It was sheer guess and the plan by which the winners were determined was as follows: When each car checked out the entrant handed to Mr. Huyette a sealed envelope containing the number of hours, minutes and seconds in which he or she estimated that the trip ought to be made. These times were added together and averaged and the result was 4:12:24 2-3 elapsed time. Of course, in order to participate in the prizes, the contestants were obliged to complete the run within the rules. These were simple and informal and did not require difficult things of the cars.

Four handsome prizes were hung up by the *North American*, two cups for the male contestants whose running time was nearest to the average figures and two for the ladies.

Mrs. B. L. Townsend, entrant of a Baker car, made the distance in 4:14:20 and won a gold mesh purse of handsome design. Mrs. E. V. Stratton, in a Waverley, was next nearest to the secret time and was awarded a silver mesh purse. Her elapsed time was 4:16:45. The men's prizes were won by Dr. C. W. Hough-

Dr. Mary Griscom,
Detroit Electric, No. 24



Scene at the handsome grounds of the Merion Cricket Club.

ton, who drove a Studebaker in 4:14:45, and by the Waverley Electric Company in 4:20:28. Dr. Houghton was given a magnificent cup and a smaller one was given to the company.

*Did not go all course
xChecked in Merion, but did not finish run.

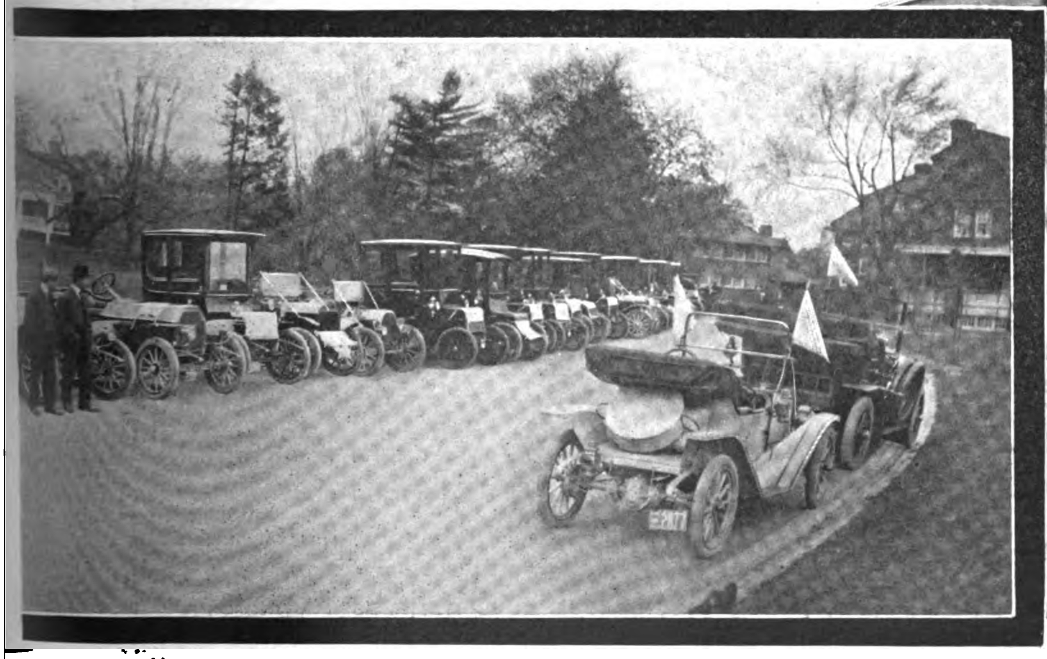
The fastest time was by a Detroit car, which covered the course in an average of 16.6 miles an hour. Two of the Detroit cars were among the missing at the finish of the run and the Clark entry furnished the other unfortunate.

No official observers accompanied the cars, as the whole course was under direct observation and the rules were so broad and elastic that minor technical and mechanical faults were not considered.

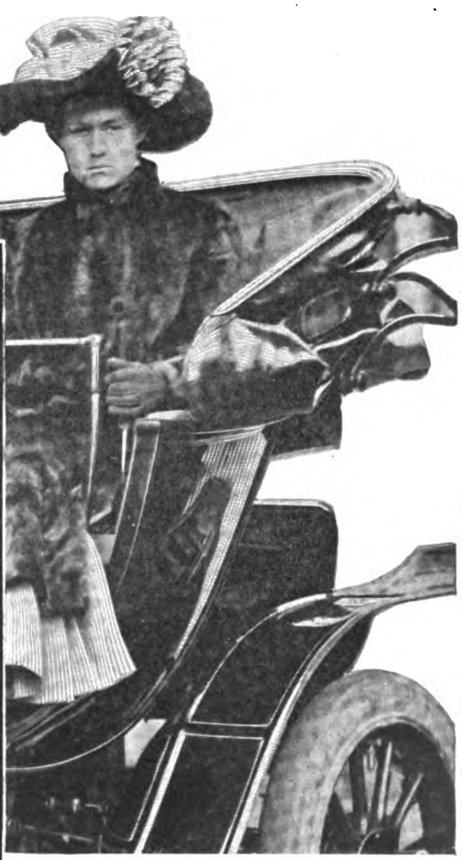
Car No. 29, a Woods, attracted considerable attention at the start and finish and at the mid-control. This car is of 1905 model and except for the fact that its battery was short it performed creditably, although it finished at the end of the procession.

The whole idea of the run was to demonstrate the capability of the electric automobile under conditions that closely approximated actual service, and after it was over contestants, agents and promoters expressed themselves as being thoroughly satisfied with the result.

They said that the field of the electric is distinct from that of the gasoline car and the presence of so many women in line explains a portion of their line of reasoning. They also pointed out that the electrics are specially useful for town car service.



where the participants in the electric run stopped for lunch



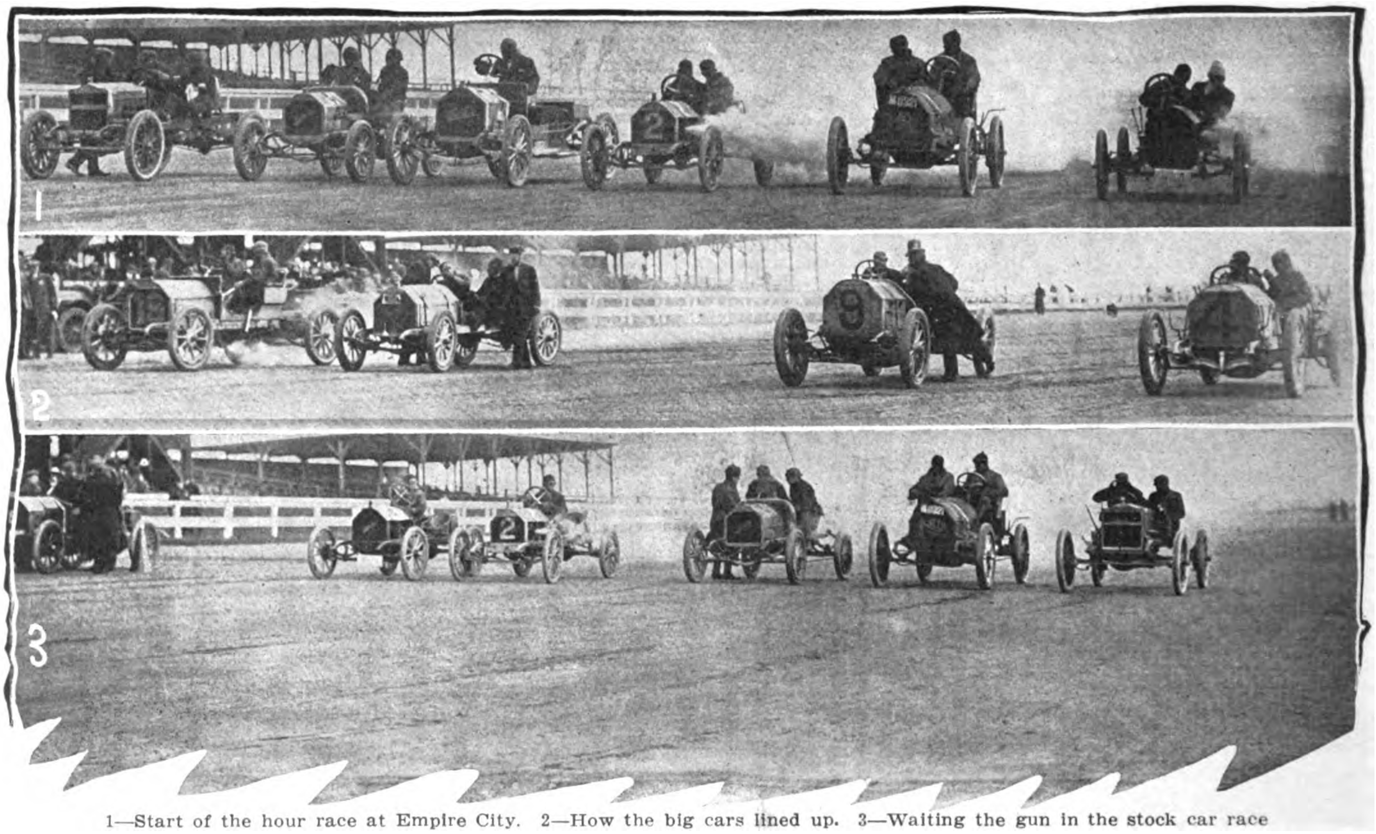
Mrs. E. V. Stratton,
Waverley, No. 33

Yonkers Meet Closes Season

MT. VERNON AUTO CLUB CONDUCTS SUCCESSFUL RACE PROGRAM DESPITE POSTPONEMENTS AND ADVERSE WEATHER CONDITIONS

DESPITE two postponements, cold weather and a 40-mile gale of peculiarly penetrating character, the fall race meeting of the Mt. Vernon Automobile Club at Empire City race track, near Yonkers, proved a success. Motor enthusiasts to the number of about 3,000 braved the weather to attend and they were rewarded by seeing some good sport.

The first event carded was an hour race in which six cars participated. They were a Maxwell, Black Crow, Buick, two Hupmobiles and a Reo. In addition to a purse of $250, which was divided among the first three, the Splitdorf Magneto Trophy went to the winner. The race was exceedingly well contested throughout. The Maxwell jumped into the lead at the start with the Black Crow of Rost's in closest attendance. After three rounds, the Reo suffered a broken wheel at the head of the stretch and it required half an hour to replace the part. The car was started again and at the end of the hour had made 15 laps.



1—Start of the hour race at Empire City. 2—How the big cars lined up. 3—Waiting the gun in the stock car race

The little Hupmobiles did not have enough power to keep up with the bigger cars and were lapped after the eleventh mile. They continued to the finish, however, and made 38 miles each without mechanical difficulty. In the meantime it was a royal struggle between the leaders. The Maxwell, hard-driven was forced further to the front for a dozen miles, opening up a gap of nearly a lap from the Black Crow and Buick. These cars took a spurt after 30 miles had been done and gradually closed upon the pacemaker. The time was too short to catch the Maxwell, however, and the red car came to the wire first by about two furlongs. The Black Crow, running very smoothly, took second place from the Buick which fell back in the final spurting.

The Vanderbilt Cup Mercedes, driven by Spencer E. Wishart had too much power for the field in the second event at ten miles, winning from a Stearns, another Mercedes and an Allan-Kingston.

The Reo which met misfortune in the first event captured the ten mile stock chassis race after a battle with the Buick. The winner's margin was 1 second. Maxwell, 16, finished third.

The five-mile free-for-all handicap drew a big field, but the Vanderbilt Cup Mercedes from scratch was working well and picked up the field handily. The last two races on the card for amateurs and club members were consolidated and run off as one race. The Stearns entry and a Mercedes entered by Harold Mendel had a neck and neck struggle for first honors, while the Black Crow, driven by Otto F. Rost was a bang-up third, ten seconds back of the leaders. The Overland wind-wagon gave an exhibition. The summaries:

ONE HOUR RACE, SPLITDORF MAGNETO TROPHY

Car	Driver	Distance
Maxwell	C. W. Lowa	44 1-2
Black Crow	O. F. Rost	44 1-4
Buick	E. L. Haas	43

Lead Battery Trouble

Sulphate Smothers the Active Salts; Chemical Asphyxiation Takes Place

POSITIVE plates of lead-lead batteries are ready to be discharged when all the salts of lead are reduced to peroxide of lead. In actual practice, it is an unfortunate fact that from 30 to 50 per cent. of the peroxide of lead is so isolated by lead sulphate that it is never reduced to sulphate, and the capacity of the battery is therefore limited by the value of the unconverted peroxide. In a word, sulphate of lead forms over the peroxide of lead and smothers further action, hence the suggestion of chemical asphyxiation. It was pointed out by Professor Robertson that the smothering action of the lead sulphate is greatest when the rate of discharge is maximum; this fact accounts for the reduced weight efficiency of batteries that are placed to do vehicle work, in which the rate of discharge is necessarily high. In vehicle batteries, on this and other accounts, the plates are made relatively thin, and an attempt is made to increase the "fluffiness" of the active material in order to afford better paths for the sulphion of the electrolyte which must reach every particle of the active material before it can be converted into sulphate of lead. It is a great misfortune that "rubbish" salts of lead (isolated particles of a mud-like consistency) accumulate at a too rapid rate, clogging up the passageways and ultimately rendering the battery useless.

Play It on the Piano

The Man Who Uses a Dirty Rag to Clean off the Automobile Body Is Requested to Try It upon His Piano at Home—By W. L. Stewart

THE average automobile owner or dealer has a very faint idea as to the method pursued in producing that beautiful mirror-like effect on the finished body of an automobile, and a much smaller percentage of them have any idea as to the method to be pursued in preserving that finish which is of so much interest to the man that prides himself on the appearance of his car, or the dealer who realizes the importance of the beauty of the car in making the sale. The following is the process used by the large manufacturing concerns in finishing a car:

The body is first sand-papered, after which it is given a coat of oil which is allowed to dry for 24 hours. Then the priming coat of lead and oil, then another drying spell of 24 hours, after which it is gone over with hard putty. Next comes a coat of filler, which is allowed to dry for 24 hours; the last item is repeated four to five times, with 24 hours' drying time between each coat.

Then the surface is sand-papered down smooth and the first coat of color applied and allowed to dry for 24 hours, after which the second coat of color is put on.

Then follows one coat of rubbing varnish, which, after being thoroughly dried, is rubbed down with pulverized pumice stone, then the body is striped or finished with any ornamental design that is required, after which the second coat of rubbing varnish is put on, allowed to dry and is then rubbed down, after which the finishing coat is applied and is left to dry.

The above complete, you have a finished surface equal to a mirror.

Now the question is how to preserve that beautiful luster.

Everyone tells you how to protect your tires. How to protect your engines. How to prevent this trouble, and how to prevent that trouble.

But as yet no one has ever attempted to enlighten you on one of the most important items in the trouble line, one that creeps on you unawares and when once there takes from $50 to $100 to repair it. The item in question is the appearance of your car, one that has as much if not more to do with your final decision in selecting your car than any other.

To prevent your car from assuming a dull, faded and unattractive appearance it requires your most careful attention.

The occupants of a highly polished car are the ones that enjoy the ride. The friend that comments on your car remarks the appearance first of all.

The writer on a recent visit to one of the downtown garages came very forcibly in contact with the advisability of the owner keeping his car in first-class condition as to its appearance.

There were two cars on the floor, same model, same make; one had been taken care of and the other neglected. The owners of the cars wanted to sell them and in the trade that ensued the man that owned the car that was clean and well-kept received $300 more for his car than the man with the car that was dirty, scratched and ill-kept. The dealer explained that the good-looking car caused him no trouble or delay in selling it and getting back the money allowed on the new car. While in the case of the neglected car, it was a plain case of having his money tied up tor from four to eight weeks while the car was being repainted and refinished at a cost of from $75 to $150 or possibly more. It easily pays to keep a car in good condition as to appearance.

The dealer went a little further in his talk on appearance and the method of cleaning used by a great many chauffeurs. When they start to clean a car they hunt around for a piece of waste and when found it more than likely is taken out of an old tool box; it is then rubbed on the varnished parts that have been partly washed, covered with grease and mud spots here and there; the grease spots are smeared over about four times the amount of space they originally covered and the sand and mud are rubbed over another four times the space they covered; the result is a smear that will catch all the dust and a lot of sand scratches.

At this stage he branched off to remark, "Can you imagine anyone going into your parlor and trying to polish your piano with an old dirty piece of waste? What you would do to them would be enough. You should at least be as careful with a machine that cost you as much as five or ten pianos."

A handsome looking car is a thing of beauty and a joy forever.

In buying a body polish get the best and don't buy one that you happen to find because it is cheap. The best is the cheapest.

Keep Lead Batteries Warm

Output of Lead Storage Batteries Is Reduced by the Cold

WINTER service of electric vehicles is somewhat marred, due to the influence of low temperature upon the output of the battery. The highest obtainable output is realized at temperatures not far from 90 degrees Fahrenheit, but as the temperature is lowered the battery discharge becomes more meager, falling off to a level that seriously affects the service when the temperature is hovering around the freezing point. It has been pointed out that the capacity of a lead-lead battery falls off at the rate of about 1-2 of 1 per cent. per degree Centigrade lowering of the temperature between 22 and 0 degrees Centigrade; that is to say, between 71.6 and 32 degrees on the Fahrenheit scale, remembering that 32 degrees Fahrenheit is the melting point of ice, and that 72 degrees on the same scale is average Summer temperature. But the temperature is frequently 100 degrees Fahrenheit in the Summer time and it not infrequently falls to zero in the Winter time. It is during these extreme conditions that batteries suffer most; they overheat on the hottest days and the electrolyte becomes so viscous on the very cold days that the results are only to be improved if a means is afforded for keeping the batteries under a more even condition of temperature than Nature seems to practise.

Don't make haste when you are making a mistake; it doubles the length of the road to success.

Don't be blind; if you do not understand how your motor is lubricated, it may be because it is not being lubricated. Find out where you are at.

Remy Kick Switches

Three Designs of Kick Switches for Ignition Control Systems

KICK switches are looked upon as a great convenience, but the practice of kicking an ordinary switch leads to brutal results, the switch not being capable of withstanding the abuse. The Remy Electric Company, of Anderson, Ind., recognizing the desirability of providing a kick type of switch to be placed upon the dashboard at a convenient point so that the autoist can throw from battery to magneto, or into neutral, as the case may be, by a simple foot movement without disturbing his control of the car or himself, has placed upon the market a line of this equipment as here illustrated.

Type-A switch is made either for a hand key or kick pedal. As shown in Fig. 1, this switch is mounted upon a highly polished coil box. This coil is practically the same as was used with their 1910 apparatus. Type-B switch, as shown in Fig. 2, is also made with either a hand key or a kick pedal. This switch is very compactly built and was designed for small and already crowded dashes, or where the dash was to be entirely plain and unencumbered.

Both of the above switches are of metal finished in black and brass. The hand key is hard rubber and of the conventional shape. The kick pedal is brass; the upper part has a sand-blast finish and the lower part is polished.

Type-C switch, as shown in Fig. 3, is made up as a kick switch only, and when installed is almost flush with the dash, as can be noted from the illustration. This switch is of brass throughout, and with its sand blast and polished finish makes a very handsome appearance. All of these switches are equipped with a hard-rubber push button for starting the motor on the spark without cranking when batteries are wired in connection.

These kick switches are all provided with a detachable key which can be conveniently carried in the operator's pocket. The removal of this key makes the switch inoperative and provides against theft of the car. One characteristic of these switches is the ease with which they may be installed. There are no soldered connections to make, all of the wires being cabled and each wire has a terminal clip. Each of the two cables of the dash kick switches is plainly marked. The wires composing the cables are in color and are to be connected to corresponding color binding posts. The cables are equipped with a brass diverging device which holds each wire out at the proper angle for connecting.

Storage Battery Diseases

Sulphate of Lead is the Normal Product

CONSIDERING the forms of storage batteries that are made entirely of lead, for both the positive and the negative elements, using an acid for the electrolyte (the solution), the tendency of the acid of the electrolyte is to convert lead, and absorbing the sulphion of the electrolyte in the process.

Starting out with peroxide of lead as the active material of the positive plates, and spongy lead as the active material of the negative plates, the mere presence of an electrolyte to supply the sulphion is all that remains as requisite for the delivery of an electric current. But in the delivery of the current there is a corresponding chemical change; the peroxide of lead is reduced to lead sulphate, and the spongy lead is also reduced to lead sulphate. Why should there be any question about this sulphion being abstracted from the electrolyte? This sulphion is taken up by the active material of the respective plates and the result is sulphate of lead. Now, sulphate of lead is of no value for purposes of delivering an electric current, although, fortunately, sulphate may be oxidized by an electric current, hence its use in storage batteries. The point here is, sulphate of lead is the compound that is most to be feared in lead batteries because it is the compound that is always being formed, due to the action of the ever-present electrolyte. Surely there is no defect in the reasoning which makes men express a preference for the new styles of torpedo bodies now to be had from every maker of gas cars.—E. H.

Electric Lighting

Illustrating the Hartman System of Electric Lighting Furnishing Current for the Horn

IN recent times the idea of electric lighting in connection with gasoline types of automobiles has gained converts and the Hartman Electric Manufacturing Company, of Mansfield, Ohio, has placed upon the market a relatively inexpensive system for this purpose, comprising a six-volt dynamo, as illustrated in Fig. 1, including a regulator, as shown in Fig. 2. The dynamo is of the enclosed type, weighing 24 pounds, and the regulator is of substantial design, and so arranged as to be mounted on

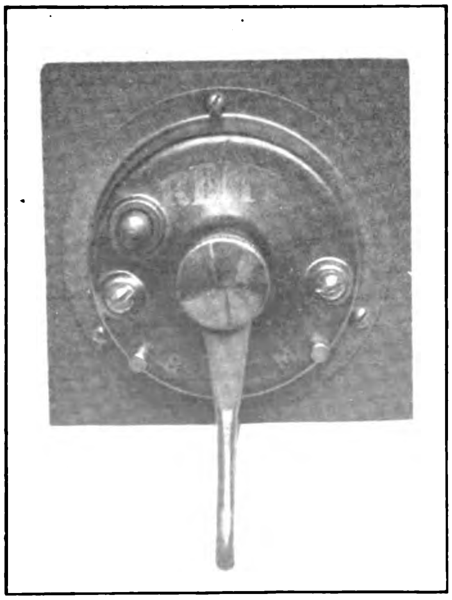

Fig. 2—Is the Remy type-B switch designed for hand key or kick pedal

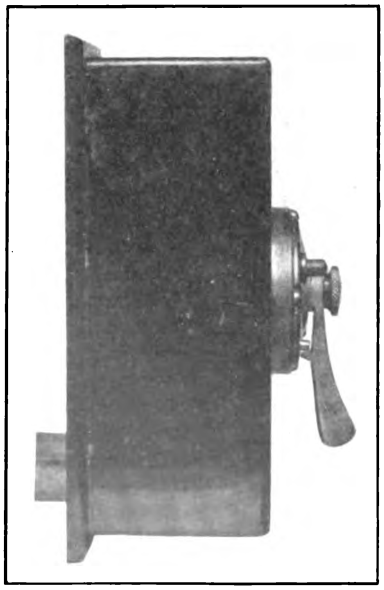

Fig. 1—Shows a type of switch which is furnished for either hand key or with a kick pedal

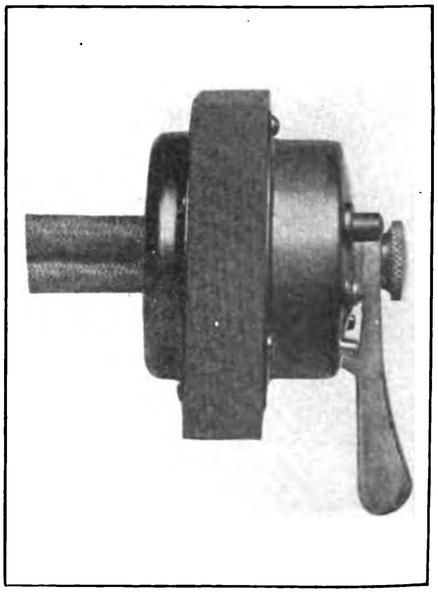

Fig. 3—Is a switch designed with a kick pedal only

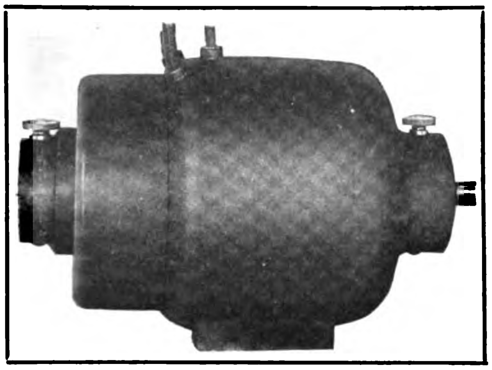

Fig. 1—Dynamo for lighting an automobile and other work

the dash. With the regulator are included three switches, one of which controls the headlight, the second operates the side lights and the third takes care of the tail light. A socket for a trouble lamp is also provided, and a battery for absorbing the surplus energy is included in the system, which battery serves as an auxiliary battery for ignition purposes. As this system works when the car is at rest, or going below 10 miles per hour, the dynamo is automatically switched out, and the current is supplied by the battery, but when the speed of the car is above 10 miles per hour, the dynamo is thrown into action, carries the load, and any surplus resulting is absorbed by the battery. The system is entirely automatic, requiring no attention beyond the occasional oiling of the bearings of the dynamo. The function of the regulating device is to maintain the dynamo voltage constant under conditions of varying speed. Tests have shown that the voltage varies but slightly under speed changes ranging from 1,200 revolutions per minute of the dynamo up to the maximum in service. The battery floats on the circuit, and is therefore protected against overcharging, but it is so situated electrically that when it is below the charged state its receptive condition invites current from the dynamo. The details of the system are worked out to a fitting limit; a turn-down feature is provided in connection with the headlight switch, which enables the driver to kill the glare of the headlights when passing through congested districts and to turn the lights on in full force when the road condition warrants doing so. All circuits are fused so that trouble on one branch is not communicated to the remaining branches, and a separate circuit is provided for the ignition system. Full instructions are furnished with each equipment, and if purchasers so desire the company will supply fittings so that acetylene lighting equipment may be changed over to electric. These facilities are also available for the electrical equipment of oil lamps.

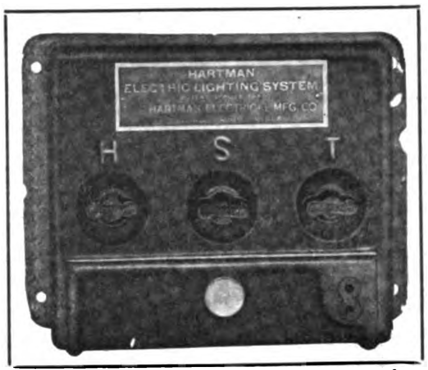

Fig. 2—Control system with switches for each circuit

Tires and Winter Driving—There always seem to be drawbacks in the tire problem, and danger to this most vulnerable part of the automobile is always present. In Summer heat has a detrimental effect due to expansion. In Winter there comes the question of moisture due to rain and snow. A tire properly inflated that would pass over a sharp stone in Summer on a dry road without damage, if driven over the same stone in Winter on a wet or snowy road would probably cut, as rubber cuts very easily when wet. A road containing loose stones should always be taken slowly and with caution; if the patch is a short one, sufficient momentum should be attained before striking them to allow the car to roll over with the clutch out: but if the stretch is long, slow down beforehand.

1910 Edison Storage Battery

FINAL INSTALLMENT — DEALING WITH WALTER E. HOLLAND'S PAPER AS PRESENTED BEFORE THE TWENTY-SIXTH ANNUAL MEETING OF THE ASSOCIATION OF EDISON ILLUMINATING COMPANIES, HELD AT FRONTENAC, THOUSAND ISLANDS, N. Y., SEPTEMBER 6, 7 AND 8, 1910

CONTINUING the explanation of the diagrams accompanying this article, Fig. 26 is an interesting curve showing the alacrity with which the Edison cell adjusts its voltage to sudden changes of discharge rate; and showing also how nearly the voltage at different rates corresponds to that of constant-current discharges at each rate. The slight disagreement between these voltage values is accounted for by variations of internal resistance due to temperature differences. The dropping off at the highest rate toward the end of the varied-rate discharge seems to indicate that it is the increased heating alone which causes full capacity to be given at the same high rate of constant current.

The Edison cell thrives on short-current discharges. Fig. 29 gives the current curves of nine consecutive short-circuit discharges of an "A4" cell, which show an actual betterment of the cell by such treatment. Nine short circuits were given, in this instance, but the betterment ceased after the fourth run. This betterment has been found to be due to the fact that high-rate discharges improve the working conditions of the iron electrode, giving the cell stronger voltage. The improvement is hardly great enough to show on a normal-rate discharge, but becomes very evident at high rates, as shown in Fig. 29.

The length of time which the new type of Edison battery will continue to have a useful capacity must remain a conjecture, sufficient time not having yet elapsed since its inception to ascertain this by actual service tests. Life tests have been made in the laboratory, however, under conditions designed to accelerate deterioration; and by comparison and inference some sort of an

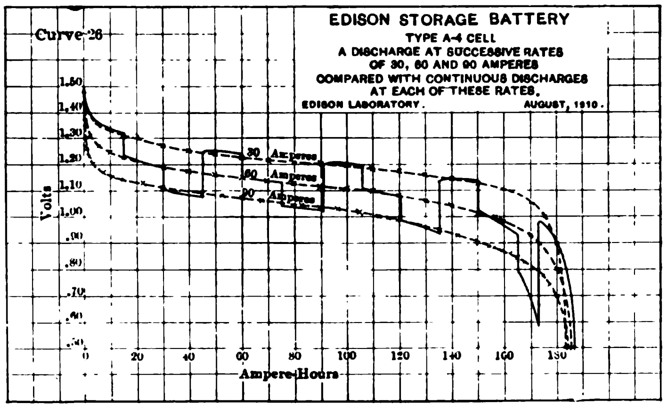

Fig. 26—A discharge at successive rates of 30, 60 and 90 amperes

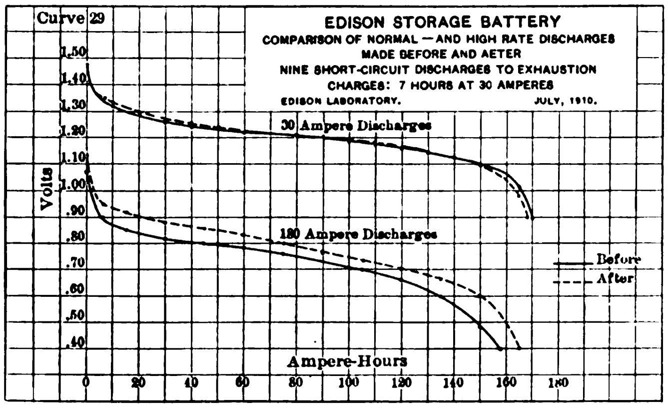

Fig. 29—Comparison of normal and high-rate discharges under different conditions

estimate can be formed from the results of these experiments.

To get life results more quickly use is made of two principles, one—mentioned previously under "Normal Ratings"—that high-temperature working shortens life; the other, that discharging to zero voltage, if practiced continually, has a similar effect.

All ideas as to improvement of the storage battery are first tried out in miniature cells having the single iron pocket and single nickel tube (1-24 and 1-30 parts, respectively, of regular plates) as electrode units. These experimental cells are just like the commercial cells in mechanical construction and give comparative results at proportional rates. A relatively quick life-test is obtained by maintaining such cells at a temperature of 130 degrees Fahrenheit during both charge and discharge, and carrying every discharge to zero voltage. After every 50 such "hot runs" each group of cells is allowed to cool down and is then tested at normal temperature. It is certain that this "killing test" is at least three and perhaps five times as severe as the conditions of commercial service; that is, 50 hot runs would be equivalent in effect to 150 to 250 runs in practice. Nevertheless, miniature regular cells will increase in capacity during 150 to 200 hot runs, and at the end of 500 hot runs will usually have better than original capacity. In some cases after 1,000 hot runs, cells had lost only 20 per cent. of their original capacity.

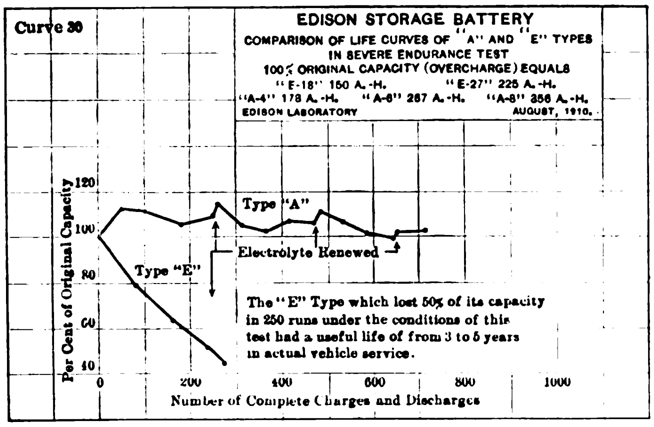

Fig. 30—Comparison of life curves of "A" and "E" types of cells

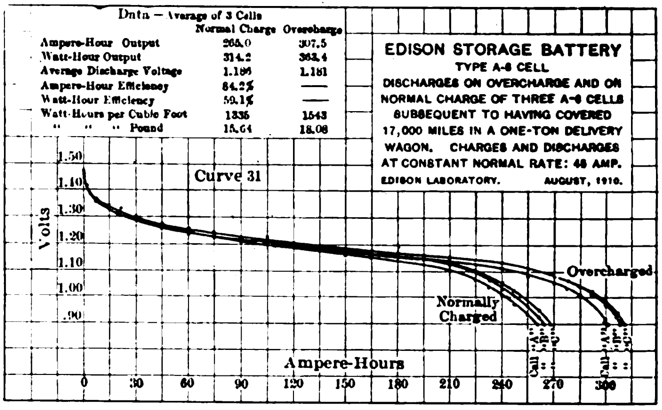
Life tests of many "A4" cells are also made, but at somewhat lower temperatures, as it is desired to have the conditions approach a little nearer the normal. In this case the temperature averages only 105 to 110 degrees Fahrenheit, but every discharge is carried to zero voltage, each cell then being short-circuited some minutes to ensure its complete discharge. The severity of this test as compared to service conditions can be judged from data obtained on the "E" type of Edison cell, some batteries of which were put in commercial operation six years ago. Curve "E" of Fig. 30 shows that this old type lost 50 per cent. capacity in 250 runs under the conditions of this test, and yet in actual vehicle service it had a useful life of three to five years. Curve "A" of Fig. 30 is the life result to date of the "A" type under the same adverse conditions. The inconstancy of the output in this case comes principally from differences of temperature, as the tests were made in a top-story room whose temperature varied considerably, depending upon outside conditions.

Two years ago the first regularly manufactured "A" type battery ("A6" cells) was installed in a demonstration wagon of one of the vehicle companies. After a few months of this service, during which several long test runs were made, the wagon was sold to a New York dry goods house, where it is still in operation. In July just past three cells were taken at random from this battery for test after having covered 17,000 miles. The results of the test are given in Fig. 31, which shows that these old cells, formed up under commercial service conditions, are actually better in overcharge capacity, in output on normal charge and in efficiency than the average of cells formed up under laboratory conditions; and that the watt-hour output given on normal charge is now, after 17,000 miles, 16 per cent. above the rated watt-hour output, while the maximum output exceeds the rating by 34 per cent. In the light of such a performance who can set a limit to the life of the new Edison battery?



Data — Average of 3 Cells

	Normal Charge	Overcharge
Ampere-Hour Output	265.0	307.5
Watt-Hour Output	314.2	363.4
Average Discharge Voltage	1.186	1.181
Ampere-Hour Efficiency	84.2%	——
Watt-Hour Efficiency	59.1%	——
Watt-Hours per Cubic Foot	1336	1543
" " " Pound	15.64	18.08

Proposed Electric Vehicle

An Admirer of Electric Vehicles Makes Valuable Suggestions

IMPOSING upon your good nature I desire to generously disagree with those who think that electric vehicles must ever have the taint of the horse and be so designed that the users will ever have to see all style and convenience pass them by, leaving a whiff of the odor of half-burned gasoline. Why is it that electric vehicles are so far behind the times? Why not make them just as gasoline automobiles are designed? If it is convenient to sit in a low seat in a gas car, what makes it inconvenient to have the same advantageous seat in an electric? If the center of gravity should be low in a gas car, why should it not be low in an electric? If the wheelbase must be long on a gas car, why should it not be long on an electric? If the wheels should be of large diameter on a gas car, why should they not be of the same large diameter on an electric? What is the fad that keeps the electric vehicle in the class of the modes of yesterday, leaving every admirer of this splendid device of transportation in the position of the ass who starved to death between two bulging haystacks? Who are the sleepers? Must they ever be with us? What is the answer? Please do not consign this communication to the waste-basket on the ground that the writer is a kicker. In all fairness to five electric vehicles that I have owned, not one of them compared favorably in style of design to any one of a dozen gas cars that can be made for not far from $1,000, but the electrics cost more.—E. H.

Operation and Care

LOOK AFTER THE LUBRICATING OF THE SMALL BEARINGS; TIGHTEN UP THE CLAMPING AND HOLDING BOLTS; LECTURES; LETTERS; QUESTIONS; TIRE-REPAIR; A VARIETY OF SHORT STORIES

OPERATING an automobile without paying some attention to the details and giving them some care is like making a hole in the gasoline tank and expecting that the fuel will remain in. The cost of maintenance of an automobile will be enormously increased unless the little things are looked after, and there is a good chance also of an accident. A long story, relating the nature of the acts that will produce good results, generally ends in confusion, but, confining the lesson, so to say, to some one phase of the whole instead of generalizing may have advantages. The illustration of a Matheson car here given, with the same raised up to permit of seeing the underparts, gives rise to an opportunity to letter the parts that are to be considered.

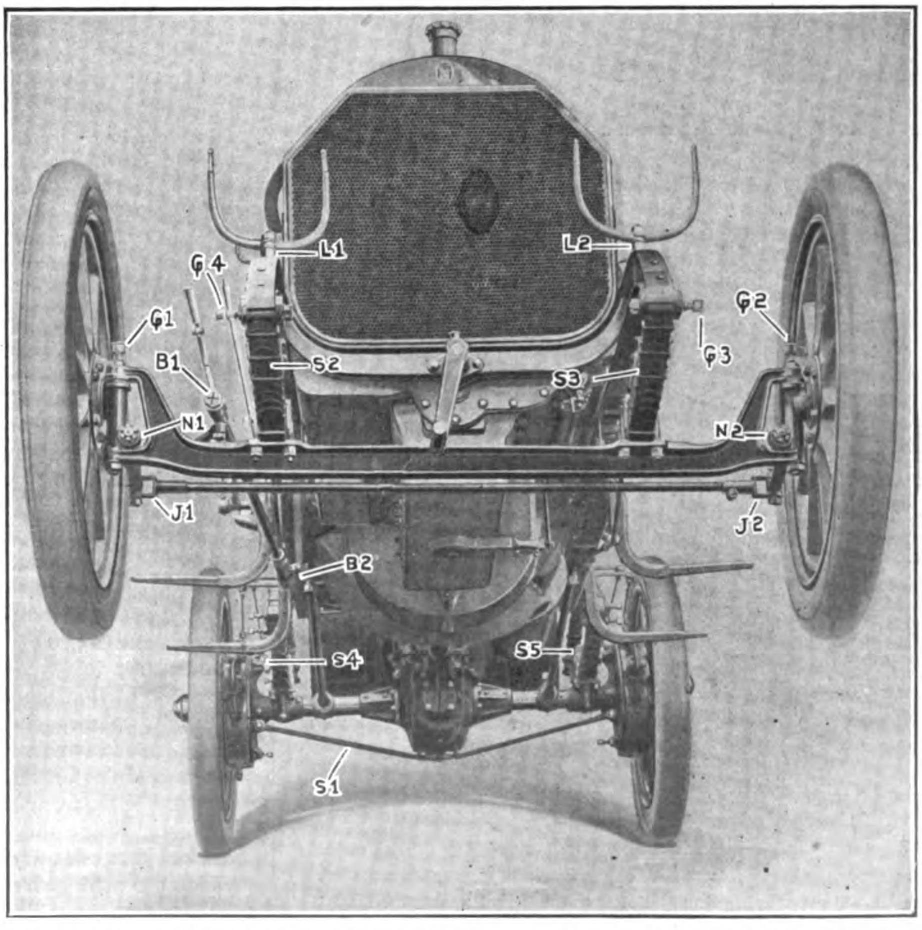
Questions of Lubrication.—Grease is fed to the small bearings by means of cups; it rarely ever happens that the cups are examined by automobilists to see if they are properly filled, or if the grease is in a good state of preservation. Referring to the illustration the grease cups G1 and G2 of the knuckle bearings should be given the best of attention, and the cups G3 and G4 of the springs, both front and back, should be kept filled. All other grease cups should be examined.

Steering Gear Bearings.—Keeping the automobile on the road is a matter of maintaining the steering gear in good order. The bearings and joints J1 and J2, also the ball-and-socket joints B1 and B2, should be looked after with the greatest regularity. Then, there are the nuts N1 and N2, in particular, not forgetting that all the other nuts on bolts and studs in connection with the steering equipment should be kept tight and locked. The springs will do good work if they are looked after; pry up the plates of the springs S2, S3, S4, and S5, squirt in some lubricating oil or smear grease over the surfaces, and let the plates spring back into place; do this every month. Lamps cost money; why not keep the brackets securely in place? The clamping bolts L1 and L2 should be looked after. When the rear axle sags the tires are abused. Why not look after the stay S1?

Take a car as it is here illustrated. It is made for absolutely silent performance; this silence is only possible if all the parts are suitably designed, and so made that all the relating members fit at the joints and so work in with each other that there is no lack of "design-harmony." In the meantime, let us call to mind that if it is desired to reduce the size of a part for any purpose, the most common practice in the shop is to set it up in centers in a grinding machine; this grinding is done so rapidly that it pays handsomely to resort to it rather than to use a cutting tool. Now, when the automobile is put into service, the first thing that the owner does is to set it up in centers in Nature's grinding machine, and, knowing full well that "dry grinding" is the most efficacious, or destructive, as the case may be, oil is scrupulously shunned and the grinding process makes terrific inroads on all the measures for silence that it costs so much.

Sand, as it drifts up from the top of the road, sifts in through the crevices however small they may be, and it is this sand that Nature so abundantly furnishes as the abrasive substance for the autoist to use. Look at a watch-case; let it be ever so tight at the seams; even so, it is but a matter of a few weeks at best when enough dust to obscure the figures on the dial will pass in through the seams; if dust has the stealth to do this, what chance is there to make joints in automobiles so tight that sand-dust will not get in? If not wanted, the great defender is oil.

False and Fair Promise.—Referring to patents, Edison says, "Is it generally realized that no matter how flagrant the infringement nor how bare-faced and impudent the infringer, no federal court will grant an injunction *until the patent shall have been first litigated to final hearing and sustained?*" On the other hand, the language of the grant would lead an unsophisticated inventor to believe that he is entitled to protection for 17 years.



MATHESON CAR RAISED UP AT THE FRONT END TO SHOW THE UNDER SIDE AND THE PARTS TO BE LOOKED AFTER

Piston Deformation

Poor Compression Sometimes Due to Warping Pistons

WHEN the stroke of the motor is long in proportion to the length of the connecting rod, or when the angularity, so-called, is a maximum, the side pressure of the piston against the cylinder wall is relatively high, and this will be accentuated if the motor compression is high, so that in the absence of good designing there is the probability of a considerable warping of the piston, resulting in undue wear in the plane of the connecting rod, unless the warping is so pronounced that the buckling of the piston increases its diameter more than the amount of the clearance, in which event wear will take place in the plane at right angles to the throw of the connecting rod. Under such conditions it is only a matter of a short time when the cylinder will be worn to an elliptical conformation, when the piston rings will no longer be capable of maintaining a tight compression. Fortunately, there are not a great number of cases of this sort in automobile work; but, unfortunately, the most efficacious remedy lies in the purchase of a new motor.

Smoke Is a Nuisance.—It is said that visible smoke consists of solid carbon particles and solid or liquid hydrocarbon particles or tar vapors. Smoke emanations are signs of incomplete combustion, but it may be true that complete combustion is impossible, due in some instances to the methods employed, and in other cases to the qualities that reside in the fuel. Excess of oxygen, *i. e.*, more air, is the proper way to eliminate smoke.

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.SC., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE FOURTH INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

I SHALL not describe how the indicator can be used to study the ignition of the charge. It is a well-known fact that in many cases, when an engine is fitted with both coil and magneto ignition, the running of the engine and the power developed is better when the charge is fired with the magneto than when it is fired by the coil. This effect is generally considered to be due to the fact that the magneto gives a much hotter spark, due to the passage of a larger quantity of electricity, and it is supposed that when the charge is fired by such a hot spark the pressure developed is greater than is the case when a feeble spark is employed.

I have examined this question, and have found that when the inlet valve is in a pocket, and the sparking plug is in this pocket, then, so long as the timing of the spark due to the magneto or coil is the same, on no occasion have I obtained any indication of a difference in the pressure developed, or even in the rate at which the pressure rises, due to the nature of the spark which is employed to fire it.

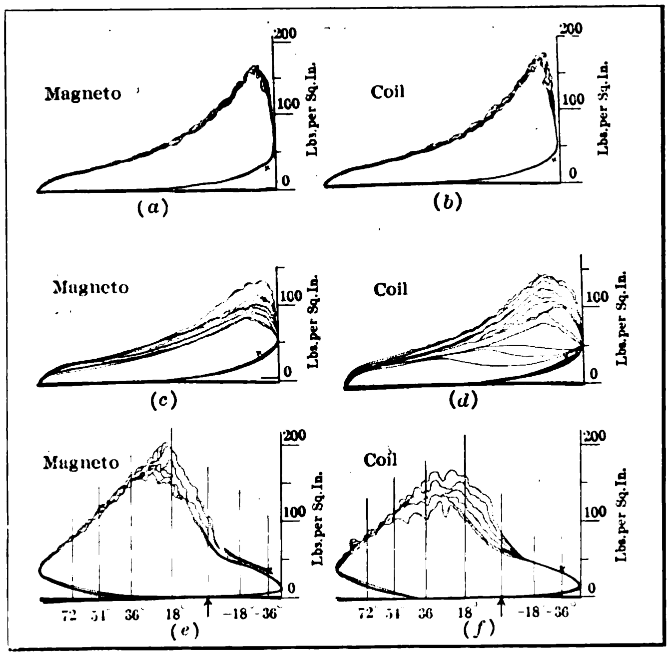


Fig. 16—Manograph cards, showing the results obtained with different methods of firing the charge

In the case of one four-cylinder engine, in which there was a marked increase in power on switching over from magneto to coil, by taking indicator diagrams from all four cylinders it was at once evident that the loss of power when using the coil was due to faulty timing. Thus, if the spark advance was adjusted to give correct timing for one cylinder, in one of the other cylinders the spark occurred too early, and in another too late. This effect was due to a badly designed commutator, and on replacing this by one designed in such a way that the timing was exactly the same for all the cylinders the engine gave as much power with the coil as with the magneto. The above remarks apply to engines having the spark plug in the inlet-valve pocket, so that, at the time of firing, the charge in the immediate neighborhood of the spark is almost free from admixture with exhaust gases left over from the preceding firing stroke.

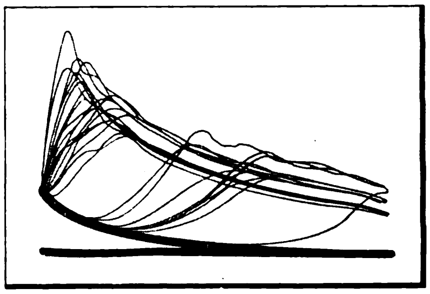

Fig. 17—Manograph card of a series of explosions that were delayed

In the case of engines in which there are no pockets, or at any rate when the sparking plug is elsewhere than in the inlet-valve pocket, then a hot spark seems to be a distinct advantage, particularly when a weak mixture of petrol and air is employed.

This effect is shown in the indicator diagrams given in Fig. 16, for which a sparking plug was used in the combustion space on the opposite side to the pocket containing the valve. The upper two diagrams were obtained with a fairly strong mixture, and in this case there is not much difference observable. The two middle diagrams were obtained with a weak mixture, and it will be observed that the maximum pressure developed, and, in fact, the pressure throughout the working stroke, is much more regular for successive strokes in the case of the magneto than with the coil. In some cases, when using the coil, the burning of the charge is excessively slow, so that the pressure does not reach its maximum value till near the end of the stroke. The crosses marked alongside the compression stroke indicate the point at which the spark passed.

The two lowest diagrams also correspond to a weak mixture.

but the phase of the indicator has been altered, so that the spot of light is traveling from right to left at the maximum speed during the time the piston is at the top of the stroke. In this way it is possible to study the rate at which the pressure rises in the cylinder during the time the charge is actually burning. The vertical lines drawn across the diagrams are separated by equal intervals of time, the one marked with an arrow corresponding to the instant when the piston is at the top of the stroke. A photograph of the spark occurring in an auxiliary spark gap, placed in series with the sparking plug, is obtained on the negatives by placing the auxiliary spark gap alongside the hole in the diaphragm through which the light which falls upon the mirror of the indicator passes. It will be noticed that the magneto spark continues for a very much longer time than does the coil spark. Further, although the coil has a trembler, only one spark passes, since before the trembler has time to act a second time the battery circuit is broken at the commutator. Another point which is brought out strongly by these photographs is the large amplitude of the waves set up in the cylinder, or, at any rate, in the pipe connecting the indicator to the cylinder. This pipe joined the cylinder just alongside the spark plug, so that the charge was fired near the end of the tube, and under these conditions it is always found that the waves in the pipe are particularly well marked.

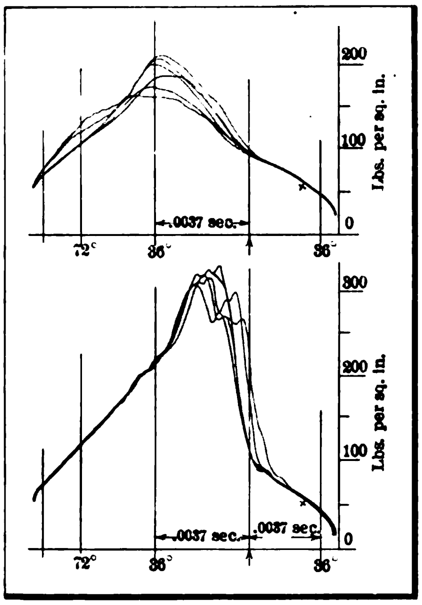

Fig. 19—Manograph cards showing the effect of varying the angle of advance and retard of the spark

When a trembler coil is employed it is important that the current in the primary shall not be less than a certain value, otherwise there will be a considerable delay, of varying amount, before the trembler blade is attracted sufficiently to break the current and cause the passage of a spark. If the current is very much reduced, then the trembler may entirely fail to act, so that the primary current is only broken by the commutator. Thus the spark, in place of occurring very shortly after the primary circuit is completed at the commutator, as is the case when the current is sufficiently powerful to cause the trembler to act, occurs when the circuit is broken at the commutator and is thus much delayed. In Fig. 17 is shown the kind of diagrams obtained when a comparatively weak mixture is fired with a trembler coil, the current being so weak that the trembler sometimes acts and sometimes fails to act. The diagrams may be divided into two series: the first series correspond to the trembler acting, and although the timing of the spark varies considerably, yet the charge is fired reasonably early. In the other series, where the trembler failed to act, the time of firing is so late that the maximum pressure is in some cases only reached toward the end of the stroke.

Another subject which I have investigated by means of the indicator, is the question of the influence of the number of sparks used to fire the charge. As has already been pointed out, even with a rapid trembler only a single spark is obtained at each spark gap, and there is no doubt that if the charge is fired by the first spark, the passage of any subsequent sparks will have no influence on the pressure developed or the rate at which the charge burns. By using two spark plugs at different parts of the combustion space, however, the charge may be fired simultaneously in two places, and hence we should reasonably expect the charge to burn more rapidly, since the flame will not have so far to spread before the whole of the gas has been inflamed.

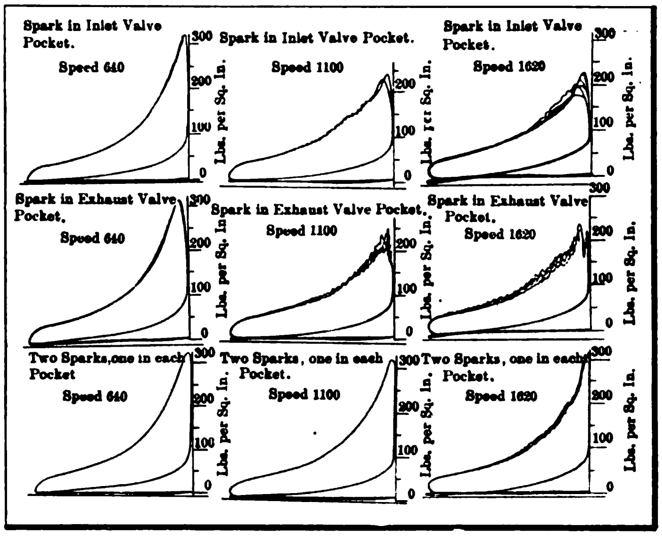

Fig. 18—A set of manograph cards showing the effect of igniting the spark at two points

The effect of varying the position of a single spark plug, as well as of using two sparks, is shown in Fig. 18.

It will be observed that at a speed of 640 revolutions per minute the diagram, and hence the power developed, is the same whether the spark takes place in the inlet-valve pocket, in the exhaust-valve pocket, or in both simultaneously. At a speed of 1,100 revolutions per minute, however, there is a distinct advantage in using two sparks, the indicated horsepower per cylinder rising from 4.6 horsepower per cylinder to 5.2 horsepower. At a speed of 1,600 revolutions per minute the effect is even more marked, the indicated horsepower rising from 6.5 to 7.3. This improvement at high speed is due to the increase in the rapidity with which the charge fires when the combustion is started at two points, as may be seen by a study of Fig. 19. The instant at which the spark passed is marked by a cross. As before the spaces between the vertical lines represent equal intervals of time (0.0037 second).

Graphite for Lubricating

Value of Oils and Greases Stimulated by Addition Thereof

WHEN bearing surfaces are examined under a powerful microscope the surface resembles a nutmeg grater. The high spots scraping over each other are the cause of friction. Flake graphite attaches itself to the high spots, fills in the low spots, and forms over the entire surface a thin, tough, veneer-like coating of marvelous smoothness, so that, instead of having actual metallic contact, there is graphite-to-graphite contact.

It has been truly said that wherever there is a mechanical movement flake graphite may be most satisfactorily used as a lubricant, and it is easy to see, with the above in mind, how the lubricating value of all oils and greases is stimulated by adding the correct proportions of pure flake lubricating graphite.

About the automobile there are many parts that are difficult to lubricate and which soon cause annoyance because of improper attention.

Wherever greases are used it is well to add from four to ten per cent. of flake graphite by weight, depending upon the service. It is better yet, however, to use graphite greases manufactured by some reliable company, that are especially prepared for the work in mind.

On a Curve

Safe Driving Depends Upon Speed, Radius of the Curve and the Center of Gravity of the Car, Including Some Local Considerations

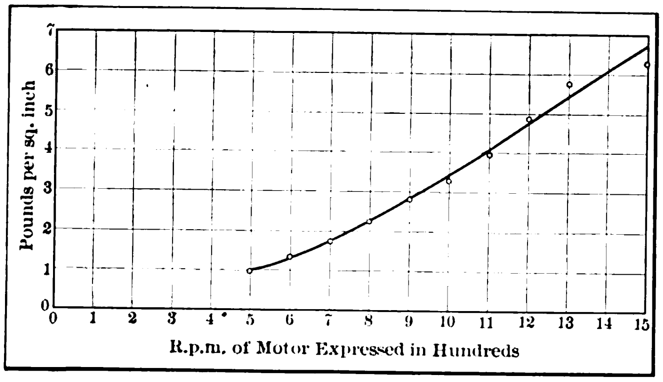
SINCE the wheelbase of automobiles is fixed by other considerations, as the conventions, safety in driving around curves depends upon the center of gravity of the automobile, radius of the curve, and the speed. There are local considerations, as the state of the road, condition of the surface, nature of the tread of the tires, and the chance that a puncture will occur just at a critical moment, and it may also transpire that the right-of-way will be pre-empted by some other automobile, or—who knows—a cow. From the speed-radius point of view, for an automobile with a low center of gravity, safety will depart when the speed exceeds that as given in the following table for the several radii:

Radius of curve, feet	Limit of speed, miles per hour
100	41.
150	50.2
200	58.
250	64.9
300	71.
400	82.
500	91.8

Back Pressure of Muffler

Some of the Power of the Motor Is Consumed in Back Pressure

ELIMINATING noise is at the cost of power of the motor, practically in every example of which exact knowledge is available, although there are types of mufflers that offend but slightly relative to those that are intended to dampen noise by the simple expedient of preventing the exhaust gas from coming out fast enough to get out of the way of the piston and the incoming mixture. It is a great misfortune that the silencing of noise is at the expense of power; but it is well-spent power at that, nerves being worth more than the cost of the power that is used up to save them. The curve as here charted shows how the back-pressure increases with the speed of the motor. Starting with a back pressure of one pound per square inch at 500 revolutions per minute, increasing to 6.3 pounds per square inch at 1,500 revolutions per minute of the crankshaft of the motor. It is scarcely to be supposed that the amount of the back-pressure will be the same in all makes of motors considering a given speed, nor is it true that all mufflers will offend to the same extent, but the fact remains that more or less back-pressure will have to be entertained as a rule. Should a muffler cut-out be used? Probably not—it is the source of much noise and it prejudices the public in favor of adverse automobile legislation. Nor is it likely that the muffler cut-out eliminates the back pressure, although it probably is true that it contributes to the easing up of the same. Of course the efficacy of a cut-out depends upon how it is made, and the manner of its installation.



Back pressure in pounds per square inch cause by muffler at different engine speeds

Compression Troubles

LOSS of compression means loss of power. The motor so suffering it is not in good order. The carbureter will also indicate that account of carbureter trouble from the purely carbureter point of a low depression in the region of the nozzle of the carbureter, and the lack of suction of the motor following loss of compression, that is

A TO Z OF THE CAUSES OF LOSS OF COMPRESSION

(a) Leaky gasket joint.
(b) Leaky inlet valve.
(c) Worn piston rings.
(d) Worn cylinder.
(e) Valve stems disformed.
(f) Leaky exhaust valves.
(g) Valve stems in tight guides.
(h) Valve stems gummed up.
(i) Valve seats pitted.
(j) Valve springs, temper gone.
(k) Valve lift adjustment changed.
(l) Crack in cylinder.
(m) Piston ring broken.
(n) Piston ring in tight slots.
(o) Piston rings, slots all in line.
(p) Piston rings gummed up.
(q) Cylinder head covers not tight.
(r) Crack in piston.
(s) Porous piston.
(t) Spark plugs not screwed in tight.
(u) Broken valve.
(v) Broken valve key.
(w) Broken valve spring.
(x) Overheated motor.
(y) Wrong valve setting.
(z) Cracked porcelain of plug.

Ensnaring Ads.

Which Fall by Being More Beautiful Than Straightforward

ADVERTISING is a science and an art—everybody says so—and withal quite crafty, too. Through the great charm of these versatile aspects, and perhaps for other reasons as well, the special ability for turning a plain business announcement into a joy forever is being assiduously cultivated and the adepts are every day introducing new methods, one more brilliant than the other, for capturing and holding the attention of the fickle public. In the absence of a suitable scale for measuring advertising achievement, it is unfortunately as yet impracticable to announce from day to day that a local, national or international record for advertising performances has been broken, but this may come as soon as advertising shall have been proclaimed a sport and a pastime, as well as a science and an art. A new mark, if not a record, was made recently, however, when a bunch of business men with goods to sell were induced to be satisfied with the reflected glory of booming the name of the artist who had chiseled their announcements into words. Under the head, "Do it once, but don't do it again," the trick marked a passing emergency rather than a threatening innovation, but it suggests the query if the advertising beautiful is, after all, the business bringer.

There must be a large percentage of intrinsic value in advertising, or it would be dead and damned long ago.

AN ANALYSIS OF THE DIFFICULTIES THAT LEAD TO LOSS OF COMPRESSION IN MOTORS, WITH A BRIEF WAY OF FINDING THE REMEDY

will perform in a "lazy" manner and the ignition system will act as if the mixture is not efficacious; this will be so, but it will not be on of view. True, the carburetion will be bad, but this will be on account this condition of the depression will be brought about on account of to say, failure of the piston to pull a proper vacuum.

A TO Z OF THE PROPER REMEDIES TO APPLY

(a) If worn, fit new one and draw up tight.
(b) Take out and clean if worn; grind in.
(c) Have new ones made to size of cylinders.
(d) No cure except lapping and fitting new pistons.
(e) Best to fit new valve.
(f) Clean off oil and carbon.
(g) Ease the valve stems in a lathe.
(h) Take out valves and clean in kerosene.
(i) Grind in with fine emery.
(j) Fit new springs equal in strength.
(k) Probably does not close early enough; close down.
(l) This can sometimes be repaired by welding.
(m) Take out at once and replace with a new one.
(n) Ease rings, not slots.
(o) If this happens often fit step rings or pin.
(p) Sometimes kerosene injected will cure it.
(q) Take off, clean face joints; if gasket, fit new one.
(r) Fit new piston; not worth welding.
(s) Slightly turned and a plate fitted might cure.
(t) Screw tight; new gaskets are cheap.
(u) Fit new one; old ones can sometimes be repaired.
(v) Fit new one; anything will do to get home.
(w) Seldom happens; can be packed temporarily.
(x) Cool off with little kerosene.
(y) Retime motor.
(z) Fit new porcelain or new plug.

New Rubber Forests

May End Scarcity by Developing a Brazilian Virgin Field

FURTHER declines in the raw rubber market are expected by the American trade, and their effect upon the tire market can be conjectured. According to those most closely in touch with the situation, there is no likelihood of large, immediate purchases in the open market as stocks on hand are sufficient for their purposes for the time being.

The supply of raw rubber for the spring trade has been picked up in small lots and by adroit buying, and at the present stage the demand is somewhat slackened. But the other factor in the situation, that of the supply, is what is having more weight with the tire men. For several weeks the price level of rubber has been steady with a downward tendency, but the fact was noted that any material buying orders stiffened the backs of holders and that the floating supply of the product was not large. This alone would indicate that the manipulated conditions still exist in the market, but the tire men have been pleased to hear reports from the Brazilian field that recent explorations have developed the fact that the practically unknown tropical jungles back from the Amazon River contain millions of acres of virgin rubber forests.

"An exchange of thought contains valuable suggestion to the listener—the tongue is the enemy of the listener."

Specific Gravity of Fuel

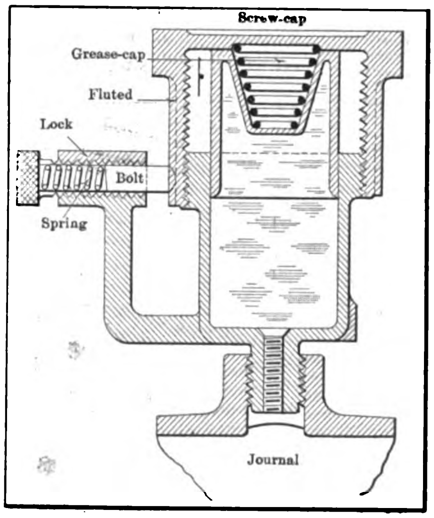
Gasoline is Fractionally Distilled of Crude Oil Holding Several Fractions

ATTEMPTING to determine the quality of automobile gasoline by sticking a hydrometer into a measure of it and observing the specific gravity of the liquid as a whole is a useless undertaking. The specific gravity may be taken without difficulty, but it will not be a measure of either the fuel value of the liquid (by indirect indication) or of the volatility of the same, due to the fact that the distiller, if he takes five fractions, can so balance the lighter with the heavier fractions as to bring about a given specific gravity without using that measure of the middle fractions that will produce the most desirable grade of automobile gasoline. No method of indicating quality should be used in determining the same, if the compounder of the mixture can by jugglery produce the apparent result without having to deliver the goods. If hexane, for instance, is the best fractional distillate then the method to employ in the determination of the quality of the gasoline is that method which will show hexane, if it is present, or the absence of hexane, if it is left out. It should be understood by automobilists that automobile gasoline is not gasoline proper; there may not be any gasoline in the mixture that he buys for gasoline. The probabilities are that automobile gasoline is a compound of the three benzine distillates, with enough hexane to permit of starting the motor, it being the more volatile fraction. To whatever extent it is possible to make a composite pure, thus eliminating by-products in the process of manufacture, it is a good thing; the price is affected favorably.

Special Grease Cup

So Designed as to Press the Grease Down

LUBRICATION by means of grease depends for its efficacy (a) upon the quality of the grease, and (b) upon the use of a well-designed grease cup. The illustration here shown is of a special form of grease cup that offers the advantage of holding enough grease to make it worth while using a cup, and in addition to this necessity, it is so made that by means of a spring which presses against the supplementary cap, the grease is gently pressed down all the time. In addition to this spring the cap proper may be screwed down from time to time, thus adding to the pressure exerted by the spring. A lock-bolt is located at a point of vantage, so contrived that it does not have to be undone when it is desired to screw down on the cap, but it does afford absolute security, preventing the cap from screwing off or down. True, this cup is rather formidable, but it is less so than the bill that comes to the automobilist who relies upon sand as a lubricant for the multiplicity of bearings that designers have not, as yet, learned to do without; until they do, let us use grease, which to do, demands a place in which to store it, and a way by which it will be forced into the journal to be lubricated. Buy good lubricating material, disregarding price,



Special form of grease cup with automatic means of pressing the grease in, in addition to the hand-pressure cap

Going Up Grade

What Happens When an Automobile Is Going Up Hill

On a grade a body is free to move only on the inclined plane. Its weight acts downward. This downward force may be resolved into the components N, normal to the plane, and R, in line with it. The component R retards the car. Since $R:W::Q:L$, $R = \frac{Q}{L}W$, or the resistance due to a grade is equal, in pounds, to the weight of the car multiplied by the proportion of rise in the grade: Roughly, 20 pounds per ton of car weight per 1 per cent. of grade. For the car in question, which, when loaded, weighs, say, 3,800 pounds, the resistance due to grade only, on a 1 per cent. grade, is 38 pounds; on a 4 per cent. grade, 152 pounds, and so on. A car must have tractive force sufficient to overcome the resistance of the steepest grade it is likely to encounter, otherwise no amount of horsepower will make it mount the hill. This is to be accomplished by using large cylinders, or more cylinders, small wheels, or a high gear ratio, or by a combination of these methods; and, after all, the operating conditions at the motor will affect the tractive force more than any other factor.

The highest tractive force is developed on the first gear, and this gear must, therefore, be used on the worst grades. This means a comparatively slow speed, since at 10 or 12 miles per hour the piston speed will have reached 1,000 feet per minute. It is desirable to use second or even third gear unless the grade is such as to stall the motor, and greater economy, of course, follows the use of the higher gear.

Viscosity Interferes

Varies with Temperature, Changes of Gasoline Altering the Flow of Same Through the Nozzle

Between Midsummer and January automobiling the temperature changes in round numbers 100 degrees Fahrenheit in the latitude of New York, and it is within the probabilities that this temperature change is fully 150 degrees Fahrenheit in northern Minnesota. This temperature change has no marked effect on the functioning of a motor *per se*, nor should it have any serious effect upon the lubrication, although it might interfere with efficacious work on the part of the water-cooling system, provided no attempt is made to utilize anti-freeze mixtures. The greatest difficulty in connection with temperature changes lies in the place where it is least expected. Gasoline, like molasses, becomes thick or thin, depending upon the temperature. Like molasses, gasoline flows through an orifice fast if it is thin, and slow if it is thick. When the weather becomes cold the gasoline, like molasses, flows sluggishly. In attempting to disregard this situation the average automobilist has a miserable time of it, and if he lacks in the qualities of a bulldog he will put his automobile away in the garage and nurse his grievance in silence; the other course is to consider natural laws, make the nozzle hole big enough for Winter work and enjoy life.

Letters from Subscribers

Loose Nuts Stopping Oil Feed

Editor The Automobile:

[2,423]—I have trouble with the lock nuts on my drip feed oiler shaking loose and the adjusting screw closing down and giving insufficient oil to the motor. I can see this in the daytime, but at night I fear that some time I shall have trouble through want of lubrication. What shall I do? R. Kelly.

Detroit, Mich.

Fit a lock nut to the existing nut (Fig. 5). A better way is to take a small piece of tube and cut it to about the right height as in Fig. 3, and this will prevent the adjusting screw falling below the proper level.

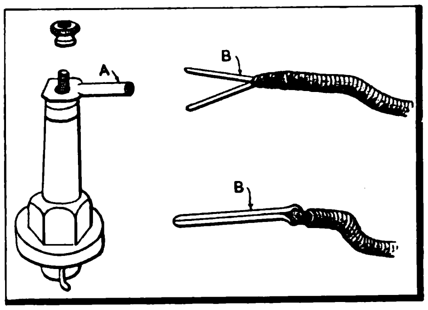

Fig. 2—Easily made terminal

To Fit Terminal

Editor Automobile:

[2424]—How can I fit terminals to low-tension wire without soldering? I find that they shake loose if not soldered. Inquirer.

Take a small piece of copper pipe, split it and hammer it flat: then drill a hole to the size required and screw it to the particular connection. A split pin that makes a tight fit in the pipe should then be used (Fig. 2); bind ends of loose wires with tape, first opening split pin slightly to make a better fit.

Inaccessible Gasoline Taps

Editor The Automobile:

[2,425]—On the last two cars I have had the gasoline tap is placed under the tank, which is located under the driver's seat, and it is necessary to take up boards every time I wish to turn the gasoline off. Can you suggest anything so that the supply can be cut off without this inconvenience? Tired.

Newark, N. J.

We would suggest that you fit a rod through the frame as shown in Fig. 6 that will grip the tap handle, but which should point downwards when open. The reason for this is in case the vibration causes the handle to drop the gasoline flow will not stop.

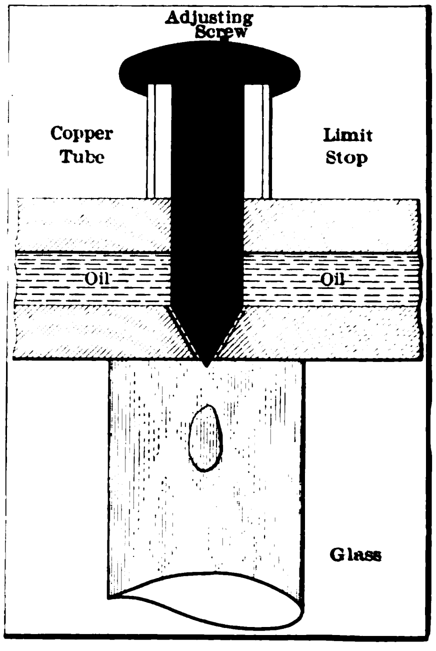

Fig. 3—Drip-feed oiler with limit stop

Repairing Broken Base Chambers

Editor The Automobile:

[2,426]—I recently had the misfortune to break a piece out of the lower half of the base chamber of my motor. Could you tell me a way of having this repaired otherwise than by welding? F. R. E.

North Adams, Mass.

This is a question that it is difficult to answer without knowing exactly what part of the base-chamber is broken or how it was done. Lugs can be welded satisfactorily, that is to say, they are guaranteed by the repairers; but presuming that the part of the base that has met with an accident does not have to bear any strain, Fig. 1 shows a method that can be employed and can be relied upon to retain oil. There is no real necessity for the inside liner, but this can be fitted if there is room and the section a large one. The outside strip is made of copper and hammered to the shape of the part to which it is intended to apply it. The broken part is then riveted to the copper strip which is in turn riveted to the base chamber.

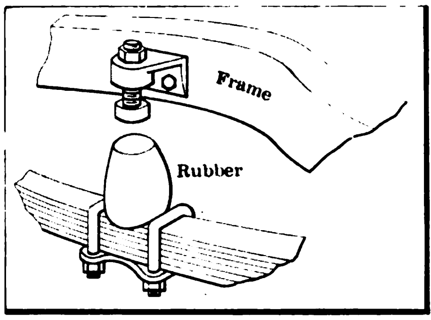

Fig. 4—Rubber buffer for upswept frames and 3-4 elliptic springs

A Buffer for Weak Springs

Editor The Automobile:

[2,427]—When the car I run is fully loaded the rear springs seem to deflect very much, and sometimes, in going over a bad piece of road or a railroad, there is a bumping noise at the rear of the car. Could you suggest any kind of buffer that will overcome this? Limousine.

New York.

The method shown in Fig. 4 should be what you want. The metal point of contact of the buffer should be slightly larger than the rubber cushion. The buffer can be so adjusted that it will strike the rubber cushion as the spring comes up and thus deaden the impact.

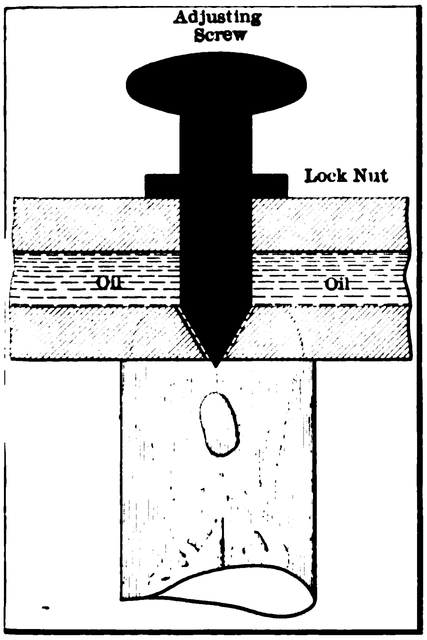

Fig. 5—Drip feed oiler with ordinary lock nut

Lubricating Advice

Noiseless Performance and Long Life Depend Upon Efficient Lubrication

JUST using a considerable quantity of lubricating oil ostensibly on the bearing surfaces is not the way to realize all there is in it. The man who counts his money carefully, making sure that the balance is correct, will be on the exact right road when he pursues precisely the same course in connection with the lubrication of the bearings of his automobile; the same care and precision are all that good judgment dictates. Below are some useful hints to be followed as nearly as the equipment of the various makes of automobiles will permit; good lubricating oil should be used, however.

(A) The resistance decreases with the thickness of the film.

(B) The resistance increases very materially with the viscosity of the lubricant.

(C) The point of nearest approach is approximately 90 degrees from the line of load.

(D) The points of maximum and minimum oil-film pressure are approximately at equal distances from the point of nearest approach.

(E) As the speed increases the points of maximum and minimum oil pressure get further and further apart, till at very great speeds they are in the line of load.

(F) As the speed increases the eccentricity of the oil film becomes less.

(G) The concentric position is the one of least resistance.

(H) Oil should be supplied at a point where the supply pressure is greater than the film pressure.

(I) The loading for a given speed must not exceed a certain limit at which the oil film is broken.

(J) This limit may be increased by lengthening the bearing, so increasing the cooling influence on the bearing.

(K) Oil grooves wrongly placed may destroy continuity of the film.

(L) A motion of pure rotation produces automatic maintenance of the film, provided the supply is adequate.

(M) The temperature varies throughout the bearing, the highest temperature being at the point where the film is thinnest.

Further, in the case of a reciprocating load we know that—

(N) A reciprocating load irrespective of rotation produces automatic lubrication.

(O) Heavier mean loads can be supported if the direction of load is reversed, because the lubricant is more vigorously sucked in, and the retardation of surfaces approaching one another normally increases very rapidly as the film becomes thinner.

Generally speaking, failure of lubrication is caused by rupture of the film due to:

(P) Inadequate supply of lubricant.

(Q) Reduction of the viscosity arising from excessive heating, either general or local.

(R) Badly placed oil grooves.

(S) Overloading.

(T) Grit.

(U) Impurities, such as water, reducing the film-forming qualities of the oil.

(V) Take nothing for granted—plausibility is a danger; it frequently leads to bad results. Investigate, and when a method is proposed, if it pans out, use it.

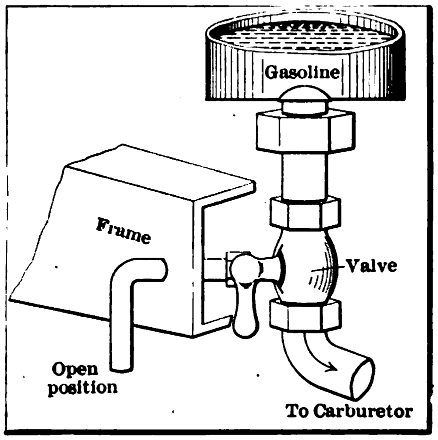

Fig. 6—Tap fitted outside frame for cars with gravity feed gasoline supply

Care and Repair of Tires

FOLLOWING up the line of thought as introduced under the head of "Imprint Methods of Testing" in THE AUTOMOBILE of November 10, it was decided to try out tires under two sets of conditions, *i. e.*, (a) to ascertain the area of tire contact under different conditions of pressure with the tires on the wheels with the car ready to use, not including passengers, and (b) rolling the car along the floor, permitting the rear wheel to intercept a "chock," the same being hewn down so as to present a face set at an angle of 60 degrees from the horizontal, the idea being to give the tire a good jolt, with a means available to show the imprint area, and compare it with the normal imprint as measured under the tire of the car standing still on the floor.

The pressures obtaining in the tire under the different conditions are stated for each print, and a study of the prints as given will at once lead to the conclusion that road obstructions have a marked effect upon the extent of deformation of pneumatic tires, introducing flexure to a degree that must have a large bearing upon the rate of deterioration, and with a view to measuring something of the deteriorating influence an attempt will be made to give an empirical formula, which while it cannot be regarded as absolutely accurate is far better than a disregard of the facts.

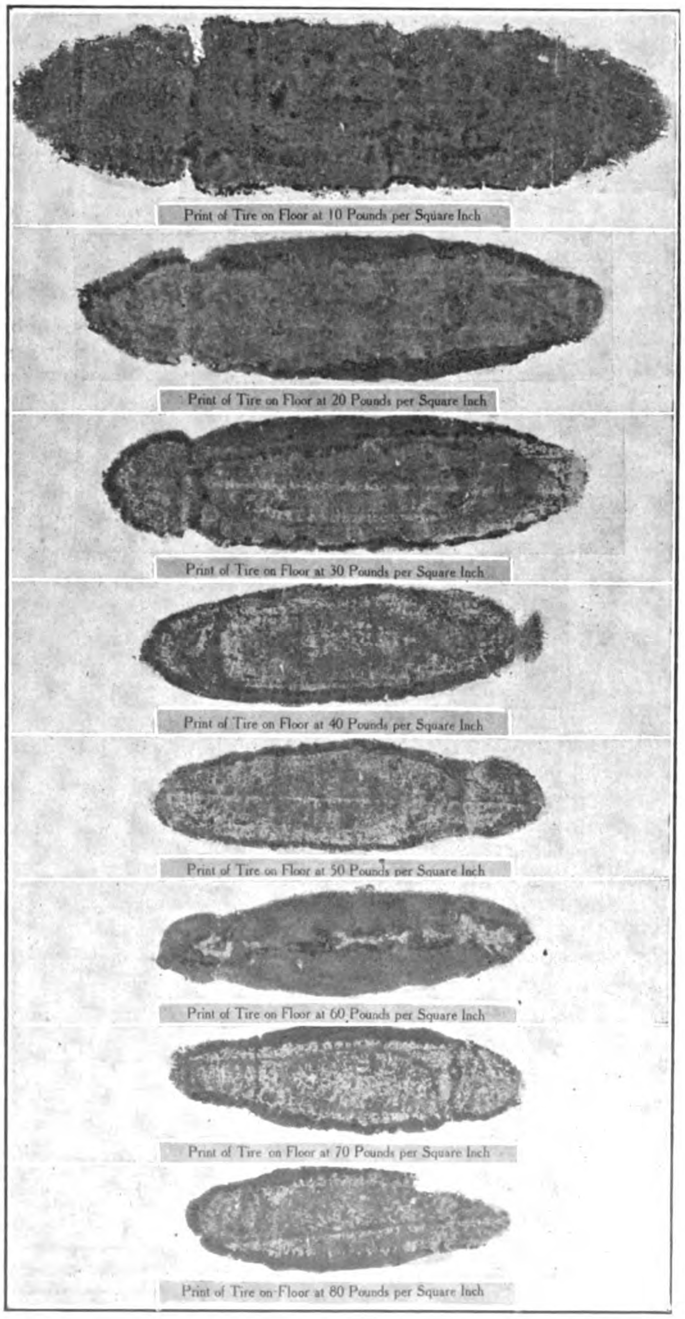

Fig. 1—Prints taken at various pressures with a 34 x 4-inch tire on the wheel, with the car standing still and resting on the floor

As a general proposition it will be possible to conclude that the tire which presents the least area of contact as shown by a print will last the longest. How much longer the life will be with the minimum area of contact must be left to conjecture to a considerable extent, but if the width of the print multiplied by its length is divided by the pressure of air in the tire at the time of making the print, the constant derived will be a rough indication of the difference in tire life. To be more accurate, find the area of the print and divide it by the pressure in the tire.

Referring to Figs. 1 and 2 of prints taken at the garage of the Overland Sales Co., 1599 Broadway, New York, for purposes of illustrating this article, the pressure in the tire under the several conditions is given in each case, care having been taken to start with the pressure as low as 10 pounds and raise the same by even increments to 80 pounds inclusive. It is generally claimed that 90 pounds per square inch is not too high for tires as large as 34 x 4 inches, which was the size used in this test, but an examination of the tire prints discloses no very sound reason for wishing to raise the pressure above 80 pounds per square inch. Fig. 1 shows the imprint of the tire under pressure between 10 and 80 pounds inclusive by 10-pound increments, with the car resting on the floor; in other words, it shows the amount of tire contact under static conditions. The tire contact around the periphery under the different conditions of pressure was as follows:

PERIPHERAL CONTACT OF A 34 X 4-INCH TIRE

Pressure per square inch	Peripheral contact in inches
10	11 1-2
20	9 3-8
30	8 1-2
40	7 1-4
50	7
60	6 5-8
70	6 1-8
80	5 7-8

The cross-sectional contact under the same conditions follows:

CROSS-SECTIONAL CONTACT OF A 34 X 4-INCH TIRE

Pressure per square inch	Cross-sectional contact in inches
10	3
20	2 5-8
30	2 1-2
40	2 1-8
50	2
60	1 7-8
70	1 3-4
80	1 3-4

Between 70 and 80 pounds per square inch the cross-sectional contact was substantially the same, but the peripheral contact changes noticeably, showing that there was a substantial gain by having the pressure at 80 pounds as compared with 70 pounds, if it is true that reducing the area of contact is beneficial. There must be a point beyond which reducing the area of contact ceases to be desirable, but this point has to do with the easy riding qualities of the automobile, and the probabilities are that easy riding is at the expense of tire life. Referring to Fig. 2, two conditions are depicted in the illustrations of imprints marked (A). The results were obtained by pushing the automobile for a distance of about 6 feet, bringing the rear 34 x 4-inch tire up against a vertical post, thus striking a blow, and bringing the car to rest by impact. In order to compare the performance of the tire with the normal contact under static conditions reference may be had to the table:

PERIPHERAL CONTACT OF A 34 X 4-INCH TIRE AGAINST A VERTICAL POST

Pressure per square inch	Peripheral contact in inches
10	12
20	11 1-2
30	10 3-4
40	9 3-4
50	8 5-8
60	7 1-2
70	7 1-4
80	6 1-2

SHOWING RESULTS OBTAINED BY IMPRINT METHODS ON A 34 X 4-INCH TIRE UNDER STATIC CONDITIONS AND AS THE RESULT OF IMPACT

The cross-sectional contact of the same tire as shown when the car was stopped by bringing the tire up against a vertical post was as follows:

CROSS-SECTIONAL CONTACT OF THE TIRE AGAINST A VERTICAL POST

Pressure per square inch	Cross-sectional contact in inches
	3 1-2
20	3 3-8
30	3 1-4
40	3
50	2 3-4
60	2 3-8
70	2
80	2

In this case it is evident that the difference between 70 and 80 pounds per square inch, from the squashing point of view, is nominal. At the very low pressures, however, the measurements indicate very little, owing to the sensitiveness of the tire and inability to accurately fix the value of the impact blow. The illustrations marked (B) to the right in Fig. 2 show the result obtained by pushing the automobile along the floor and arresting motion by bringing the tire up against a chock cut to an angle of 60 degrees for a height of 9 1-2 inches. The point AB represents the top of the chock, and a sharp line indicates the point where the tire rolled over onto the top of the chock in each case. Necessarily the tire squashed down the most just where it turned over the edge of the chock. The cross-section contact of the tire increased as the tire rolled up on the chock, and the maximum measurements under the different conditions of pressure are given as follows:

CROSS-SECTIONAL CONTACT OF THE TIRE WITH A 60-DEGREE CHOCK

Pressure per square inch	Cross-sectional contact in inches
10	6
20	5 1-2
30	5
40	4 1-2
50	4
60	3 3-4
70	3 1-2
80	3 1-4

No attempt will be made at this time to interpret these tire prints beyond pointing out how increasing pressure increases protection and how road obstructions concentrate the work on a small area of the tire, thus making it self-evidently desirable on the part of the autoist to steer clear of large road obstructions, particularly if the automobile is going at a high rate of speed. The impact prints given here were made when the car is rolled along the floor by two men with barely a 6-foot start. The strain on the tire would be increased enormously were the speed of the car higher.

Who Buys Autos?

Sentiment and Character Seem To Be Factors As Well As Money

IT puzzles French manufacturers to find some good reason accounting for the fact that England has twice as many automobiles in daily use as their own country despite the position as pioneers and teachers which the French held for a number of years. The distribution of wealth does not explain the situation, as there is a large wealthy middle class in both countries. Perhaps, it is said, it is because the Englishman employs his automobile for both pleasure and business and makes of it a paying investment which he can well afford to keep in good order, while the Frenchman uses it for pleasure only and gets little direct pecuniary return. But this explanation is not hailed as perfectly satisfactory. The question remains of interest even to the manufacturers of other countries, though it might be dismissed as simply another demonstration in favor of the almost established contention that the French prefer constitutionally to get rich by economy and the English by push and expenditure. Time is money in Great Britain, while in France it is an opportunity for a new sensation, and the automobile is not exactly new any more. Its general idea is settled, and the French love to prove out new general ideas for the benefit of the rest of the world, in all things, except money, capital and investment. With British capital preponderating in most of the large automobile manufacturing companies operating under French names on French soil and with French workmen, it is not really to be marveled at that the average *citoyen* cares little about swelling their dividends—and is there not at this point a reminder to the American manufacturer who consents to merge the individuality of his company in a larger capitalization, in whose ups and downs the American citizen takes only a secondary and impersonal interest?

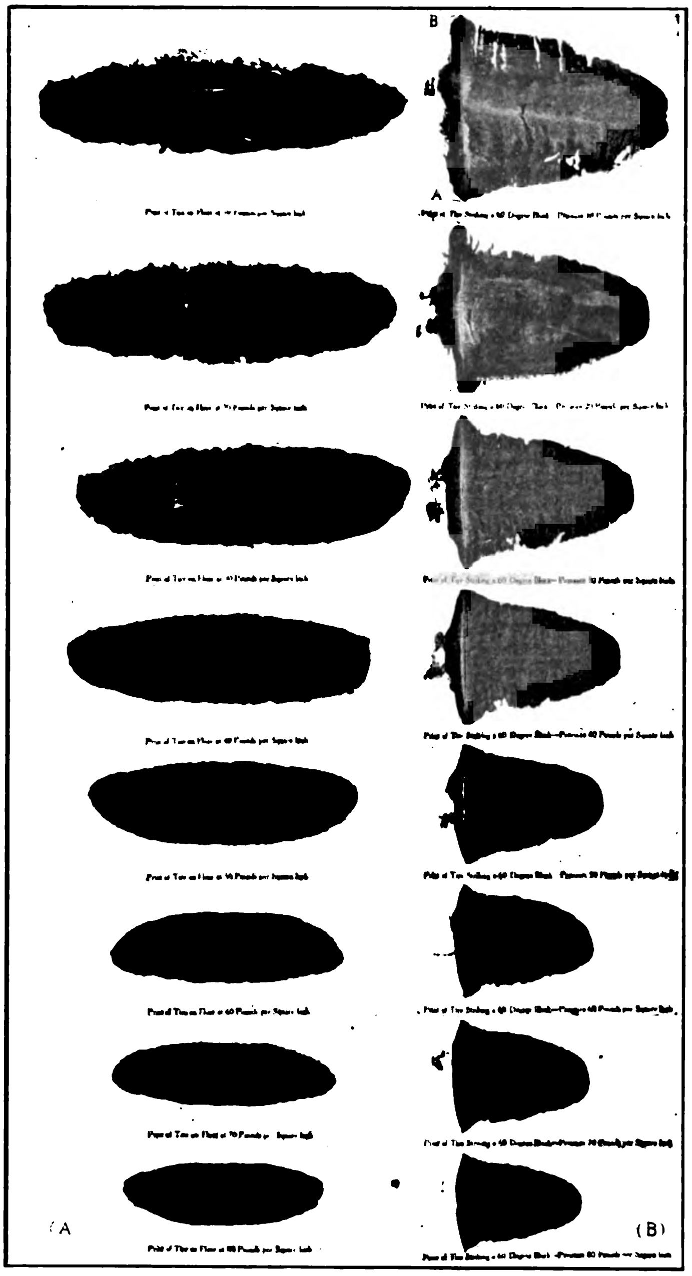

Fig. 2—Prints taken from a 34 x 4-inch tire (A) by bringing the car to rest by contacting the tire against a vertical post (B) by rolling the car along the floor and up against a 60-degree chock until the tire passed over and on top of the chock, the elevation being 9 1-2 inches

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FOREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[273]—How can you make an emergency repair of a broken leaf-spring—one of those which carry the body of the car?

A.—Place a bar of steel along the spring and fasten the bar and spring together with U-shaped clips, somewhat like those commonly used for fastening the spring to the axle. Two or more clips must be used. The elastic action of the spring is of course lost to a considerable extent, or even wholly.

A rubber bumper or a block of wood will hold the body up if the spring will still keep the axle in position otherwise.

[274]—What is a convenient way of removing a valve spring of the coiled form?

A.—A bar of steel, thin and forked at one end to straddle the valve stem and press against the washer at the end of the spring is a suitable tool. Put it under the spring, or washer, and compress the spring by lifting on the bar. The key can then generally be readily removed from the valve stem so as to leave the valve free to be lifted out and the spring removed.

If the forked bar can be used as a lever resting on a fulcrum, the operation is more easily performed. Some such bars are provided with a chain having a hook to catch on the head of the motor cylinder.

Some of the earlier forms of springs have the end stuck through a hole in the valve stem. No key is used with them. The forked bar can be caught in the spring just above the end of the latter and lifted to relieve the pressure of the spring against the hole in the valve stem. The end of the spring can then be forced out of the hole with more or less difficulty.

[275]—When putting a gasket or packing in a pipe-connection, what precautions must be taken?

A.—That the packing does not squeeze into the pipe so as to stop the passage. This is most apt to occur when candlewick packing is used.

Sheet packing between metal parts should be as thin as will allow it to adjust itself to the irregulations of the surfaces.

If the joint is to be opened frequently, coat one side of an asbestos, paper or canvas gasket with graphite and the other side with oil or varnish. This facilitates removals and holds the gasket in place.

[276]—How can a cracked or broken gasoline pipe be temporarily repaired?

A.—Slip a piece of rubber tubing over the pipe, or wrap a piece of sheet rubber around it and bind with tape and string. Adhesive tape will not hold long on account of the gasoline dissolving the rubber in it.

Or put rather soft bar soap on the pipe and wrap with tape such as is used on clothing. Bind with cord. In the absence of tape a piece of strong paper may answer. Rubber cement, instead of soap, may serve for a very short time.

[277]—How can a leaky radiator be repaired?

A.—Sometimes it is possible for the novice to repair it by soldering. It is generally a decidedly difficult operation, however, and there is danger of doing more harm than good by opening up some of the other soldered joints. In such a case the only satisfactory solution is the skilled repair man.

A honeycomb radiator can be temporarily repaired sometimes by putting a small bolt with a soft washer at each end through the tube around which the leak occurs; tightening the nut on the bolt will draw the washers against the ends of the tube so as to stop the leak. A rubber washer or one of steam packing in the sheet form will do, back soft washers with stiff metal ones.

[278]—How can a loose nut be prevented from jarring off?

A.—A temporary expedient is to wrap a piece of string under the nut so that when the latter is drawn tight it will pinch the string between it and the part against which the nut would otherwise bear directly. In case the nut is in a place that becomes very hot, some such material as asbestos cord with a wire core is suitable. A thin copper wire may answer in any case.

A split lock-washer under the nut will of course always hold it in place. It is sometimes objectionable, however, because of its cutting and gouging the metal when the nut is removed.

[279]—How can a tire be tested for a leak at the valve?

A.—Turn the wheel so that the valve is at the upper part and hold a glass of water around the valve. Bubbles will pass out through the water if the valve leaks. Or saliva can be put around the valve stem cap and note taken of the appearance of bubbles.

The valve itself may be leaky, but the cap on the stem tight. To determine this, move the cap and test as above.

The best remedy for a leaky valve is a new one. They are inexpensive. The valve can be screwed out with the slotted end of the cap. A leaky valve can sometimes be made tight temporarily by putting a drop of oil on it. Use only a drop.

[280]—How can an inner tube be examined for punctures or slight leaks?

A.—If the tube has been punctured by a nail or a wire, look for two holes; one next the tread and the other on the side next the rim The punctures may be invisible with the tube deflated. Then pump up the inner tube to a light pressure and examine by stretching the rubber while holding it near the face or ear. Too much pressure will cause it to suddenly bulge at one point and possibly rupture. If the leak cannot be found in this manner, immerse the tube in water and look for bubbles while stretching the rubber. The valve should also be immersed.

Narrow Street Work

The Wheelbase Length Affects Turning of Car in Narrow Street

SELECTING an automobile is not so simple a matter as it looks. The intending purchaser, in addition to desiring a well-built car, of good material, accuracy of workmanship and appropriateness of design, must necessarily have in mind the nature of the service that is to be rendered, and he must govern himself accordingly. If a car is wanted for long-distance touring over mud and such other roads as may be encountered, this service will naturally suggest a long wheelbase, large diameter wheels, much power with great flexibility, a transmission gear with at least three speed changes, a well-fixed gear ratio, excellence of the spring suspension, a good windshield and a proper top, deep cushions and wraps.

But these are precisely the facilities that are not wanted in an automobile that is to go around in a congested district, and be sufficiently mobile to make city service pleasant and profitable. It is worth a great deal to be able to turn a car around in a complete circle, even if the street is comparatively narrow, and this facility puts a limit on the length of the wheelbase. Where the wheelbase can advantageously be from 116 to 124 inches in general touring work, it is necessarily limited to a maximum of 110 inches if turning around in narrow streets is to be measured as a particular advantage, and 100 inches would be a very good figure for town car and taxicab work, considering this point only

Don'ts for the Autoist

A FEW MEASURES OF INDIRECT VALUE TO THE MAKER, DEALER AND USER; THE PUBLIC AT LARGE CAN CHIME IN IF IT WANTS TO

Don't imitate the ass who starved to death between two haystacks; tackle one of the two; be the apex of a flying wedge and put on steam.

Don't work like a slave to get a few dollars and then work like a slave to get rid of your hard-earned pelf.

Don't hanker after everything that intercepts your line of vision; there are a lot of things in this world that you do not need.

Don't really want for anything; go after what you need; get it; it is a mere matter of the advantageous expenditure of energy.

Don't forget that energy is a most vigorous form of resistance that can only be overcome by an equal display of the same force.

Don't throw away the energy that is at your beck and call in your mad desire to acquire energy that is pre-empted.

Don't measure energy, in the form of dollars, as being your property, unless you can hear them clink against each other in your pocket.

Don't throw the nest-egg away just because the hen is not laying to-day.

Don't tug away on a thing that you cannot lift—get a crow-bar and pry it up from the pest who holds it down.

Don't stand on the peak of a high mountain and say, "I wish I owned all that I can see." It is more to the point to go down on the working level and chase opposition up a tree.

Don't borrow money for a day—wait a day and there will be no occasion to incur the liability.

Don't be dismayed by the pole-cat who threatens your right-of-way; execute a flanking movement, but don't forget that the predicate is not the subject. The pole-cat is predicate to the subject, but the subject lies beyond. Flank the cat, but stick to the subject.

Power of Motors

May Never Be a Mere Matter of Piston Displacement

STRANGE as it may seem, the idea has gained a footing that the power that is to be expected from internal combustion motors is proportional to the piston displacement. This would be true were all motors made exactly alike, but such is not the case—far from it; they are at wide variance with each other. The piston-displacement rule as it is promulgated by racing boards is not based upon the assumption that for equal displacement the power of the several motors will be the same. The real idea is that for a given displacement the power of all motors would be the same were they all equally designed. Of course, all the motors would be equally bad, or good, according as the model showed capabilities, and this is the possible danger to be encountered when standards are established. If the standards are high, the products will show the same characteristics. The piston displacement rule leads to abnormal conditions in racing, due to the fact that it is possible to so design a motor that it will deliver power at a high speed and be incapable of performing at all at low speed. This will be true if the "cold compression" is so high that the mixture will pre-ignite at low speed and only operate when the speed is so high that the compression will be lowered by wire-drawing of the mixture. It will be possible to start a motor of this character, but it will not be possible to run it at a low speed.

Don't disregard the fact that nothing is useless if it lightens the burden—make every point tell.

Don't accept the dictum that knowledge is cheap; it would be were it not for the fact that experience is power.

Don't cackle like a hen or roar like a lion; they are level-fixing habits; one lays eggs and the other serves as a door-mat.

Don't confer benefits that do not belong to you—let the owner thereof be the dispenser thereof.

Don't cheat yourself as you do when you say that you would do a thing if you had time; time is yours whether you like it or not; will you waste it?

Don't whine if you tax yourself as you do when you fail to think for yourself.

Don't forget that it is with loaned money that all the harm is done; if you loan you are a harm-doer; if you borrow you are harmed.

Don't partake of real sound stupidity in which you will be unrivaled if you expend all the money you have in an automobile, leaving nothing with which to meet the maintenance charges.

Don't forget that the path of life leads to something; find out what it is; if it is good, throw in high gear; if it is not good, clap on the brakes.

Don't do less than Stradivarius, who made violins; or Leonardo, who painted good frescoes; or Napoleon, who dragged cannons over the Alps; or Wellington, who made St. Helena famous.

Don't make a canyon out of a foot-path; blaze the way, but let it be a way of your making.

Don't dig for coal in a culm pile; Mother Earth welcomes you in virgin fields.

Don't think that because you are one of 90,000,000 that you have to ride on the cart of despair; there are thrice 90,000,000 opportunities rotting for want of attention.

Don't take off your hat to success; tackle the jade.

Don't forget that when the jay hoards up nuts for the winter the squirrel makes a memorandum of the location of the bird's store-house.

Don't choose between a tyrant and a conqueror; just be the latter.

Don't make your abiding place anything less than a king's palace, nor forget that some kings' palaces are fools' Paradises.

Don't be a little potentate; there is nothing the matter with playing the part of a big man.

Don't know yourself by the little things, nor pause on the crest of the biggest wave—go on!

Don't glut yourself at the breakfast of life or be stilled by wine at life's dinner—beyond lies supper and the long evening with its manifold enjoyments.

Don't accept the utterances from the tongue when the eyes speak another language—believe what the eyes say.

Don't let money be the principal object; life's work should be the aim, and money but one of the increments of the dividend.

Don't be a swine; it is to be bombarded with pearls that will look to you like cobble stones.

Don't be nonplused by the bright stars that are fanned into a flame by a passing breeze.

Don't silence the human voice and struggle to reach the heart of the antagonist with a sharper instrument—no weapon of man's devising is the equal of a well-modulated voice.

Speed with Security

BY MARIUS C. KRARUP. THE "FIFTY PER CENT." REDUCTION OF TRAFFIC-EASE RESULTING FROM PRESENT METHODS—THE PHYSIOLOGY OF OBSERVATION AND CAUTION. (SECOND INSTALLMENT.)

IF it is assumed that the present legal regulations, while in most localities onerous and one-sided, would safe-guard traffic as much as is required if they were enforced, but accomplish this object (wherever it is accomplished) mainly by cutting down the average speed to something less than is intrinsically desirable, it follows that the cutting out of elements which are admittedly important sources of danger and inconvenience, but which have never so far been subjected to regulation or elimination, must result automatically in raising the average permissible speed not only for automobiles, but for all members of the traffic which are capable of taking advantage of the change. Systematic agitation on this basis would pave the way for a general understanding of the fine points involved—points which are not necessarily too fine drawn because they have not so far been spontaneously and commonly appreciated. Nearly all the factors in modern civilization which make civilization what it is, and which no one would think of abandoning, are in their origin beyond the range of popular insight. The automobile motor is one of them. The true means for securing safe traffic in conjunction with high average speed may be similarly inconspicuous to the average mind before their efficacy has been proved in practice, and yet they may be readily perceived by the specialist who is acquainted with the underlying facts and is accustomed to weigh the values of general ideas, one against the other.

The traffic regulation in New York city offers an example of speed increased by means of the suppression or regulation of other dangerous elements. By halting the traffic at crossings and sending it away in blocks, the average speed of the traffic has been raised considerably and the safety of pedestrians has been increased at the same time. At high speed more vehicles pass a given point in a given time. Inversely, at any one point a given number of them are farther apart.

One of the leading considerations, when one is looking over the hindrances which at present exist against the general adoption of speedy traffic, is presented in the obvious requirement that the reasonable degree of caution which everybody is expected to observe shall not be reduced from a mutual to a one-sided obligation. The normal condition of the past—preceding the automobile—has been that A looked out for B, but also that B looked out for A. Neither A nor B can be satisfied to have safety reduced 50 per cent. at the outset by having all the obligation or all the ability to observe caution delegated upon one of the two. "Fifty per cent." is here used figuratively. It may be more or less. Nobody can tell the exact relations. Perhaps security depends 25 per cent. on one party's caution, 25 per cent. on the other party's caution and 50 per cent. on the combination of both. The vital fact is that it suffers when the full use of the senses is not shared by all concerned.

This condition is realized, however, if traffic member A is usually so placed that it is physically impossible or difficult for him to get out of the way of an automobile unless the driver B of the automobile observes him and voluntarily contributes his share by veering from his course, slowing up or signaling. Evidently speed is in this respect of importance; in fact, the largest element of all the danger ascribed to speed consists in this reduction of chances. The remedy consisting in speed reduction would be almost ideal if it were desirable and if it could be enforced. But, being undesirable, it cannot be enforced, and slow speed, adopted as a rule but most conspicuous by its exceptions, becomes perhaps more dangerous than an expected high average speed which the members of the traffic learn to more or less accurately gauge and look out for.

The "fifty per cent." reduction of tranquillity and safety which undeniably must be the result if one person instead of two is depended upon for producing the desired situation in each instance is so serious, if anything in traffic regulation is serious, that it must by some means be counteracted if it shall be said that the system of regulation is efficient. A fifty per cent. reduction of ease and a somewhat corresponding reduction of safety in traffic would be too high a price to pay for speed. From this viewpoint, among the 16 causes of disturbance enumerated above, those which involve a reduced capacity for observation on the part of all traffic members with regard to the speed and direction of the movements of automobiles should be considered in the very first line, if they have not been considered before, and remedies should be devised for their removal. Probably No. 8 among these causes of trouble has been less considered than any other, and is also in itself the most important one, partly because it applies to all automobiles and partly because the existing deficiency to which it refers would seem to be removable without hardship in any direction. It relates to the lack of change in the contour of a moving automobile. Its importance depends mainly upon facts with which all well-informed physicians are familiar. These facts relate to the physiology of the senses. Leaving aside all scientific phraseology, the condition for perceiving motion in one's surroundings may be said to consist in having motion represented in the sense images produced in the brain of the observer or the person who is in line for receiving a sense image, whether consciously observing or otherwise. Motion in a sense image means change from one image to a different one. If this change from one image to another is slow or very small, the idea is conveyed to the mind that the thing in the surroundings which moves is distant or moves slowly. The mind can usually determine whether it is slow or distant by the aid of a number of simultaneous sense images; that is, sound helps to interpret sight, and man's dual or perspective vision, due to the co-ordination of the two eyes, is in itself usually sufficient for deciding whether the motion is slow or distant. When the attention of the person is focussed upon the moving thing the difficulties in forming accurate perceptions are, of course, minimized, but for the subject in hand the question is one of the perceptions formed under less favorable circumstances, as when the "mind is absent" and the different senses are not consciously co-ordinated. Examples may illustrate the matter. When a person places his finger upon another person's naked arm the act is noticed distinctly because the sense image of the touch represents a change, but if the finger remains there and is not noticeably warmer or colder than the arm the mind, if otherwise occupied, is likely to become nearly unconscious of the presence of the finger, the sense image produced by its light pressure remaining without change except such as may be due to pulsation, slight difference in temperature, etc. If a person not intimately familiar with the gait of horses hears the steps of a walking horse, but sees nothing, he receives frequently the impression of two horses trotting or of a fast canter, because the walk produces a more rapid succession of separate and distinct auditory sense images and only the slow change in the distinctness of the sounds convinces him after a little hesitation that the movement causing the sounds is in reality slow, whereupon he reasons that it is a walk. Similar hesitation in the traffic is to be avoided.

Digest

A SHORT EXPLANATION IS OFFERED HERE OF TWO RECENT FOREIGN DEVICES INTENDED TO CHEAPEN THE PRODUCTION OF AUTOMOBILES DESIGNED FOR THE HUMBLEST FORMS OF TRANSPORTATION—SINGLE-LEAF VEHICLE SPRING AND SUBSTITUTE FOR DIFFERENTIAL

The production of automobiles of extremely low first cost, which may be adapted to displace the horse in even the humblest forms of transportation, continues to engage the attention of European designers. Francis Ernoult proposes a new type of vehicle spring which might be applied to such automobiles at first, though he believes its field of application should eventually prove much wider. He wants to use a spring plate of uniform thickness and varying width instead of the multiple leaf spring of uniform width and varying thickness. The illustration (Fig. 1) shows the comparative dimensions of an ordinary vehicle spring and of the one-leaf spring intended to take its place, and also two other shapes in which triangular cut-outs or a series of perforations permit the sides of the spring to remain parallel. With regard to simplicity and cost of making, Ernoult mentions that, apart from the eyes, which are alike for both types, the one-leaf spring may be stamped in a single operation, while the ordinary spring requires many. When cut to length each of the leaves must be arched, one differently from another; they must be perforated for the assembling bolt, the ends must be rounded, they must be beveled, slotted and pinned or spurred, the leaves must be placed and adjusted with care, lubricated and mounted. As to wear, the single leaf escapes the friction of one leaf upon another and therefore demands no care, while the multiple spring must be taken down occasionally, cleaned and greased. The single leaf works always in the same manner, while the multiple one creaks and becomes hard, when not greased, and weaker from wear. Defects in the temper or curve of any one leaf may cause it to break.—*La Technique Automobile et Aérienne,* October 15.

Evidently with a view to very cheap construction, Léon Charpaux offers a substitute for the differential gear in the arrangement shown in the sketch (Fig. 2). The axle A is supposed to be driven from the sprocket wheel O and is joined rigidly with the hub C of one of the driving wheels by means of a squared end portion and a nut. The other end has two short squared portions D and F, between which lies a cylindrical portion operating as a bearing member for the other driving wheel, the bushing J being interposed. Two friction plates G and H are mounted upon the squared portions D and F and are pressed against the adjacent surfaces of the wheel hub by spring K, secured by a nut. Leather washers between plates G and H and the hub surfaces are kept lubricated from a mass of consistent grease filling the hollow spaces in the hub. The tension of the spring K is adjusted to produce a friction coupling which will hold tight for straight driving, but will yield more or less at turns (and grades), permitting the wheel to rotate faster or slower than the other.—*La France Automobile,* No. 38.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, RACES, HILL-CLIMBS, ETC.

Nov. 19-26	Oakland, Cal., Idora Park Show, Under Management of Oakland Automobile Dealers' Association.
Dec. 1	Chicago, Ill., First Annual Aeronautical Exhibition in the Coliseum.
Dec. 31-Jan. 7, '11	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14, 1911	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12	New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28, 1911	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, Third Regiment Armory.
Jan. 15-21, 1911	Detroit, Wayne Gardens, Detroit Automobile Dealers' Association.
Jan. 16-21, 1911	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A. L. A. M.
Jan. 28-Feb. 4,'11	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-Feb. 11,'11	Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 18-25	Minneapolis, Minn., Annual Show Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25	Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 24-27	New Orleans, La., Annual Show, New Orleans Automobile Club.
Mch. 4-11, 1911	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 25-April 1	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mch. 25-Apr. 8	Pittsburg, Annual Show, First week, pleasure cars; second week, commercial trucks. Automobile Dealers' Association of Pittsburg, Inc.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

ELECTRICALLY, activity is pronounced. The coming of the Edison storage battery has awakened financiers to the unlimited possibilities for safe investment in this field. The managers of central electric lighting stations are everywhere preparing to charge electric vehicles upon demand; they can afford to do this work at a price that will compare favorably with, if not outstrip, the cost of gasoline, especially if the demand be made upon them during the hours of the day when their machinery is lying idle—eating its head off, so to say. It is not strange that the whole battery situation should take on a new and hopeful attitude. Competition is the life of trade, unless it gets a strangle grip; but if it is possible to silence an industry by competitive strangulation, it is no less feasible to reduce it to a state of perfect stagnation by a strong grip uncontested. There never has been the shadow of a doubt about the ability of electric vehicles in short-haul work. The points of demerit were recognized when reference was had to long-haul work, and to the life of the battery. Clearing up these retarding influences is sufficient to awaken capital, and when this potential force responds to the call, it brings with it enterprise, brains, and brawn.

* * *

DUE to the splendid foresight and thoroughly good management of the citizens of the South, and those of Savannah, Ga., in particular, the Grand Prize was run under the most favorable conditions, from the point of view of the track, the policing, and the looking after the visitors from afar and the folks at home. It is to be regretted that so much cannot be said for the contestants. From abroad came cars that had such a high center of gravity that they tipped over, and such soft material that the axles sprung, or the parts gave out. Among the American cars, there were two points of demerit, one of which was represented in the car that was driven fast enough to win but that was fitted with tires that were too small; nor was any provision made for replacing them with tires of the proper size, thus tracing the losing of the race directly to tire trouble of the kind that has nothing to do with quality. It was a clean case of lack of preparedness, and the reckless trusting to luck; luck was snoozing in the other fellow's back yard. The second demerit is attached to the splendid automobiles that performed consistently from start to finish, with no sign of mechanical trouble of any sort, nor even tire trouble. In those cases, had the cars been driven fast enough to induce a little tire trouble, it is more than likely that the result of the contest would make different history and better reading.

* * *

IN the operation and care of automobiles it seems to be necessary to continue to point out the advantages that are to be derived if the lubricating question is attended to with precision and intelligence. On page 831 of this issue a car is raised up at the fore, and some of the points for lubrication are indicated, and it is the purpose here to go on record as saying that, however inconspicuous these points appear to be, they are just as much entitled to attention as the crankshaft of the motor or the gear spindle in the transmission case. Statistics, of which the supply is too meagre, point absolutely to one thing, and that is that the average automobile is relegated to the scrap heap because it makes too much noise. Strange to relate, the average automobilist troubles himself much about the quality of the motor, and the ability of the transmission, in the face of the fact that these main units rarely ever give out. The way to make cars last longer is as simple as A B C. It is a plain case of putting lubricating oil on the little bearings that are here and there in the chassis, even if this extra effort results in some lack of attention to the motor.

* * *

JUST to show that tires are subject to frightful abuse, if they are permitted to intercept road inequalities while they are in an uninflated condition, some tire prints were made, and reproduced on page 839 of this week's AUTOMOBILE, and they offer conclusive evidence of the fact that this form of neglect is companion to a most destructive process. The test shows that a 34 x 4 inch tire on the wheel of an automobile tracks 3¼ inches when the pressure is 80 pounds, and the tire is rolled up on a 60-degree surface, but the same tire with the pressure reduced to 10 pounds tracks 6 inches. The width of the imprint in tracking is an index of the flexure induced, and the difference between satisfactory service and a disconcerting tire bill is represented in the difference between almost no flexure and a very little bit. In the meantime repeated tests show that tires are not maintained in a proper state of inflation; in many cases the pressures are below 50 pounds per square inch, but the chauffeurs almost invariably claim that it is from 80 to 110 pounds; they do not seem to know just what pressure is being maintained, and in some instances the chauffeurs had gauges in their tool-boxes which they failed to use.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

Benz and other foreign cars wrecked during Savannah race. Big list of visitors entertained in Southern style. Velie wins and loses in litigation with A.L.A.M. News of Olympia Automobile Show. News of seventeen different automobile shows. Triple tie in Chicago Motor Club Reliability. Matured debts of General Motors Company ordered paid—new board elected—Durant remains. E. R. Thomas Motor Company fails. Society of Automobile Engineers will meet January 11 and 12. Important happenings pending.

Savannah Grand Prize Race in Silhouette

Pertinent facts about the Grand Prix: The race was over the longest route ever attempted in America, 415.2 miles, 24 rounds of a course 17.3 miles long. The winner broke the American road race record, averaging 70.55 miles an hour. His car was a giant of power, the pistons displacing 920 cubic inches. The race was won by less than 1 1-2 seconds, the tightest fit ever experienced in a big road race. Bruce-Brown, the winning driver, is the son of wealthy parents and drives for the excitement of driving. He only recently graduated from the amateur ranks; in fact, until this race there was some doubt as to his having surrendered his amateur standing.

THE Marquette-Buick, No. 17, which finished third, made the best performance ever receivey by an American car in a road race. This creditable showing is all the more remarkable on account of fifteen tire changes required to keep the car going. As usual with the Buicks, the car was driven and beaten and lashed throughout the race; was run at terrific speed on the turns and through the unfortunate fact that its tires did not fit nearly every round found it in trouble. Despite all these things the car finished the full course. Conservatively driven on tires that fit, this car should have been much further to the front. While the rated horsepower of this Buick is only 57 3-5, upon dynamometer test it has showed 120 horsepower.

The Lozier pair and the Marmon, which completed the route, showed careful driving and splendid stability. The Loziers could have gone faster. Mulford did not have to change a tire throughout the race and there is no doubt that the white car could have plugged along several miles an hour swifter than it did. However, the reliability of the performance was generally commented upon. Horan's Lozier did a little more spurting than that of his teammate, but was not quite so steady. The little Marmon, the smallest car in the contest, did all it could.

Already the Savannah Automobile Club has made application to stage the running of the Grand Prize in 1911, and from the success attained in the recent race the chances favor such an outcome.

The system used to protect the track from over-running by spectators was as near perfection as can be imagined. Armed soldiery to the number of over 400 guarded the whole course effectively. Governor Brown of Georgia, representing the State, the County Board, representing the county, and Mayor Tiedeman of Savannah with the city officials, representing the city, gave the affair the aspect of an official function.

The citizens of Savannah and the Savannah Automobile Club showed a superior brand of Southern hospitality. Homes were thrown open right and left for the accommodation of visitors and everything was done to make the attending Northerners feel at home. Prices were high and in some of the hotels accommodations were impossible to get, but there was little complaint from any quarter.

It is estimated that fully 100,000 strangers were in Savannah Saturday. In some quarters it is figured that probably 150,000 would be closer to the true number.

One of the interesting features of the social side of the race was the dinner tendered to Governor Brown by the Motor Racing Association on board the "Wall Street Special" Friday night. A number of speeches were made and the guest of honor replied in a welcoming oration.

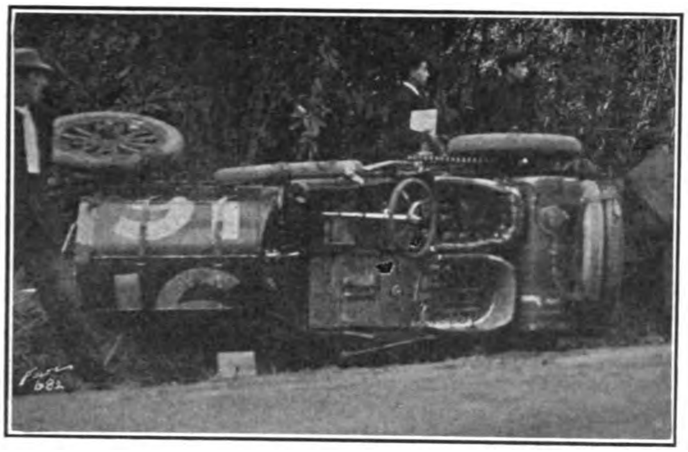
The whole affair was ably conducted without reference to expense and the impression created was wholly pleasant.

Benz and Fiat Racers Wrecked During Race

SAVANNAH, GA., Nov. 14—Now that the big race has passed into history, the preliminaries that insured such a brilliant success as was attained are coming in for much commendation all around. The work of the officials was done with refreshing precision during the running of the race. Not a slip was noted and not a word of criticism is spoken of them and their work.

The accident that put Wagner's Fiat, 16, out of the running might have been avoided had the driver heeded the warning of the technical committee in time. A bolt in the left side of the right front spring broke early in the race, causing a crack in the spring seat. He was flagged in the eleventh lap and it was suggested to Wagner that a new spring seat be installed. Caleb Bragg, team manager, added his advice to that of the committee, but Wagner declined to stop for repairs. In the seventeenth round while passing over the one soft spot on the course something yielded and spectators saw the car strike an abutment of a bridge and turn end for end into the ditch. Whether it was simply a skid on the soft place in the road or whether the rest of the spring clips gave way can hardly be determined with certainty because the impact of the car broke off the front axle at the

Wreck of Benz car as it was shown disabled alongside of the track



Flat racer driven by Wagner with a bent axle which threw the sprocket chain off

weakened spring seat, even if the break did not occur prior to striking the bridge.

Benz car, 18, driven by Haupt, was badly wrecked while the driver was attempting to make a sharp turn at the Montgomery cross roads. The car was unable to swing safely into the straightaway at the speed at which it was going and turned over and over into the ditch, throwing the driver and his mechanic clear of the wreckage. By some marvelous freak of luck neither was seriously hurt.

"Wall Street Special" a Big Success

The "Wall Street Special," the solid vestibule train run from New York to Savannah over the Atlantic Coast Line to accommodate metropolitan motor enthusiasts who wished to see the race under ideal conditions, proved a big success. The Motor Racing Association had charge of the train and conducted the affair with much careful forethought.

The train consisted of five Pullman stateroom cars, an observation car, dinner, composite and baggage car. The journey in both directions was accomplished without untoward incident and a pleasant, comfortable time was enjoyed by those who composed the party.

The following is the list of passengers on the train: Horatio M. Adams, H. P. Burchell, E. R. Bergdoll, H. A. Beale, Jr., Mrs. Beale, George McK. Brown, Robert McC. Butt, Duncan Curry, Mrs. Curry, C. M. Chauncey, George Chorpening, A. B. Cordner, O. J. Delaney, Mrs. Delaney, E. T. Delaney, C. A. Frank, Miss Fish, F. Gregory, L. D. Gregory, G. M. Graham, Willis Holley, A. E. Hall, Mrs. Hall, Robert Hager, Jr., J. R. Humpton, Mrs. Humpton, E. E. Hewlett, J. S. Hartsell, Frank Johnson, Ed. Korbel, John Kerrison, F. Keenan, R. W. Kane, Emanuel Lascaris, Harry B. Lasher, J. McNamara, E. C. J. McShane, Charles Meegan, Thomas F. Moore, Mrs. Moore, Edward Moss, Mrs. J. J. Mullen, Edgar G. Murphy, E. B. Nussbaum, E. S. Partridge, A. Rostein, M. J. Sullivan, G. L. Sullivan, E. E. Schwartzkopf, James Sullivan, H. M. Swetland, A. N. Sweeney, A. J. Smith, George Thomas, 3d, Jonathan Thompson, George P. Tangeman, George H. Thomas, Mrs. Thomas and and G. Weiss.

Sharp Dead as Result of Accident

SAVANNAH, GA., Nov. 14—W. H. Sharp, automobile manufacturer and entrant of the Sharp-Arrow car in the Grand Prix race, died to-day at the Savannah Hospital as the result of injuries received when his car turned over in practice for the big race last Thursday. Mr. Sharp was internally injured and his mechanic, Albert Fuchs, was almost instantly killed.

Mr. Sharp designed the car that cost him his life. He was originally a photographer at Trenton, N. J.

Bruce-Brown Also Won Back His Home

SAVANNAH, GA., Nov. 14—Winning the Grand Prize race was not the only agreeable development Saturday as far as David Bruce-Brown is concerned. The winning was fine, but there was something else about the result that will appeal to Mr Bruce-Brown with more force even than being returned a winner for he regained his home and won the prize at the same instant. The youthful driver became interested in motoring while he was a student at Yale and late in his college career he bought a big racing car. He was reticent as to his plans, at least as far as discussing them at home is concerned, and when the newspapers came out one morning with the story of how he had driven and won an important race, his mother, a wealthy and prominent member of society, forbade him to repeat his performance on pain of losing his income.

Bruce-Brown did not consider the proposition long and cast his lot unreservedly with the drivers of racing automobiles. Domestic relations were strained, in fact cut off for a long time thereafter.

But when the young man steered his giant racer back to the pits after flashing past the judges a winner, the first person to greet him was his mother. She could not wait until he removed his cotton mask, but rushed into his embrace as he stepped from his car.

Those who sat near the mother in the stand during the race declare that she "pulled" openly and fervidly for the success of her son.

His future as a race driver is being discussed widely and from a number of viewpoints, the general opinion being that his future course is in the balance.

Velie Wins One Decision, but Loses Another

Wisconsin Supreme Court holds against four concerns of A. L. A. M., who sought to check conspiracy action in Circuit Court. The Federal Circuit Court in opinion on merits of contract between Velie and Kopmeier sustains demurrer of Milwaukee representatives of motor company, holding that the contract was one of agency and not of outright sale.

MILWAUKEE, Nov. 14—Two particularly important opinions of high courts have been filed recently in connection with the litigation instituted by the Velie Motor Vehicle Co., of Moline, Ill., against the A. L. A. M. and its constituent members and its former representative in Milwaukee, Wis., the Kopmeier Motor Car Co.

The first of the decisions is embodied in the opinion of Chief Justice Winslow of the Wisconsin Supreme Court in which the court holds favorably to the plaintiff in a matter of procedure. In the other case, which was brought in the Federal Circuit Court, Eastern District of Wisconsin, Mr. Justice Quarles sustains the demurrer of the Kopmeier Motor Car Co. and holds adversely to the merits of the Velie Co.'s claim.

In the suit against the A. L. A. M. the Pierce-Arrow Motor Car Co.; the Chalmers-Detroit Motor Car Co.; the Pope Manufacturing Co. and the American Automobile Co. filed writs of prohibition to nullify service made upon their representatives in Milwaukee on behalf of the original suit of the Velie Co. The method taken was to invoke the power of the Supreme Court of the State to prohibit the Circuit Court from proceeding with the cases against the defendants.

Chief Justice Winslow holds that the relief prayed for is not proper and peremptorily denies the motion to restrain the Circuit Court, without going into the merits of the case.

The status of the litigation is placed at the same level it would have assumed if no question had been raised as to the service upon the defendants.

In the Federal case the decision is more radical.

The Velie Co. entered suit against the Kopmeier Motor Car Co. to recover damages for the alleged breach of an executory contract based upon an agreement set forth in the contract between the parties, that the Kopmeier Motor Car Co. agreed to handle the Velie product in the Milwaukee territory and under the agreement promised to buy at least 50 motor cars.

Judge Quarles holds that the contract as set forth is not a contract of sale, but rather one of agency. The foundation for his reasoning is the fact that in the contract it is provided that the Kopmeier concern is required to perform certain acts with regard to the automobiles, alleged to have been sold under terms of the contract, long after they would have passed absolutely to the Kopmeier Co. if the contract had been one of sale and not of agency.

The defendant company filed a general demurrer to the complaint and the court sustains the demurrer, which defeats the suit so far as the allegation of sale to the Kopmeier Co. is concerned.

In the suit against the four members of the A. L. A. M., which was decided favorably to the complainant's contention, a dissenting opinion has been filed by Judge Timlin, which was concurred in by two other members of the bench.

Mayor Gaynor Knows How to Get Around the Callan Law

New York, Nov. 16—1,200 chauffeurs are on strike and they decline to come to an agreement with their respective companies in the taxicab business unless their union is recognized. Mayor Gaynor has undertaken to bring about a settlement, and is showing some impatience at the inertia of the strikers.

It is now proposed to encourage strike-breakers, and the Mayor, according to the most recent report, threatens to put a policeman on every cab for the purpose of protecting property and the strike-breakers. No doubt a settlement of the strike will be effected in the long run, but it is interesting to note that the strike-breakers will either have to comply with the terms of the Callan Law and show competence, or if the Mayor puts policemen on taxicabs, he will do so for the purpose of protecting law-breakers.

The only reason for giving this whole matter serious thought lies in the fact that the citizens of the Empire State have had this law inflicted upon them, and it was foisted by a set of men who are making a living out of it, but strange to relate, the chauffeurs were in favor of it, and automobilists were indifferent. It was the most slippery piece of law-making of which we have any record before us, and those who have to deal with the striking chauffeurs now know why they did not oppose it.

In the meantime, the plain citizens now know why automobilists were indifferent. A law that permits a band of chauffeurs to take the community by the throat should be quite satisfactory to the chauffeurs themselves, but a law that permits children to drive without a license is only good for one purpose, and that is to give cheap politicians a job. In the meantime, we wonder how the Mayor can afford to violate the law in the process of upholding it.

E. R. Thomas Motor Company Goes Under

Buffalo, N. Y., Nov. 14—Inability to secure financial relief and a strike at the Reading factory in which its frames are made are given as the causes of the failure of the E. R. Thomas Motor Company, of Buffalo. The company had been in close quarters since early Summer and recurrent rumors of financial troubles were circulated at intervals.

Matters came to a crisis last week when E. R. Thomas, president of the company, issued a statement to the creditors appealing for time to gather the resources of the company and to try to make additional financial arrangements. In this statement Mr. Thomas says that until the last few weeks he had been quite hopeful for the affairs of the company, but that the onslaught of the bankers, politics and commercial conditions had prevented the acquisition of more funds.

Mr. Thomas declares that the company owes him more than it does all the other creditors together, and states that he is willing to wait for payment until the company can shape its affairs.

In putting the matter directly to the creditors, he says that the creditors have everything to gain and nothing to lose by delay in court proceedings. He says that he has loaned the company $300,000 in cash and much valuable collateral and asserts that he has reason to believe that a reorganization of the company on conservative lines will be accomplished within a week through the injection of Buffalo capital. This is to be made available by reason of the collateral loaned by Mr. Thomas.

No formal proceedings have been instituted to date against the company as far as the records show.

Remington Gets Manly Drive License

New York, Nov. 16—Emerson Brooks, who is the retiring general manager of Rothschild & Co., and for 20 years vice-president of J. M. Quinby & Co., of Newark, N. J., is booked for the vice-presidency and general management of a new undertaking under the name of the Remington Standard Motor Co., which concern has just been incorporated under the laws of West Virginia, with a capitalization of $1,000,000. This new company is taking over the plant of the Baldwin Steel Co., at a valuation of $229,000. The new concern will be "at home" at Charleston, W. Va., but the executive office will be at 1597 Broadway, New York City. F. M. Staunton, president of the Kanawha Banking & Trust Co., of Charleston, has been elected second vice-president; George A. Grounds, president of George A. Grounds & Co., of Pittsfield, Mass., is treasurer, and the directors of the new concern are: Eliphalet Remington of Ilion, N. Y., DeWitt Bruce, of Lenox, Mass., and Harrison B. Smith, of Charleston, W. Va. The most important undertaking of this company will be represented in the manufacture of a 2-ton truck, utilizing the Manly hydraulic transmission, the details of which were given in The Automobile more than a year ago, in which it will be remembered that the gasoline motor is hooked up to a battery of hydraulic pumps, and they in turn drive a battery of hydraulic motors, the latter being attached to the rear road wheels of the truck. This plan does away with the transmission gear, differential and bevel drive, also the extensive lever control system, including brakes as ordinarily required. The first truck of this type has been run around New York for a couple of years and works extremely well.

Trade Association to Give Reliability Run

November 29 and 30 have been selected as the dates upon which the New York Automobile Trade Association will hold its two-day endurance run through New York, New Jersey and Connecticut. The contest is open to stock cars which will be classified under Class A, in its seven divisions.

W. C. Poertner is active in promoting the affair. An entry list of 25 cars has been promised and there is a likelihood of half a dozen others. The run will be conducted on strictly technical lines and will be fully sanctioned by the Contest Board. Entry blanks have just been issued.

Gilbert Mfg. Co. Sues on Tire Case Patent

The Gilbert Manufacturing Company, of New Haven, Conn., has filed a bill of complaint in the Circuit Court of the United States against the B. E. Manufacturing Company, of New York City, asking for an injunction and an accounting.

Activity in Line of Shows Centers Attention

A. L. A. M. preparing vast quantities of lattice and 7,000 yards of carpet to floor the white and gold splendor of the Garden Exhibit. Nine more motor car manufacturers sign up for space in Palace show. Plans being formulated for automobile shows at the Importers' Salon, New York, at New Orleans, Cleveland, Omaha, Columbus, Milwaukee, Cincinnati, Pittsburg, Buffalo, Detroit and Los Angeles.

ACTIVITY in preparing for the A. L. A. M.'s coming Eleventh National Automobile Show at Madison Square Garden from January 7 to 21 is rampant. Two entire floors of an immense carpenter shop are being devoted to the manufacture of lattice for use in decorating. This will be used along the sides of the main hall. More of this type of fencing will be utilized at the show than ever before. In another department, dozens of men are busy cutting and sewing 7,000 yards of light green carpet which will be used to cover exhibition spaces on the main floor and elevated platform. The carpet is of special weave and will give the impression of the cars standing upon grassy lawns.

The color scheme of the decorations will be white and gold, shot and set off with green and crimson. It is estimated that 300 men are at work on the preliminary details.

Nine More Makers Sign for A.M.C.M.E.A.

The L. J. Bergdoll Motor Co. announces that it will exhibit a Colonial Coupe in dark wine color; a standard touring car; a fore-door touring car in Richelieu blue and a chassis at the A. M. C. M. E. A. exhibition at the Grand Central Palace, which opens New Year's eve. Among the other motor car manufacturers who have signed up for space at the Palace show are the following: Cass Motor Truck Co., Port Huron, Mich.; The Only Car Co.; Alpena Motor Car Co., Alpena, Mich.; Henry Motor Car Sales Co., Chicago; Correja Motor Car Co.; Gaylord Motor Car Co.; Otto F. Rost (Black Crow); Geneva Wagon Co., Geneva, N. Y., and Richard B. Dare (Cyklonette).

Importers' Salon Insures Foreign Show

At a final meeting of the companies that are interested in the exhibition of foreign automobiles in New York, a fund of $8,360 was subscribed and a permanent organization was formed. The first official act of the new concern was to close a lease of the big banquet hall of the Hotel Astor, in which the show will take place January 2-7, 1911.

The following companies were represented and will have space at the show: Panhard, Renault, Benz, Itala, De Dion-Bouton, C. G. V., Darracq, Isotta, S. P. O., Zust and S. B. A., a new car made in Belgium. Among the accessory and aeroplane motor companies that will exhibit are the Anzani and probably the Gnome companies. Burr & Co., carriages, have also taken space.

Columbus Club Looking for Exhibit Hall

COLUMBUS, O., Nov. 14—The show committee of the Columbus Automobile Club is busy in its efforts to secure a suitable hall for the purpose of giving the coming show. Considerable difficulty is encountered in the work of securing a hall which is sufficiently large.

Cleveland Club Adjusting Show Situation

CLEVELAND, Nov. 14—The directors of the Cleveland Automobile club will meet to-night to take up the local situation as regards the holding of an automobile show in Cleveland this Winter. As a result of disagreements among the dealers, the city had two shows last year, one under the auspices of the Cleveland Automobile Club and the other given by a faction of the dealers.

The directors of the automobile club will endeavor to bring all dealers into amicable relations this year with a view of effecting a combination of forces. Even if the directors are successful in this it is pointed out in some quarters that two shows will have to be given because of the lack of a hall big enough to house a show in which all dealers and all makers are represented. No dates have been set.

Milwaukee Dealers' Show Association

MILWAUKEE, Nov. 14—Milwaukee motor car dealers have revived the organization formed several years ago and a permanent association has been incorporated under the laws of Wisconsin. The name is Milwaukee Automobile Dealers' Association. There is no capital stock. One of the main purposes of the corporation is to conduct an annual motor show in Milwaukee. In February, 1910, when the Milwaukee Automobile Club held its second annual show, fourteen of the best known dealers in Milwaukee refused to join in the exhibition and held private shows in their garages. These dealers are the leaders in the new organization, the charter members of which are: The KisselKar Co., Frank J. Edwards, manager; Welch Bros. Motor Car Co.; Curtis Automobile Co.; Albert Smith; Jonas Automobile Co.; Hickman-Lauson-Diener Co.; Edgar F. Sanger Co.; Rambler Garage Co. of Milwaukee; Johnson-Burnham Sales Co.; American Automobile Co.; Bates-Odenbrett Auto Co. and the Kopmeier Motor Car Co. The membership fee is $250. A directorate of seven members has been elected as follows: Frank J. Edwards, the KisselKar Co.; Emil Estberg; Frank Hickman, Hickman-Lauson-Diener Co.; Clifford E. Golder, Curtis Automobile Co.; A. F. Timme, Kopmeier Motor Car Co. and H. B. Pruden.

Omaha Association Perfects Show Plans

OMAHA, Nov. 14—The Automobile Show Association has arranged to hold its Sixth Annual Automobile Show from February 20 to 25 inclusive. It will be held in the Omaha Auditorium. The show will be managed this year by Clarke G. Powell and Willard Hosford, who have managed the shows for the past three years.

Every dealer in Omaha belongs to the Association, and will exhibit at the show. The stage and boxes will be removed from the Auditorium, and by rearranging the space more room will be given than last year.

Detroit Dealers to Exhibit in January

DETROIT, Nov. 14—Plans are already under way for the Tenth Annual Automobile Show, to be held under the auspices of the Detroit Automobile Dealers' Association, January 16-21. As was the case for several years past, it will be held in the Wayne Hotel Gardens. Walter R. Wilmot, who was in charge of the automobile exposition at the State Fair, has been selected to manage the forthcoming show, which it is promised will in every way surpass its predecessors in splendor and in the number of exhibitors.

Los Angeles Show in Redwood Forest

Los Angeles, Nov. 14—The Licensed Motor Car Dealers' Association, of Los Angeles, will hold their Second Annual Show at Fiesta Park, December 24-31, 1910, except Sunday.

This show promises to surpass in magnitude and splendor the very successful exhibition of last year. It will be held at the same place, under a waterproof canvas canopy, covering 80,000 square feet of floor. The redwood forest idea will be repeated, and in addition to this beautiful feature, a cascade at the north end will supply a mountain brook, which will traverse the entire length—400 feet, terminating in a pool. A pumping plant will be installed to return the water to the cascade, with a capacity of 1800 gallons per minute. Twenty-five thousand 16-candle-power incandescent lights will set the beautiful scene in a blaze of light.

Thirty members of the licensed dealers' association will exhibit an aggregate of about 200 1911 models.

Cincinnati Club and Dealers Unite for Show

Cincinnati, O., Nov. 14—An agreement has just been reached between the Automobile Club of Cincinnati, and the Cincinnati Automobile Dealers' Association by which the Dealers' Association is to give the annual automobile show with the hearty moral support of the club. The retail dealers' association show committee, which is now making a canvass of the situation and expects to arrange dates for the latter part of February or the first part of March, consists of Edward Herschede, chairman; Harry T. Boulden, secretary; H. L. Leyman, R. C. Crowther, Frank H. Miller, W. G. Welbon, and Edward F. Kruse. Owing to the marked advance of the Queen City as an automobile center during the past year and the spirit of co-operation now existing on all sides the forthcoming event is expected to make a most creditable showing.

Two Exhibitions to Be Given at Pittsburgh

Pittsburgh, Nov. 14—A movement is on hand to have an independent automobile show next Spring. The Associated Automobile Dealers of Pittsburgh is the name of the organization which was formed at the meeting a few days ago to promote the show. Its officers are: J. Joe Feicht of the Liberty Automobile Co., president; Edward Bald of the Bald Motor Car Co., vice-president; James Kerr of the Kline-Kerr Motor Co., secretary; J. B. Howe, of the Pittsburgh Automobile Co., treasurer. Thirty-four members were enrolled and the building has already been secured for the show.

The 1911 show committee is making good progress in shaping up affairs for the fifth annual exhibition. The second week of the show will be the exhibition of motor trucks, motor boats, etc. and 12 dealers have already taken space for this event.

Bridgeport Dealers to Use Big Auditorium

Bridgeport, Conn., Nov. 15—The Bridgeport Automobile Dealers' Association announced to-day that a show would be held and plans are now under way to secure the Park City skating rink, one of the largest auditoriums in Bridgeport. No date has yet been set for the show. Bridgeport's first automobile show was held last March. Frank Rantz, president of the association, stated to-day that a meeting will be held next Tuesday evening at the Stratfield to fix upon the date of holding of the show. J. L. Bloomer, secretary of the association, is preparing for a vigorous campaign.

Buffalo Show to Be Held at Arsenal

Buffalo, Nov. 14—The annual automobile show will be held in the Broadway Arsenal during the week beginning Feb. 5, under the auspices of the Automobile Trade Association of Buffalo.

Plans for Crescent City Exhibition Formed

New Orleans, La., Nov. 14—A large automobile show, as compared to most local shows, will be held by the dealers of New Orleans under the auspices of the New Orleans Automobile Club, February 24, 25, 26 and 27, 1911. The show will be in conjunction with the third annual Mardi Gras Speed Carnival, but will open one day in advance and will be open the first two nights. Homer C. George will be general manager of the show and races, working in conjunction with a committee of three representing the exhibitors.

Upon the day of the announcement, twenty dealers signed applications for space, agreeing to exhibit cars. Each will be given a space 25 by 25 feet. Accessory exhibits will be half this size. The car exhibits will be placed in the enclosed betting ring under the steel grand stand at the Fair Grounds, while the accessories will be exhibited in the ladies' dining room.

The show will be under the special direction of the dealers' committee and will not be a money-making enterprise in any sense. If any money is realized from it, said money will go toward building a road, upon which work is now being done under the auspices of the Motor League.

Chicago's Exhibition Has Vast List

Chicago, Nov. 14—The demand for space at the Chicago show is greater than ever. For the first week, January 28 to February 4, there are a dozen or more makers of cars and more than fifty makers of accessories on the waiting list. A typical line of commercial cars will be shown from February 6 to 11, and the main floors of the Coliseum and Annex are practically full.

Following is a list of the commercial car makers who have contracted for space, to be supplemented later by several to whom allotments have been made but who have not yet completed the formalities: Mack Bros. Motor Car Co., Allentown, Pa.; Mais Motor Truck Co., Indianapolis, Ind.; U. S. Motor Truck Co., Cincinnati, Ohio; Hart-Kraft Motor Co., York, Pa.; White Co., Cleveland, Ohio; Studebaker Bros. Mfg. Co., South Bend, Ind.; Alden Sampson Mfg. Co., Pittsfield, Mass.; Courier Car Co., Dayton, Ohio; W. H. McIntyre Co., Auburn, Ind.; Waverley Co., Indianapolis, Ind.; Reo Motor Car Co., Lansing, Mich.; Cartercar Co., Pontiac, Mich.; Grabowsky Power Wagon Co., Detroit, Mich.; Garford Co., Elyria, Ohio; Packard Motor Car Co., Detroit, Mich.; Avery Co., Peoria, Ill.; Pope Mfg. Co., Hartford, Conn.; Rapid Motor Vehicle Co., Pontiac, Mich.; Reliance Motor Truck Co., Owosso, Mich.; Peerless Motor Car Co., Cleveland, Ohio; American Locomotive Co., New York; Pierce-Arrow Motor Car Co., Buffalo, N. Y.; Metzger Motor Car Co., Detroit, Mich.; H. H. Franklin Mfg. Co., Syracuse, N. Y.; Knox Automobile Co., Springfield, Mass.; Kissel Motor Car Co., Hartford, Wis.; Kelley Motor Truck Co., Springfield, Ohio; Adams Bros. Co., Findlay, Ohio; Chase Motor Truck Co., Syracuse, N. Y.; Chicago Commercial Car Co., Chicago, Ill.; Lansden Co., Newark, N. J.; Federal Motor Truck Co., Detroit, Mich.; Automobile Maintenance & Mfg. Co., Chicago, Ill.; F. B. Stearns Co., Cleveland, Ohio; Economy Motor Car Co., Joliet, Ill.; Anderson Carriage Co., Detroit, Mich.; Marquette Motor Vehicle Co., Chicago, Ill.; Monitor Automobile Works, Janesville, Wis.; Clark Delivery Car Co., Chicago, Ill.; Schmidt Bros. Co., Chicago, Ill.; Brodesser Motor Truck Co., Milwaukee, Wis.

No Date or Place Yet for St. Louis Show

St. Louis, Mo., Nov. 14—At a meeting of the officers of the St. Louis Automobile Dealers' and Manufacturers' Association it was decided to leave the question of the 1911 show to the members. This action was taken because of the fact that opposition to the 1911 exhibit has developed. The same condition existed previous to the last show, but when it came to a vote an almost unanimous ballot was cast in favor of the proposition. The last show was held in the First Regiment Armory.

Olympia Automobile Show Opens in London

Olympia Show opens in London. Tendency of manufacture as shown in exhibits is toward smaller motors. Compactness and neatness in cylinder casting is a feature. Sixty per cent. of the automobiles shown are listed at less than $2,500, this includes, eight different makes of six-cylinder cars ranging up to 25 horsepower. Stroke of motor is longer in proportion to bore. Show is pronounced to be one of the most interesting ever held.

LONDON, Nov. 5—The motor show now in progress at Olympia is considered something of a step in advance as compared with any other show ever held in England. Space to exhibit was exhausted long before the show opened and the collection of automobiles on exhibition is one of the most interesting ever gathered under one roof.

The motors shown are generally smaller than they have been in the past; the horsepower being between 12 and 15, in a great number of instances. One of the first things that impresses the visitor, is the improvement in cylinder casting and design. The tendency is toward neatness and compactness and those concerns which adopted the plan last year of enclosing their valve stems, tappets, etc., have continued the practice, which goes a long way toward eliminating noise and excluding dust. The thermo-siphon system of water circulation which jumped into favor last year, is evidently holding its own.

More engine cylinders are cast en bloc this year than ever before and many new models are equipped with that type of cylinders.

Over 60 per cent. of the cars shown are listed at less than $2,500, even the six-cylinder cars of from 18 to 25 horsepower being so listed. Among the cars priced under that figure are the Arrol-Johnson, Daimler, Darracq, Fiat, Mors, Sunbeam, Clement-Talbot and Vauxhall all six-cylinder cars.

There is a tendency with small cars to rely upon ball bearings for crankshafts, but little success has followed the use of ball bearings in engines with bore of over 90 mm. The idea of equipping the car with only two ball bearings on the crankshaft has been tried to some extent in the current models, notably the Argyll. The worm drive, back axle, is slowly increasing in favor, half a dozen of the new models having been so equipped.

There seems to be a drift toward the adoption of a drive giving four forward speeds as opposed to three. The Wolseley Co. exhibits a gear box giving four and reverse, with direct drive on the fourth speed rather than the third, as heretofore. The Maudesley box gives direct drive on third with the fourth geared higher.

One of the chief developments of the year is the elongation of motor stroke with regard to the cylinder bore. The average of 14 typical makes of four-cylinder cars has been shown to be 3 1-4 by 4 13-16 inches.

The twin jet carbureter has made some advancement in popularity. The high tension system of ignition is practically universal, except where a dual system is used in cars of large power.

In the matter of engine lubrication the only novelty of any importance is the adjustable trough system, which while a clever idea does not seem to return sufficient advantage from its use to warrant the extra cost.

Clutches of all kinds are shown, including internal expanding, plate, leather-faced and metal to metal. The leather-faced clutch is maintaining its popularity and provision is generally made for smooth engagement by a series of springs under the leather facings. The hydraulic clutch is making no headway.

Frame design is very similar to last year, as finality in construction seems to have been reached in this line. The most general type of frame the side members are set in to give increased steering lock and are arched over the rear construction.

Front wheel brakes are growing in use on the higher priced cars, but on account of their more involved mechanism they are not likely to invade the field of the low priced lines.

The design of the rear axle, particularly as regards torque and radius rods, is the same as last year in almost all cases.

The chain drive is as dead as Queen Anne in the best known English makes, although the silent chain is creeping in for two to one shaft drive.

Among the accessories are shown several types of self-starters, one of which embodies the idea of an air compressor. Detachable wheels are shown in great variety.

Flush-sided bodies are shown in many lines, several makers having arranged the change speed lever within the frame to facilitate fitting on this popular style of body. Even in limousines and landaulets the current models show side doors attached to the front seats almost universally. In the matter of upholstering some of the ideas are novel. For instance, in the limousines it is not uncommon to find the bodies lined with wood in place of cloth. One line is displayed where the interiors are finished in the choicest tropical woods, comparable in pattern and workmanship with the best work of the cabinet-makers.

The Society of Automobile Engineers' Annual Meeting

NEW YORK, Nov. 16—Howard E. Coffin, president of the Society of Automobile Engineers, has announced that the annual meeting will be held in New York City on Wednesday and Thursday, January 11 and 12, 1911. The two days sessions will be devoted to the business of the Society and to technical subjects upon several of which papers will have been printed and distributed in advance of the meeting.

The work of the Society's standards committee is continuing actively; meetings of two divisions of this committee were held last week at the Society's New York office.

At the meeting of the plain, ball, and roller bearings division, the following were present: Henry Souther, Chairman Standards Committee; Henry Hess, Hess-Bright Mfg. Co.; A. P. Sloan, Jr., Hyatt Roller Bearing Co.; S. P. Wetherill, Jr., Wetherill Finished Castings Co.; Coker F. Clarkson, secretary.

At the meeting of the division on aluminum and copper alloys the following were present: Henry Souther, Chairman Standards Committee; Thomas J. Fay, Editor THE AUTOMOBILE; R. S. Fretz, Light Mfg. & Foundry Co.; H. W. Gillett, Aluminum Castings Co.; S. P. Wetherill, Jr., Wetherill Finished Castings Co.; Coker F. Clarkson, secretary.

General Motors New Board: Debts Paid

Responding to the instructions of the voting trustees, now in charge of the General Motors Co., a new board of directors has been chosen. It consists of the following: W. C. Durant, Anthony N. Brady, James J. Starrow, Albert Strauss, J. H. McClement, Nicholas L. Tilney, Richard Lukeman, Jr., Benj. F. McGuckin, H. L. Carlebach, Arthur P. Bush, Jr., and George Reichert.

All of the old board except Vice-President Durant failed of re-election. Anthony N. Brady, whose name is second on the list, has been financially interested in motor manufacture for some time and is connected with a number of prominent companies. James J. Starrow, represents Lee, Higginson and Co. and the others on the list represent various financial interests identified with the flotation of the $15,000,000 bond issue.

Announcement was made after the meeting that all matured obligations of General Motors had been taken care of and checks were being prepared for mailing.

Three Perfect Scores in C. M. C. Reliability Run

CHICAGO, Nov. 14—With a triple tie between a pair of Moline cars and a Fal, all of which finished the 1,000-mile reliability run of the Chicago Motor Club with perfect road and technical scores, the Van Sicklen Cup in the Roadster and Toy Tonneau divisions will be held by the Moline Auto Co. for eight months and by the Falcar Co. for four months. The Haynes entry was declared winner in the touring car division, with a penalization of two points for a loose bolt in the brake. This car is awarded the Stewart Speedometer Trophy. The team prize was won by the Moline pair, with perfect scores. The Standard Oil Trophy for economy in gasoline consumption was captured by the Cunningham, driven by J. C. Emery, using 83.80 gallons, the car weighing 2,930 pounds. The Falcar was second with an average of 17 miles to the gallon. The Michelin Tire Co. was awarded the Branstetter Cup with 15 points penalization.

The plan of holding the run was to send the cars over about 200 miles of varying roads each day for five days, the total mileage being about 1,050. The feature of the affair was the stability shown by the contesting cars and the excellent scores made by them. The technical examination to which they were subjected was severe and the fact that so many survived may be taken as proof of the good character of the competing automobiles.

The economy test proved illuminating as a measure of the cost of fuel and oil in touring under severe road and weather conditions. The clean scores registered in the roadster division of the tour were very creditable, as it scarcely seemed within the realm of possibility that no technical defects should be developed in such a hard test.

Tribune Trophy Goes to Chalmers

MINNEAPOLIS, MINN., Nov. 14—The Barclay Auto Company has become the permanent possessor of the Tribune Trophy through the decision of the trustees of the Automobile Club of Minneapolis. The Chambers "30" had finished the three contests with the best average score, as provided by the rules made in 1908.

Upon being informed of the club's action, Mr. Barclay immediately arranged a banquet to fittingly celebrate the disposal of the trophy.

TABLE SHOWING PERFORMANCE OF CONTESTANTS IN C. M. C. RELIABILITY RUN—TOURING CAR DIVISION

Car No.	Car	ROAD SCORES											FINAL EXAMINATION												ECON. COMPETITION

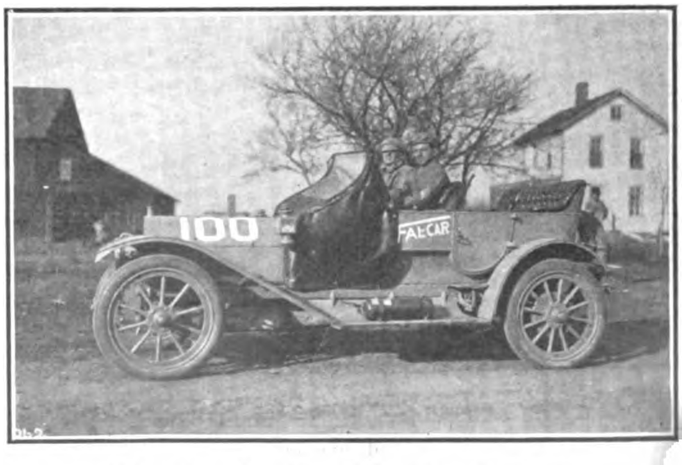
Moline, No. 104, came through with a clean score



Falcar, No. 100, also ended with a clean score

News Notes from Hoosier Capital

INDIANAPOLIS, IND., Nov. 14—Many new companies are being formed with the expectation of getting in line for the 1911 season, and some important changes in agencies are resulting. Among the most important changes is that of the Premier agency from the Gibson Automobile Co. to the Premier Motor Sales Co. with Henry L. Johnson, formerly of the Boston Premier branch, as manager. The new company will distribute the Premier throughout the State.

The Marion Sales Co. has also been formed to act as general distributor for the Marion, which is to be manufactured on an extensive scale, during the coming season. Those interested in the company are: E. A. Brown, James E. Kepperley and J. O. Vanier. The Marion will be built in two chassis types, with a choice of a large variety of bodies, ranging from roadsters to taxicabs.

About 300 employees of the Overland factory in this city were entertained at a theater party last Monday night by Will H. Brown, vice-president of the company. Before the performance the Overland factory band gave a concert.

New Company to Make Automobiles

BUCYRUS, O., Nov. 14—The incorporation of the Sommer Motor Co., of this place, recently, with an authorized capital of $125,000 means the erection of a large plant for the manufacture of the Sommer automobile, which has been made on a small scale at this place for several months. The charter of the corporation permits the company to manufacture and sell automobiles, motor trucks, and other vehicles as well as automobile supplies and accessories in general.

The incorporators were: L. A. Sommer, who will be president and general manager of the corporation; L. M. Smith, F. C. Hopley, S. S. White and D. F. Flohn. Active preparations are being made for the location of the factory.

Auto Refrigerator Offers Advantages

The auto-refrigerator car shown in the accompanying illustration is utilized for transporting beef at Buenos Ayres by the Compania Sansinena Carniceria "Na Negra" de Carnes Congeladas. It is capable of handling 4,500 kilograms of meat in each load and is operated by a 35-horsepower motor of the four-cylinder type constructed at Puteaux-on-the-Seine, and is of the De Dion-Bouton type. The motor ice truck noted in the accompanying illustration is provided with a similar four-cylinder motor of 24-horsepower capacity; the cylinders of this engine have a bore of 104 mm. and a stroke of 130 mm., and the truck is arranged for three speeds forward and one reverse. This new motor truck has a capacity for handling 3,000 kilograms of ice in each load.

Automobile refrigerator car in Buenos Ayres

United International Motors Makes Its Bow

Benjamin Briscoe's trip abroad is already bearing fruit and the United International Motors, Limited, affiliated with the United States Motor Co. and representing that corporation in England, has made an auspicious début. United International Motors has obtained a concession from United States Motor Co. to manufacture and sell in the United Kingdom and continental Europe the various types of cars made by the American company. A staff of representative Britons has been assembled and the announcement has been made that it is the intention of the company to install a manufacturing department in full co-operation with the American plants. A guarantee for four years is given to all purchasers. The Brush, Maxwell, Stoddard-Dayton and Columbia types are specially emphasized. The new company has secured temporary quarters and is showing fifteen models.

Annual Election of A.A.A. Last of Month

The annual meeting of the American Automobile Association will be held November 30 and December 1, when the election of officials will take place. There has been the usual grist of rumors about radical changes in the make-up of the slate and indications point to the election of Vice-President Hooper of Philadelphia as president of the association. The groundwork of the Contest Board apparently will remain without revolutionary change although a number of officials now connected with it are likely to be switched about. The composition of the Technical Committee is arousing considerable comment. The opinion is expressed that it is likely to remain about the same as in the past season. Chairman S. M. Butler will stay at the head of the Contest Board.

Carples Resigns as Manager N. Y. Dealers

James M. Carples, general manager of the Licensed Automobile Dealers of New York, has placed his resignation in the hands of the Executive Committee, announcing that his new duties as general manager of the Daimler Import Co., who will handle Mercedes cars in America, made it impossible for him to continue as general manager of the Licensed Automobile Dealers.

Mr. Carples' successor has not as yet been chosen.

R. H. Johnson and J. M. Uppercu have been chosen members of the Board of Directors of the association.

Syracuse Club Points Out Auto Route

SYRACUSE, N. Y., Nov. 14—Notice has been received by The Automobile Club of Syracuse that since Nov. 5 the ferry from Cayuga to Seneca Falls has been discontinued. The road across the marshes at Free Bridge will be kept open and passable through the winter, which is welcome news to automobilists of this section that like to use their machines during that season.

Tourists going west from Auburn have been directed to follow the macadam on Clark street to Free Bridge, cross the marshes and take the second left turn into Seneca Falls. Going east through Seneca Falls, they are to turn left into Cayuga street and take the right fork to Free Bridge.

Ryan Head of Aero Club of America

Allan A. Ryan and his whole ticket were elected to administer the affairs of the Aero Club of America. The insurgent movement that was projected after the recent meeting at Belmont Park did not materialize. No formal announcement was made by the club as to action in the case of Drexel and other malcontents.

Don't try to accomplish a life's work in a day; constant **washing** wears away the hardest stone; wash, brother, **wash.**

Boston Truck Dealers for Organization

Boston, Mass., Nov. 5—At a meeting of a number of dealers connected with the Boston Automobile Dealers' Association, who handle commercial vehicles in addition to pleasure cars, an organization was formed, known as the Boston Motor Truck Association. The organization will start in at once to push commercial vehicles and in the future will have shows, endurance runs and reliability contests of various kinds.

Officers were chosen as follows: J. W. Maguire, Pierce-Arrow, president; A. P. Underhill, Knox, vice-president; J. S. Hathaway, White, treasurer; Chester I. Campbell, secretary; board of directors, the above officers and A. B. Henley, Franklin; Victor A. Charles, Inter-State; L. B. Butler, Rapid and C. F. Whitney, Alco and Stoddard-Dayton.

The advisability of having a show for commercial vehicles solely, this season, was discussed and it was decided that the plans could not be matured sufficiently without interfering with the arrangements for the regular motor show next March.

Windshields in United Manufacturers

Rumors that told of the dissolution of the United Manufacturers, which handles the Jones Speedometer, Motorol, Metzger windshield, ignition specialities and the Weed chain, and the erection in its place of a merger of various windshield companies prove to have little foundation in fact. The situation as far as it has developed indicates that, instead of dissolving, the United Manufacturers is planning considerable accessions to its lines.

It may be said with semi-official certainty that the company contemplates continuing in business. A plan is under way to bring several important manufacturers of windshields into the company. Announcement of the details will be made in due course.

L.I.A.C. To Be Ten Years Old Next Month

With much ceremony and rejoicing the Long Island Automobile Club will celebrate its tenth anniversary Dec. 7. The ample club house at 920 Union street will be the scene of a feast, entertainment and a meeting to commemorate the occasion.

The club has had a prosperous year and its size and importance have increased largely. Its club runs and competitive tours have proved a distinct addition to the pleasure of motoring.

Automobilists Satisfied with Election

While the storm of ballots raged last week something happened that will probably prove of benefit as well as interest to motordom. Among those who were not selected to make laws and administer them were the New Jersey legislators who were instrumental in framing the sumptuary law now on the statute book of New Jersey, which oppresses visiting automobilists and is a standing reproach to the fair name of the State. New Jersey roads are proverbially excellent, but the existing statute has proved so obnoxious to motordom generally that reprisal legislation has been passed by neighboring States against the Jerseymen. The associated automobile clubs of New Jersey realized that this condition was wrong and for months before election the members labored diligently to secure pledges from candidates of both parties to correct the legal situation.

As a result, the legislature chosen in Jersey on Tuesday is formed of men who have given their words of honor to change the burdensome and unjust law.

In New York State it may be noted incidentally that Samuel S. Koenig, Secretary of State, who was very active in the administration of the laughable Callan Act, and Albert S. Callan, the youthful Assemblyman from Columbia County, who was the titular father of the State motor law, are numbered among those who fell.

Road Builders to Confer for Four Days

Indianapolis, Nov. 14—Four days will be devoted to the study of road problems by the American Road Builders' Association at a convention to be held at Indianapolis, Dec. 6-9. Extensive preparations are being made for this conclave and the hope for State aid and State control of highways in Indiana hinges largely upon the automobile owners.

The Indianapolis Trade Association, with the aid of such men as Carl G. Fisher, president of the Indianapolis Motor Speedway, and Will H. Brown, vice-president of the Willys-Overland Co., is seeking the active support of every owner of a motor car in the State.

Detroit Favors $2,000,000 Road Bonds.

Detroit, Mich., Nov. 14—That the people of this community are fully awake to the advantages of good roads was demonstrated in the election of last Tuesday, when the proposition to bond Wayne county for $2,000,000 for road building purposes carried by a large majority. It served to show what a powerful force the motor car industry has become here, for the united support and co-operation of these interests were important factors in the success of the issue.

State Senator John N. Anhut, who was formerly actively connected with the industry as president of the Anhut Motor Car Co., now the Barnes, was defeated by his Democratic opponent, James H. Lee.

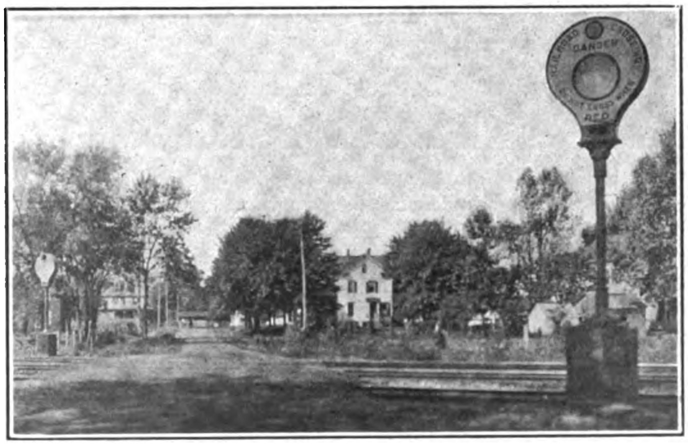
Reciprocity with Canada for Automobiles

Negotiations are being conducted between the authorities of Canada and the United States looking to a reciprocal arrangement of customs with regard to the introduction of automobiles from one country into the other. Officials of both nations are being strongly urged to reach an agreement by representatives of motordom on both sides of the line.

Nullifying Grade-Crossing Perils

Quite an advancement in the art of protecting grade crossings has been made by the Lehigh Valley and installed on one or two dangerous intersections of highways with the railroad right-of-way.

As shown in the accompanying illustration, the warning signal is substantially built upon a column of perhaps 15 feet high. For use in the day, the signal bears the caution: "Railroad Crossing. Danger. Do not cross when Red." An electrically operated gong also gives audible warning of danger. At night the signal shows a red light when a train is approaching the crossing and the bell also gives voice.



How the Lehigh Valley Railroad proposes to protect dangerous crossings

News of the Detroit Field

TWO MOTOR CLUBS MERGE AND HENCEFORTH WILL BE KNOWN AS THE WOLVERINE AUTOMOBILE CLUB—NOTES OF THE TRADE

DETROIT, Nov. 14—The Stanley Motor Car Co. has begun operations here making the Stanley "30" and the Stanley "40," selling at $1,450 and $2,000, respectively. The company is located temporarily at 315 Howard street and two cars have been turned out. From now on the concern expects to turn out one car a day and the product will be marketed principally in the West. The officer are: President, G. S. Murdock; secretary-treasurer, A. A. Savois; general manager, F. E. Gibbard.

An interesting bit of news to local autoists was the announcement that the Detroit Motor Club and the Wolverine Automobile Club had decided to consolidate, the name of the latter being retained. Committees from the two organizations have been at work on the matter for some little time and the details have just been completed. The combined membership is about 600, which, it is expected, will be increased to 1,000. Secretary F. H. Trego and Assistant Secretary W. O. Peck have established temporary offices at 1215 Woodward avenue. The club plans to erect one of the finest club houses in this section of the country.

William F. Cornell, of the Detroit Motor Car Supply Company, has been elected president of the Detroit Rotary Club, a new organization representing forty-five business and manufacturing concerns of Detroit with an investment of more than $7,000,000.

Mayor Philip Breitmeyer, who retires from office January 1, and his secretary, Frederick A. Van Fleet, are president and secretary-treasurer, respectively, of the Wolverine Motor Supplies Company, which has filed articles of association at Lansing and has already commenced operations at 1221 Woodward avenue. The company's principal output for the present will be the Detroit spark plug, invented by Theodore L. Beguhn. It differs widely from the ordinary spark plug in that mica washers take the place of the customary wire points for sparking purposes. Frank W. Kanter is vice-president of the company and George W. Stimpson is factory manager. John Gillespie, of the Gillespie Auto Sales Company, is also interested in the new venture.

Following the recent annual meeting of the Warren Motor Car Company General Manager J. C. Bayerline has announced that the capital stock of the concern has been increased from $100,000 to $300,000. Whether this means a stock dividend or a further enlargement of the company's facilities is not made known.

The Hupp Motor Car Company has announced that its new four-passenger touring car at $900 as well as its other 1911 models, including the runabout, a coupé and a torpedo, are ready for the market.

The Board of Commerce is doing some effective campaigning on behalf of its good roads bonding project. George S. Ladd, former master of the Massachusetts State Grange and now lecturer for the National Grange, is delivering a series of good roads talks here under the auspices of the board.

Roy Buell, who has been connected with the publicity department of the Regal Motor Car Company, has been promoted to the position of advertising manager. Mr. Buell is an ex-newspaper man. He went to the Regal company from the Associated Press.

Rothschild & Co., Body Makers, Fail

Bankruptcy proceedings were commenced Monday against Rothschild & Company, manufacturers of automobile bodies at 550 West Fifty-seventh street, New York City. Lillian H. Mendel, of Mount Vernon, and several other creditors instituted the proceedings. Federal Judge Hough named Charles Singer receiver under $5,000 bonds and authorized him to continue the business for ten days.

Liabilities are estimated at $100,000 and the schedule of assets foots up about $30,000. The company has on hand about $50,000 in contracts and the work of the receiver will be to fill as many as possible during his tenure of office. The company was formed in 1906 with capital of $35,000. This was increased subsequently to $200,000.

Auto and Airship Neglected by Military

Possibility of war between the United States and Japan, the readiness of the Japanese and the unpreparedness for such a development in the United States are being discussed with much freedom in European military circles, according to H. H. Rogers, son of the late Standard Oil magnate, who returned recently from across the Atlantic.

In speaking of this talk, Mr. Rogers said: "High military officers are unanimous that the war will come about within a few years, surely before the opening of the Panama Canal, and that America will be whipped just as Russia was."

Such reports, coming as they do from sources that should be well informed, carry a certain amount of force that the ordinary traveler's tale does not possess.

History clearly shows that in armed struggle the side which is able to mobilize its forces with the most facility and to determine the intentions of the enemy always wins. Napoleon said that Providence was on the side which had the heaviest batallions, but his practice showed that he did not believe in trusting to Providence alone. It was his plan to discover the intentions of the enemy and to "beat him to it," by engaging him with heavier forces than he could bring to bear upon a given crucial point.

All of which goes to show the importance of swift mobilization. In this age of the automobile and aeroplane as existing military forces the neglect of them by the United States Government is inexplicable. In case of war with Japan the problem presented to the army and navy would be one of swift assembly of fighting force at the point of attack. Those who have taken the pains to investigate the situation at all are agreed that there should be a board of automobile engineers installed at once co-ordinate with or superior to the general staff of the army and that a similar body of aeronautical engineers should be charged with the task of preparing a defense of the country by airships.

The palpable neglect of these two important elements of defense might lead to a very black page in American history.

Goes to Paris to See Long-Stroke Motors

Eugene Grenwauld, superintendent of the Moline Automobile factories sailed Tuesday from New York for the Paris Auto Show. The Moline Co. expects to get some ideas from inspection of the foreign exhibits at the Paris show, especially with respect to long stroke motors. The 1911 Moline motor is of the long stroke type, being 4-inch bore and 6-inch stroke.

Among the Accessory Makers

SHORT NEWS; SCHEBLER CARBURETER AND METHODS OF MANUFACTURE; ACTIVITIES OF ACCESSORY MAKERS AND OTHER ITEMS

—J. E. Strater has opened a branch office in Cincinnati for the Hoffecker speedometer and the Flentz shock absorber.

—J. C. Irwin has resigned his position as Wisconsin representative for the Firestone Tire & Rubber Company, of Akron, Ohio.

—Ground has been broken for the new Vulcan gear works, at Pontiac, Mich., one of the four new factories which are to be erected there.

—Wiley F. West has been appointed manager of the St. Louis branch of the Firestone Tire & Rubber Company. He comes from Atlanta, Ga.

—The Booth Demountable Rim Company has removed its general offices to 8410 Lake avenue, Cleveland, Ohio, where its factory is located.

—Truffault-Hartford shock absorbers will be used to equip Oldsmobile "Limited" and "Autocrat" models of 1911 and upon all Rambler cars.

—William Smith, former treasurer of the Lyric Theater of Cincinnati, now represents the Michelin Tire Co., in Ohio, Indiana and Kentucky.

—The Pennsylvania Rubber Company has appointed the Post & Lester Company, Boston, Mass., agents for Boston and vicinity, covering its automobile tires.

—E. J. Benson, who has been with the B. F. Goodrich Co., Detroit, for seven years, has joined the selling force of the Pennsylvania Rubber Co.

—W. A. Merriam has been appointed advertising manager of the Warner Instrument Company, and will conduct that feature of the business from the Boston office after December 1.

—The Badger Auto Tire Repair Company of Milwaukee, Wis., has moved to larger quarters at 132 Oneida street. V. A. Massee is manager. The company will handle the Kelly-Springfield tires in this territory.

—The J. S. Bretz Company has opened a western office and salesroom at 1215 Woodward avenue, Detroit. H. J. Porter and J. W. Hertzler, the western sales representatives of the company, will make it their headquarters.

—In calling attention to the application of a dynamo for lighting in an article which appeared on page 661 of THE AUTOMOBILE, it was stated that the dynamo used was an Apple. After investigation showed that it was an Applco.

—Charles W. Simpson has assumed the management of the Diamond Rubber Co.'s Cincinnati branch office and store at 807-809 Race street, succeeding E. B. Tozier, who has been appointed manager of the Diamond Co.'s branch at Minneapolis.

—Papers were filed with Secretary of State Thompson recently by the B. F. Goodrich Company, of Akron, Ohio, increasing its capital stock from $10,000,000 to $20,000,000. The increased capitalization will consist of 7 per cent. preferred stock.

—The following named concerns have been elected to membership in the Motor and Accessory Manufacturers' Association: Edison Storage Battery Co., West Orange, N. J.; The McCue Co., Hartford, Conn.; Pfanstiehl Electrical Laboratory, North Chicago.

—George B. Gaylord, formerly assistant to the general manager of the Buick Motor Company, at Flint, Mich., will hereafter have charge of the accessories and parts department of the Minneapolis Regal Auto Company. Mr. Gaylord assumed his new duties last week.

—George A. Wallace, of New Castle, Pa., is at the head of a big company composed of New Castle and Cleveland capitalists which has bought a site in Youngstown, O., for $300,000, on which it proposes to build a $2,000,000 plant. It is reported that automobile parts will be manufactured.

—Chase Langmaid, manager of the Hartford Rubber Works Company's Boston branch, announces its removal to the new building at 863 Boylston street. The five-story building is occupied entirely by the Hartford Rubber Works Company and has every convenience and facility.

—The Hollis Electric Company, jobbers' and manufacturers' agents, now located at 9 North Sixth street, Minneapolis, Minn., has just signed a long time lease for a building to be erected at No. 12 South Eighth street, just off Hennepin avenue, in the heart of the automobile section. The building is to be completed by February 1.

—Fred Helser, formerly with the Black-Crow Motor Car Company, and his father, Jesse Helser, of Warsaw, have formed a partnership under the firm name of the Helser Sheet Metal Specialty Company, and have opened a shop at 123 North Main street, Elkhart, Indiana. The output of the firm will be sheet metal parts for automobiles, including fenders, tanks and fixtures.

—The Archer Automobile Association, of Burlington, Vt., have applied for patents on a new style of clutch. It is cone shaped, and consists of one transmission member and two engine members, one of which applies friction to the outside and the other to the inside of the transmission member, and which will be fitted with leather, cork or asbestos, for various purposes. If desired they may be so arranged that one surface engages earlier than the other, so as to pick up the load without shock.

Making Schebler Carbureters

ILLUSTRATING THE VARIOUS TYPES OF SCHEBLER CARBURETERS; SHOWING METHODS OF MANUFACTURE; DEPICTING TESTING EQUIPMENT AND RAMIFICATIONS

GAUGING the automobile industry is to some extent accomplished by counting the number of carbureters that are being turned out, remembering that every motor used requires its carbureter. Without trying to show as whether or not each of the makes of carbureters has been manufactured on the same increasing basis year after year, the point will be made that the Schebler carbureter as manufactured by Wheeler & Schebler, of Indianapolis, Ind., has been turned out in increasing numbers as indicated by the statistical schedule as follows:

ANNUAL PRODUCTION OF SCHEBLER CARBURETERS

Year	Carbureters
1900	1
1907	48,625
1908	57,513
1909	100,000
1910	200,000
1911 (capacity)	4,000 per day

The first carbureter as invented by George M. Schebler was put out in 1900. A little later on, when the firm of Wheeler & Schebler was formed, the carbureter was somewhat improved, and the company went ahead with its manufacture on a modest basis, leading up to the 1907 output, which, at that time, was considered an enormous production. One of the basic reasons for the enormous advance in the production of carbureters at this plant is attributed to the consistent policy of Frank H. Wheeler, resulting in the continuous running of the plant, day in and day out, rain or shine, panic or no panic. When, during the 1907 panic, nearly every industrial establishment was either shut down or running on part time, Frank H. Wheeler kept his men at the bench and tools, turning out 48,600 carbureters, accumulating a stock of 24,000 carbureters, against the advice of every half-scared wiseacre in Indianapolis and for 100 miles around. One day, when business awakened, and manufacturers of automobiles made the discovery that carbureters were on a famine basis, promises were to be had a-plenty, but of carbureters there were none. This was Frank H. Wheeler's opportunity. In response to a telegram from the management of one of the big manufacturing companies Wheeler said: "Will ship a carload of carbureters to-day." The answer came back: "Do your damnedest." When the freight car was shunted off the siding that night it carried within a bakers' dozen of 5,000 carbureters. It was only a matter of a few days when the entire 24,000 carbureters were ordered and delivered, and it established the reputation of Wheeler & Schebler for promptness in making deliver-

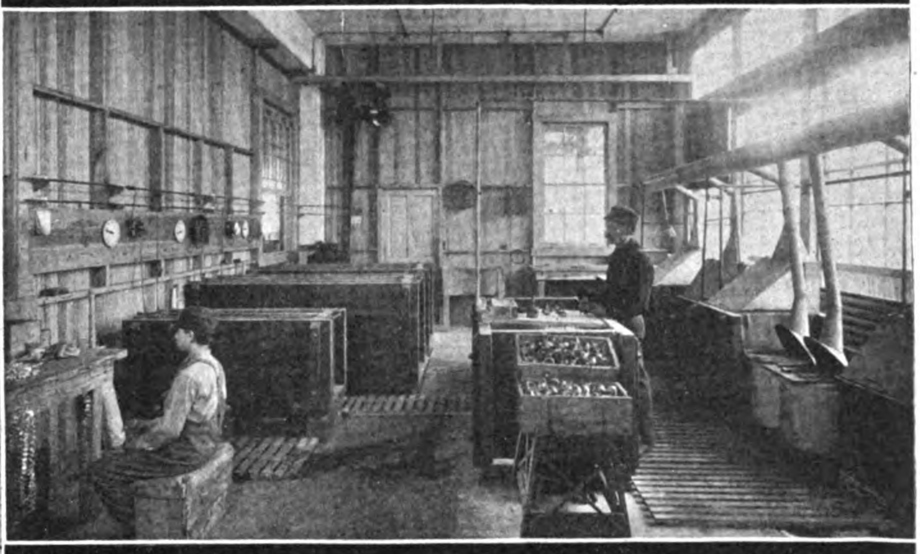
Corner of the Watch Lathe Department Where Needle Valves, Nozzles and Other Small Parts are Made to Great Accuracy

ies, made it perfectly plain to manufacturers that the quality would be the same for a single carbureter or a carload; and Wheeler & Schebler have been busy ever since maintaining this reputation. Since the plant was discussed in THE AUTOMOBILE last year, the foundry capacity has been doubled, which means that the raw material used therein is on a basis as follows:

New copper...	4 carloads per month.
Block tin......	12 tons per month.
Pig lead.......	4 tons per month.
Spelter	2 tons per month.

The floor space of the plant, as previously reported, is about 150,000 square feet. This floor space has been added to this year, making the total at the present time 300,000 square feet. Under the old conditions 500 men were kept continuously employed in the production of carbureters, but this labor list is being rapidly swelled, it being the idea to have a pay-roll of 1,500 men by the first of the year.

rew Machines for Turning
er Small Parts



Dipping Room, Where the Float Bowls and Other Castings are Finished by Dipping After They Pass From the Sand Blast Department

General View of Assembling Room, Showing the Systematic Lay-Out in Order to Secure Rapidity and Precision

Types of Carbureters Being Turned Out

The regular output of the plant is divided into five types of carbureters, known as models H, D, E, L and F, all of which are shown herewith. Fig. 1 shows the testing rack with rows of float bowls with floats in place for the purpose of observing the buoyancy of the floats, and the tightness of the bowls and the fittings. The floats are made of the finest selection of Spanish cork, which, after being fastened into place, is given a suitable coating of the best grade of shellac, and in this test each carbureter is examined in order to note if the cork is of the right buoyancy and whether or not the coating of shellac is complete.

It has been found in practice that the best grades of cork are impervious to the gasoline, excepting to a very slight extent, and this tendency to absorb the liquid is entirely offset if a proper grade of shellac is used as a coating, provided it is applied in the most efficacious way.

Fig. 2 shows the final inspection system, with Model L and F carbureters being put through. In this test the inspectors are instructed to examine every part with the utmost care, make comparisons with suitable standards, and decide with great definiteness as to whether or not the carbureters are good enough to be boxed and shipped with the assurance that they will be satisfactory to the purchaser and capable of maintaining the established reputation of the maker. After the carbureters are given the final inspection, they are forwarded to the stock and shipping department, as shown in Fig. 3, where they are properly scheduled and either boxed for immediate shipment or stored on shelves for stock.

An Undertaking with Many Details Thrown In

Thus far no attempt has been made to indicate the extent to which the manufacture of carbureters involves precise and almost innumerable details. Fig. 4 shows the screw machine department with two batteries of multiple spindle screw machines that are used and continuously operated in the production of screws and small parts as used in the carbureters. Two years ago the company purchased these small parts as screws. etc., and while it was found that the prices were low enough the fact remained that deliveries could not be depended upon, and the quality of the commercial product was far from uniform. Disregarding, for the time being, the question of the market, it was decided to install these screw machines, taking advantage of the better quality, and protecting the customers against a famine of material of this character. It was found in the long run that the better quality of product turned out effected a saving in other ways that fully compensated for the increased cost of raw material and the overhead charges involved in the installation of a screw machine department on this enormous scale.

As an indication of the variety of work involved, reference may be had to Fig. 5, showing a part of the watch lathe equipment which is used in the finishing of the small parts, as needle valves, nozzles, etc. As an offset to the time required in doing the watchmaker's part of carbureter work, the dipping department, as shown in Fig. 6, is referred to, in which the heavier castings are dipped and otherwise made ready for machining at a rapid rate, in which a sand-blasting equipment plays an important part. Through the use of the sand-blast and a well-equipped dipping department, the bowls and remaining heavy parts are brought to a fine state of finish at small cost. To give an idea of the magnitude of the undertaking, reference may be had to Fig. 7, which is a general view of the assembling department, taking in about two-thirds of the space available in the assembling of carbureters. One of many tests of carbureters of this make is given below, in which the speed is advanced from the low point at 600 revolutions to a maximum of 2,000 revolutions per minute, resulting in a delivered horsepower of 14.1 at the low speed, ranging up to 32 horsepower at the highest speed.

SCHEBLER CARBURETER TEST

Needle No. 7. Very fine taper. Recommended as most suitable

Speed	Gross Load Lbs.	Tare Lbs.	Net Load Lbs.	D HP

News of the Makers

Interesting Short Items Concerning the Doings of the Manufacturers

Roader Company Discontinues Its "20."—The Roader Car Company, of Brockton, Mass., has announced that it will confine its attention to making the Roader "30" instead of continuing to manufacture the 20-horsepower car that has been put on the market. The company states that the bulk of the demand seemed to be for the larger car and that in deference to it the decision was reached to discontinue the Roader "20."

Abbott-Detroit Car on 50,000-Mile Trip.—With the intention of covering 50,000 miles, mostly in the out-of-the-way places of the American continent, the Abbott Motor Company started one of its 1910 models away from Detroit November 13. The itinerary of the trip will include a long leg to Portland, Me.; thence through New England and New Jersey to Washington and Virginia; to Pittsburgh, Cincinnati and southward to Jacksonville, Fla. The northerly trip will be up the Atlantic Coast to New York. Doubling back to Detroit the car will take a course southward again to New Orleans, and thence through Texas and Old Mexico to Southern California, making a swing up to Seattle and then across the continent to Detroit.

First "Virginian" Car Turned Out.—The Richmond Iron Works Corporation, of Richmond, Va., an organization founded from a number of smaller iron works concerns many years ago, has now placed on the market the first automobile which was ever manufactured in Richmond. The corporation will operate an automobile department along with its other lines, and the machine manufactured will be known as the "Virginian."

The officers of the corporation are: M. A. Finn, president; H. H. McCurdy, vice-president; M. J. Francis, treasurer; W. P. Dessaussure, secretary; R. Massie Nolting, assistant secretary and treasurer; W. H. Woody, general manager; H. G. Wagner, automobile sales manager.

American Company Buys Indiana Plant.—Plans have been made to establish a large automobile factory near New Albany, Ind., by the American Automobile Company, which makes the Jonz gasoline pleasure car. At present the concern has plants in Kansas City and St. Louis. The machinery from both of these factories will be shipped to New Albany and the entire manufacturing business done there.

The plant of the New Albany Woolen Mills, now known as the Kentucky and Indiana Power Co., has been purchased by the American Automobile Co. for $30,000. The plant is situated within close proximity to New Albany proper and on the line of the Monon railroad. It includes about six acres of ground, the greater part of which is under roof. Work of remodeling the buildings will begin about November 20.

Berton B. Bales, president of the company, said yesterday that about $350,000 will be invested in the new factory. The machines will be turned out across the river, while the business of the concern will be transacted through the main offices of the concern in Louisville. The plant will employ about 700 people in the various departments.

Moline Auto Company Spreading Out.—The Moline Automobile Company has issued an order calling for overtime daily in the assembly department, the paint shop and the setting-up room. The overtime will extend until 8 p. m. daily. This company likewise is building an additional four-story warehouse. iThe dimensions are 60 by 130 feet and the contract price $45,000. The basement of the building will be of concrete and the remainder of brick. A sprinkling system and automatic fire equipment will be installed. The contract, which has been awarded to Henry W. Horst, of Moline, calls for completion in three months.

The company is likewise building a concrete testing track which is rapidly nearing completion and will be in use in a short time. It is located east of the plant.

Prominent Automobile Accessories

TURNING GEAR FOR HEADLIGHTS

The automatic gear for headlights shown in Fig. 1 consists of an adjustable lamp-fork mounted on a swivel post and bracket which is bolted to the frame of the car. The bracket is connected by means of ball jointed connecting rods to the upper end of a vertical shaft that rises from the front axle near the spring, the vertical shaft being held in position by means of a clamp which fits over the axle.

Fig. 1—Projects headlight's rays around turns

At its lower end the vertical shaft carries an arm or crank which is connected by means of a connecting rod to a similar arm or crank having an eye which is attached to the steering knuckle by removing the knuckle nut and putting the base of the crank under the nut; or if the knuckle has no nut, an arm is furnished to screw into a hole to be drilled and tapped in front center of knuckle.

The gear is attached to only one of the lamps and as the car is guided and the wheels turn, the lamp turns automatically and projects its light along the road and around turns in advance of the car, keeping the road ahead lighted at all times.

This gear is manufactured by the Scranton Automobile Equipment Co., 1438 South Penn Square, Philadelphia, Pa., and is sold complete ready for attaching to any make of car.

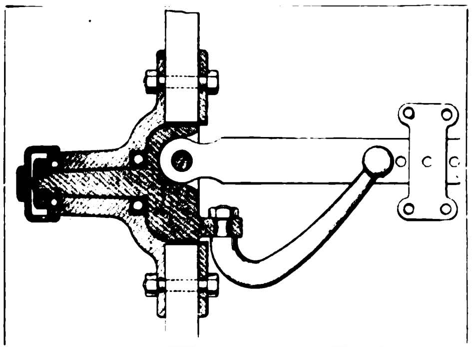

Fig. 2—Front axle designed on the caster principle

CASTER FORM OF FRONT AXLE

The caster form of front axle is made by setting the spindle 1 inch back of the center of the connecting pin on the end of the axle in the hub (Fig. 2). This gives a perfect caster for front wheels and it is claimed they will run straight ahead even if each wheel is disconnected from the other, also from the steering post.

In case the steering connections break and one or both wheels become disconnected from the steering post the car will not leave the road, perhaps to run into a fence or ditch, but will go straight ahead, giving the driver ample time to stop the car. The spindle is so connected with the end of the axle in the hub that it will bend or break the axle before it is possible to break the spindle. This axle is manufactured by the Queen Mfg. Co., Webster City, Iowa.

POWERFUL EMERGENCY JACK

Soft ground and mud are treacherous places to venture with an automobile owing to the likelihood of sticking in the mud. It would be well, especially during the winter, when country roads are likely to be bad, to equip the car with some means of easily lifting it out should it become stuck. The jack manufactured by E. I. Spencer, of Wichita, Kansas, can be fitted to the outside of the hub as shown in Fig. 3 and the car lifted without having to crawl under it and find some suitable place to put a jack, and go hunting for wood to keep the car up out of the hole it has fallen into. The feet can be raised as well as the top, there being an inside worm for this purpose.

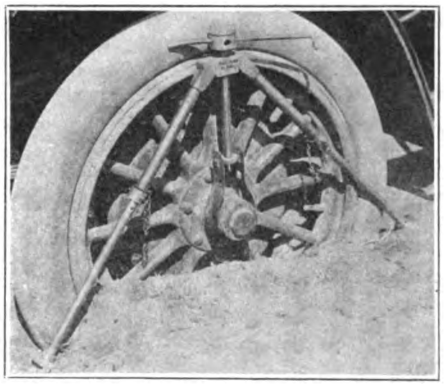

Fig. 3—A handy and powerful jack for mud runs

TO FRUSTRATE THE MEDDLERS

Cars that are fitted with switches that can be locked in the "off" position are less likely to be tampered with than those not so equipped. The New York Coil Co., 338 Pearl St., N. Y., has perfected such a switch. Yale locks are used, and the switch must be turned in the off position before the key can be removed.

THERMOID TIRE REINFORCEMENT

Attention has been turned of late to the better protection of tires by the advent of what are termed reinforcements.

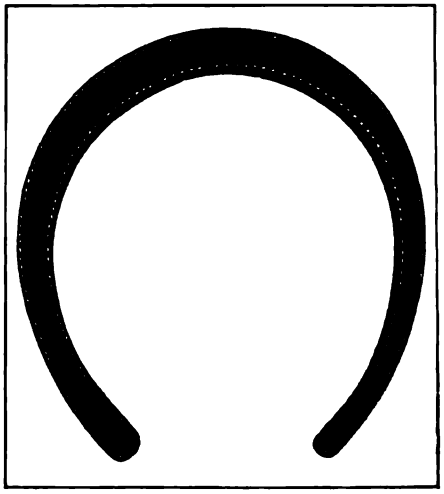

Fig. 4—Section of the Thermoid tire reinforcement

The insert illustrated in Fig. 4 is a product of the Thermoid Rubber Company, of Trenton, N. J., and is easily adaptable for a new tire or to act as a protection for a used cover to prevent blowouts.

The reinforcement is inserted between the casing and the inner tube and consists of duck in one single piece filled with solution or compound by a secret process. It is claimed that these inserts do not minimize the resiliency of the tire and that they distribute the strain and pressure over a greater area, and as a result weak spots are not called upon to bear the full burden.

WESTEN SHOCK ABSORBERS

It is not only necessary to eliminate the sudden rebound that proves so detrimental to automobile springs, often breaking them, but also the damaging vibration.

In the construction of the Westen shock absorber (Fig. 5) there are inserted two separate friction planes—one to lessen or moderate frictional resistance that controls the vibration caused by the lesser inequalities of the roadbed and the oscillation caused by the engine, and the second or greater frictional plane that controls the excessive vibration or rebound.

These shock absorbers are manufactured by the Westen Mfg. Co., 294 Halsey street, Newark, N. J., and the prices include all attaching parts.

Fig. 2—Right-hand side of the 18-24-horsepower Deasy motor
Fig. 3—White car with an English torpedo type of body

REVIEWING the exhibits at the Olympia Show, which is now being held in London, would offer few advantages as compared with the picking out of the more important new features, discussing such details as will be of interest to automobile engineers in America. While it is interesting to know that the small-car craze is spreading over Great Britain, it having completed its first cycle on the Continent, this information is lacking in detail, just as the statement that the long-stroke idea is persisting fails to impress anyone on a practical basis. Just so long as the reference to the long stroke is confined to the single-cylinder types of motors, with a bore of something like 3.9 inches and a stroke of approximately 9.6 inches, it is easy enough to understand what long stroke means. It is a far cry from this truly long-stroke plan to the claim that a motor is of the long-stroke variety if, perchance, the stroke happens to be an inch more or less than the bore. Standing on a technicality is what it all amounts to, and to some extent the reports that emanate from the Olympia Show seem to indicate that for advertising purposes technicalities are taken advantage of. In order to be able to discriminate between the material facts from the point of which was recently held in automobile making and the immaterial technical claims, THE AUTOMOBILE has taken the pains to have a technical man of skill go over the exhibits, have them photographed, and it will be the purpose here to show by photographic reproduction the things that might be worth perpetuating by automobile engineers in America. But the mere fact that a thing is good does not necessarily mean that it should be adopted in place of some other device that is serving its purpose efficaciously; it is fortunate that most problems may be solved in two or more ways and there is more than a possibility that a solution which is highly efficient from the point of view of English practice would prove to be a poor plan in America if for no other reason because the roads are not so good.

In order to appreciate the general plan of the British automobile builder of skill and discrimination it will be necessary to examine Fig. 1 of the new 40-horsepower Rolls-Royce chassis, which was one of the most admired examples of chassis work in a long list of 1911 automobiles. Since it is not the purpose

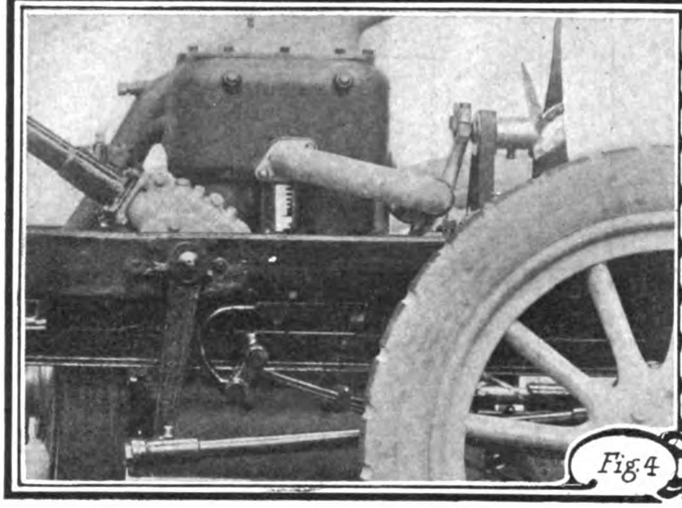

Fig. 4

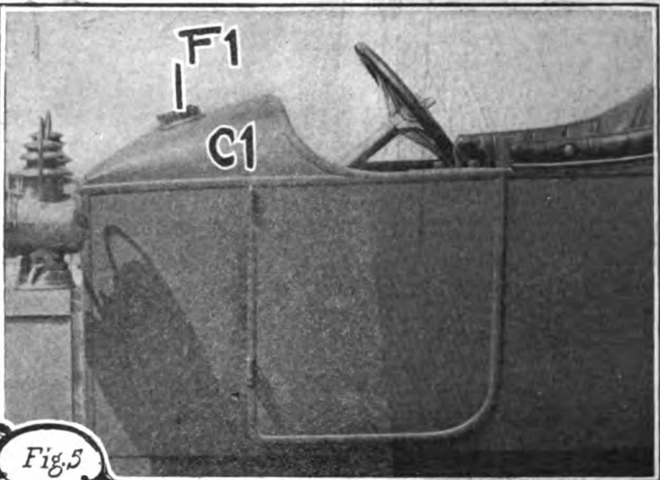

Fig. 5

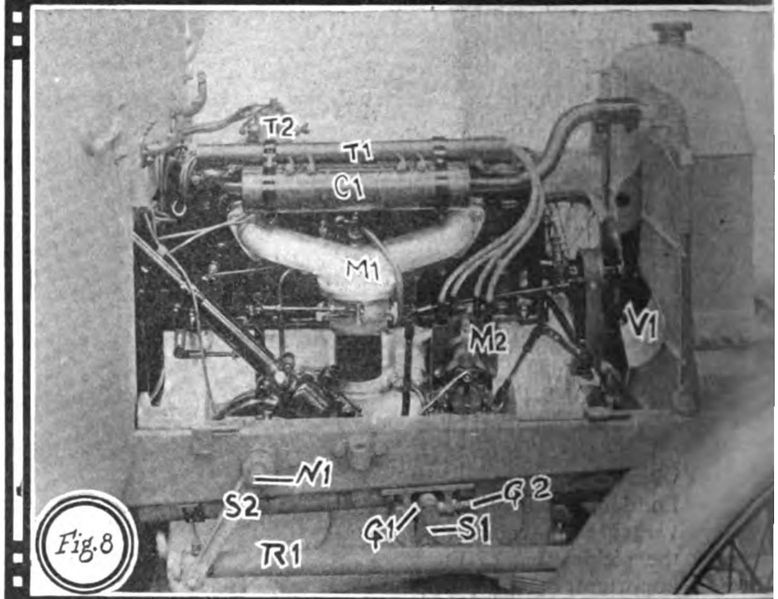

Fig. 8

here to delve into the details of the cars from a buyer's point of view, the reader is requested to pass on to Fig. 2 of an 18-24-horsepower, four-cylinder Deasy motor, in which the bore is 90 and the stroke 130 millimeters. The fan veins are on the exterior of a bowl-shaped flywheel and the water piping for the thermo-syphon system of cooling is trumpet-shaped at the fastening extremity. Attention is also called to the large area of the water piping and the high riser from the top of the cylinder to the main branch. Beyond this point it is worthy of note that the general designing is symmetrical and the motor is supported by webbed flanging with fastenings on the chassis frame, thus eliminating the need of an underpan, and in this particular example, the oil pump P is on the underside in a get-at-able position, with the chance perhaps that "drift" from the road surface might damage the pump or put the piping awry.

Fig. 3 is an example of the White car and is offered here as an indication of the "American invasion" which is now assuming substantial proportions. This car also shows an excellent example of British body-building, with evidences of style and of display of that smooth exterior which seems to be the thing abroad.

Mutterings of dissatisfaction at the performance of the various sleeve types of motors that are being developed in Europe are now so loud and persistent that they invade the editorial office of The Automobile with sufficient force to be noticed and the main cry is that all the attempts to supplant the "silent Knight" type of motor have thus far proven to be substantially futile. It is perhaps too much to expect that foreign designers are aware of the long series of efforts that were made in America as far back as twenty years ago to bring out sleeve and sliding types of valves that would compare favorably with poppet valves. As a matter of fact, the Raymond engine, with a rotary valve in the head of each cylinder, was the only one of the lot that survived long enough to assume commercial proportions, and it cost in the neighborhood of $400,000 for the makers of the Raymond engine to find out that poppet valves were better. It was on account of these trials and failures that Chas. Y. Knight, of "silent Knight" fame, had to go to England to "float" this type of engine, but, strange to relate, the American public tired of the idea just one motor too soon. Had it been a little more patient, accepting the Knight motor, there would have been ample compensation for the many failures experienced and the Knight motor would have been serving on American automobiles to-day instead of on the British Daimler, an example of which

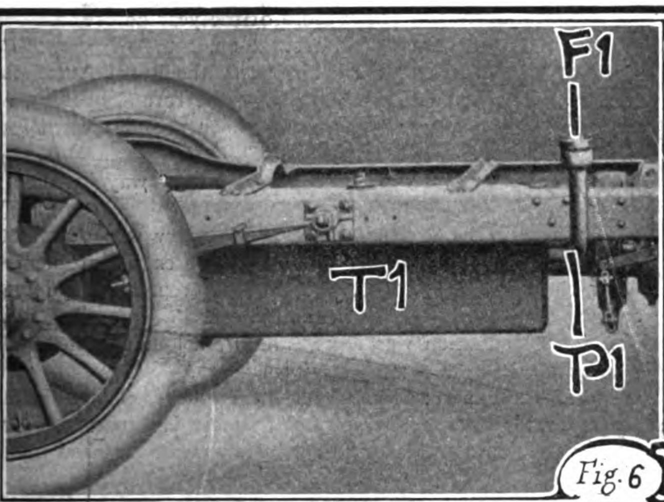

Fig. 6

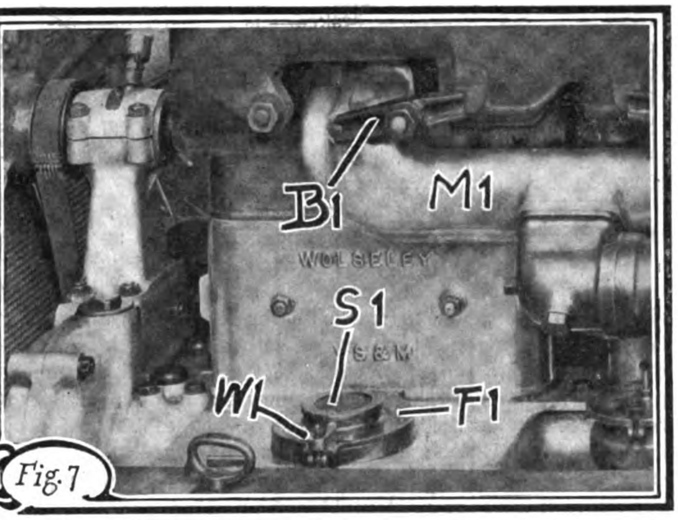

Fig. 7

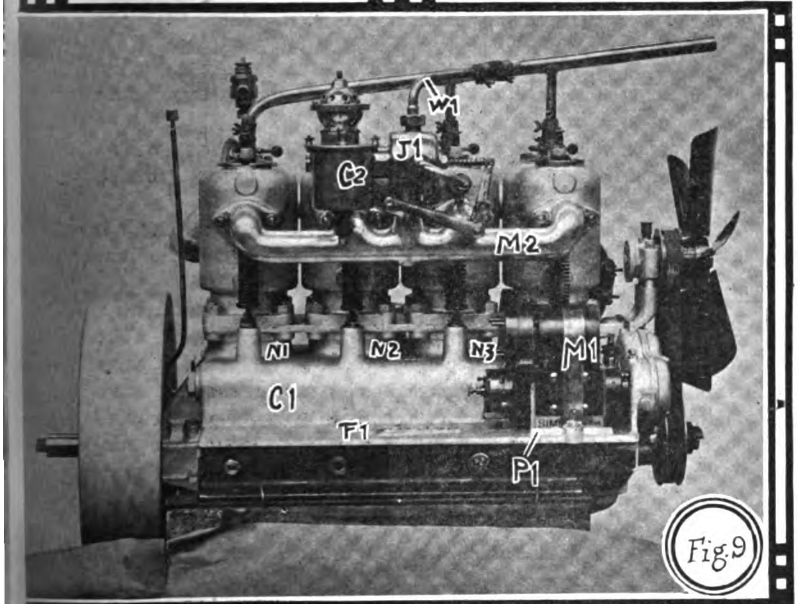

Fig. 9

is shown in Fig. 8, of a 38-horsepower sleeve type of Knight motor. The motor nests in the automobile without looking different from poppet valve types of motors, but attention is here called to a few ramifications, notable among which is the cylindrical spark coil C1, lying along the carbureter manifold M1, with the carbureter below, and the magneto M2 to the fore, with its high-tension leads curling up into a distributing tube T1 on the top of the motor, and for auxiliary ignition purposes the timer T2 shows above the top line of the motor in front of the dash. From the purely mechanical point of view attention is called to the curved veins V1 on the air propeller back of the radiator. The rear shackle S1 of the half-elliptic front spring slides in a cylindrical guide G1 and a grease cup G2 is provided for purposes of lubrication. The English idea of stability of the steering equipment will be appreciated by observing the size of the drag-rod R1, and the steering arm S2 is keyed to the steering gear spindle with a lock nut N1, the spindle coming through the chassis frame in the neutral section, which is half-way between the top and bottom flanges. In other respects, it cannot be claimed that this construction is a great advance. The radiator is extremely heavy and the auxiliaries to the motor seem to be slovenly installed.

In small motor work, to show the trend, attention is called to Fig. 4 of the 10-12-horsepower, two-cylinder Swift design, which is placed in a light construction chassis with relatively large diameter wheels and liberal sizes of pneumatic tires, thus indicating that in English practice the aim is:

(a) Economy of fuel.
(b) Limiting maintenance cost of tires.
(c) Moderate speed.
(d) Good roads.

Referring to Fig. 12 of the 18-24 Deasy chassis, there are a few details that may be worth noting, as, for illustration, the live rear axle A1 is split in the vertical plane and many bolts are used in the clamping together of the two halves. The propeller shaft S1 is of small diameter and relatively long. It is provided with a worm meshing with a worm wheel on the differential within the enlargement of the live rear axle, and the end bearing B1 of the propeller shaft shows clearly at the back. The service brakes with two shoes S2 and S3 are in front of the universal joint U1 at the point of securing of the forward extremity of the propeller shaft S1. Perhaps the equalizers E1 and E2 on the distance rods will attract some attention. These equalizers are spring actuated, comprising a cylinder and a

Fig. 12—Looking at the rear of the 18-24 Deasy chassis

piston with limit stops. The brakedrums B2 and B3 are of good diameter and the covers C1 and C2 are tight, thus excluding foreign matter. The actuating levers L1 and L2 are keyed and pinned to camshafts with large bearings B4 and B5, making the construction substantial, but perhaps a little heavy. The remaining details of this chassis, looking at it from the rear, are sufficiently brought out to require no further comment.

Referring to Fig. 11 of the rear of the Rolls-Royce chassis, attention is called to the shock absorbers S1 placed at the inside of the frame at the point of curvature of the kickup, also to the brake adjustment B1, comprising a flanged portion on the shaft S2 and a flange to match on the lever L1, with holding bolts B2 engaging the two flanges with an interlocking means in the form of a seriate of edge-like teeth. The limit stop S3 prevents the lever L1 from oscillating, something of this sort being necessary on account of the use of wire cables C1 for the pull member. There are other indications of substantial construction and the three-quarter elliptic springs of wide plates and eleven laminæ are substantially anchored to the chassis frame.

Another idea which crossed the "Western Ocean" and took lodgment in the crop of a British designer is shown in Fig. 9 of the Austin motor of the four-cylinder type, individual style. The cylinders are shortened and necks N1, N2, N3 and N4 extend up from the aluminum crankcase to make up for the difference in distance. The Simms magneto M1 rests on a pad P1 of the flange F1, extending out from the upper half of the crankcase C1, the magneto being held in place by a steel strap with a foot and a holding bolt. There is one other point in relation to this motor that did not come from America; it is represented in the carbureter C2, located above the intake manifold M2, with a hot water connection W1 to the carbureter jacket J1.

It is just possible that the location of the gasoline tank in the 15-horsepower Argyl, Fig. 5, will be of interest to some American designers. The filler F1 is in the overhanging cowl C1 and the tank occupies the space beneath the overhang and between the dash line and the post of the foredoor. It extends down far enough to afford the requisite gasoline capacity without interfering with the foot room of the occupants of the front seat. Another idea in gasoline tank locations is shown in the Wolseley 24-30-horsepower, six-cylinder model, as presented in Fig. 6, showing the gasoline tank T1 in the fore and aft position on the right-hand side of the chassis in front of the rear axle with the filler F1 outside of the chassis frame and a curved filler pipe P1 passing around the frame and inboard to the front end of the gasoline tank.

The disposition of the lubricating oil supply is evidently regarded as extremely important in 1911 British automobiles and a good example of the most exacting type of practice is shown in Fig. 7 in connection with the 50-horsepower Wolseley, in which the filler F1 for the lubricating oil is in an extension of the crankcase on the left-hand side of the motor just back of the radiator. This filler has a large diameter cap with a wing nut W1 for quick release and a screen S1 placed to keep dirt out and making it possible to use this cap as a "breather." The method of holding the intake manifold M1 comprising a bridge coupling B1 is quite common practice in many of the cars.

As a slight advance over common practice the dash mounting of the Daimler chassis as shown in Fig. 10 is mentioned, presenting stanchions S1 and S2 in sockets S3 and S4, to which the dashboard B1 is secured, the dimensions of the latter being barely sufficient for the kick switch K1 and the telltale T1. When the body is taken away the skeleton-like dash opens the way to the motor at the rear end for inspection and other purposes. When the body is in place this form of dash presents the customary good appearance.

What the Experts Say About the Olympia Show

The genuine buyer was protected by having to pay extra admission; the charge was five shillings on November 8, which was the day set apart for the elimination of the goats by this simple expedient.

Individual orders fell below those of the year before, although it is predicted that the end will average up.

Owing to the death of the chairman of the Royal Automobile Club, H. R. H. Prince Francis of Teck, the formal opening was dispensed with, and the annual press dinner was postponed for a year.

It seems quite certain that the show in every way justified its existence.

Mechanically, the lesson learned at the show was that motor manufacturers have been struggling with the engine problem.

It is claimed for the 1911 product that it represents quietness, economy in gasoline, general flexibility, etc.

The steam situation was represented by a lone car, the White—American.

Quoting the expert: "Every maker, of course, claims absolute silence for his own particular make; silence is, however, only a comparative term, and we have not by any means reached finality in this direction."

The Daimler Company, with seven distinct models, including three 6-cylinder types, with worm drive back axles, with two exceptions, is the center of attraction.

The highest worm drive equipment is represented by a 6-cylinder Daimler, the motor having a bore of 101 millimeters, and a stroke of 130 millimeters.

The smallest Knight engine is rated at 12 horsepower with a 69 millimeter bore, and a stroke of 114 millimeters, 4-cylinder. This motor is cast *en bloc*.

The leather-faced cone clutch is holding its own, although it has always had the preference in Daimler practice. The new Daimler cars dispense with the accelerator pedal.

The smallest Wolseley car is rated at 12-16 horsepower, with a bore of 3 1-8 and a stroke of 4 1-2 inches, 4 cylinders. The Wolseley Tool & Motor Company is owned by Messrs. Vickers Sons & Maxim, so that it is regarded as a power in shaping trend.

The Wolseley Company works 4,000 men, and its plant covers 24 acres. The Wolseley former practice included a transmission with direct drive on the third speed. The new product gives direct drive on the fourth speed.

In the 50-horsepower Wolseley the transmission gear box is fitted with an oil pump which forces the lubricating oil through pipes so that it impinges on the teeth of the meshing gears—this is a step to noiselessness.

In the Rolls-Royce exhibit the 40-50 horsepower, 6-cylinder chassis is a highly polished example of attractive automobile building. The expert says: "The chassis is practically the same as that of last year with a few detailed improvements."

The dashboard on a Rolls-Royce is clean. The control for the magneto and carbureter was removed to the top of the steering post.

The British idea of nomenclature is undergoing crystallization. The expert states: "One of the difficulties of the motor business at the present time lies in the fact that there is really no actual definition as to how much or how little should be included in the chassis."

The Rolls-Royce chassis, according to the expert, is provided with every possible adjustment that can be thought of.

In the Rolls-Royce car pressure of the lubricating oil, which is circulated by a pump, can be varied at will. In the same car the carbureter is of the multiple-jet type, fitted with an automatic valve, and, in addition to the usual throttle control, the flow of gasoline from the jet may be varied at will by a lever on the steering gear. A centrifugal governor also actuates the throttle.

In the Rolls-Royce chassis an oil feed is directed at the leather of the clutch; when the clutch is withdrawn a minute quantity of oil is permitted to pass onto the leather. The 14-16 Delsize chassis, with the same dimensions as the small Wolseley, has a selling price of 255 pounds sterling; the Wolseley price is 400 pounds sterling; this statement indicates that there are high and low-priced automobiles, without a difference, as the purchaser sees things, excepting as to the price. It is claimed that the lower price is due to the fact that the maker concentrates on one model.

Hickory

EXTRACTS FROM A BULLETIN, ISSUED BY THE FOREST SERVICE, UNITED STATES DEPARTMENT OF AGRICULTURE; CONCERNING ITS USE IN AUTOMOBILE WORK, WASTE, AND RENEWAL; TESTS AND COMPARISONS

OF American hardwoods entering into the construction of automobiles none would be more difficult to replace than hickory in case of a shortage in supply. Hickory is not remarkable for beauty of color or of grain, it shrinks badly in drying, it is not durable in contact with the ground, and it is very liable to attack by insects; on the other hand it is heavy, hard, strong, stiff, and very tough. No other commercial wood, native or foreign, combines these properties to so great a degree.

The Forest Service has co-operated with the National Hickory Association, an organization of the users of hickory who have foreseen a coming shortage in the supply, and who have united to help prevent it, to study the different species, and to suggest means to produce and maintain the necessary supply.

The census returns for 1908 show a cut of about 200,000,000 board feet. This is intended to include, however, only the material actually cut and sold as lumber, while much of the hickory cut is not lumber. In 1908 an additional cut, equivalent to about 135,000,000 board feet, was worked up directly into other products, such as spoke billets, handle blanks, and rim strips, difficult to reckon in board feet. This gives a total consumption, excluding fuel, of about 335,000,000 board feet, allowing for all necessary waste. If, however, the unnecessary waste, both in the woods and at the mill, were included, the total amount of hickory consumed would probably be not less than 450,000,000 feet.

The vehicle industry in America uses more hickory than any other, is most dependent upon it, and takes about 65 per cent. of the total cut, of which more than one-half is used for spokes. About 1 per cent. of the annual cut of hickory is used in the manufacture of automobile spokes and wheel rims.

To give a relative idea of the real meaning of this statement, the American automobile industry last year used approximately 800,000 wheels, containing about 9,000,000 spokes, not to mention an enormous additional amount of material necessary for the construction of the felloes.

Manufacturers of heavy wagons consume about 9 per cent.; the tool-handle industry about 10 per cent.; the agricultural-implement business about 8 per cent. and oil wells about 2 per cent. of the annual hickory output, together about 95 per cent. of the total cut. The other 5 per cent. is used for many special products.

It is probable that the greater part of all the hickory cut is used for fuel, and this portion may amount to 1,000,000 cords.

A great deal of American hickory is used in the vehicle industry abroad. It is exported chiefly in the form of bent rims, spokes, and shafts, but a great many finished wheels and logs are also sent. About 5 or 10 per cent. of the annual output is used in this way. In addition, large quanities of hickory, both in finished and unfinished form, are sent to Canada. About 40 per cent. of the total output for tool handles is shipped abroad, mainly to Germany, to South Africa, and to Australia.

The original supply of hickory is now approaching exhaustion. East of the Alleghenies and north of the Potomac it has disappeared almost entirely. West of the Alleghenies and north of the Ohio only a few scattered remnants are left, and the bulk of the supply lies south of the Ohio River. Most of the northern manufacturers get their supplies from the South; all of the larger operations are there and competition is very keen.

The cost for logging and lumbering hickory is greater than that for any other common native hardwood. It takes much time and trouble to locate and buy it because it can rarely be secured in large lots; because of the widely scattered supply the mill must be moved a great many times or the logs brought long distances; the wood is hard to cut and heavy to haul, and there is a great amount of waste at the mill—40 per cent. or more of the timber that reaches the mill. In addition, rough stock must always be shipped green, and that makes high freight bills. Altogether, it often costs twice as much to get hickory to the factory as it does oak.

Spoke billets are commonly rived. Rived billets are preferred by the spoke makers and bring the best prices, but riving is wasteful. Skilled hands may get as many rived spokes out of a given bolt as could be obtained by sawing, but fewer cuts are taken from the tree and the material which will not make spokes is never utilized, except occasionally for firewood. There is an additional waste because heartwood and birdpecked wood, which would be used if it were at the mill, is generally left in the woods. Much waste is avoided when the tree is cut into round bolts of the proper length and these are hauled or shipped to the mill to be sawed. A cord of hickory will yield about 700 rived spoke billets, or 900 sawed ones, or from 250 to 300 handle blanks.

The amount of merchantable hickory wasted each year may be conservatively estimated at 40 per cent. of the total cut. It consists both of waste in the woods and waste at the mill.

The greater waste is in the woods and is due chiefly to unnecessary restrictions against heartwood and birdpecked wood. Millions of feet of good hickory are cut each year and left in the woods because of the presence of a few birdpecks, or the large proportion of heartwood makes it unprofitable to market it. Such waste is especially great where spoke billets are rived out

A plantation of big shellbarks 27 years old. (The spacing was originally 4 by 4 feet, but the stand has been thinned)

A group of stump sprouts of pignut hickory

in the woods and only white billets are taken, because the red billets bring little more than half as much as the white. Another source of waste comes from the discrimination against the wood from the upper cuts of the tree in favor of that from the lower cuts. This is due not alone to the knottier character of the upper logs, but also to the prevalent opinion that the wood is considerably inferior to that from the lower cuts. The practice of cutting high stumps prevalent in the South is also very wasteful. It is claimed that the difficulty of sawing out with the grain makes it unprofitable to cut below the flare of the butt; therefore small trees are generally cut more than a foot above the ground and large trees more than 2 feet. Some firms, however, cut low stumps and consider that the greater width of the sap and the greater toughness of the wood in the butt are a sufficient offset to the difficulty of sawing. If the average stump height—at least 2 feet—were reduced only 8 inches, as would easily be possible, there would be saved as much as 10,000,000 board feet annually on the total cut.

A somewhat unavoidable waste arises from the taking out of special products, which leaves a lot of stuff in the woods which would make good handles or spokes, while the spoke or handle makers use up a great deal of material which should really be put into other products. Even where economy is attempted and spoke billets or handle blanks are cut in connection with poles, shafts, or rims, it is often difficult to dispose of the by-product, and it often happens that for lack of a market thousands of feet of hickory are destroyed by insects.

Much of the waste at the mill is due to the discrimination against the heartwood and birdpecked material. Another source is the practice of cutting spoke billets and rim and pole and shaft strips unnecessarily long. This is especially true of spoke billets, which are cut into a uniform length of 30 inches, whereas the spoke lengths range from 18 to 24 inches.

In addition to the waste of merchantable material, in lumbering much promising young growth is used for skids, is swamped out, and is broken by falling trees. This loss is hard to estimate, but it is very great, and will seriously affect the future supply.

To produce spoke and handle material, which takes more than half the annual cut of hickory, no method seems better than reproduction by sprouts. Sprouts grow faster than seedlings for the first fifty or sixty years, and produce heavier yields per acre; where sprout reproduction is at all successful it is less uncertain than seedling reproduction.

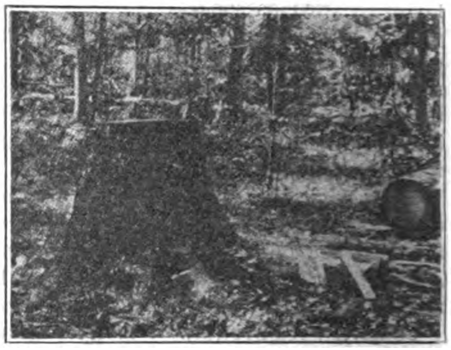
A simple clear-cutting for coppice growth, which can be used with oak and chestnut, will not, however, apply to hickories as they occur in mixed stands, because faster - growing species invariably outstrip and suppress the hickories so that they appear only on the edges or in the openings of such mixed stands. But there are many old fields and pastures, especially in the Ohio Valley, which are coming up to pure stands of hickory, and there the coppice method could be applied successfully. Since the sprouting capacity falls off very rapidly as the tree grows older, the cutting should begin as soon as the trees are large enough to use, which will be when they are from 8 to 9 inches in diameter and from 40 to 50 years old. The stand may then be cut clear.

Hickory sprouts coming up from the roots

Pure stands, however, are uncommon and it will often be advisable to plant hickory with the idea of ultimately managing it as a sprout forest. Because of the danger from squirrels and mice, Fall planting should not be attempted. The nuts should be kept over Winter between layers of sand and planted in the Spring, and since the long taproot makes transplanting impracticable, the nuts should be planted directly in the permanent site, and never in a nursery. The spacing should be about 5 by 5 feet, and two or perhaps three nuts should be placed in each spot about 2 inches under the surface, or it might be well to try a group mixture with a light-seeding species, such as white ash.

Care should be taken to plant only those species which are suited to the soil conditions. On exposed situations or on dry or sandy soils pignut is to be preferred, and even that demands a moderate amount of fertility to produce timber of good quality. On moist or wet soils big shellbark should be selected, and on fresh, fertile soils either shagbark or pignut. The latter furnishes the better grade of wood.

To secure the normally rapid growth essential to the production of strong wood, the stand should not be allowed to become overcrowded. Thinning should begin about the twenty-fifth year. The crooked or defective trees and those which are being crowded and have not room enough to grow should be removed. Eight or ten years later the thinning may be repeated. At the end of the next ten years, if the soil is fertile, it is barely possible that the stand may be ready to cut, but since seedling stands grow more slowly than sprout stands, it will usually be necessary to wait an additional ten years before cutting. In this case another ten-year thinning should be made, and by the fiftieth or sixtieth year the stand should be merchantable, and should then be cut and managed as a sprout forest.



Waste in hickory cut for spokes. (Showing the much too long stump and the workable material left in the woods)

Intelligent cutting can increase greatly the proportion of hickory in the forest and can improve the quality of the wood by hastening its growth. In such a forest the hickories finally should be cut when they have reached a diameter of about 12 inches. At this diameter, on moderately good soil, they will be increasing in volume at the rate of about 4 per cent. a year; at 14 inches the increase is about 3 per cent., and at 16 inches 2 1-2 per cent.

It will not be wise, however, to establish a hard and fast diameter limit, because the condition in which the stand is to be left must be taken into consideration. Smaller trees may be cut wherever there is promising young growth to take their places. If it is desired to increase still further the proportion of hickories in the stand, the trees should be left longer, and they must also be left longer where the other species are cut to a large diameter limit or where it is impossible to give the stand much attention.

Among the true hickories the common shagbark (*Hicoria ovata*), so called because of its peculiar bark, also known as "scalybark" and "shellbark," is the most widely known. The shagbark attains large size, and heights of from 130 to 140 feet, and diameters of from 20 to 30 inches are fairly common in the

Cumberland Mountains. In the river bottoms along the Mississippi the trees grow to larger diameters, but the maximum height growth is usually less. The southern shagbark (*Hicoria carolinæ septentrionalis*) is a recently distinguished species of little commercial importance.

Very similar in appearance to the common shagbark is the big shellbark, or king nut (*Hicoria laciniosa*). Lumbermen rarely differentiate between the two species, although they are quite distinct.

Of all the hickories none is more important than the pignut, and none offers more difficulties to the botanist. It is exceedingly variable and grows under widely differing conditions of soil and climate.

The mockernut (*Hicoria alba*) generally is smaller than either shagbark or pignut. The stem is less likely to be straight, and the branches are heavier.

In the forest the hickories are rarely predominant. Except through the interference of man, they do not grow in pure stands but always in mixture, somewhat group-wise, with other species, and especially with the oaks.

Salient points of the botanical distribution of hickory are the wide distribution of the true hickories, especially the pignut and the shagbark; and the centering of the distribution of nearly all the species in the lower Mississippi Valley, in western Tennessee, eastern Arkansas, and northwestern Mississippi.

Of all the species, shagbark and pignut are most widely and evenly distributed, and these two furnish the bulk of the hickory of commerce. Since most of the remaining virgin hickory is in the lower Mississippi valley, and since cutting is now especially heavy there, it is probable that most of the hickory on the market is shagbark.

The right way to raise hickory—A young stand of trees after the more mature growth has been cut

The commercial distribution of pignut corresponds closely to that of shagbark, except that it extends farther toward the coast in the Southeast.

Mockernut is characteristically a southern species. It is abundant in the lower Mississippi valley, but is commercially less important than shagbark.

Big shellbark has a narrow commercial distribution. It is most prominent in the region around the lower Ohio River, south along the Mississippi to central Arkansas, and northeast through the Wabash valley to northern Indiana and Ohio.

Dust Is a Meddler

Many New Automobiles Had to Be Refinished on Account of It

ONE of the makers of automobiles, during the dull season, had to store some 150 automobiles for several months. These cars were put in shape for shipping, and as the company thought, all that remained was to hunt up customers, which it proceeded to do. When things picked up again it was found that over half of all the finished cars were unacceptable to the agents on account of the state of the body finish; the storage room was dusty and the finish of the body work was soft when the cars were placed on storage.

The cost of the refinishing was not far from $50 per car, not counting the cost of the delay. The work of refinishing was done as follows:

(A) The bodies were removed from the automobiles and were placed in a light, well-ventilated room, protected from dust.

(B) The chassis were rolled into a separate light, well-ventilated room, protected from dust, and carefully gone over.

(C) The bodies were rested on "horses" and gone over to get rid of the free coat of dust.

Spoke bolts cut from pignut hickory. (This shows a close use of material; the stump is cut low and the tree utilized well into the leaf)

(D) With small bunches of waste saturated with turpentine the body surfaces were rubbed down to soften the outer skin of varnish.

(E) Strips of burlap were then used, rubbing vigorously, to remove the accumulation.

(F) By scraping, using a knife or a hook, accumulations that resisted the burlap rub-down were taken off.

(G) A second application of turpentine on waste was given to clean off all the remaining particles and any grease that might have been picked up.

(H) A burlap rub-down followed.

(I) In one or two bad cases, where the accumulations resisted removal, soft soap, with a dash of sal-soda was applied, using a coarse hair rubbing pad in the process.

(J) The next rub-down was with pumice stone flour to remove all the specks. This process also flattened down the surface.

(K) In all the cases that looked promising enough to "finish" with one coat of varnish, the old color was matched up, using enough rubbing varnish in the new match to cause it, when applied to the surface, to dry with enough gloss to counteract the light-absorbing properties of the color.

Judgment had to be used, especially in the bodies that showed "dead," and it was not possible to top off with one application of varnish.

Anti-Advertising

Which Does Not "Create a Favorable Impression on a Possible Customer"

IT would cost about $2 to remove it, and still it remains there for years, visible every day to thousands, or at least hundreds, of more or less impressionable observers. "It" is the large and conspicuous sign of a manufacturer's abandoned selling agency painted in gilt letters on a 30-foot expanse of a deserted building's dust-begrimed windows. It is an effective "anti-ad" against the automobile whose name it announces and couples undeservedly with relinquishment and decay. But it is only a type of many similar anti-ads which meet the eye in every large city. Perhaps a further consideration of the subject of anti-ads, in the form of unobliging clerks or poor stationery, could in many cases be added to the diversions of the advertising expert.

Reproduction of hickory in a field cut over four years ago and pastured severely by sheep, cattle and horses

Devoted to Electric Subjects

PROMINENT PART PLAYED BY ELECTRICITY IN AUTOMOBILE MANUFACTURING; CHART OF IGNITION BATTERY DISCHARGE; ELECTRIC AIR COMPRESSORS

ENORMOUS production in the gasoline automobile field has so attracted the attention of those who have the time to eye-measure the automobile art that they fail to penetrate to the bottom of the situation, and their dreams are of gasoline, and nothing else. Let us have a look at the real situation, and observe what an enormous part is played by electricity, using vast quantities of electrical equipment, in the form of dynamos, motors, and accessories for lighting and power purposes in the plants, and this is all beside the question of electric vehicles and the position they occupy in the art. It is variously estimated that upwards of 270,000 horsepower in electric motors is used in the propelling of machine tools utilized in the building of automobiles.

The power required for these electric motors demands the use of dynamo electric machines of a combined capacity of 67,000 kilowatts, or 90,000 horsepower. The steam engines of the various plants aggregate a delivery of 125,000 horsepower on an average basis as they are employed in the driving of the dynamo electric machines that furnish current for power purposes to the electric motors in the plant, and this takes no account whatever of the lighting requirement.

The blight that has been feeding upon the electric vehicle for years is being eliminated; quality, bereft of an entangling alliance, is forging ahead, and, as in every other art, a contract with Satan is not binding, nor is it advantageous. Just how Satan has kept electric vehicles out of the running is a matter that will not have to be discussed; there is no use of going back into the smoke after emerging, but the future prospect of the electric is too much of a good thing to be entirely ignored, and those who have ever expressed a preference for electric vehicles are now enjoying the situation.

Ignition Battery Discharge

Chart of the Discharge of an Ignition Battery

LEAD-LEAD storage batteries are much used as the source of electrical energy in ignition work, and while it is not possible to present a curve of discharge at a constant rate, for a long period of time, the curve as here offered was over a duration of 55 hours as plotted in the ordinates, and abscissa show voltage, there being three cells in the battery, so that the maximum voltage when the battery was fully charged was 6.6. The discharge was regulated by one 16-candlepower incandescent lamp in circuit, fixing the rate of discharge at about 55 watts. The discharge ran along at a constant rate for 25 hours, and then tapered off to 5.4 volts at the expiration of 45 hours, which represented the end of the safe discharge. The next 10 hours brought the battery down to 2.5 volts, which of course induced a condition of excess sulphation, tending to deteriorate the battery. From the automobilist's point of view, the danger of destroying the battery comes with his lack of knowledge of the state of the discharge or of a means, ready to hand, for determining when the battery should be recharged.

Motor-Driven Air Compressors

Portable Electrically Driven Air Compressors

TIRE life depends absolutely upon the state of inflation, and the latter, in turn, is rarely ever up to the point where safety resides. A staff representative of THE AUTOMOBILE made it his business to examine a considerable number of tires just as they were required to serve, taking the pressures on the street and as the cars were rolled out of garages, invariably obtaining from the chauffeurs their version of the actual pressure obtaining in each case. As an example, one car with 36 x 5 1-2-inch tires registered a pressure of 70 pounds, and the chauffeur said that the pressure was 110 pounds. He was so positive about it that he questioned the accuracy of the 70-pound pressure measurement,

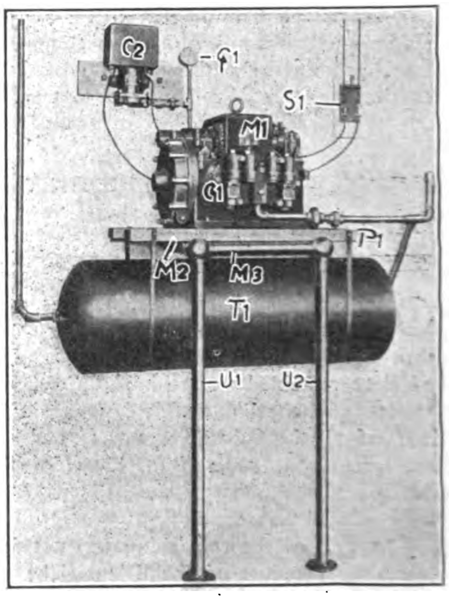

Fig. 2—Compressor unit on a tubular structure with the air tank swung beneath

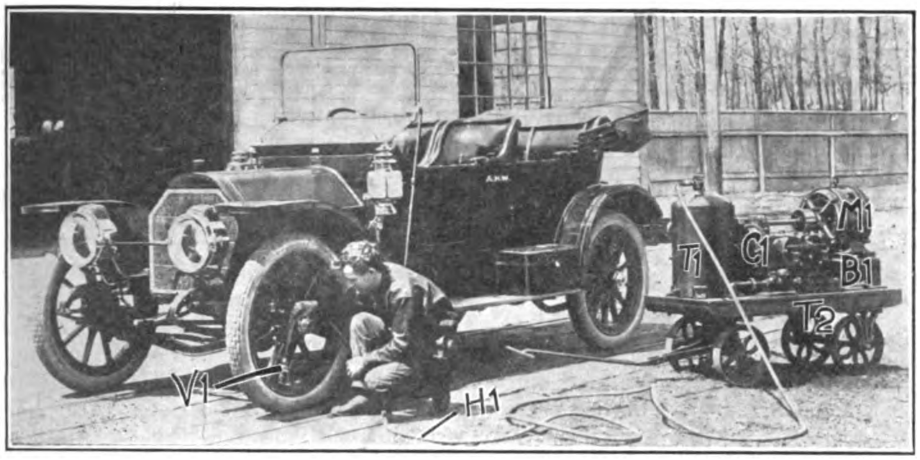

Fig. 3—Compressor unit on a truck for portable work with a long hose connection

putting his gauge on instead of that of the staff man, only to find that the pressure was inside of 75 pounds, but slightly over 70, according to his gauge. In another case, where the chauffeur said he was running pneumatics on a pressure of 80 pounds, the gauge showed that he had 30. In no case whatever, where reliance had been placed upon ordinary tire pumps, was the pressure found to be more than half of what it should be.

Quite a number of garages are fitted out with air compressor units, and in many cases the owners of automobiles use inflating tanks, or some form of power pump that permits of inflating the tires up to the desired point without manual labor. In nearly all of these examples tire pressures have been found up to standard. The inference to be drawn is that the best way to conserve tires is to provide a power method of inflating them, and in a garage there is nothing more efficacious by way of equipment than an electrically-driven air compressor, and a suitable tank as shown in Fig. 1, in which the compressor C1 is driven by an electric motor M1, comprising a unit, resting on a frame F1, the latter being fastened to a post P1. Air is delivered by a pipe P2 to a tank T1, connected with a gauge G1, with a safety valve S1, not forgetting, however, that the motor is started and stopped automatically, and that the pressure is ordinarily maintained at the desired point, through the good office of automatic valves V1, attached to the compressor C1. The air pressure is piped to various convenient points, and tapped off by means of flexible metallic hose H1 for use in the tires T2.

Another and neat installation of this type of compressor is shown in Fig. 2, where the compressor C1 is driven by its motor M1, delivering air into the tank T1, which is fastened to the platform P1 and control is maintained by means of the automatic device C2 with a pressure gauge G1 to show the amount of pressure carried in the tank. The platform P1 is carried on a tubular structure with uprights U1 and U2 resting on the floor with heading members M2 and M3 as shown, the remaining heading member not being shown. The tubular structure is built up of the character of tubes and fittings in common use in railing work. When it is desired to start the motor, the switch S1 is closed, and the automatic starter takes care of the motor thereafter.

Still another application of the electric compressor unit idea is shown in Fig. 3. In this case the motor M1 is mounted on a bed plate B1, driving the compressor C1 which puts air in the tank T1 and the pressure is taken away by the hose H1 for use in the tires in the regular way. A quick acting valve V1 serves as a convenience in attaching the hose to the tire. The compressor and its driving unit together with the tank are placed on a truck T2, and by means of electric cables, together with wall attachments at convenient points, aided by the use of a long pressure hose, it is feasible to roll the compressor unit to the various points of vantage, connecting up the electrical current as the occasion requires, and utilizing the long pressure hose to some extent. The unit is very compact and convenient.

Fig. 4 shows the compressor unit as manufactured by the Allis-Chalmers Co., of Milwaukee, Wis., with the compressor head H1 bolted to the base-casting C1, by means of holding bolts H2, of which there are 10. The valves V1, V2, V3 and V4 are in an accessible position, and power is delivered to the compressor by means of a single reduction square cut gear within an oiltight housing H3. The motor M1 is of the consequent-pole type with liberal main bearings B1 and B2 of the sleeve type, provided with ring oilers in the customary way. The commutator C2 is of large diameter, and the armature is cross-connected, thus reducing the brushes to one set, B3 and B4. The motor is furnished for any of the desired voltages, but in ordering, it is necessary to state the voltage of the circuit to which the unit is to be attached, also whether or not it is direct or alternating current.

Electric Market Active

Widespread Charging Facilities and Low Cost of Energy Popularizing the Type

ACTIVITY in electric vehicle work is the most noticeable feature of the present market. A better understanding of the utility of this type of car, accompanying a more healthy state of the battery situation, coupled with a brisk demand for electric commercial cars, all tend to the betterment of the whole situation, but it must also be remembered that large financial interests are now in a better state of mind about all automobile activities. It was but a short few months ago when financial houses were scared half out of their wits for fear all the money in the world would migrate to the coffers of makers of automobiles; they overlooked the fact that very few men indulge in "white elephants," and to the man who has no use for an automobile it is a white elephant with a vengeance.

There are other influences that the public at large will only learn of in time; it is now possible to obtain a "charge" for a battery in almost every hamlet from Maine to California. What is equally to the point, the cost of electrical energy is relatively low; it compares very favorably with gasoline at $32 per ton.

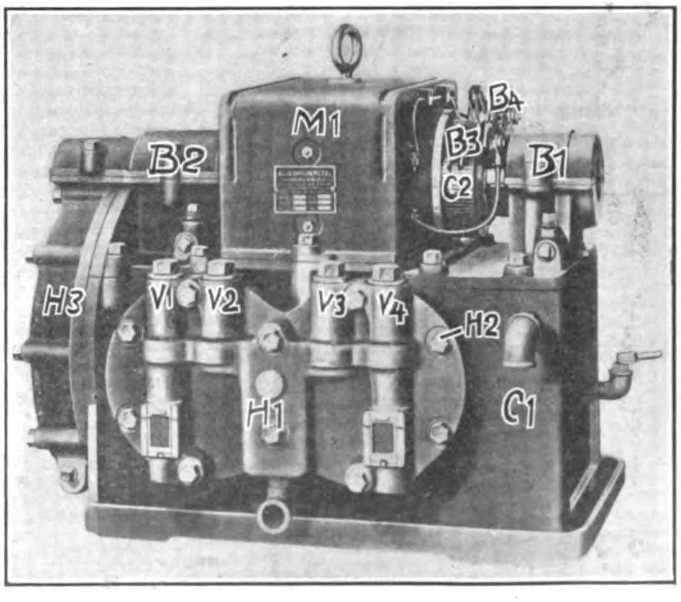

Fig. 4—Air compressor unit with the consequent-pole motor bolted to the base, with a single-reduction square cut gear drive

Operation and Care

DESIGNING FOR NOISELESS PERFORMANCE; KEEPING NOISE OUT; COST OF A TOUR; CANTOR LECTURES; CARBURETER ACTION; PRACTICAL REPAIRING, AND A SERIES OF SHORT ARTICLES

When an automobile is placed in the hands of the user, his main concern lies in utilizing it for the intended service, and the more he can get out of it, the greater will be the return on his investment. There are two principles involved in the operation of a machine. In English locomotive practice, as it obtains on railways there, the locomotives are so designed that they may be readily repaired, and the operating engineers make it a point to use them sparingly, laying them up for repairs, or adjustment, on the slightest provocation, the idea being to husband the machines, with the intention of putting into them as much by way of upkeep as is taken out of them by service. According to this plan, a locomotive is intended to last until progress puts it in the classification of the obsolete. In American railway practice the exact reverse holds. A new locomotive is put into service and it is run to death. It is the claim of the American railway engineer that the value to be kept track of is the number of ton miles that a locomotive pulls in the shortest possible space of time. It is recognized that when the machine is new, with its superabundance of sweet-running qualities, it will do the most work, and that, too, without putting money into it on a repair basis. There is one other advantage to be ascribed to this plan. All the good that resides in the new machine is abstracted from it before it becomes obsolete.

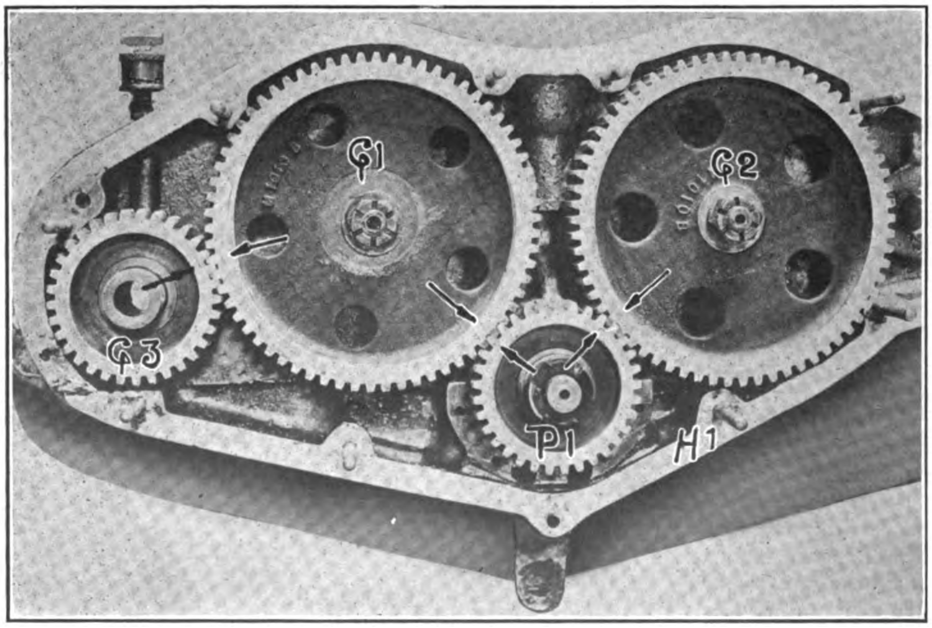
The only difference there is between a railway locomotive and an automobile, from an abstract point of view, lies in the fact that the locomotive has a "permanent way" with steel rails to roll on, and it serves under "factor" conditions. The automobile is excused from doing factor work, but it labors under the disadvantage of having to go in response to the will of the operator over such roads as indifference provides.

It remains, under the circumstances, for the owner of a car to choose the English method if he thinks that his automobile will not become obsolete by virtue of the production of a better one within a year or two after he makes his purchase, or he can pin his faith to the American idea, disregarding the future, getting all the service that the automobile will deliver, with the expectation that it will last long enough to pay for itself, leaving him in a position to take advantage of a new market at the propitious time.

Perhaps a happy medium offers some attraction, in which event the purchaser of an automobile must become familiar with the mechanism and learn how to fix it if the occasion requires. Under such conditions it is believed that the first thing to know is how to time the valves, and remembering that the camshaft runs at half the speed of the crankshaft in a 4-cycle motor, it remains to examine the gear system which actuates the camshafts, and observe (see illustration) that the pinion P1, on the end of the crankshaft, is provided with half as many teeth as the gears G1 and G2 on the ends of the camshafts. The gear G3 is placed to drive the magneto, and in this example it has the same number of teeth as the pinion P1, making the magneto rotor rotate at the speed of the crankshaft. When the cover is removed, exposing these gears, the first thing to observe is that the gears are marked, if the automobile is well made; but if it is, by some chance, the product of an indifferent plant, they must be marked. In the illustration the gears are marked in such a way that the space 3 of the pinion P1 accommodates the tooth 3 of the gear G2, and the tooth 2 of the pinion P1 meshes with the space 2 of the gear G1, whereas the tooth 1 of the gear G1 meshes with the space 1 of the gear G3. In disassembling the gears, unless they are properly marked, it may take one unfamiliar with the situation several days to reassemble them, whereas by observing the markings it becomes a mere matter of putting them together, taking, perhaps, five minutes. This illustration shows the virtue of first deciding what to do and then doing it systematically, but in the absence of system it is recommended that the automobilist adopt and stick to the American practice as it obtains in railway work, *i. e.,* run the car until it becomes unruly, and then scrap it.

But this plan should be carried out with some intelligence, and the mileage obtainable under sweet-running conditions will be a maximum if the automobile is "groomed" on occasions; nor is there any good ground for assuming that the degree of neglect allowable should exceed the amount that other means for transportation will thrive upon. It is not uncommon to see automobilists struggling with well-made cars, looking here and there for troubles they cannot find, destroying the good adjustment that bespeaks harmony of the relating members, when, in all seriousness, the cleaning of the spark plugs would overcome the whole difficulty, revamping more or less a $3,000 investment at the cost of a little labor.

But if the trouble is not quite so close to the surface it may be in the shape of a few globules of water clustered around the orifice of the nozzle in the carbureter, or a little leak in the intake manifold between the carbureter and the combustion chamber, if not due to a valve shutting off the flow of gasoline from the tank to the carbureter, although an empty gasoline tank gets in the way of success every once in a while.



HALF-TIME GEAR SYSTEM OF A TWO-CAMSHAFT MOTOR, SHOWING METHOD OF MARKING FOR FUTURE REFERENCE

Care and Repair of Tires

DEALING WITH THE QUESTION OF WEAR AND SUPERFICIAL AREA OF CONTACT AND LARGE REPAIRS TO CASINGS THAT APPEAR GOOD TO THE NAKED EYE

THE average autoist does not really go into the question of tire upkeep with any degree of thought. What principally interests him is that tires cost so much; when will there be a reduction in price, when will they invent something that will do away with his *bête noir*, "puncturable tires"? It is with the idea of calling his attention to some of the causes of tire wear that this article has been prepared.

It is fair to assume that if friction is applied to two surfaces with a certain pressure the one with the larger area will wear out sooner than the other, and if the pressure is increased (which may be represented by the increased speed of the car), the wear on the larger will take place faster still than on the smaller area.

Fig. 1 shows the length of the tread of a 34-inch x 4-inch tire fitted to the rear wheel of a five-passenger car unloaded, and it will be seen that the amount of tangential contact increases twofold as the tire is underinflated, thereby offering double the amount of tire surface for frictional wear to the ground.

These figures were obtained by lifting the car from the ground by means of a jack and allowing an imprint to be taken of tangential contact without taking into consideration how much a tire will further deflect when driving strain and torque are added. The area in square inches more clearly illustrates the surface presented to the ground as the following table shows:

Pounds per Square Inch	Area of Contact in Square Inches of a 34x4 Tire
80	4.94
70	5.87
60	6.88
50	9.01
40	11.2
30	13.62
20	15.06
10	16.32

Fig. 2 shows the amount of slip that takes place when the steering wheel is moved while the car is traveling, and here we get two distinct actions: first, the rolling action under pressure due to the superimposed weight, and, second, the side friction caused by the necessities of steering. This impression was taken with the tire inflated to 80 pounds and represents a surface slide; but the moment the tire is deflated there is added a pulling at the side walls which tends to weaken them, and in some cases tears them off the rims if a curve is taken too fast. This can be clearly seen in Fig. 3; the top point of contact shows signs of twisting strain in the way it tore the paper, and this means the infliction of a small bruise which has the effect of tearing at the strands of canvas that form the lining of the tire. Repeated bruises similar to this may cause a weakness in the canvas and affect the adhesion of the rubber to it. A small hole caused by a nail or sharp stone at this part starts the trouble and ends in a blowout, as moisture can creep through the bruised canvas, and thus, like a disease, infect a large area around the small initial hole. It is surprising to some autoists that, when they send their tires to the shop for the remedying of what looks to be a two-inch repair, they should be called upon to pay for anything from a 6- to 16-inch insert. The cause is that when the section to be repaired is ripped away the canvas at either side of the section is found to have parted company with the strip to which it was once vulcanized. The repairer is then compelled to cut and rip away till he finds the layers have a firm anchorage. It is about as much use repairing on a bad foundation of canvas as to try to stick a patch on an inner tube that has not first been cleaned off with gasoline or sandpaper. Repairers should pay particular attention to this, and rather than do a job that would not last, endeavoring to vulcanize rubber on a bad foundation, it is better to tell the owner the facts of the case. If a tire is repaired in this condition it will not last any length of time, and this accounts in the majority of instances for retreaded tires giving way almost immediately after they are put on.

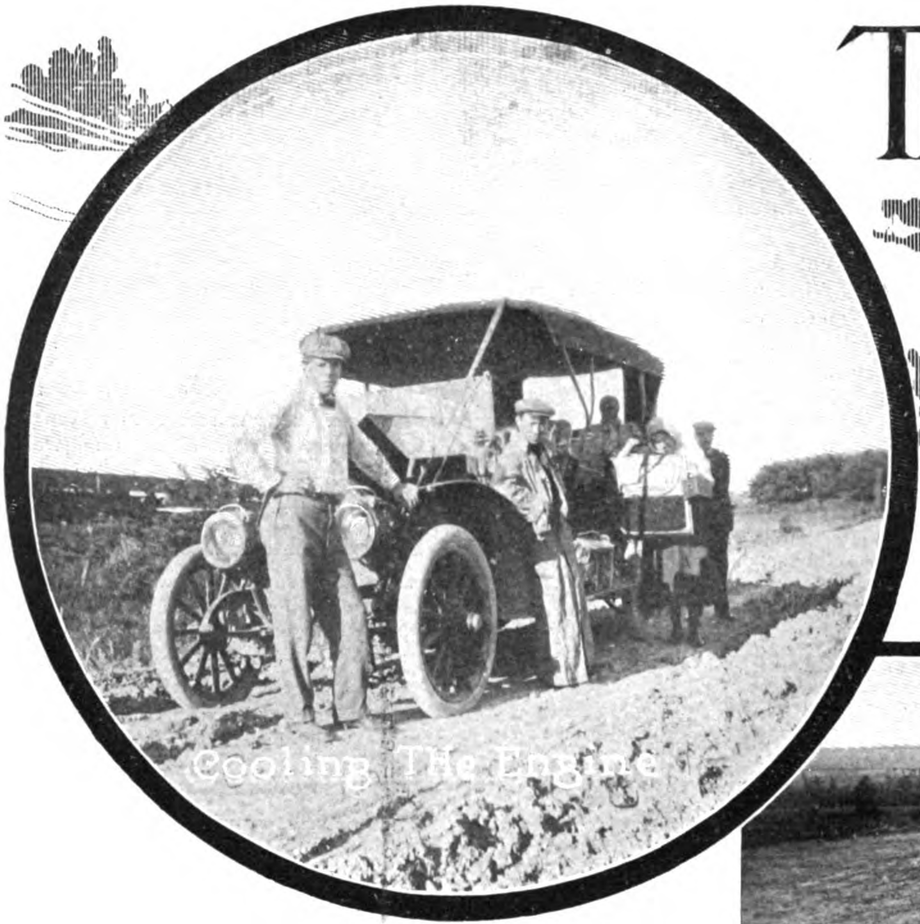
The Cost



Cooling The Engine

INEXPERIENCED automobilists when they first acquire a car permit their ambition to run away with their good judgment. Starting out on a long tour is easy enough for them, but unless their funds in hand far exceed the judgment they display, they fail to enjoy the situations that they originally considered paramount, and are mostly concerned about how they can get home with gasoline, lubricating oil, tire bills, and hotel expenses to pay.

Unfortunately, those who have acquired this character of experience, fail to keep an accurate account of their expenditures, or decline to publish the accounts. The cost of touring, considering the advantages, is really not great, but the trouble encountered is due to the fact that inexperienced automobilists labor under the impression that all they have to do is to steer the automobile and look at the scenery.

The particular tour of which an account is here given of the cost, took departure from Freehold, N. J. (en route to Billings, Mont.), on Tuesday, June 22, 1909, and, as the author of this article states: "Followed very excellent and familiar roads to New York City, via Perth Amboy, and Staten Island."

The owner's log of the trip continues on as follows:

There were several reasons for our undertaking this trip. One was that a rather enjoyable and certainly very instructive vacation would be spent. Another, the desire to see a member of the family who resides in the vicinity of Billings. Another the complete novelty to us of the whole thing and the anticipated pleasure of "burning up" the prairie in an automobile. At the outset, we did not exactly expect to cover the entire distance, yet we had so much confidence in our car and chauffeur that, through our ignorance, we were quite hopeful.

One mistake was made in taking along too great a supply of rugs, coats, sweaters, etc., half of which were never used. The tonneau was littered to such an extent that we had difficulty to get in and out. Then we attempted to carry, on the rear, more trunks and valises than were good for the car. At Erie, Pa., we thought it best to express some of these to Chicago.

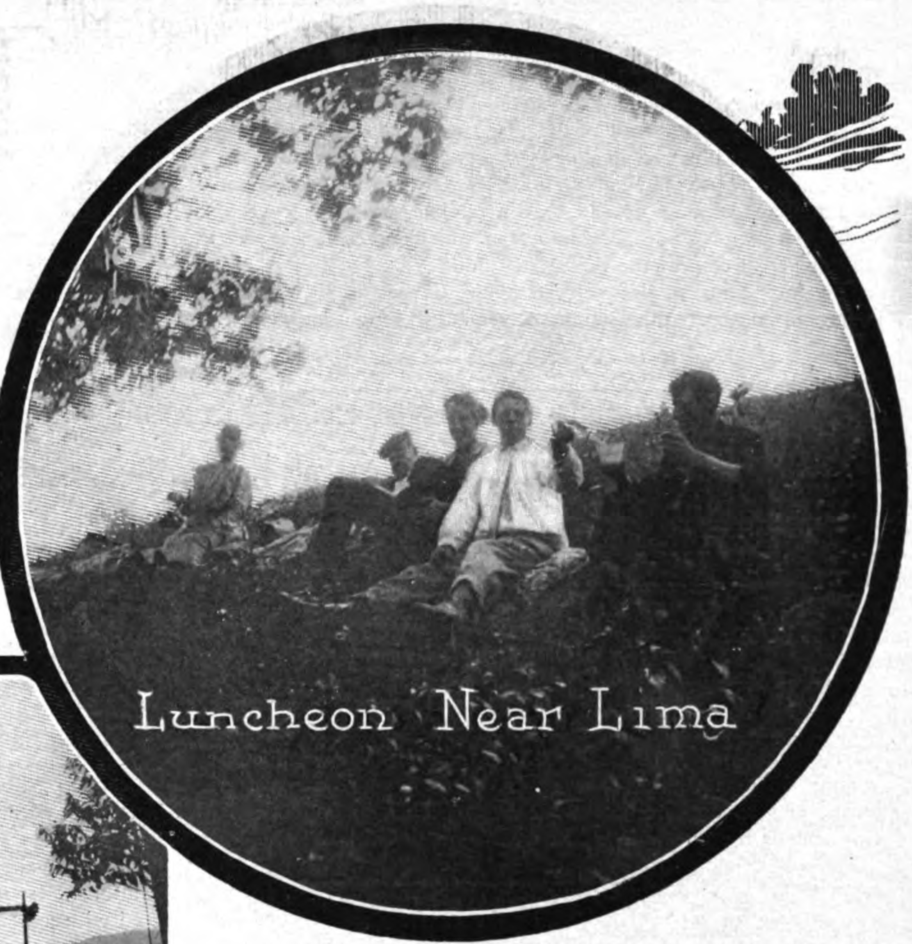
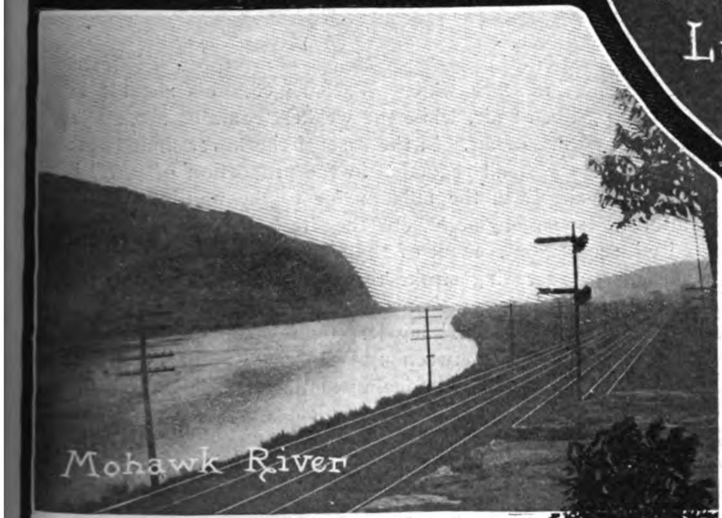
Along the Erie Canal

f A Tour



Luncheon Near Lima



Mohawk River

An Old Covert Bridge in Ohio

At no stage of the tour did we attempt to hurry.

We left Freehold on Tuesday, June 22, 1909, following very excellent and familiar roads to New York City, via Perth Amboy and Staten Island. We had lunch here and about 3 o'clock went up Broadway and followed the Albany Post Road to Tarrytown. This road was very poor. Here we missed our route, taking a back way to Briarcliff, where we spent the night. 80 miles.

June 23. Left Briarcliff late in the forenoon, taking the Post Road again. As far as Fishkill it was the same. From there to Albany it was very good. At Poughkeepsie we had lunch and purchased a Blue Book of N. Y. State, a very necessary item. A few miles outside of that place the shock absorbers in the rear, which had not been put on correctly, were smashed by the bumps and had to be taken off. Kept on the East Side of the river to Albany, where we arrived at 8 o'clock. 132 miles.

June 24. Remained in Albany in the morning to see the Capitol and some historic houses and churches. About noon we took the road to Schenectady and on from there through Amsterdam, where we had lunch, and Herkimer and Utica. To within 15 miles of the latter town the road was rough and generally bad, beyond that excellent. The Mohawk valley was beautiful and we followed the banks of the river for a great many miles. 95 miles.

June 25. Went on through Syracuse to Auburn. Excepting for a few miles the road was fine macadam. Had the first tire trouble this day. Arrived in Auburn in time for lunch and decided to spend the night there, as the hotel was very good. 78 miles.

June 26. Got an early start and went through the Montezuma swamps and Seneca Falls to Geneva. We were very much impressed by this beautiful old town with its colonial houses. Went on from there past Canandaigua Lake and Lima, where we had lunch, to Buffalo. Had two punctures. Excellent road almost all the way. 141 miles.

June 27. Remained in Buffalo to rest and "take in" the sights.

June 28. Good road to Erie, Pa. Went through Fredonia to Westfield in the midst of the Chautauqua County grape section. Had our lunch here and took a look around until 5 o'clock. Expressed surplus baggage to Chicago. One puncture. 95 miles.

June 29. Beautiful road to Cleveland, Ohio. Passed Conneaut over a great viaduct leading into Ashtabula and through Cleveland on the famous Euclid avenue. Here we missed the good road to Sandusky, Ohio, and took a terrible back way covered with deep ruts. Made poor time, but finally reached Norwalk, Ohio, where we spent the night. 160 miles.

June 30. Poor road to Bryan, Ohio. Went to Toledo for lunch and on across the Maumee River and through Archbold to Bryan. The country was beautiful, but did not impress us especially. Were disgusted with the roads. We had a little trouble with the chains, which were loose and kept coming off. 125 miles.

July 1. Fair roads to South Bend, Ind., but fine from there to Chicago. Went through Waterloo to Kimbelville, where we lost our way completely and had a terrible time as far as Rome, Ind. Spent the afternoon in South Bend, going on in the evening to Chicago without a stop. Just outside of Chicago we lost our way again in a maze of roads and railroad tracks. 216 miles.

The distance from Freehold, N. J., to Chicago by our route was 1,122 miles. We used 154 gallons of gasoline. Average, 7 1-4 miles to a gallon.

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.SC., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE FIFTH INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

IT is found that in a mixture of gases which are capable of rapidly combining together when heated sufficiently at one point, the combination or combustion may take place in two entirely distinct manners. In the first of these, called inflammation, the combustion spreads out from the point at which it is started, each portion of gas, as it burns, heating the neighboring portion till its temperature is sufficiently raised so that it itself burns, and so on throughout the mass. This method is quite slow, but is the one with which we are primarily interested.

The other method of combustion is called detonation, and appears to be caused when a wave of compression is set up in the gas, so that the heat developed by the compression is sufficient to fire the mixture. In this case the combustion is spread as fast as the wave of compression travels through the gas, that is, at an enormously greater speed than is the case in inflammation. Thus, when a mixture of carbon monoxide and oxygen is lighted in a tube about a foot long, the progress of the flame can quite easily be followed by the eye, the speed at which the flame travels being about 4.7 feet per second. If, however, I start a compression wave in some of the same mixture contained in a lead pipe, about 20 feet long, by firing a small quantity of electrolytic gas at the end, you will notice that the explosion appears to take place throughout the whole length of the tube, and a length of glass tube at the far end is shattered, at the instant at which I depress the key which causes the passage of the firing spark. The detonation wave is not, of course, quite instantaneous in its passage, but since it will travel 5,500 feet in a second, the time taken to traverse 20 feet is quite inappreciable. The noise produced in the case of the detonation, and the shattering of the glass tube into a fine powder, will suggest to you that detonation, if set up in an engine cylinder, might cause great damage. Luckily the nitrogen, which forms about 79 per cent. of atmospheric air, acts as a preventive, as far as the detonation of air-petrol mixtures is concerned. If, however, pure oxygen is employed, or if such a gas as acetylene is used, then this question of the production of detonation will become of importance. That pressure waves, such as are required to initiate detonation, do, under certain conditions, exist in the cylinder is shown in Fig. 18. In the case of the charge fired by a spark in the exhaust valve-pocket, pressure-waves having an amplitude of as much as 100 pounds to the square inch actually existed when that particular diagram was taken.

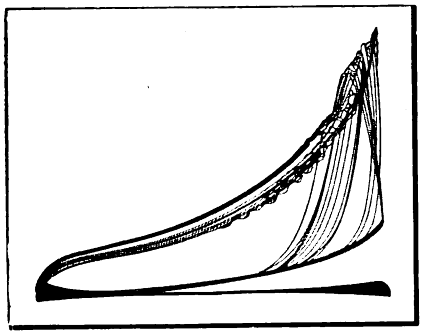


Fig. 20—Manograph card showing earlier and earlier ignition on compression stroke

Returning to the combustion of air-petrol mixtures, it is found that the richest mixture which will burn contains about 1 lb. of petrol to 7 lbs. of air, while the weakest contains about 1 lb. of petrol to 26 lbs. of air. In the case of the lower limit (weak mixtures), a very small reduction in the proportion of petrol is sufficient to pass from the inflammable to the non-inflammable conditions. In an engine where the fresh mixture is always mixed with a certain amount of the products of combustion left over from the preceding stroke the lower limit is about 20 of air to 1 of petrol, but satisfactory working will only be obtained with mixtures containing less than 17.5 of air to one of petrol. For mixtures between 17.5 and 20 of air to one of petrol, there is liable to be popping in the carbureter. This is because these very weak mixtures burn so slowly that the charge is still actually burning even at the end of the exhaust stroke, and hence the incoming charge catches fire, the combustion spreading through the induction pipe to the carbureter.

Although I am not aware that any direct experiments have been made on the temperature to which a mixture of air and petrol must be heated before combustion starts, from the values obtained in the case of other hydro-carbons (methane 700 deg. C., ethane 575 deg., etc.), it is probable that at a temperature somewhere between 600 deg. C. and 700 deg. C. petrol-air mixtures will inflame. This fact limits the amount of compression which can be used in a petrol-engine, for the charge, being compressed practically adiabatically (*i.e.*, without loss of heat), if the compression is carried too far, will fire before the end of the compression stroke, causing the phenomenon called pre-ignition. That one can easily fixe a mixture of petrol and air by compression I can show by an experiment. I have a glass tube closed at one end and fitted with a piston. I drop a small piece of cotton wool soaked in petrol down the tube and rapidly depress the piston, when the petrol vapor burns, causing a bright flash.

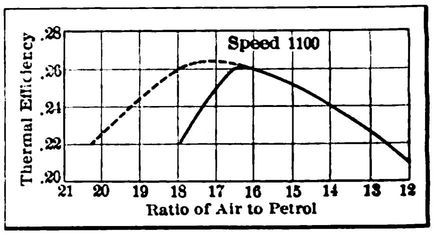

Fig. 23—Chart showing gain in economy by advancing spark when using weak mixtures

Pre-ignition may be started in an engine in which the compression is not great enough to cause the temperature of the mass of the charge to reach the ignition point, if some solid body, such as a projecting wire or piece of carbon, gets sufficiently hot. In such a case the gas in the immediate neighborhood of the hot body starts at a fairly high temperature, and the increase in its temperature, when compressed, may be sufficient to cause ignition. By placing a platinum wire in the combustion space of the engine used to illustrate these lectures, and then gradually heating this wire by the passage of an electric current, we can cause pre-ignition to occur, and you can follow the phenomenon by means of the indicator diagram thrown on the screen. Pre-ignition, once started, rapidly gets earlier and earlier, because when a gas is fired in a closed space the portion of the gas first fired, and which is compressed by the rise of pressure produced as the rest of the charge is fired, reaches a much higher temperature than that reached by the portions which ignite last. Hence, when pre-ignition starts at the wire, the great heat there developed raises the temperature of the wire very rapidly, so that ignition takes place earlier and earlier on the compression stroke, as is shown very clearly in Fig. 20.

The speed at which inflammation travels through mixtures of air and petrol of different strengths has been examined by Dr. K. Neumann, of Dresden, and some of his results are plotted in Fig. 21. It will be observed that the maximum speed is only 7.5 feet per second. This corresponds to a mixture containing 12.5 parts of air to one of petrol; for both richer and weaker mixtures the speed decreases rapidly, so that for those near either limit the speed is less than one foot per second.

The fact that the speed varies with the strength of mixture can be easily shown by experiment. Thus I have a glass tube filled with a weak mixture of petrol vapor and air, and firing this at one end, it will be seen that the flame travels quite slowly down the tube. On refilling the tube with a stronger mixture and repeating the experiment, the flame is seen to travel much more rapidly.

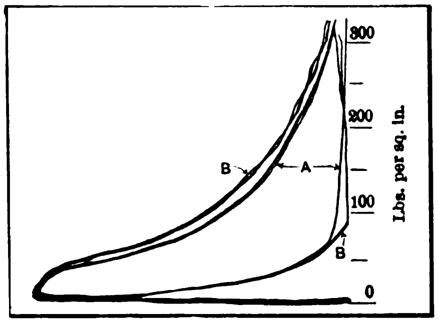

Fig. 24—Manograph showing advantage of advancing spark as speed increases

The slowness with which flame travels through a mixture of petrol and air can also be shown by the following experiment: Such a mixture is caused to escape through a narrow glass jet, the pressure being variable. When the pressure is low, so that the velocity of the escaping mixture is small, the flame, on lighting the gas, remains at the top of the jet. If, however, the pressure is increased, the velocity of the gas is such that near the jet, where the velocity is a maximum, the flame does not travel down as fast as the gas moves up. Hence the flame rises up from the jet and can be kept stationary at two or three inches above the end of the jet. The point at which the flame becomes stationary is that at which the upward velocity of the mixture of air and petrol is exactly equal to the downward velocity of the flame propagation. The question of the velocity of flame propagation is one of considerable importance, particularly in the case of high-speed engines. Thus in the case of an engine having a speed of 3,000 revolutions per minute the whole of the working stroke only occupies 0.01 second. Now, if the combustion of the charge, in place of being complete soon after the top of the stroke, is delayed till the piston has completed a fifth of its stroke, a very marked decrease in the mean effective pressure is observed, so that the instant of attainment of complete combustion must be adjusted to within two thousandths of a second in the case of an engine working at 3,000 revolutions per minute. Further, since the speed with which the flame spreads through the mixture varies with the strength of the mixture, what is a correct spark advance for, say, a strong mixture, will not be enough for a weak and hence more slowly burning mixture. This effect is illustrated in Fig. 22. In the left-hand diagram we have the spark timing adjusted as suited to a fairly strong mixture, and, as a result, the maximum pressure is not reached, that is, the charge is not completely inflamed, till about a quarter of the stroke is completed; the indicated horsepower being 2.36. If, however, the spark is advanced considerably more than would be advisable with a strong mixture, it is possible to obtain complete inflammation near the top of the stroke, as is shown in the right-hand diagram, and, as a result, the indicated horsepower rises to 2.76, an improvement of 17 per cent. The gain in economy by being able to advance the spark more than usual when using weak mixtures—and it is only with such weak mixtures that economical working is obtained—is shown by Fig. 23. The curve shows the efficiency obtainable with different strengths of mixture, obtainable in the case of a certain engine. The full line curve shows the conditions when the spark advance is kept throughout as it would be with the stronger mixtures, while the dotted curve shows the improvement obtainable by suitably advancing the spark.

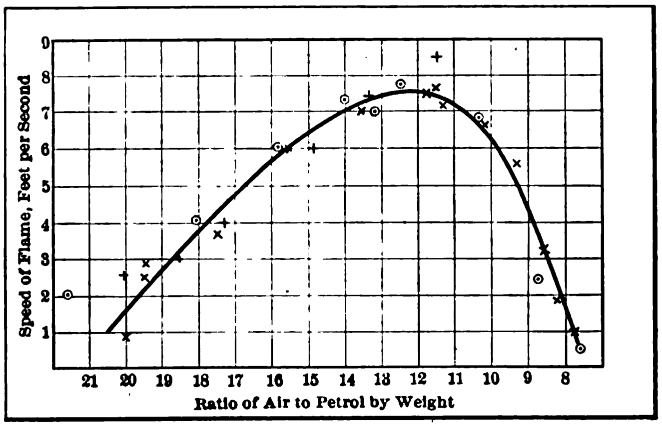

Fig. 21—Chart showing speed at which flame passes through mixtures of air and gasoline of different strengths

Not only is the power of adjusting the timing of the spark of advantage to counteract the change in the velocity of flame propagation, with change in the strength of mixture, but it also allows us to secure the best results at different speeds. It is evident—since the distance the flame has to travel remains the same at all speeds, while, if the timing of the spark is fixed, the time between the passage of the spark and the top of the stroke decreases as the speed of the engine increases—that if the timing is right at slow speeds, then as the speed increases the spark advance will not be great enough, and *vice versa*. This effect is shown in Fig. 24. The diagrams shown were obtained at a speed of 640 revolutions per minute, the spark advance in the case of the diagram marked A being such as to give the best results at a speed of 1,600 revolutions per minute. The diagram marked B is that obtained when the spark advance is reduced to the best value for the speed of 640 revolutions per minute. The indicated horsepower corresponding to A is 2.9, while that corresponding to B is 3.3, a difference of 14 per cent.

It would thus appear that with an engine fitted with a fixed ignition, neither with varying strengths of mixture nor with varying engine speeds can as good results be obtained as if we are able to adjust the spark advance to suit the conditions.

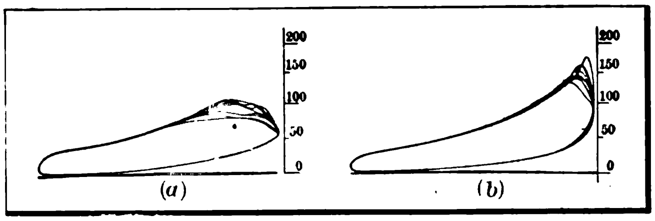

Fig. 22—Manograph cards showing how horsepower is increased by advancing spark

Don'ts for the Autoist

WHAT NOT TO DO ABOUT REPAIRING AN AUTOMOBILE. HOW NOT TO DRIVE ON THE ROAD AND A FEW OTHER INJUNCTIONS

Don't linger on the brink of a bad repair job; if the repairman is a bungler "can" him.

Don't undertake to run a repair shop without competent help; it is extremely difficult to conceal the shells.

Don't forget to look after the insurance policy of your automobile just before you send it to a repair shop; places like that do burn down.

Don't run a repair shop without having everything properly insured; you may have to fix the place up a little before the insurance people will take the risk; why not do so?

Don't try to bribe the inspector from the building department in order that you will be able to evade some of the rules that are promulgated for safety; why not put your money into the building instead of trying to make a crook?

Don't handle gasoline in the garage just as if it were a fire extinguisher; the regulations for the safe handling of this liquid are fairly good—it is cheaper to follow them.

Don't roll your car out of the garage at a racing speed; you might run over your nearest relative, or the man who is on his way to make you his heir.

Don't smoke cigarettes, but if you must hasten the time, why endanger other people by lighting them in a garage, or near a can of gasoline?

Don't clean the garage floor if you have money in the tire business; the way to increase the demand for tires is to soak them in lubricating oil.

Don't attend to your own affairs if you want to have them mismanaged—just leave it to your help to do things wrong.

Don't take advantage of progress; be a back number; that is, if you want a large tire bill to pay; old style clincher rims are at a premium on inactivity, and so the cost goes up.

Don't ask a "native" for directions to the place to which you want to go; natives are notoriously inaccurate—equip yourself with "canned" directions in the form of a reliable guide book.

Don't ramble; it is more enjoyable to map out an itinerary; be sure and include some historical place that will make it an object to travel; something to look forward to.

Don't map out too long a journey per day; there is little enjoyment in a ride of more than 100 miles in 10 hours.

Don't fall in with speed maniacs; let them pass on; you are not bound for the same place.

Don't take any man's dust; all that you have to do to avoid it is to allow him to speed on. True, you will be left in the lurch; it is a rather nice place; beats a hospital.

Don't map out a belated schedule; it will make you work. Touring is work, unless it includes leisure of thought and action.

Don't neglect the advantage that comes from a good average speed in the absence of spurting; all damage is done at the higher speeds.

Don't overlook the story that insurance statistics tell; high-speed automobiles have proven to be inferior insurance risks.

Don't forget that a poorly made automobile will outlast a high-priced creation if the latter is driven at a high speed all the time.

Don't ask the maker to fix your car up with a gear ratio that will permit you to travel like the dickens on a level; the car will then go like a snail up a hill.

Don't forget that good average speed is superior to good level road performing; miles per day should be considered rather than miles per minute.

Don't overlook the advantage of a speedometer of some kind; buy a good one; resolve never to tax it above a certain reasonable speed.

Don't be so short-sighted as to travel by the speedometer to the extent of going by it irrespective of the road condition.

Don't go 20 miles per hour on a road that is only fit for 10 miles per hour.

Don't go as fast at night as you do in the day time, even if the lighting facilities are good.

Don't let the chauffeur drive a foot after he quenches his thirst.

Don't have a thirst of your own if you have to drive an automobile.

Don't entertain any exception to this rule; accidents are invariably urchins of exceptions.

Don't put a tooth in letting the chauffeur know where to jump off if he has a thirst.

Don't assume that there are no temperate chauffeurs; all the good ones are positively temperate.

Don't expect the chauffeur to be without any habits at all; some of them smoke; others may smoke hereafter; choose the one who smokes here.

Don't discover a good chauffeur and then hold him down to poor pay; cut diamonds are worth money.

Don't forget that a good chauffeur can save you a round thousand dollars per year in cost of maintenance—give him a share of the saving.

Don't be blind to the cost to you of a poor chauffeur; he may stretch your purse to the extent of an extra thousand per year; give him half the profit.

Aluminum Alloys

Some Actual Tests of Cast Aluminum Used for Crankcases

ALUMINUM as used in crankcases and transmission gear boxes differs in strength over a wide range, depending upon the composition of the same, whether or not new metal is used in testing and if scrap is put in the charge the purity of the latter must be taken into account. It rarely ever happens that good aluminum castings result from the use of even a small amount of scrap, due to the presence of Babbitt metal, the contents of which has a marked influence upon the performance of the aluminum. Since Babbitt bearings are employed in motors and elsewhere in automobile work, it is almost a moral certainty that some Babbitt metal will find its way into the aluminum scrap, part of which, during the process of turning and scraping the white metal bearings, and for the rest in diverse unaccounted ways, so that for good aluminum castings no reliance is to be placed upon anything but new metal.

No.	Tensile Strength	Elastic Limit	Mod. of Rupture	No. of Vibrations	Deflection at Breaking Load	Elongation per cent. in 8"	Specific Gravity	Melting point (degrees)	
								C.	F.
12	21,500	12,000	30,240	1,215,750	.450"	1.5	2.82	625	1156
31	29,400	13,000	34,100	608,725	.275"	.5	3.10	611	1132
63	42,500	25,000	51,800	510,900	.325"	.8	3.33	595	1100

The above tests are based upon the use of new metal, and show results obtainable only when the greatest care is taken and the foundry is fitted to do the best class of casting work.

It Stands to Reason

RELATING TO MATTERS OF INTEREST TO THE MAN WHO OWNS AND RUNS AN AUTOMOBILE, AND NOT WITHOUT INTEREST TO THE MAN WHO MAKES IT

That the best automobile to purchase and use is the one that will not break out of financial bounds.

That the motor should be large enough to do the work, with a little power in reserve, but there is no need of having a surfeit of reserve power.

That the lubricating system should be simple and reliable, with some way of telling how much oil there is present, and whether or not it is feeding at the proper rate.

That the ignition system should be such that the motor will crank readily and run well.

That the carbureter should be capable of furnishing a suitable mixture of gasoline and air at all speeds and temperatures.

That the clutch should work without slipping, unless the driver wants it to slip.

That the universal joints should hold grease in order that they will work freely and last long.

That the transmission gear system should afford the requisite number of speed changes, be free from noise, and not "clash" badly when the gears are being shifted.

That the propeller shaft should be fitted with such a system of universal joints as will take care of the angularity, but this is no license to have the angle more than a few degrees.

That the live rear axle should be well made, stout, and the bevel drive should make little or no noise.

That the road wheels should be well secured to the jackshafts.

That the tires should be large enough to sustain under the load without squashing down more than a small part of an inch.

That the chassis frame should be of stout design in order that it will serve as a stable platform for the machinery.

That the steering gear should be free from lost motion.

That castings should not be used in any of the parts that have to do with shock work, if the lives of the occupants of the automobile are at stake.

That the body should be made so that it will not "check" when it is exposed to the weather.

That the upholstery should be of a good grade and free from coloring matter that will "fry" out under conditions of Summer heat, only to blacken up the clothing of the occupants of the seats.

That some form of windshield is indispensable to the comfort of the occupants of the automobile.

That a top of some kind is necessary for touring service.

That good lighting is absolutely necessary from the point of view of safety, and the law demands it.

That a proper horn with which to make signals should be provided; but that its presence should not be abused.

That provision should be made for a supply of lubricating oil sufficient to cover 200 miles.

That the automobile should be washed with great regularity, and that this is no license to scour the surfaces of the body with a dirt-laden rag.

That good common sense should be displayed at all times—especially at the time of selecting a new automobile.

That an extra tire should be taken along, and that several tubes should be in the locker.

That tires will give out soon unless they are kept in a state of good repair.

That a vulcanizing set is necessary if it is proposed to maintain the tires in a good state of preservation.

That good tires are conducive to permanent repairing work, and that the reverse is true of the other kind of tires.

That springs will not work well unless they are lubricated; pry the plates apart and squirt lubricating oil in between them.

That a new broom sweeps clean; be a new broom all the time; some automobilists deteriorate rapidly, and the car is then neglected.

That the life of an automobile is short in the hands of the man who makes a mile in a minute on a road that is barely fit to travel at a rate faster than ten miles per hour.

That going around corners fast is not only dangerous, but it is very hard on tires and some parts of the mechanical structure as well.

That racing up a hill may seem like good driving, but it is not.

That the motor serves very well as a retarding mechanism on a down grade.

That it is a good idea to examine the brakes at frequent intervals, making sure that they will stop the car within a reasonable distance.

That a car can only be brought to a stop within a certain distance in any case, and it is proper to find out just what the distance is for every make of automobile.

That the only device that seems to thrive on noise is a drum.

That noise in an automobile is a sign that some part is awry.

That noise must be stopped or the automobile will stop.

That the sooner noise is stopped the more money the owner of the automobile will be able to keep in his pocket.

That noise is the particular friend of the repairman.

That the repairman should extract the noise from a car if he is paid for the undertaking.

Chain Lubrication

Reason for Running a Chain Dry as Compared with the Method Sometimes Used of Covering it with Grease

THE life of a chain is dependent upon the quality of the metal employed and the lubrication, and presuming the chains to be of high-grade work and material, the lubrication becomes the important question. The first point is: What part of the chain requires lubrication? The pins and rollers undoubtedly; consequently, smearing grease on the outside of the chain has about as much utility as putting thick grease inside an engine and expecting it to act by splash. The pins, and these alone, require lubrication, as when the pins are oiled the inside of the rollers is also lubricated. To make an emery valve-grinding paste one takes powdered emery and mixes it with oil. When grease is smeared on the outside of a chain it collects dust and mud and forms an excellent grinding material to wear the chains and sprockets. At the end of a journey in the rain the chains should be rubbed over with a stiff brush dipped in kerosene, to prevent rusting of the pins, and some oil squirted into the rollers with an oil can. Every 2,000 miles or oftener the chains should be removed and allowed to remain in kerosene for about six hours, or overnight if possible, and thoroughly freed from all dirt; then take four pounds of grease of a vaseline consistency and mix into it about half a pound of flake graphite. Over a flame (a blow lamp will do) turn the mixture into a liquid and steep the chain in it for a few minutes, moving it to and fro so that the grease has a chance of finding its way to the pins. Hang the chain up on a nail over the pail in which the grease has been heated and it will drain off. When the mixture has cooled off whatever remains on the chain should be scraped off and the chain is ready for use. Graphite will greatly quiet the chain.

Amount of Wind Resistance

Retarding Influence Not Great Under 20 Miles Per Hour

According to Professor William D. Ennis, when a body bounded by a plane surface is subjected to a normal current of air, or moves normally in still air, a pressure is produced on the plane amounting in pounds per square foot of surface to

$$0.0025\,V^2,$$

in which V is the velocity in miles per hour. The total pressure over an area of A square feet is then

$$0.0025\,AV^2.$$

In an automobile the value of A may be taken as the sum of the areas of the approximately normal surface, since a body partially protected by a wind shield may still be subjected to some resistance as the air eddies around the latter. For the car in question we may then perhaps take A at 28 square feet, whence the resistance is

$$0.0025 \times 28 \times V^2 = 0.07\,V^2 \text{ pound.}$$

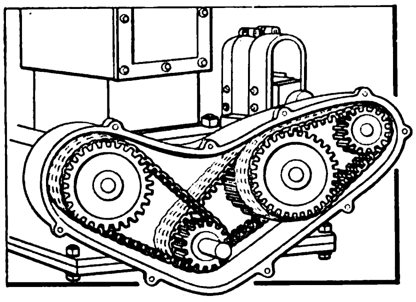

Fig. 1—Cam and magneto shafts operated by silent chains

No provision is made for measuring this in testing cars by the method referred to; for, although a large fan blows air against the front of the radiator for cooling, the car does not move against this current of air nor does the presence of the latter influence the amount of power exerted by the motor. The tractive forces necessary to overcome wind resistance alone are then about as follows:

Speed in miles per hour	Resistance due to velocity in still air, pounds
10	7
20	28
30	63
40	112
50	175
60	252
70	343
80	448
100	700

If there is a head wind, the velocity of the wind must be added to that of the car to obtain the equivalent speed. Thus a car running at 40 miles per hour against a head wind of 20 miles per hour experiences a wind resistance of 252 pounds. It appears that, as in railroad locomotives, wind resistance is of little importance at low speeds (say, below 20 miles per hour), but of serious effect at high speeds. Therefore, a racing car at 70 miles per hour would experience an extra resistance of 3.06 pounds from an extra normal surface 6 inches square—say, a man's head—and this would sacrifice more than half a horsepower.

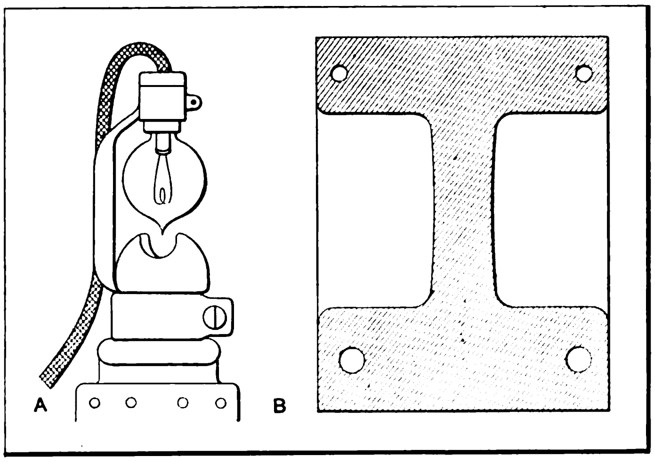

Fig. 2—Method of making electric light holder for oil lamps

Letters from Subscribers

Magneto Wiring and Connections

Editor The Automobile:

[2,428]—Could you tell me how a Bosch Dual magneto should be wired? I can follow the wiring from the magneto to the plug, but where do the wires from the coil go?

Scranton, Pa. R. E. Duff.

Fig. 5 shows how the wires are attached and the different connections to be made:

1—to circuit breaker on magneto.
2—magneto grounding wire.
3—driving end of magneto to switch.
4—center of distributor to coil.
5—to battery from coil.
6—to earth.

Chains for Distribution Gears

Editor The Automobile:

[2,429]—The timing gears on my car are exposed and make a loud humming noise. Is there any means of quieting them?

Findlay, Ohio. R. C. B.

Exposed gears are always apt to rattle, and when made of raw hide or fiber the dirt that is sucked in the hood causes them to wear quickly. Fig. 1 shows a method that is gaining favor in some parts where the gears are enclosed, and there is no reason that it would not act just as well with unenclosed gears. A metal cover made from sheet tin would keep the gears clean, and a little grease with a small quantity of graphite mixed with it sometimes helps to quiet unenclosed metal gears.

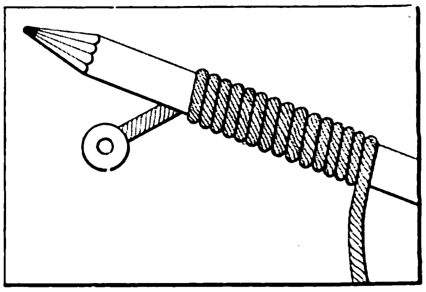

Fig. 3—How to coil electric cable

Grease Gun

Editor The Automobile:

[2,430]—I find great difficulty in filling the rear axle of my car with oil or grease, as the body covers it from the front and the gasoline tank prevents me getting at it from the rear. Could you suggest any method of overcoming this?

Albany, N. Y. L. Henry.

Find out the size of the plug hole and buy a piece of gas piping to fit it and an elbow already threaded. A plunger can be made of wood. To fill the improvised gun, unscrew one end and force it in the grease can and it will fill itself. A small amount of force will send the grease where it is needed. (Fig. 6.) With another elbow the same idea could be used for oil.

New Lamps for Old Ones

Editor The Automobile:

[2,431]—My car is fitted with oil lamps. How can I adapt these for electric light?

Galveston, Tex. W. F. Wright.

There are several adapters on the market for this purpose,

THIS DEPARTMENT IS DEVOTED TO THE ANSWERING OF LETTERS FROM SUBSCRIBERS ON ANY SUBJECT RELATED TO THE RUNNING OF AUTOMOBILES

but if you wish to do the work yourself take a small piece of sheet brass and cut it as shown in Fig. 2; bend it to the holders and drill for small bolts. The back can be looped to take the wire. It would be as well to coil the wire as shown in Fig. 3 somewhere in the circuit, so that when the exposed part wears it will be possible to pull the coiled part out and have sufficient to make new connections without rewiring or making joints. These coils prevent any pulling or breaking of the wire, which should be attached with staples, placing a piece of rubber between the staple and the wire to prevent chafing.

Piston Ring Holder

Editor THE AUTOMOBILE:

[2,432]—I have obtained some new unslotted piston rings from the factory where my car was built, and as I wish to slot them myself, what method do you suggest to hold them firm? My car is fitted with low-tension magneto, and I wish to equip it with high-tension magneto; what is the best method in which to proceed, and do you think I could manage it myself?

New York City. A SUBSCRIBER.

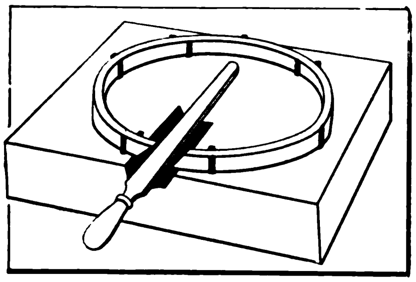

Fig. 4—Method of holding piston ring for slotting

The method of holding rings for slotting is shown in Fig. 4. With this inexpensive tool the rings can either be angle-slotted or step-cut, first using a fine hacksaw and afterwards a fine file. Unless you are used to filing you had better have a mechanic do this part of the work. There is no difficulty in altering the system of ignition. Take the tappets out and make a plate out of quarter-inch metal, bolting it on in place of the tappet. Take out the push rods and cover the holes in a similar manner. Fit gaskets to prevent leaking of compression and oil.

Most low-tension magnetos are run at half-speed, and it is necessary to ascertain if this is the case, as the ordering of the new magneto will depend upon this, the amount of space available on the bedplate and position of the carbureter as to whether the high-tension magneto will fit. The height of the center of the drive from the bedplate must be ascertained, and if this is less on your present magneto than the new one you propose to fit, you can pack up to this with sheet fiber; but if it is more you had better get advice from some one who is used to this class of work.

Cleaning Brass with Salt and Vinegar

Editor THE AUTOMOBILE:

[2,433]—What are the proportions of salt and vinegar for cleaning brass? Will this cleaner injure the brass? J. HARPER.

Gladstone, N. J.

The probability is that salt (sodium chloride) and vinegar (acetic acid) will have a detrimental effect on the brass alloy by eating holes in it and giving it an irregular, rough surface. The abrasive principle is by far the better, as the wear is then at a constant rate and the polish lasts longer.

Calculated Horsepower

Average Autoist Thinks A. L. A. M. Formula Tells Actual Horsepower of a Motor

WHEN a committee of the A. L. A. M. decided to establish a conventional empirical formula for use in comparing motors it was quite well understood that its value would be limited to the advantages to be derived by reducing all motors to a common level and thereafter find out by a more definite means, as a test, how near the motors might perform to the established standard. It was, of course, recognized that some motors would deliver power up to the standard, other motors might fall below the standard, and a few motors might reach to a higher level. It is a great mistake to assume that a designer would take months, or even a whole year, in laying out a motor with no better expectations than to come up to an average formula in private performance. Every designer hopes to be better. The way to ascertain the power of a motor is to test it. The formula states that the power is determined as an approximation at 1,000 feet of piston travel, as follows:

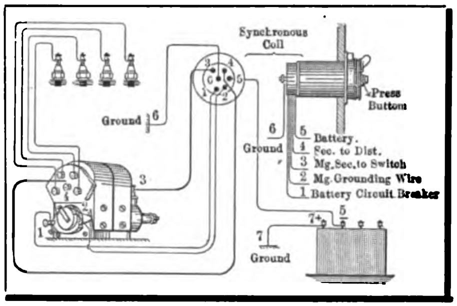

Fig. 5—Wiring of Bosch Dual Ignition

$$\text{HP.} = \frac{d^2\, n}{2.5}$$

when

d^2 = the square of the bore of the cylinder in inches.

n = the number of cylinders.

2.5 = an empirical divisor based upon the average performance of automobile motors and a piston travel of 1,000 feet per minute, thus making it unnecessary to consider the angular velocity of the crankshaft.

A numerical example of the above formula for a four-cylinder, four-cycle motor, with a bore of four inches and a stroke of the same, would be as follows:

$$d^2 = 4 \times 4 = 16$$
$$n = 4$$

when

$$\text{HP.} = \frac{16 \times 4}{2.5} = 25.6 \text{ horsepower.}$$

The mere figuring out of the horsepower in the manner as above shown has no more to do with the actual horsepower of a real motor than the drawing of a battleship would have to do with its gun-power in a real engagement. It is a fortunate circumstance that when a theory gets in the way of a practice the theory gets run over—the facts remain. There are, of course, motors of this size that will deliver 25 horsepower and there may be motors that will deliver more than 25 horsepower, but there are also a large number of motors that will not deliver 25 horsepower, and the great main point is to find out what they will deliver, rather than to assume that they are up to a standard.

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FOREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[281]—How can the inner tube of a double tire be removed and replaced by another?

First lift the wheel free from the ground with a jack and deflate the tire. If of the clincher type, with tire lugs (clamps), first loosen the nuts on the radial bolts that hold the heads of the lugs down against the inner surface of the outer shoe; also remove the nut, or nuts, from the valve stem. Remove one side of the outer shoe from the clincher groove. A pair of blunt irons (prodders) about 3-4 inch to 1 inch wide and 1-8 inch or less thick at the end are most commonly used for prying the tire off on one side. Care must be taken not to pinch and tear the inner tube. Remove the inner tube by pulling it out by hand, beginning at the part farthest from its valve, and then by the use of an iron suitable in shape for raising the outer shoe somewhat, take out the valve from the rim of the wheel. A double-prong iron can be used by placing a prong under the shoe on each side of the valve.

If the tube has been punctured, feel inside of the shoe to find whether anything is still projecting through the tire that will injure the inner tube when replaced. Also see that there are no sharp points or edges on the tire lugs.

Rub a liberal supply of powdered talcum (soapstone) on the inner tube, also place a liberal supply inside the shoe and rotate the wheel slowly, at the same time kicking or striking the shoe so that the powder will be well distributed over its inner surface. Place the tube in the shoe. Inflate it slightly to straighten it out, which may need some assistance by hand. Pass the hand carefully around the tube to make sure there are no twists or folds. Then, by the use of tire irons, force the shoe back into place, remembering that each clamp must be lifted as the part of the shoe next to it is sprung into position.

Push the clamps up to see whether the inner tube lifts freely. If not it may be pinched under the clamp and should be released. There should be a leather or rubber washer under the clamp nut to prevent the entrance of water and grit to the tire. Tighten the clamp by hand and inflate the tire so that it will bulge only slightly at the sides where it rests on the ground. (Pressure gauges to use with a tire pump can be purchased.) Try the clamps again to see that they are tight. Thumb nuts on the clamps can be made tight enough by hand.

When the outer shoe is to be completely removed from the rim, the clamps or lugs must be taken entirely out after removing the inner tube. A tire iron suitable for lifting the shoe at that point facilitates this operation. Numerous forms of tire irons are in use. None seems to have any great advantage over the others.

A stubborn tire shoe can sometimes be quickly put in place by sitting down and pushing against its side with both feet, at the same time striking the flat part of the bead with a hammer that has well-rounded edges.

Various convenient tools for forcing a tire-shoe back into place on the wheel can be found on the market.

[282]—How can a temporary patch be put on the outside of an inner tube?

Manufactured patches can be secured for this purpose, or a patch can be cut from a sheet of rubber or an old inner tube whose material has not deteriorated appreciably. Only rubber patches should be used on the inner tube. Canvas, etc., will not do, because it does not stretch like rubber.

Rub the tube around the puncture with a piece of sandpaper, emery paper, or a clean fine file over an area somewhat larger than the patch to be used. The space to be covered by the patch must be clean and free from partly torn-out pieces of the rubber. The clean space should be somewhat larger than the patch.

Liquid rubber cement is used for fastening a temporary patch in place. There are almost numberless makes of it. Some dry, or set, much more rapidly than others. The directions for using generally accompany the better grades.

See that the tube is perfectly dry, especially that there is no water on it when beginning to cement on the patch. The patch should also be dry.

In the absence of directions on the cement tube or box, the patch may be put on as follows:

Apply the cement with a brush to the rubber tube and one side of the patch. Wait till the cement dries enough to become sticky. Then place the patch on the tube, taking care to put it on with a rolling motion so as to exclude all air from beneath it. Press the patch on firmly, first pressing at the center and gradually working out toward the edges. A small, narrow roller in the end of the bar is a suitable tool for pressing the patch on. It is used by rolling it back and forth across the patch, gradually working side-wise at the same time. The tube should be laid on a smooth surface under the place where the patch is being applied. Lay a smooth piece of board on the top of the patch and weight it. Leave until the cement sets.

If it is not known how long it will take the cement to set, a couple of test pieces of rubber may be stuck together with some of it after the patch is put on. The test pieces can be pulled apart, a little at a time, to note the condition of the cement.

Coat the patch with talcum or other powder to prevent its sticking to the shoe.

A patch put on in the above manner without vulcanizing will last for some time, if the tire does not become hot, as by rapid running of the car. Heat softens the cement and the patch becomes loose.

The patch is sometimes put inside the tube by the repairman.

[283]—How can a small cut or tear in a tire be repaired?

Scrape the rubber clean in the cut or tear and fill it with prepared plastic rubber. Then vulcanize it at the repaired place.

Drain Cocks

They Must Be Provided for if the Motor Is to Be Properly Protected in Winter

OF the 400,000 automobiles that are now in service, 213,000 were built prior to 1910, and of this considerable number of cars many of them are so lacking in harmony that the hydraulic grade idea is missing from the cooling system. Perhaps nearly all the owners of these cars have gone through at least one Winter's experience, and those of them who succeeded in protecting their motors from the effects of freezing probably did so by putting drain cocks in at various points and taking the pains to open them every night in order to let all the water out. In many cases, no doubt, the freezing question was handled through the proper use of non-freezing solutions, one of which is composed of glycerine and water, using about 30 per cent. glycerine in solution. Of those who rebuilt their automobiles to the extent of putting drain cocks in at low points, some of them found that it took several drain cocks to satisfy the situation. If anti-freezing solutions are taken advantage of, it still remains to have drain cocks at the low points for the purpose of getting rid of the worn-out liquid—it does wear out.

Carbureter Action

BEING AN ABRIDGMENT OF A PAPER READ BEFORE THE BRITISH INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS. BY W. MORGAN, B.SC., AND E. B. WOOD, M.A. (CANTAB)* (FIRST INSTALLMENT)

THE work on which the following results and conclusions are based was undertaken at the Daimler Motor Works some three years ago as preliminary to an attempt to design a paraffine carbureter suitable for traction work. The difficulties of the task were twofold, the low volatility of the paraffine giving rise to one set of problems, while the narrower limits of smokeless and odorless combustion, as compared with those of petrol, intensified the difficulties met with in an ordinary carbureter of obtaining suitable fuel mixtures over the wide range of demand required by a modern road engine. It was therefore necessary to find or design a carbureter which could give a mixture of fairly constant composition. Investigations which had been made on carbureter action assumed the steady flow of both air and liquid fuel, with apparently misleading conclusions when applied to designing a carbureter for the engine.

Dr. Watson, in his paper on "Thermal and Combustion Efficiency" (Proc. I. A. E., 1908-9, pp. 387-473), shows the character of the pressure variation in the induction pipe of a four-cylinder petrol engine at a speed of 656 revolutions per minute with open throttle (see Fig. 1, copied from Dr. Watson's paper). In this particular case it appears that actual reversal of flow takes place. so that any argument based on steady flow must be regarded with suspicion.

It was decided to ignore as far as possible all formulæ relating to steady flow, and to measure directly the related quantities of gas and liquid induced under the engine suction. In the first series of experiments, as will be seen, the writers fell from grace, and estimated from pressure the amount of exhaust gas dealt with. The possible danger of error was recognized, but as the necessary apparatus for directly measuring the volume of air was unobtainable and the correctness of the conclusions based on this method was confirmed by gas analysis, no misgivings were entertained as to the general accuracy of the results.

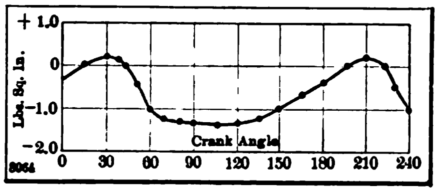

Fig. 1—Chart showing pressure variation in the induction pipe

Last year it was found possible to lay down a more complete equipment at the Merchant Venturers' Technical College, Bristol, and to confirm the results of the previous work.

The outfit at the Daimler works consisted of a standard four-cylinder engine, 124 millimeters bore by 150 millimeters stroke with tappet valves, driven through a belt and speed cones by a two-phase motor. The engine was fitted with a graduated petrol gauge and the exhaust passed into a small tank of about 2 cubic feet capacity perforated with several 1-2-inch holes; the pressure in this tank was read on a suitable gauge and converted into volumes. The motor was an 8-horsepower, direct-connected, and the speed regulated by inserting a water resistance in the armature circuit. Great constancy of speed was obtained and over a 10-minute run the speed variation was less than 0.4 per cent.

The petrol gauge was designed with the object of enabling readings of petrol consumption to be taken with an engine running under its own power without stopping from time to time to refill the gauge.

The carbureters used in the first experiments varied in form, but the plain-tube carbureter used at Bristol will serve as a type of the others. The section is shown in Fig. 2 and it is seen to have consisted of a gas cock in a straight tube fitted with bushes of various diameters and standing over a petrol jet which stood inside the bush. Pressures at the jet were read by means of a fine brass tube fixed near the jet.

The earlier carbureters used were simply lengths of 1-1-4 inch copper pipe swept horizontally so that the air flowed across the jet and not along it. In the later experiments the air was measured by observing the time required to pass 30 cubic feet into the gas-holder, observations of temperature and barometric pressure being made. In the last series of experiments which were taken to confirm previous work, the barometer, temperature and humidity were so nearly constant that it was thought unnecessary to apply an atmospheric correction which would affect all readings proportionally. In several cases the correction factor was found to be 1.005. Again, no correction has been made for the volume of petrol vapor, as this correction does not affect the main conclusions which follow, as will be shown later.

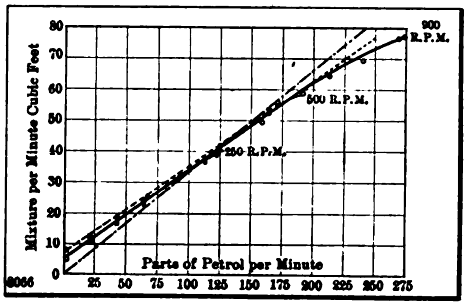

Fig. 3—Characteristic graph for plain-tube carbureter

The gas measurements further required a correction for leakage on the induction and the exhaust side of the engine. On the induction side, beyond making the induction pipe joints gas tight, no attempt was made to prevent leakage. There was no perceptible leakage past the pistons, but at high vacua there were indications of considerable air flow up the valve guides, although the valve stems were a good fit and were well lubricated. It was decided to allow this leakage to continue as it was a factor with which the carbureter must deal. Afterward it was argued that this leakage could have varying relative values with different engines, so that it was desirable to obtain a value for it; accordingly a correction was obtained in the following manner. The engine was first run with closed throttle and the quantity of air passed into the tank per minute measured; at the same time the suction in the induction pipe on the engine side of the throttle was taken.

The throttle was then opened to successive marked positions with the engine running at a constant speed and the suction in the induction pipe noted at each position. The value of this correction is shown by means of the dash line in Fig. 3. In this petrol per minute is plotted against air per minute taken by the engine at different speeds and throttle positions; the plain line graphs are corrected for leakage and give the relationship between petrol and air which has passed the jet.

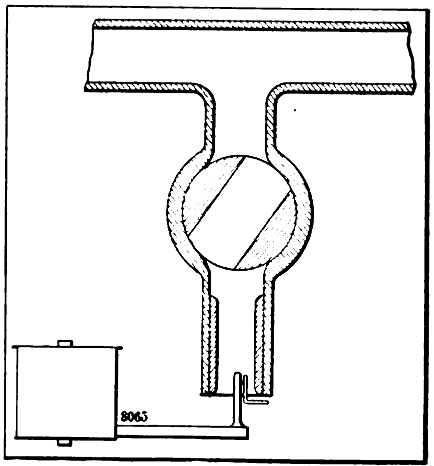

Fig. 2—Diagram of plain-tube carbureter used for tests

---

*From "The Commercial Motor."

With regard to the correction for losses on the exhaust side it was found that with clear exhaust pipes the back pressure never exceeded 48 inches of water and with the 500 revolutions per minute series of experiments 24 inches. The leakage at this pressure was less than 1-2 cubic foot per minute at open throttle and fell away very rapidly with closing throttle. No correction was made for this leakage.

The results are presented in the form of graphs, which have been obtained from simultaneous readings of petrol and air as shown in Fig. 3 and those following.

Fig. 3 may be taken as typical of the whole. This is the petrol-air graph of the plain-tube carbureter at the approximate speed of 250, 500 and 900 revolutions per minute with a bush 3-4 inch in diameter. It will be seen that the main parts of the superimposed curves lie on a straight line and that the upper end of the graph for each speed droops toward the petrol axis. Neglecting the drooping parts of the graphs for the present, it then follows that the law connecting the flow of petrol and air in a carbureter of this type is of the form $y = a \times bx$. This conclusion is borne out by every similar experiment made by the authors on various engines, which include four old type Daimlers, two new type Daimlers, one Talbot and a Darracq.

Accepting this law connecting petrol and air in plain-tube carbureters, the running of an engine with such a carbureter is at once explained. The chain line in Fig. 3 shows the graph of constant fuel mixture of such composition as will approximately give complete combustion of both air and petrol; this may be called the ideal line or line of correct mixture. Any point on a graph lying between the air axis and the ideal line indicates a weak mixture, while a point on the other side of the ideal line indicates a rich mixture. It is now clear that this plain-tube carbureter must give a weak mixture until the consumption reaches 30 cubic feet per minute; for higher gas consumption the mixture becomes richer. Hence the graph shows, as is borne out by experience, that with this carbureter the engine would be difficult to start without flooding, would not run or pull at a low speed and when opened out the mixture would be slightly rich. It is a defect of this type of graph that it does not readily show the percentage variation from constant mixture. Fig. 3 shows the percentage composition of the mixture plotted against air.

It should be borne in mind that all the graphs shown are corrected for leakage on the induction side of the engine, hence the point of intersection on the air axis appears lower than actually is the case. This correction leaves the type of the graph unchanged; the same is true of the correction which could be made for the volume of vaporized petrol. The volume of petrol vapor is proportional to the quantity of petrol taken, hence the correction would tend to slightly decrease the inclination of a graph. Here, again, the type of graph is unaltered, so that the main conclusions are unaffected. The value of the point of intersection of the curve with the air axis is of importance, for if this were lowered to zero the plain-tube carbureter could be made to give quite good results.

Effects on engine speed are at once obvious from Fig. 3. The straight line part of the characteristic is extended along the line $y = ax + b$, which is peculiar to that arrangement of the carbureter, while the droop is but very slightly modified, if at all.

The size of the jet modifies the slope of the straight line characteristic as might be expected. Fig. 3 gives the graphs obtained with two jets, the smaller having an aperture one-half the area of the larger. The characteristic is seen to swing on the point of intersection with the air axis, so that by suitably setting the jet the characteristic of such a carbureter may be set parallel to or at any desired angle with the ideal line.

Economy and Speed

The Relation Between Rate of Speed and Amount of Fuel Used Is Fixed

IS it not strange that there is so much talk about economy in the use of fuel in automobile work, and an inclination on the part of many autoists to look for more economical machines in some form of construction that is not now commercialized, as if to point out that present practice is ill-advised? It is like trying to show that experience is wrong, that the designers who have industriously labored for a number of years failed to take the right road, and are afraid to turn back. Observation seems to indicate that the men who dream the most, and articulate the loudest, are the very automobilists who disregard every consideration for economy, entirely overlooking the fact that if they fail to conform to the reasonable demands of the situation, it is up to them to pay the penalty, whatever it is. There is an economical speed for every automobile, and this speed depends upon the weight of the car. Designers are compelled to provide motors that are capable of driving automobiles on the level, hard road at speeds that are higher than economy dictates. This excess speed comes from the necessity of providing power enough to propel the automobiles up steep hills and through long stretches of soft going. The economical speed for weight is about as follows:

PROPER SPEED TO DRIVE A CAR OF A GIVEN WEIGHT

Miles per hour	Weight in pounds (maximum)
28	1,000
20	2,000
17	3,000
13	4,000
12.5	5,000

These speeds are all too low to suit the average automobilist, but disregarding them is at the extra cost of tires, and the man who elects to go faster has no rightful ground for complaining about the life of the tires.

Standardization Suggestion

Maintaining the Appearance of a Car May Demand a New Body

FREQUENTLY it is found that an automobile is doing good work even after two or three years' service, but the practice of bringing out new models every year has the demerit of rendering old models passé. One way to recoup this loss is to put a new body on the old car and thereafter refinish, thus bringing it up to date, in so far as it is possible to do so, and within a reasonable cost. Reasonableness of cost must always be judged in the light of the broad possibility. If there is no standard to go by, so that bodies cannot be produced for stock, the reasonable cost will be based upon the production of one body for the specific purpose, as a special effort. It would be a step in the right direction to write "reasonable" in front of a much lower cost than that due to the making of one body, but this can only be brought about if bodies are standardized. In France it has been the practice for seven or eight years to make bodies to a standard width, and some of the lengths, as follows:

RULING LENGTHS OF BODIES IN FRENCH AUTOMOBILES

Length in metres	Equivalent in inches
2.00	78.74
2.10	82.67
2.20	86.61
2.30	90.55
2.40	94.48
2.50	98.42

Unless American body builders will adopt the metric system of measurement it might be well to fix upon a standard of length of American bodies, arranged in even inches, as 75, 80, 85, 90, 95, 100, 105, 110, etc., or 72, 78, 84, 90, 96, 102 and 108. Perhaps the latter arrangement would be the most appealing in view of the six-inch increments intervening, thus affording a definite relation to the English foot.

Ravages of Tinkeritis

Herbert L. Towle Fell In With Carrington Again

I FELL in with Carrington again on the train the other day. Carrington, you know, owns a Hurriup runabout, and from the height of his four years' experience with successive models of that celebrated make, he surveys with much edification the 'prentice efforts of his friends to get along peaceably with similar machines. His last experience was with Snyder, who has had his little red Hurriup for about five months.

"I got a telephone call last Sunday," said Carrington, "begging me to run over and see if I could help Snyder get his car started. Previous adventures in helping Snyder out of his troubles had made me wary, so I asked him where the machine was. It was just down the hill, a couple of yards from Snyder's house, the other side of town. So I got into my car and ran over. I found that Snyder and a darky, who had appeared out of nowhere to help him, had been taking turns at the crank for an hour or two. Snyder or the darky would whirl the crank to beat the band; the motor would spit once or twice, or would do nothing whatever, and after each whirl Snyder would give the vibrator screws a twist. The vibrators were working as well as could be expected under such treatment, so after adjusting them properly I investigated the sparks at the plugs.

"After finding the sparks O. K. I turned the crank. I got four or five explosions and the engine stopped. After repeating, with a like result, I looked at the carbureter. The needle valve was two full turns open, though half a turn was more than enough. How under the canopy that man had ever persuaded his engine to run at all with such a dose beats me. I screwed the needle valve down to where it ought to be, judging from the feel, but still the engine did not run. Then I took the needle out, and found it had been bent four ways from Sunday by my friend's strenuous efforts with a screwdriver on some previous occasion. No wonder I couldn't get the right mixture! Snyder promptly declared he could straighten the thing, and was off with it to the garage before I could stop him. So I went up on the porch and chatted with the ladies. After a while Snyder came back, announcing that he had straightened the needle, and asked me to put it in. I laughed at him.

" 'Not on your life,' I said. 'I'll put in a new one, if you like, but I won't waste a minute fooling with that busted thing."

"It is funny," I observed, "how hard it is to teach amateurs the importance of a hundredth of an inch in things like that."

"Indeed it is!" responded Carrington. "As I was saying, I refused to touch the thing further, and the end of it was that Snyder got a mob of boys together and he and they and the darky pushed the runabout to the garage while I steered."

"A man like that makes more trouble for himself than the slickest chauffeur could for him," I observed.

"Say," burst out Carrington, "it just beats creation how many ways Snyder can find of queering a perfectly good machine. I'll bet anything that by ten o'clock this morning he will have either a cylinder or an axle or the radiator off his car, hunting for some fool thing that would have been all right if he had only let it alone. You expect to see amateurs meddle with the little things, like adjustments, but this man is not satisfied with that. It is only the big things that interest him. For example, his high-tension system was leaking like a basket the other day. I touched it somewhere, and it knocked me about six feet. I told him he had better run new cables to his spark plugs, but such a matter was too trivial to interest him."

"He must need education badly," I said.

"He has the worst case of tinkeritis I ever saw," responded my friend. "If his car was running beautifully, like a sewing machine, with absolutely nothing the matter with it, he'd want to know why it was running beautifully, so he'd take off the cylinders. And when he got them on again he'd mix the valves or do something else so the car wouldn't get out of its own way.

"You know the front axles of those cars are guided by a wishbone of steel tubing. Well, lately, Snyder thought that the connections from the wishbone to the front axle didn't look just to suit him, so he took off the wishbone, plugged it with sand, and put a neat bend in each leg close to the front axle. The result is that the knuckle pivots now rake backward like a bicycle fork reversed, and it is almost impossible to steer the car at all. It tries to slow off, first to one side, then to the other, in spite of anything you can do."

"Is he really a natural mechanic, who has simply not learned to apply his bent, or is he just one of those who rush in—you know the line?"

"He isn't a mechanic in any sense of the word," replied Carrington. "He has a certain amount of common sense, but his ignorance of mechanics is wonderful. He is learning, though! You bet he is learning, and he is paying for it, too. For example, I noticed a while ago that one of his rear tires had a flat spot on it, where apparently it had slid when he set his brakes a trifle hard. A few inches of fabric were exposed, and I advised him to take the shoe off and send it to a vulcanizing shop. But no, that was too simple for him! All the tire needed was a patch, and he guessed he could put the patch on as well as anyone. So he spent a couple of hours cutting a piece from an old inner tube, scarfing its edges down as neatly as he could, and cementing it over the flat spot."

"What sort of cement did he use?" I asked, with a grin.

"Just common ordinary cement; the kind that comes in tin tubes. Well, of course, the patch came off right away when he ran the thing. Then he thought the reason it came off was that the front edge could peel up, and that the way to make it stick was to have an endless band all around. So Snyder actually put in half a day peeling all the rest of the tread from that perfectly good tire, and cementing an endless band from an inner tube all around it."

I gasped.

"Needless to say, his beautiful endless band parted company with the tire without much ceremony. A few days later, he invited my nephew to go with him for a ride. I knew what that meant, and warned the boy that he would probably have to work his passage. He went, however; guess he wanted to see the fun. Before they had gone fifteen miles that re-treaded tire went bang! where water and his surgery had weakened it.

"The other day, after I had steered his car into the garage, he asked me what I thought he ought to do with it. I said to him, 'Snyder, I'm your friend, and I'll help you with this car to the point of getting it so it will run. But that is absolutely all I'll do. You have put the rig on the bum in too many ways for me to feel inclined to have a hand in it. When you get it so it will run, take it to town and ask the agent for his best offer in part trade for a new car. Take his offer, even if it is only fifty cents. And, when you get the new car, for Heaven's sake *let it alone!*' "

Properties of Aluminum

Specific Gravity Changes with Thickness of Castings

IT has been shown that the strength of aluminum castings is greater for thin than for thick walls, and it is also true that the specific gravity of the metal is increased as the walls are cast thinner. The approximate variation in specific gravity of the metal is as follows:

Thickness in inches	Specific gravity corresponding
1 (square)	2.964
3-4	3.004
5-8	3.002
9-16	3.004
1-2	3.012
3-8	3.024
1-4	3.007
1-8	3.007

Note.—It is true that the variations in specific weight, as noted, were not uniformly increasing as the thicknesses of walls decreased, but the indication is pointedly in favor of increasing weight with decreasing thicknesses of walls.

Practical Repairing

DISCUSSING THE OVERHAULING AND REPAIRING OF CYLINDERS; WITH AN ILLUSTRATION AND DESCRIPTION OF AN AIR TEST AND A REPLACEMENT

CAST gray iron is universally employed for cylinders, it being a product that pours into moulds with a fluidity sufficient to produce thin walls, and under proper conditions a closeness of texture that holds compression sufficiently for the intended purpose. It is also true of this material that it withstands heat changes, as they obtain in motor work, and the wearing surfaces take on a darkened bronze-like luster that is quite permanent, excepting when the design is inferior and the castings are below the customary standard. But the best-made cylinder must wear in time, and in order to hold compression thereafter it becomes necessary to refinish the bore, make new pistons to fit, and supply new piston rings to match. It not infrequently happens that the cost of the overhauling work is greater than the cost of a new set of cylinders; this depends upon the price asked for the repair parts by the maker of the automobile as against the amount of work that will have to be done to put worn-out cylinders in a state where they will perform efficient service.

There is no way of stating clearly the best course to pursue, excepting after an examination of each individual repair case. Some cylinders wear to an elliptical bore, due to great angularity of the connecting rod coupled with high compression and high speed. In such cases it is easy enough to measure the difference between the major and minor axis of ellipse, and if it amounts to more than two or three thousandths of an inch nothing remains but to refinish the bore. In refinishing work the first consideration is to measure the thickness of the wall of the cylinder, and if it is not of the uniform thickness account of this fact must be taken. If the thinnest point in the cylinder wall is under 3-16 of an inch, it is scarcely to be supposed that it will be worth while to undertake reboring, on the ground that the strength of the wall will be insufficient for the purpose. If the finished section of the cylinder wall is found to be ¼ of an inch or better, reboring becomes an excellent possibility, although these questions are coupled up with the dimensions of the cylinders, it being the case that the greater the bore the thicker the wall should be.

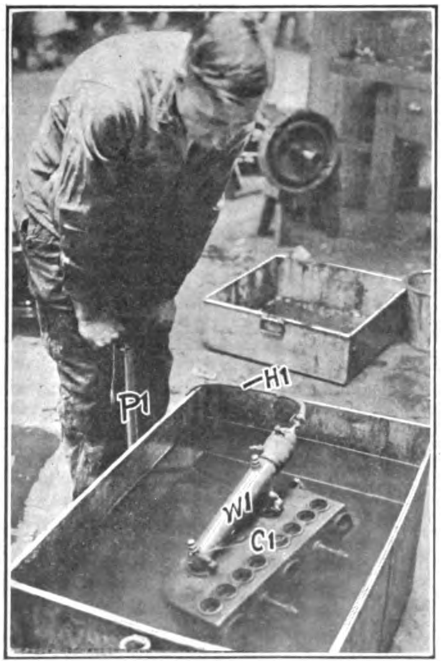

Fig. 1—Method of air-testing cylinders, showing casting in a tank of water, and compressed air being forced into water jacket

Independent of the dimensions of the cylinder the pressure varies depending upon the compression, efficiency of the ignition system, and quality of the mixture, the latter depending upon the carbureter. It is not uncommon to take manograph cards from cylinders of motors that show an explosion pressure of 300 pounds per square inch, and certainly in considering the maximum possibility it would not be too much to expect that this pressure might go up to possibly 400 pounds per square inch, not as a regular thing, but under a conceivable set of conditions, and it must be remembered that breakages do not come from a long series of abuses, but, as a rule, from a single excess.

Granting that an examination of the cylinders of a motor discloses a sufficiency of the elliptic condition to require that reboring be done, it remains to fix upon the method to pursue, and, if the repair man has a choice of facilities, he will readily select the grinder without resorting to reboring, not only on account of the speed at which grinding can be done, but because of the excellence of the result. If there is no grinder at hand, and the difference in bore is a matter of two or three thousandths of an inch, a reamer suggests itself, or even a cat-head will do. In either event the cutters must be sized to precision, and fairly inserted in the bore of the cylinder by a repair man of some skill. The work can be done upon either a drill press or a lathe.

There still remains a very excellent means for refinishing cylinders if the difference is within ten thousandths of an inch. Cast a disc of lead or Babbitt metal to a diameter slightly greater than that of the cylinder, with an axlewise thickness of perhaps two inches. Bore a hole in the lead disc, or cast it with a chord hole, and clamp the disc so made on a mandrel, fetching it up tight, thereafter setting the mandrel up in centers, and turning the disc down to a diameter of three or four thousandths of an inch greater than the bore of the cylinder to be finished, tapering the diametral face of the so made lead lap slightly to give it "entrance." When the lead lap is ready it remains to smear it over with cylinder grinding compound, the latter being of ground glass rather than of emery or carborundum, starting with a relatively coarse grade of the abradant, ending with the finest grade in order that the bore will be perfectly smooth. In operating this equipment the work may be done on a drill press, or better yet, on a platen type of lathe, unless a vertical milling machine is available, in which event the cylinder may be set up on the platen, and the lead lap may be chucked. With the cylinder adjusted on the platen so that its axis coincides with the axis of rotation of the lead lap, it remains to feed the cylinder up against the tool, rotating the latter at some convenient speed, and it will be found that by feeding the cylinder up and down a few times the bore will be increased perhaps two thousandths of an inch per feed, and the elliptic condition

Fig. 2—Process of replacing cylinders, showing how two workmen guide cylinders over pistons without damaging the rings

will be taken out of it, leaving the bore perfectly round and quite smooth. As a last resort, the cylinder may be tooled out on a drill press.

It might have been stated that there is no use of boring out a cylinder if the valve seats are worn down so much that no metal will be available for dressing them. Leaving this part of the repair question for future treatment, assuming only for the time being that the seats are not worn too much, it remains to point out that after refinishing the bore it will be desirable to test the cylinder for tightness, and this may be done in the manner as shown in Fig. 1, in which C1 is the cylinder, W1 is the water pipe, H1 is a hose connection, and P1 is an air pump of the hand variety. The cylinder is submerged in water, and air is pumped into the water jacket proper under pressure, with the result that if there are any leaks bubbles of air will show up in the water.

One of the hazardous undertakings in connection with cylinder repair work comes when it is desired to replace the cylinders, as shown in Fig. 2. In this case the cylinders C1 are being slipped over the pistons P1, and one man is engaged in holding the cylinders in the vertical position while a helper compresses the piston rings and guides the cylinders over, both operators working together and exercising great pains in order not to damage the piston rings. The helper is holding the rings firmly in the slot, with the right hand, and with a flat-blade knife in the left hand he is guiding the piston into the bore, taking advantage of the bevel around the extremity and compressing the rings at the same time. It is a tedious operation at best, resulting too often in the damaging of the rings, which can only be known when the motor is started up and it is found that the compression is poor.

Expense Account Compiled

U. S. Jameson, of Worcester, Mass., Shows How to Operate an Automobile

EVERY man understands how easy it is to get rid of money if no account is kept of the individual expenditures. The pennies mount into dollars, and the dollars pile up, until finally the victim is brought to a halt by the glaring evidences of a shortage in his funds, there being no other way out of it under such conditions. It cannot be said that the coming of the automobile has altered this fundamental situation; some automobilists maintain that the trouble is even more acute. From time to time level-headed automobilists send in their well-kept expense accounts, one of which is here given, and in addition to the direct evidence of cost afforded there is the possibility of finding out just what are the most troublesome items, after which it is possible to treat with them, hoping, perchance, that they will bow to intelligent action.

In this particular example the car was operated from April to October, inclusive, covering 8,750 miles, and the largest item of total expense was for repairs and painting. Particular attention is called to the foresight of the automobilist who had the good sense to include repairs and painting in the cost of maintenance. The next largest item was for the salary and maintenance of the chauffeur, and then come tires and tubes. It is just possible that the repair account could be reduced were the chauffeur more capable; it is not the purpose here to state that this particular chauffeur received too much money, or that he was in any way negligent, but the fact remains that if the owner had driven himself he would have saved $355.20 that he paid the chauffeur, and he might have saved some of his repair and painting account. Moreover, the tire and tube account of $344.22 presents a rich field in which a careful owner has a wide opportunity to distinguish himself. Mr. Jameson, in offering this evidence of cost, states:

"Your readers may be interested in the carefully kept expense of operating a touring car on its fifth season. The following figures are reliable:

"Five-passenger, 4-cylinder touring car of standard American make, built in 1906. Weight, 3,300 pounds. Tires, 34 x 4 and 34 x 4½. Season, April to October, inclusive. Mileage, 8,750, half in city, half in country."

Items	Total expenses	Cents per mile
Repairs and painting	$433.04	4.94
Tires and tubes	344.22	3.94
Supplies and miscellaneous	96.65	1.10
Chauffeur	355.20	4.06
Storage and washing	123.88	1.42
Gasoline	191.89	2.19
Oil	48.80	.56
Grease	5.35	.06
	$1,599.03	18.27

"Civilization is a function of industrial production and industrial production is a function of technical insight." This epigram is somewhat widely quoted in Germany as expressing the protest of the technical world against the domination of the untechnical, lawyers, legislators and merchants, for example, in shaping the living conditions and institutions. It is the gist of an article on the subject in *Automobil-Welt* that technical bodies should make themselves felt in political activities and assert their superior rights for deciding ways and means in the advancement of civilization.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, RACES, HILL-CLIMBS, ETC.

Nov. 19-26	Oakland, Cal., Idora Park Show, Under Management of Oakland Automobile Dealers' Association.
Dec. 1	Chicago, Ill., First Annual Aeronautical Exhibition in the Coliseum.
Dec. 31-Jan. 7, '11	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14, 1911	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12	New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28, 1911	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, Third Regiment Armory.
Jan. 15-21, 1911	Detroit, Wayne Gardens, Detroit Automobile Dealers' Association.
Jan. 16-21, 1911	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A. L. A. M.
Jan. 28-Feb. 4, '11	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-Feb. 11, '11	Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 18-25	Minneapolis, Minn., Annual Show Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25	Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 18-25	Newark, N. J., Annual Show, New Jersey Automobile Exhibition Co.
Feb. 24-27	New Orleans, La., Annual Show, New Orleans Automobile Club.
Mch. 4-11, 1911	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 25-April 1	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mch. 25-Apr. 8	Pittsburg, Annual Show, First week, pleasure cars; second week, commercial trucks. Automobile Dealers' Association of Pittsburg, Inc.

GERMANY:—A. Seydel, Mohrenstrasse 9, Berlin.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

IGNITION problems, of which there are a number, are in a more or less chaotic state in certain respects, despite the strides that were made and the relatively perfect methods, of which there is so much to be said in a favorable way. The introduction of the manograph as a means of photographing the wave of pressure during the power stroke affords an insight and a means of comparing the various classes of ignition equipment and the efficacy of the several plans. The most recent investigations of the thermic performance of motors utilizing the manograph show that one spark, well timed, is all that the occasion requires when the speed is low. The result is precisely the same with or without a magneto at this low speed, provided only that the timing is propitious. As the speed is increased difficulty is experienced, and an acute ambition creeps in as the speed advances from approximately 800 revolutions per minute. One safe conclusion is that the spark plug should be located in the region of the intake valve. There is a positive gain also if two sparks are delivered in the mixture simultaneously.

* * *

REVIEWING the practice abroad as it is being displayed at the Olympia Show in London, is not disconcerting from the point of view of the American designer; British practice, as it is reflected for 1911, indicates that the "economy bug" is in full control of the thinking apparatus of the English engineer. The reports coming over, however, to the effect that small cars are ruling, fails to take into account the overshadowing influence of a surfeit of taxicabs. Take the taxicabs away and English automobile practice will then be found more or less as it was last year. Discussion in the past is father to the thought that the English were bent on eliminating poppet valve types of motors, substituting rotary and sleeve-valve mechanisms, taking the Knight motor as the standard to go by, or the thing to get around, as the case may be. An examination of the Olympia Show proves quite conclusively that the English designers failed to get around the Knight patents. The prevailing opinion is that trouble was encountered and most of the innovators are delighted to be back home among poppet-valve motors. If the English designers failed in their attempt to substitute something better than poppet valves for motors, they have at least introduced many little refinements, and the cars, taking them as a whole, are refined.

* * *

WIRE wheels are used more extensively than ever in English automobile work, but an article on hickory, which appears this week in THE AUTOMOBILE, presents the main reason for this partiality to wire construction. Every man who ever had anything to do with a bicycle will have a positive opinion that will not be entirely favorable to wire wheels. The other side of the story is that hickory is not a familiar product in Great Britain and the time has arrived in American forestry when the conservation of the hickory supply is a paramount issue. The Forest Service of the United States Department of Agriculture is giving this important problem distinguished consideration, pointing out the waste that runs riot, and how wood-choppers disregard every consideration for economy. The support of the automobile industry is due the Department in this important undertaking and it is believed that the threatening invasion of the wire wheel, and all it implies, should suffice for the impetus.

* * *

RECOUNTING the incidents and cost of a long tour opens in THE AUTOMOBILE this week. This character of information has been extremely difficult to obtain bereft of trade cant, but in this case the incidents of the tour were very carefully recorded log fashion and the final summing up of the cost will be good information for the new automobilist who may be too much inclined to the belief that touring is a one-sided affair, with pleasure holding the center of the stage. The real pith of the matter is that touring, under well-regulated conditions, with a studied itinerary, provision for the cost, and a proper outfit, holds no equal in the field of recreation. It is a great mistake, however, to mar the pleasures of a tour through a short-sighted disregard of the simple expedients which even a journey on a railroad train would naturally suggest.

* * *

THIS year seems to be the most promising for the introduction of commercial (freight) automobiles. The several plants throughout the country are giving this part of the industry more and better attention than formerly and the users of freight automobiles are intelligently receptive now. The second week at the Garden Show should prove most interesting to makers and users alike.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

Selden Patent case on hearing in United States Circuit Court of Appeals—Arguments will be concluded on Friday—News of the coming automobile shows—A. L. A. M. announces list of freight truck exhibits for second week of Garden show—Special article on Olympia show in London—W. H. Cameron says British makers use unnecessary labor—Motor Club of Harrisburg conducts its autumn endurance run—New York Automobile Trade Association has many entries for its coming two-day run—Briscoe will make and sell "Utility" cars in England—Peeps through auto goggles at distant lands—Other snappy news from all around.

Curtain Rises on Last Scene of Selden Fight

WITH impressive pomp and circumstance the curtain has risen upon what may prove the final scene of the long-drawn-out Selden Patent litigation. The stage is set in the Federal Circuit Court of Appeals and the full bench, consisting of the venerable judges, McComb, Ward and Noyes, are hearing argument *pro* and *con* with regard to the most momentous question ever raised in the history of motordom.

Both sides are represented by eminent counsel and the court room at each session is filled with interested audiences.

The status of the matter is as follows: Appeal was perfected by the Ford Motor Company and others from the decision of District Judge Hough, who upheld the Selden Patent and granted an injunction against them.

The patents involved are those covering the gasoline engine and its chief auxiliary elements as applied to locomotion on the roads. The complainants originally were George B. Selden and the Electric Vehicle Company, and later the Columbia Motor Car Company succeeded to the rights of the Electric Vehicle Company. The A. L. A. M. is interested through its administration of the licensing power conveyed to it through the other parties in interest.

A decision sustaining Judge Hough's ruling would mean a readjustment of motordom to meet the new condition. An adverse decision would prove even more radical in its effects, as it would lift the present restrictions from the motor-making trade.

Henry Ford, president of the Ford company, a battler of the first rank, is attending every session, as are attorneys representing many of the independent organizations and corporations. On the other hand, the A. L. A. M. is represented by a battery of legal talent, and Alfred Reeves and a number of other officers are watching each step in the proceedings with intense interest.

The proceedings were opened by Livingston Gifford on behalf of the appellant Ford company. His argument dealt chiefly with the facts, leaving the discussion of the law principally to the closing argument of Edmund Wetmore.

In Mr. Gifford's argument he traced the history of the automobile, beginning with steam vehicles in England prior to the introduction of the railroad and carried it down to the time of Selden's application for patents. He referred to delays in the patent extending from 1889 to 1895 and then continued with the history of the development of the modern automobile. He particularly referred to the exhibition of a Benz car at the Paris Exposition of 1893 and continued up to the present. He spoke in detail of the contributions to the art by Daimler, Ford, Duryea and Maxwell.

Taking another line, his argument went into the history of hydro-carbon gas engines, commencing with Lenoir in 1861; Brayton in 1872; Otto in 1876, and subsequent developments of them.

His deductions from his array of facts were that Selden had contributed nothing to the art; that the Selden vehicle was wrong in every particular, including his wagon, his engine and his combination of wagon and engine. Finally Mr. Gifford concluded that the Selden patent was invalid in toto; that nobody had ever infringed it and that Selden himself had never built a vehicle or an engine that would run.

At the opening Tuesday morning, Samuel R. Betts, for the appellees, opened the other side of the argument. Mr. Betts treated of the case generally, upholding the Selden device at every point where Mr. Gifford had assailed it. He asserted that the patent was valid and that courts had so adjudicated it. He was followed by William A. Redding, who took up the facts involved in the case. He pointed out the fact that there were no automobiles in use prior to the Selden patent and made an emphatic point that no patents are on file covering the subject matter that antedate those of George B. Selden.

Time for adjournment cut off Mr. Redding's address and it will be continued Wednesday morning.

Following him will come Frederick P. Fish, a noted orator, who will complete the case of the A. L. A. M., treating upon the law of the action.

Edmund Wetmore will conclude for the Ford company, except for an address by Frederic Coudert, who has been representing the Panhard interests.

It was found that the case could not be finished by Wednesday night and two hours will be allowed the attorneys on both sides to wind up the presentation, on Friday.

Already the attorneys are figuring upon the future of the litigation. In case the patents are overturned the case may go to the Supreme Court of the United States under the same procedure that obtained in the Carnegie case. On the other hand, if the decision of the lower court is sustained, the attorneys for the appellants figure that a certificate of importance will be sufficient to take the case to the highest court.

Both sides express the utmost confidence in the merits of their cases, but neither principals nor attorneys would express any opinion as to the outcome.

Throughout the arguments, the judges were attentively interested and numerous pertinent queries were directed at attorneys for both sides from the bench. Judge McComb particularly questioned Mr. Betts on several points made by the lawyer. This single fact seemed to enliven the opposing attorneys. On the other hand Mr. Gifford had to answer numerous queries while he was addressing the court.

A decision of the case is not expected immediately and may be delayed in regular order for several weeks.

News Notes of the Coming Automobile Shows

AUTOMOBILE exhibitions are now the foremost element of interest in motordom. Shows of every kind, ranging from those of national scope to local exhibitions of a few styles and makes, are in the process of making. Every center of motoring is preparing for its show and as a result there is a stirring and activity of interest wherever two or three live dealers are gathered together.

Preparations for the New York shows are moving along steadily and while nothing radical with regard to them has developed during the past week, distinct progress has been made.

In the coming A. L. A. M. show at Madison Square Garden the announcement is made that the following cars that have never been shown at a licensed exhibition will be displayed:

Marmon, Reo, Maxwell, Overland, Premier, Mitchell, National, Jackson, Brush, Regal, Stoddard-Dayton, Hupmobile, Midland, Moline, Moon, Oakland, Ohio, Pullman, Speedwell, American, Amplex, Atlas, Cartercar, Case, Chadwick, Inter-State, Kissel, Buckeye, McIntyre, Marion, Courier, Morgan, Garford, Mack, Rapid, Reliance and Grabowsky.

The above are in addition to the old members of the Association of Licensed Automobile Manufacturers and the importers, the total number of car exhibitors for the big show being 68.

A.M.C.M.E.A. List Includes 61 Makers

Two more motor car manufacturers were signed up for space in the Palace show during the past week. These are: The De Tamble Motor Co., of Anderson, Ind., and the L. M. Hartman Sales Agency, of York, Pa., which handles the Hart Kraft truck.

The Chase Motor Truck Company will have a full line displayed at this show, as will also the Henry Motor Car Sales Co. The list now contains the names of 61 concerns that may be classed as manufacturers or special representatives of the makers.

Dealers and Club Clash in Milwaukee

MILWAUKEE, Nov. 21—The motor show situation in Milwaukee, Wis., has taken a serious turn and the split between the Milwaukee Automobile Club and the dealers, which threatened to weaken the second annual club show last February, has been made complete. The dealers now have organized a permanent association and at a meeting last week decided to hold the first annual show during the week beginning January 15, 1911.

The club, as usual, had planned to hold its third show during the week following the Chicago show, or February 12. The club has an option on the Auditorium for this period, while the dealers' association has contracted for the use of the building during the week of January 15.

At a special meeting of the Milwaukee Automobile Club, on November 18, a committee was appointed to confer with the dealers' association with the idea of combining the two shows. It is known that it would be ill advised to have two shows in Milwaukee.

The dealers' association is proceeding with its plans and has appointed Bart J. Ruddle as general manager of the show. The show committee consists of Frank J. Edwards, manager of the Kissel Kar Co.; Emil Estberg; R. G. Bates, of the Bates-Odenbrett Automobile Co.; Waldemar Kopmeier, of the Kopmeier Motor Car Co., and Edgar F. Sanger, of the E. F. Sanger Co.

Applications for space have been made by the following named dealers. all members of the association:

American Automobile Co., Pierce-Arrow: Bates-Odenbrett Automobile Co., Winton, Overland. Marion and Marmon: Curtis Auto Co., Reo and Corbin: Emil Estberg. Pope-Hartford and Woods and Waverley electrics: Franklyn Auto & Supply Co., Franklin and Babcock electric: Hickman-Lauson-Diener Co., Ford; Jonas Automobile Co., Peerless and Cadillac; Johnson-Burnham Sales Co., Interstate; Kopmeier Motor Car Co., Detroit electric and Chalmers; Kissel Kar Co., Kissel; Rambler Garage Co., Rambler; Studebaker Automobile Co., Studebaker, E-M-F and Flanders; Albert Smith, Palmer-Singer; Edgar F. Sanger Co., Stearns, Maxwell and Columbia; Welch Bros. Motor Car Co., Packard and Rauch & Lang electric.

Clifford E. Golder has been elected president of the Milwaukee Dealers' Association. Other officers are: Secretary, H. B. Pruden; treasurer, August A. Jonas.

Newark Show Dates Are Selected

NEWARK, N. J., Nov. 21—Dates for the Newark automobile show have been fixed for the week of February 18-25, and the New Jersey Automobile Exhibition Company is now busy trying to find a suitable hall. Former shows have been held in the Sussex County armory, but as the indications point to a much larger list of exhibitors than ever before, it is thought the armory would prove too small. The company is considering the First Regiment armory. The show has the support of the New Jersey Trade Association and the Associated Automobile Club of New Jersey.

Big Show Promised in Boston

BOSTON, Mass., Nov. 21—The ninth annual automobile show will be held in this city from March 4 to 11, and already the Boston Automobile Dealers' Association is confronted with the problem of supplying space for all those who wish to exhibit. A plan to limit the amount of space to be allotted is under consideration. A corps of architects and engineers has surveyed Mechanics building and it is thought that considerable additions to the available space can be made by slight alterations.

Electric Division Quaker Feature

PHILADELPHIA, Pa., Nov. 21—One of the features of the Philadelphia Automobile Show this year, which is scheduled for the Third Regiment armory the two weeks of February 14-28, will be the display of electrics. Among the cars that will be shown in this division are: Woods, Rauch & Lang, Baker, Babcock, Studebaker, Columbia, Detroit and Waverley.

Columbus Club May Abandon Show

COLUMBUS, O., Nov. 21—At a meeting of the board of governors of the Columbus Automobile Club it was decided to abandon the proposed automobile show unless a suitable hall can be secured, nearer to the heart of the city than the Ohio State Fair Grounds. The committee to secure a site for the show failed to report much progress.

Chauffeurs' Strike Still Critical

"Closed Shop" and no quarter is the demand of the striking chauffeurs in New York, and a settlement of the strike seems as far away as ever. The Motor Cab Owners' Association has issued a statement that the difficulty is about over, and while the taxis are moving with a trifle more freedom than heretofore with the aid of the police, the strike is still on.

A meeting of the strikers was held Sunday night, at which resolutions were passed to continue the strike to a conclusion. As we go to press every taxicab on the street is "riding" a policeman and of "fares" there are none at all.

Fifty Per Cent. of Clean Scores in Harrisburg Club Run

HARRISBURG, PA., Nov. 21—The fall endurance run of the Motor Club of Harrisburg started to-day with an entry list of 22 cars. To-day's run was 170 miles through York, Hanover, Hagerstown, Chambersburg and back to Harrisburg. The entries are classified in four divisions from 3A to 6A, which means that they are strictly stock cars valued at from $1201 to $4000 each. The list of entries includes:

DIVISION 3A—$1,201 TO $1,600

Car	Entrant	Driver
Crawford	Crawford Auto Co.	A. A. Miller
Reo	Harrisburg Auto Co.	G. G. McFarland
Everitt	W. Wayne Davis Co.	Davis
	Runabouts	
Maxwell	And. Redmond	Redmond
Firestone-Columbus	Seltzer & McCowen	Rasmussen
KlineKar	Ideal M. C. Co.	Vandergrift
Warren-Detroit	Taylor Mot. Dis. Co.	Kinginger
	DIVISION 4A—$1,601-$2,000	
Inter-State	Cent. Pa. Auto Co.	I. W. Dill
Velie	Zimmerman M. C. Co.	P. W. Walker
Maxwell	A. Redmond	H. E. Walls
Velie	Rockefeller and By'y	Rockefeller
Kline	B. C. K. M. C. Co.	Fletcher
Pullman	Keystone M. C. Co.	Brown
	DIVISION 5A—$2,001-$3,000	
Pullman	Pullman M. C. Co.	Steins
Pullman	Pullman M. C. Co.	Gallatin
Kline	B. C. K. M. C. Co.	C. C. Fairman
	Runabouts	
Kline	B. C. K. M. C. Co.	Seig
Pullman	Keystone M. C. Co.	Jones
	DIVISION 6A—$3,001-$4,000	
Columbia	A. Redmond	Smith
Matheson	Ideal M. C. Co.	Hall
	Runabouts	
Pullman	Pullman M. C. Co.	Welker
Kline	B. C. K. M. C. Co.	Kline

HARRISBURG, PA., Nov. 22—Eleven out of the 21 starters in the two-day run of the Motor Club of Harrisburg came through yesterday's trial with clean road scores. Three Klines were penalized; a Maxwell had oiler troubles and was withdrawn, while another drew a penalty for work on the road. The Firestone-Columbus turned turtle and the Inter-State entry met with a bad accident caused by skidding. One of the Crawfords broke an axle. A Velie car was penalized 21 points for lateness at control.

The run to-day is over a route that is quite as trying as yesterday's, with more and stiffer hills to climb. Tire troubles were much in evidence yesterday.

Two Thanksgiving Day Race Meetings

Thanksgiving Day will be celebrated by two race meetings within a short distance from New York. O. D. Corbett, who is secretary of the Automobile Club of Hudson County, is head of an enterprise to hold a race program at the old Guttenburg race track. This meeting has attracted a large list of entries and is sanctioned by the Contest Board.

The other meeting will be held at the track of the Bridgetown, N. J., Driving Association, under the auspices of the newly formed South Jersey Motor Club. Harvey Ringler is one of the promoters of this meet.

Aviation Meetings Present and to Come

PHILADELPHIA, Nov. 21—Aviation has succeeded the other important things in life as the most interesting phase of existence in Philadelphia this week. The flyers started last week at Point Breeze, and the Quaker City has acquired a crick in the neck from looking upward to see if a stray machine or two might not be hovering over the town.

A big section of the population was rewarded by seeing Grahame-White swoop across the navy yard, flying in a Farman close to the latticed fighting masts of the anchored battleships, and other feature flights have attracted attention. The meeting will continue until Friday.

HAVANA, CUBA, Nov. 21—John B. Moisant, winner of the Statue of Liberty flight in New York recently, and an aggregation of flying talent will show in Havana during the coming season. It is announced that Mr. Moisant's company will consist of half a dozen prominent airmen.

Racers Ready for Santa Monica Trial

LOS ANGELES, Nov. 21—Eight racing cars, entered for the annual Santa Monica road race, are being sent along at speed over the smooth 8.4-mile course in preparation for the big event which is scheduled for Thanksgiving day. The entries so far include: Apperson, Fiat, Isotta, Pope-Hartford, Lozier, Knox, Ohio and Only Car. It is predicted by the drivers that last year's record of 64.45 miles an hour will be excelled. The race is 24 laps of the course. A light-car race and a stock-car race will precede the main event. Both are fairly well filled.

Through an error in THE AUTOMOBILE's account of the recent electric run promoted by the Philadelphia *North American* it was made to appear that the second-prize-winning Studebaker car was a Waverley. The car was splendidly driven by Mrs. E. V. Stratton, wife of the Studebaker manager in Philadelphia.

Naphtha Given Service Test on Road

CHICAGO, Nov. 21—Benzine as motor fuel was given a test last week under the direction of the Chicago Motor Club. The Falcar that tied with two Molines with perfect score in the recent 1,000-mile reliability run, equipped with a Rayfield carbureter, was used in the test.

The tanks of the car were drained and filled with naphtha, commercially known as benzine, testing .55 specific gravity at 40 degrees Fahrenheit. A gallon of pure lubricating oil was put into the crankcase reservoir.

Starting from Van Dyke's garage last Thursday the car was run 670 miles to Cincinnati and return by way of Indianapolis and Lafayette. The average running time was 22 miles an hour and the total fuel consumption was 36 gallons, an average of 18.6 miles a gallon. Oil was taken on at Cincinnati and at Indianapolis on the return trip.

No motor trouble was reported except difficulty in starting on the final leg of the trip after the car had stood all night in a cold garage. Then it required priming with gasoline several times before it would start. The car weighed 3,600 pounds with three passengers.

Benzine test on a Fal-Car fitted with a Rayfield carbureter made to determine the feasibility of using heavy hydrocarbon fuel instead of gasoline proper

Big Crowds Attend Olympia Show

LONDON, Nov. 10—Wonderful, indeed, is the London Olympia Show, both as regards number of cars exhibited and attendance of visitors. At the moment of writing, right in the middle of the week, the official figures of those passing the turnstiles on the first four days is 102,200. The regular price of admission for six of the days is 24 cents from 10 a. m. to 10 p. m., continuously; on one day it is $1.25 and on one day 60 cents, and even on the highest priced day 16,000 persons put their money down at the turnstiles.

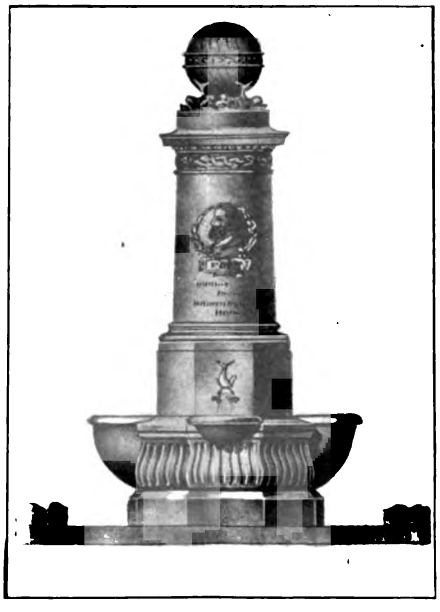
There are in the building a total of 589 cars and polished chassis (8 less than were seen at the last Olympia show) made up of 294 British, 185 French, 29 German, 28 Italian, 25 Belgium, 18 United States, 7 Swiss and 3 Austrian. The total number of exhibitors of all kinds being 298.

The first inspection gave an impression that there was little alteration from last season's models on the polished chassis and it was only by carefully examining the details that one could learn of the real changes effected in the engine and transmission. There is no likelihood of any maker in England standardizing in large quantity which has so materially aided in the success of several well-known United States cars.

The extent to which the wire wheel is now used can be realized from the statement that all the leading British car makers fit these as their regular pattern and almost all of them will only fit wood wheels to special order and will not promise any time for delivery.

One English maker who catalogued a four-cylinder block casting during 1910 has reverted to single-cylinder casting and this is about the only exception that can be discovered on the increasing use of the block casting for engines up to about 80 millimeters diameter. For the first time at any show a six-cylinder block casting is displayed by a French maker and the Fiat Company has something on the same lines; both engines rate at 24 horsepower.

As regards number of cylinders, the four holds 95 per cent. of the trade, only four English makers turning out a single-cylinder engine and not more than half a dozen make the two cylinder. The six cylinder, hitherto thought too costly for other than large cars, is being introduced for as small as 15 horsepower by the Delauney-Belleville and slightly larger engines by some dozen companies, hardly any exceeding 24 horsepower.



Good roads memorial to be erected in honor of Colonel Pope

The big valves talked about last show time is still upon paper and whilst sizes are fractionally increased, more attention has been devoted to cam profiles, silencing of the tappet rods, reducing strength of valve springs to a minimum and completely guarding springs and valve stems against dirt by enclosing with oil-tight covers.

One English firm stands by the overhead valve, both for inlet and exhaust, Darracqs show overhead valves on their new model 15 horsepower and a Belgium house introduces similar valves driven by an enclosed chain from the tail end of the engine. Engine noises are decreasing, the timing gears coming in for much attention from designers, helical or skew wheels making an otherwise noisy engine quiet.

The ratio of bore to stroke, taking an average through quite a long list of cars, is 1 to 1 1-4, although a French house is intending to sell a chassis with the ratio of 1 to 2, viz., 80-mm. bore and 160-mm. stroke. Practicable limits of compression have been reached and 80 lbs. to the square inch is the standard. Piston speed is increasing and how many revolutions a minute will be reached only a year hence, no one would care to predict. To give an idea of what English designers are trying for in this direction, it may be remarked that a week before these words were written a four-cylinder Vauxhall, 90-mm. bore by 130-mm. stroke was driven for a flying half mile on Brooklands track at the officially certified speed of 100.08 miles per hour and this same car is capable of over 90 m.p.h. for a ten-mile spin.

Oiling systems for moderate-priced cars, selling complete for $1,000, have an oil pump in the crank chamber.

Small air pumps for raising and maintaining pressure in gasoline tanks are regular features of nearly all the new models, these air pumps receiving motion from the camshaft.

On moderate powered and small cars, say below 26-30 horsepower, thermo-syphon circulation is on 75 per cent.

In connection with the water circulating system some makers are prepared to install devices for heating the interiors of limousine and landaulet bodied cars.

"Silent" Knight Inventor Coming

Charles Y. Knight, inventor of the "Silent" Knight motor, which has found immense favor abroad, is en route for America. Mr. Knight is expected to arrive in New York the last of this week. He is a native American, although his residence is in Coventry, England, where his extensive business is located.

His trip to the United States at this time will arouse much speculation as to its significance. It is understood that several American manufacturers have been negotiating with Mr. Knight.

Delay in 1911 Model Announcements

Almost at the opening of the current year it seemed as if many of the big automobile manufacturers of America would announce their lines for the coming year long before the business of 1910 had been finished.

There are several of good reasons why undue haste should not be used in making announcements of this character, and the trade is to be congratulated that a number of makers have restrained, even thus far, from prematurity in this regard. Prominent among the concerns which have shown a high degree of conservatism in this particular are the Pierce and others, which concerns probably will not make the annual announcements until just before show time, or even at the show.

Pope Memorial as Tribute for Road Work

HARTFORD, Nov. 21—As a tribute to the work for good roads done by the late Colonel Albert A. Pope, of Boston, a movement which was started a short time after his death to collect funds and build a memorial to Colonel Pope in Hartford, Conn., promises to be successful. The memorial will be placed in Pope Park, which Colonel Pope presented to the city of Hartford.

The Hartford Board of Trade has been collecting money and working to interest the users of the roads in the movement, and the announcement is made that nearly $4,500 has been realized. It is proposed to erect a handsome drinking fountain to cost about $7,500.

"Good Cars, but Labor Is Wasted," Comments Cameron

LONDON, Nov. 12—W. H. Cameron, chief engineer of the Willys-Overland Company, who is now abroad on a tour of investigation of various automobile plants, was interviewed exclusively for THE AUTOMOBILE during his visit to England. Mr. Cameron had nothing to say about the foreign plans of the Overland company, but he did make some interesting comments on British motor car manufacture after personal inspection of several plants and visiting the Olympia show.

"I am struck with the amount of unnecessary work done on many of the British cars," said Mr. Cameron, "and I believe that the education of the automobile-buying public in England has been given a wrong turn by reason of it. In my opinion too much stress is laid upon finishing. It seems to me that a saving could be made by abandoning the practice of machining up the throw of crankshafts and similar parts.

"This extra and unnecessary labor must add to the cost of the car without increasing its value, which, naturally, makes the finished product unduly expensive. The workmanship on English-made automobiles is equal to the best anywhere."

While Mr. Cameron was in France he met with some difficulty in inspecting the motor-car plants on account of the attitude of the French makers with regard to visiting engineers. He is about to leave for Italy and expects to return to America in three weeks.

Receiver for Barnes Motor Co.

DETROIT, MICH., Nov. 21—The long expected crisis in the affairs of the Barnes Motor Co., formerly the Anhut Motor Car Co., came Tuesday last, when Frank Howard, of this city, on behalf of a number of creditors, filed a petition in the United States District Court here, asking that the concern be declared bankrupt. Following the formal order of adjudication, William M. Walker, president of the company, was appointed receiver with a bond of $15,000.

The schedules place the total liabilities at $64,242.33 and the assets at $143,540.25. Many of the latter are of a doubtful character, however, and the creditors will not realize anywhere near the full amount of their claims.

The bankruptcy proceedings were forecasted by Mr. Walker more than a week ago, when about $14,000 was distributed among the creditors through the Union Trust Co.

Among the principal creditors are: The Peninsular Savings bank, Detroit, $4,000; American Ball Bearing Co., Cleveland, $3,697.40; Anhut-Robinson Auto Sales Co., Detroit, $1,960; R. C. Day, Toledo, $1,648; R. C. Durant, son of W. C. Durant, of the General Motors, $2,812; Fez Auto Sales Co., Chicago, $2,500; Griswold Motor & Body Co., $6,245; N. B. O'Connor, $3,000.

Assets include auto parts, machinery and partly completed motor cars in the plant at No. 510 Howard street, on which a valuation of $21,500 is placed; a factory and real estate in Chatham, Ont., valued at $50,000; $2,116 due the company in notes, and $26,571.23 in open accounts, but included in the latter item is about $20,000 in fire insurance policies.

Gaeth Assets Sold to Stuyvesant Co.

CLEVELAND, Nov. 21—The Stuyvesant Motor Car Co. has purchased the assets of the Gaeth Automobile Co., which recently went into the hands of a receiver. The Stuyvesant Co. is now building a 6-cylinder car called the Stuyvesant and has a large factory at Sandusky, covering 150,000 square feet of floor space.

The Gaeth plant will be removed to Sandusky and the company will continue to build the Gaeth model. It is the intention to build 200 4-cylinder Gaeths and 100 Stuyvesant Six models for 1911. The board of directors of the Stuyvesant Co. are F. E. Stuyvesant, for a number of years with the White Co., A. H. Frunfelder, A. C. Newton, and C. J. Castle.

Matheson Reorganization Perfected

WILKES-BARRE, Pa., Nov. 21—Under a rule of the Court of Common Pleas of Luzerne County, the assets of the Matheson Motor Car Company have been ordered transferred to the Matheson Automobile Company. The order was directed to Asher Miner and W. C. Shepherd, receivers of the manufacturing company and required them to turn over the property, franchises and rights to the New York concern.

Under the plan of reorganization the following directors have been named for the Matheson Automobile Company: W. C. Shepherd, J. W. Hollenback, Asher Miner, W. H. Conyngham, John A. Turner, W. H. Son, John C. Bridgman, R. N. Bennett, I. M. Thomas, C. W. Matheson, M. M. O'Boyle, Henry Hess, E. S. Fretz, J. B. Russell and Cortez Jennings. The capitalization of the new company has been increased by $700,000, making the security issues total $1,100,000 plus a new bond issue of $300,000. On the face of the situation the company is now in much better financial shape than ever in its history.

The wholesale sales department has been transferred to Wilkes-Barre, and the New York salesrooms and other departments will be operated as a retail branch. The company will confine itself to the manufacture of its Big Four and Silent Six exclusively. W. C. Shepherd is president and general manager.

American Invasion Will Become a Reality

If the English persist in over-finishing the cars made there.
If unnecessary labor is thrown promiscuously into English cars.
If French makers continue to hide behind a Chinese wall.

Bretz Company Takes Larger Quarters

Changing from its location in the Times building, the J. S. Bretz Company, which handles a number of imported accessories, has secured the whole of the sixth floor of the Motor Hall, 250 West Fifty-fourth street.

Clubman Proves Ability as Race Manager

Otto F. Rost, who was active in conducting the race meeting of the Mt. Vernon Automobile Club at the Empire City track November 12, accomplished quite a feat in making the meeting a success. It was postponed twice on account of bad weather, and the day finally selected to hold it was anything but favorable. Nevertheless, the paid attendance was sufficient to meet all expenses and the sport was interesting.

Mr. Rost is a native of Hamburg, Germany, and has been in the automobile business for about three years. He started as a salesman for the Black Manufacturing Company, of Chicago, and after one year was made New York manager of the Black Crow line.

Otto F. Rost, who promoted the recent Mt. Vernon Club Meet.

Two-Day Autumn Run Attracts Big Entry List

WITH an entry list including many more cars than were expected, the two-day endurance run under the auspices of the New York Automobile Trade Association, which will be held November 29 and 30, promises to be one of the most interesting affairs of its kind given about New York this season. The contest is restricted to stock cars under Class A rules.

There are seven divisions in Class A, ranging from under $800 to over $4,000, and sterling silver trophies will be provided for the winners in as many of the classes as fill. In addition to the trophies hung up by the association, a number of firms and corporations have signified their intention of furnishing trophies for the contest.

The first day's run starts at 8 o'clock Tuesday morning, November 29, from Columbus Circle. The route is through Stamford, Conn., via New Rochelle, Larchmont, Mamaroneck, Rye, Port Chester and Greenwich. Thence through Springfield, New Canaan and Ridgefield to Danbury, where noon control will be established, 62 miles from the start. Returning, the column will go through Mill Plains, Brewster, Carmel, Lake Mahopac, Baldwin Place, Briarcliff, Elmsford, Harts Corners and Greenville to New York. Checking stations will be established at Briarcliff, Danbury and Stamford, and, of course, at the start and finish. The total distance of the first day's run will be 136 miles.

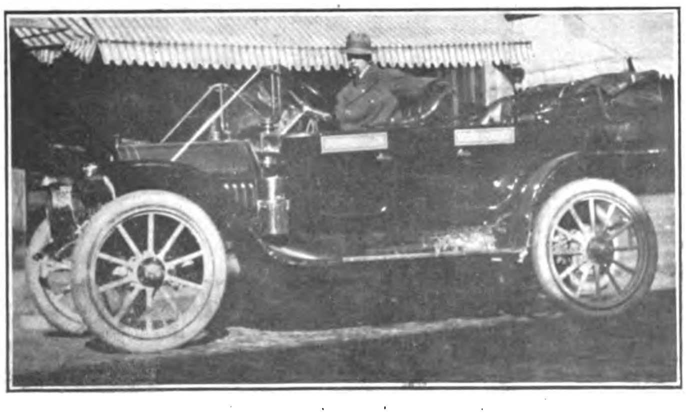
The final day will be through New Jersey. The cars will be checked out on the Jersey side of the Forty-second street ferry at 8 o'clock and will proceed through Hackensack, Suffern, Ramapo, Tuxedo, South Field, Vails Gate to Newburg, noon control. The return trip will be via Little Britain, Goshen, Chester, Munroe and South Field; thence following in reverse the route taken in the morning. Entries close tomorrow.

The list of entrants includes the following to date:

The B. F. Goodrich Co., of New York; Maxwell-Briscoe, Inc.; Mitchell Motor Co., of New York; The A. Elliott Ranney Co.; Pope-Hartford Auto Co.; Union Automobile Co.; Cimiotti Bros.; The Gordin Motor Vehicle Corporation, of New York; The Allen Auto Specialty Co.; Jackson Motor Co.; Poertner Motor Car Co.; Oldsmobile Co., of New York; Warner Inst. Co.; Carl H. Page & Co.; Pennsylvania Motor Car Co.; Short & Wright; Garland Automobile Co.; Atlantic Motor Co.; Chas. E. Reiss; R. M. Owen; The White Co.; Ford Motor Co.; Victor Auto Storage Co.; Haynes Automobile Co.; Stearns Motor Co.; Zust Motor Co.

Everitt "30" Shows Well Over the Hills

BOSTON, Nov. 21—J. E. Brown, of the J. W. Bowman Company, of this city, recently drove an Everitt "30" from Portland, Maine, to Concord, N. H., via York Beach and Dover, a distance of 108 miles, at an average speed of 20 miles an hour, using one gallon of gasoline for each 15 miles traveled over the heavy roads and stiff grades and did not suffer any tire trouble. Mr. Brown was accompanied on the trip by G. R. Lewis, of the *Engineering Review*.



Everitt "30" which recently made a creditable trans-Maine record

New Racers Will Speed at New Orleans

NEW ORLEANS, Nov. 21—The début of the Case car in racing will be made at the Mardi Gras speed carnival, which will be run off at the Fair Grounds race track February 25-27. This car was formerly known as the Pierce-Racine, but so far its part in contest work has been limited to a few reliability runs. The Cino will also make its bow. Entries have been made of several Cole "30s," Jacksons and Buicks.

Ohio Car Starts Across Continent

NEW YORK, Nov. 22—Starting from the ancient City Hall at noon Tuesday, an Ohio car took up the first leg of a run that has San Francisco as its terminus. It is planned to make 150 miles each day and to reach the Golden Gate on Christmas Day. An accurate record of gasoline and oil consumption will be kept throughout the trip.

The car, known as the "Mud Hen, is driven by Charles Thacher. E. L. Ferguson and Guy W. Finney are passengers.

R. E. Ross Resigns from Q. C. M. C.

PHILADELPHIA, PA., Nov. 21—Robert E. Ross, one of the most active members of the Quaker City Motor Club, and head of the contest committee of that organization, has resigned from the club. Mr. Ross ascribes as a cause for his action the pressure of private business. Recently the concern with which he is identified secured some large paving contracts in and about Philadelphia.

The annual election of the club is scheduled for November 30 and a full report of the recent Fairmount Park road race will be submitted. Some of the officers declare that the report may contain the real reason for the withdrawal of Mr. Ross.

Ray Harroun to Make Aeroplanes

INDIANAPOLIS, Nov. 21—The retirement of Ray Harroun as a driver of racing automobiles has been announced. Mr. Harroun has entered the field of manufacturing aeroplane engines and aeroplanes and will be seen no more in the yellow-jacketed Marmon racing cars. His appearance in the Grand Prix race was his final exhibition of that sort.

In racing Mr. Harroun has enjoyed a big measure of success, although engaged in it only a comparatively short time. He has been head of the racing team of the Marmon-Nordyke Company for a little over one year. He is a college-bred man and has a degree of M. E.

Military Automobile Arouses Interest

Recent editions of newspapers in different sections of the country contained an interesting article, quoting E. H. Barnum, New York branch manager of the Regal Motor Car Co., and a National Guard officer in his State, relative to the possibilities of the automobile in the army.

Mr. Barnum says that as a result of the article he has received many letters from inventors, would-be inventors and fanatics, making inquiries and soliciting his aid with a view of bringing forward to public attention inventions and proposed inventions of their creation. Mr. Barnum believes that there are tremendous possibilities for the automobile in the army.

Briscoe to Make and Market "Utility" Cars

LONDON, Nov. 5—Benjamin F. Briscoe, president of the United States Motor Company, who is now visiting England and Continental Europe for the purpose of founding the United International Motors, Limited, a company affiliated with the big American concern of which he is the head, has departed for Paris after a stay here of considerable length. The company was launched during his stay, although a site for the British factory has not yet been selected.

In speaking about the situation before leaving, Mr. Briscoe in an interview exclusively for THE AUTOMOBILE had the following to say:

"An examination of the motor situation in England shows the opportunity for the 'utility' car. By 'utility' car I do not mean an automobile limited to the carrying of freight, but such a car as will lend itself to the use of physicians, contractors, salesmen, farmers and other persons who are now using horse-drawn vehicles for personal transportation in their callings. In fact, the field might be extended to many who do not feel that they can afford a horse and buggy in business, but who could easily afford a small car that would have a much wider range of usefulness than the horse.

"Such a car, to cost from $575 to $1,500, would find a ready market not only in England, but upon the Continent as well, in my opinion, and the production of such types will be the mission of the United International Motors, Limited. From my personal observation there is a dearth of such cars in England.

"Careful investigation of the motor conditions here shows that the total production of motor cars in England amounts to about 12,000 or 14,000 annually. In addition there are some 7,000 imported each year. I believe that cars such as we propose to build here, with all the advantage that we have of a strong technical staff of engineers connected with our American factories and the cumulative experience they have had in construction work and experimentation, will fill a gap of considerable proportions.

"We have been looking for a suitable site for the erection of our first factory in England, but have not definitely fixed upon it. It appears to me that many of the automobile factories are not scientifically located as regards transportation, labor and other important particulars. We wish to secure the most available site possible and will be very careful in selecting it.

"I believe that motor cars can be manufactured in England at less expense than they can in the United States, particularly with the aid of our engineers and their staffs now engaged in America, utilizing English labor and material."

Upon leaving London Mr. Briscoe went to Paris and from there he will go to Berlin with the idea of arranging branches of United International Motors. He will return to England before sailing for home.

The plans of Mr. Briscoe and those associated with him have attracted much attention in England, and as a general thing it may be said that the establishment of the factory will be welcomed by the British public.

Reno Valveless Motor Interests France

PARIS, Nov. 14—Europe has plenty of valveless motors, but very few besides the Knight that have given satisfactory results under working conditions. There is an exception in the Reno, a slide valve motor of French origin, just placed on the market by Hart O. Berg.

The cylinders of the Reno have two circular ports; the upper one is for the intake, the lower one for the exhaust. Within the cylinders is a split ring—a compression ring—with a face depth of about 1 1-2 inches. This depth is sufficient for the ring to cover both ports, thus giving a compression-tight chamber. When the ring is moved upward it uncovers the exhaust port; when brought downward it uncovers the intake and at the same time closes the exhaust port. The main idea is remarkably simple, and the adoption of this principle results in a reduction in the number of parts required for the motor, with, contrary to the generality of slide valve motors, a considerable reduction in manufacturing cost.

For accessibility and ease of upkeep the motor compares well with the poppet valve type.

Lubrication has been provided for by means of an oil pump worked off the camshaft, which delivers oil to the four rocker arms, which are encased with their actuating rods. The supply of oil is carried along the rocker arm to the ball and socket at the inner end, a sufficient quantity passes through to the walls of the compression ring, and the surplus flows down the outside of the cylinder and within the push rod housing to a hole in the base of the cylinder through which it flows onto the connecting rod. Crankshaft bearings and cylinders are lubricated by splash.

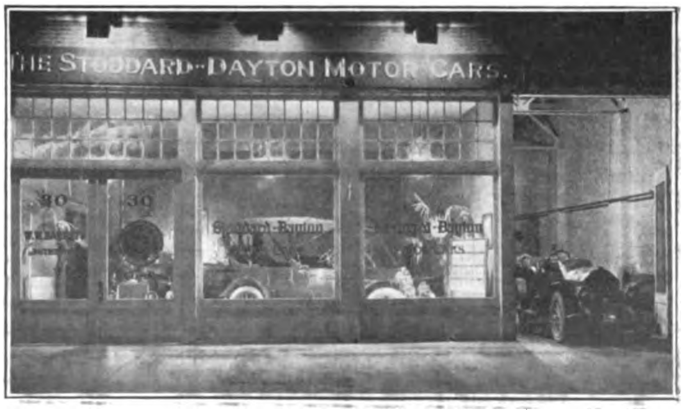
So far as can be judged from road tests, it has the advantage of big valve area, ensuring complete filling of the cylinder and a quick and complete scavenging. At the same time the large valve area is secured without the enlargement of the combustion chamber and the loss of efficiency through the formation of pockets. The split rings have been found to retain compression as well as poppet valves in the best condition. On the bench the motor develops 28 horsepower at 1,350 revolutions, which is found to be its most efficient speed. It can be accelerated up to 2,200 revolutions a minute.

Congressmen Campaigned in Stoddard

DENVER, COL., Nov. 21—Congressman G. M. Hitchcock, candidate for the United States Senate, and Congressman Latta, candidate for re-election at the recent election, made a tour of certain portions of Colorado during the campaign that is as unique in politics as it is in motoring.

In a Stoddard-Dayton car, driven by a son of Mr. Latta, the two politicians made a trip of over 1,000 miles through the mountains and deserts in nine days, making from seven to a dozen speeches each day. The actual running speed of the car was about twenty miles an hour over going that would be hard to equal anywhere. One whole day was consumed on roads that ran across typical Colorado sand ridges, a terror to motorists.

The car made the trip without mechanical trouble and only a small amount of tire difficulty was experienced. Other candidates have used the automobile in making their canvasses, but the tour of Messrs. Hitchcock and Latta is probably a record of its kind. The accompanying picture shows the Colorado home of the Stoddard-Dayton.



Home of the Stoddard-Dayton in Denver—at night

Peeps Through Auto Goggles at Distant Lands

IN the City of Jerusalem there are but two automobiles. Like Jerusalem, like Palestine. It may be many years before the automobile becomes a popular vehicle, even for purposes of pleasure, in Palestine. But there is a plausible reason for the holding back of improvements in the way of locomotion. The trouble is with the roads. It is doubtful if much worse roads exist in any part of the so-called civilized world. Up to this time, there has been but one tourist who has had the bravery to attempt to thread the roads of Palestine with an automobile.

From Ceylon comes the news that the taxicab has to a certain degree found favor. Bombay and Calcutta have taken their place among the modern cities of the world in the matter of calling for up-to-date methods of locomotion. Cars to the number of sixty are to be introduced at once into these cities, a company having been organized with a view to the undertaking. Cab hire is at the rate of 16 cents a mile.

There has yet to be seen an automobile upon the streets of Sandakan, the capital of British North Borneo. It has 6,000 or 7,000 inhabitants and is situated on Sandakan Bay. The Chinese town is on the flat, near the sea. The European bungalows are principally on the hills at the back of the town. Sandakan Harbor runs inland 17 miles. There is limited opportunity for automobiles just within and around the town. It takes from four days to a month to reach the interior, formerly called the "head-hunting country"; but now gradually giving way to industries, and especially in the Para rubber line. Later reports from there say that the plantations devoted to rubber-raising are doing well.

Until within a few years, transportation in Portuguese East Africa by means of the automobile seemed a question of wild speculation. But quite recently conditions changed materially for the better. Formerly, there were only "rivers of sand" in this portion of the world. In Lourenço, which is the capital of the province, an automobile appeared upon the street recently. It was the first ever seen there. The automobile in question is of the pattern which sells in America for $750, or thereabouts. By the time that the middleman and the tariff each had their bit out of the deal, the automobile stood the purchaser $1,400. Since the day that this machine made its appearance, four other automobiles have been put into active service in Lourenço. The streets of the town have just been paved with stones brought 50 miles by rail from the borders of the Transvaal, and they are now in excellent condition for automobiling. There is a market here for a limited number of cheap-grade automobiles.

Within the reef district in Johannesburg there are at least 1,000 motor cars in practical use. This number includes about 60 taxicabs, of European make. The types of automobiles which seem to be particularly in demand are cars of from 16 to 28 horsepower. The prices which seem to be most favored are from $1,250 to $2,500.

In the hilly island of Porto Rico, where the roads were built originally for heavy traffic, and particularly for military service, with very slight regard for grades, there is now a demand for automobiles in excess of the supply. There are about 750 miles of splendid roads on the island. But the humidity of the climate is exceedingly hard on automobiles.

During the last fiscal year Canada imported 1,424 automobiles, their value being $1,732,215, of which $1,569,227 came from the United States. Canada manufactured and exported automobiles to the value of $405,011.

At Huddersfield, in the West Riding of Yorkshire, England, where the fox-hunt has for years been one of the glorious sports, the automobile is creeping in. There are already 539 machines of various makes in that city. Of the total number of automobiles in use in Great Britain, 90 per cent. are in England and Wales; although there are 20,000 machines in Ireland and Scotland.

There being but one small automobile factory in Denmark, practically all of the automobiles in service are imported. Small runabouts, costing $750, for use by professional men are seen in considerable numbers. There is a low import duty on automobiles—2.68 cents per 2.2 pounds.

One sees few small automobiles in Germany. The demand runs to touring cars. In Nuremberg gasoline costs 32 cents per gallon.

Owing to lack of facilities for repairing automobiles in Rio de Janeiro, Brazil, the field for American-made automobiles has not been encouraging.

There are 44,769 automobiles, with 569,276 horsepower, registered in France.

The Italian Minister of Public Works has granted licenses for the opening of 52 new automobile lines, whose total length represents 1,864 miles, for the transportation of passengers and small freight throughout the Kingdom. Three taxicabs were recently put into commission in Palermo. There never have been any American-made automobiles in Palermo.

There are only 22 motor cars in use in British Guiana, in addition to five motor busses, which are in operation in Georgetown. Of the 22 machines, 11 were manufactured in America. The streets of Georgetown are wide, and well built. The automobiles are used to a considerable extent to run the distance to the Bartica rubber belt, where there are a number of rubber plantations. Gasoline is quite expensive in British Guiana, the price being $3.60 per drum of ten gallons.

The roads in the vicinity of Nanking, China, are in exceptionally good condition for automobiling and there are many pleasant drives. But there are only two automobiles owned by residents, these being the property of Chinese.

In the Amazon River region the owners of the rubber plantations are pressing automobiles into service to some extent, for the purpose of running between the estates. But as the South Americans are slow to adopt modernisms, the enterprise is not gaining ground rapidly.

Foreign automobiles without an international passport may be admitted to Germany, provided the driver can present to the customs officials at the border, or to the appropriate officials in uniform, a certificate from the proper officials in the foreign country, or if the vehicle in question complies with the local requirements of the driver's own country.

A person making application to become the driver of a motor vehicle in Germany is obliged to present his birth certificate, together with an unmounted photograph of himself; and he must also submit a doctor's certificate relating to his physical condition, especially with reference to eyesight and hearing.

Personal and Trade Notes

MINNEAPOLIS, MINN., Nov. 21—A. N. Smith, sales manager for the Royal Automobile Company, returned from Redfield, S. D., Saturday, where he closed with the Redfield Motor Car Company for the State agency on Abbott-Detroit cars. The deal involved the placing of 50 cars of this make on the initial order.

CHICAGO, Nov. 21—F. W. Eisele, who has been acting as a special factory representative of the Stromberg Motor Devices Company during the last year, has been appointed Ohio and Indiana manager, and will open up branch offices at Indianapolis.

DETROIT, MICH., Nov. 21—C. E. Gordon, formerly vice-president of the Western Malleable Iron Company, has joined the sales staff of the Timken-Detroit Axle Company.

CINCINNATI, O., Nov. 21—B. F. Gramm, vice-president and general manager of the Gramm Motor Truck & Car Company, which is completing a $300,000 factory at Lima, O., states that the concern will start off in January with a working force of 400 men. F. E. Castle, of the Castle Lamp Company, has removed from

Detroit to New York, and the New York offices of the Castle Lamp Company will be opened in the Fitzgerald Building, Forty-third street and Broadway.

Fargo, N. D., Nov. 21—This city has been selected as the location of the twenty-fifth branch house for the Ford Motor Company. The territory covered comprises North and South Dakota, and will be in charge of C. F. Reynolds, formerly with the Ford branch at Chicago.

Newark, Nov. 21—On the opening day of the next State Legislature, the New Jersey Automobile and Motor Club will present a bill remedying the present defects in the motor vehicle law. This bill is now being whipped into shape by the Legal Committee of the club, of which Vice-President Harry D. Bowman is chairman.

Boston, Nov. 21—The salesrooms of the Cole "30" in Boston are now located with the other motor agencies on Massachusetts avenue, the G. E. and H. J. Habich Co. having moved from Berkeley street last week.

Boston, Nov. 21—Fred P. O'Brien of the J. W. Maguire Co., Boston, agents for the Pierce-Arrow, was married last week to Miss Mary Elizabeth Mullins, of Cambridge. They went West on their wedding tour.

Boston, Nov. 21—John I. Taylor, owner of the Boston American baseball club, has embarked in the motor business with a company known as the Taylor Motor Sales Company, of which he is president. The company has taken on the Herreshoff for a start, but later on will take also a larger car and a commercial vehicle.

St. Louis, Nov. 21—The new branch house of the Hartford Rubber Works Co. has been opened at the southwest corner of Nineteenth and Locust streets. O. O. Petty, until recently manager of the local Firestone branch, is manager. A well equipped tire repair department has been made an important feature of the new business.

New York, Nov. 21—The Packard Motor Car Co. of New York has opened its new service building at Long Island City. The completion of this mammoth structure, after delays caused by quicksands, labor troubles, etc.. marks another important step in the progress of the Packard Co.

New York, Nov. 21—Louis Mansbach, treasurer of the Times Square Automobile Co., has left on the 20th Century for an extended visit to their western branches at Chicago, St. Louis and Kansas City.

Jacksonville, Nov. 21—The Glide Auto Co. of Florida has been formed to handle the Glide line for 1911. W. A. Jones will be manager of the new company, with headquarters in Jacksonville, where a new salesroom will be opened shortly.

Peoria, Nov. 21—The Bartholomew Co. of Peoria, Ill., is rushing the work on two extensive additions at Peoria Heights.

Wilmington, Del., Nov. 21—The Studebaker Automobile Co. has taken possession of its new building, 210 West Tenth street, where it has large and commodious quarters. The local agency is in charge of E. Gerry Brown. The Wilmington Automobile Co. has taken the local agency for the Lozier car, and during the past few days a representative of the company has been here demonstrating the machine. The West Side Garage, Inc., whose establishment is at Third and Connell streets, has taken the agency here for the Metz car. Andrew Johnson is the manager. Having taken the agency for the Hudson car, the Bradford Automobile Co. this week received a carload of 1911 models for local distribution.

Batavia, N. Y., Nov. 21—The Batavia Machine Co., Hilts & Kennedy, has dissolved partnership and the business has been taken over and will be continued by T. J. Kennedy.

Racine, Wis., Nov. 21—The entire force of the Mitchell-Lewis Motor Co. of Racine, Wis., has been placed on a ten-hour workday schedule. For some time the plant has been running eight hours a day, but the increase in the demand has forced the company to lengthen the workday and add more workmen.

Cleveland, Nov. 21—The business formerly conducted by the Auto Electric Co., 227 Jefferson avenue, Detroit, selling agents for the Willard Storage Battery Co. of Cleveland, Ohio, will in the future be conducted as a factory branch of the Willard Storage Battery Co., under the management of Max Hillman, formerly of the Auto Electric Co.

Mannheim, Germany, Nov. 11—Benz & Cie Rheinische Gasmotorenfabrik A. G. announce that Director Nammesfahr has retired from the management of that company.

Book Reviews

"EDISON: HIS LIFE AND INVENTIONS," IN WHICH ARE SET FORTH MANY HITHERTO UNKNOWN HAPPENINGS IN THE CAREER OF THE GREAT INVENTOR; "THE ART OF AVIATION," AND OTHER BOOKS

"EDISON, HIS LIFE AND INVENTIONS," Harper & Brothers, two volumes, 472 and 516 pages respectively, blue pebble cloth, gilt top and lettering, uncut edges, large type, charmingly illustrated, 16mo, and conspicuously good printshop work. The price is $4.00 per set.

EDISON, of popular conception, is not destroyed in this work; its virtue lies in its clearness of the putting of a long series of potential incidents, beginning with telegraphy before the war, following through the "great internal struggle," describing many amusing scenes not without their instructive side, with Edison in the foreground.

The first volume takes up "the age of electricity," presents Edison's pedigree, his boyhood days at Port Huron, Mich., are dwelt upon; it is pointed out how Edison as a telegrapher was none too satisfactory in view of his penchant for experimenting. From the crude instruments of war-time telegraphy to the stock ticker, and the introduction of automatic, duplex and quadruplex telegraphy, form intensely interesting chapters; then comes the telephone, for which Edison has done so much, to be followed by the motograph and microphone.

Perhaps the early struggles with the phonograph will hold interest for the average reader, but the coming of the incandescent lamp, coupled with the many ramifications of electric lighting, including the "world hunt for filament material," the contriving of a complete system of lighting, and the building of the first Edison station are all matters that make interesting and instructive reading, from the point of view of the audience without class or distinction. These were days devoted to the making of history for the historian, romance for the romancer, and the foundation of the greatest industry that the world has ever known. The first volume ends with the electric railway, but in closing the book reluctantly, Edison, as a boy, and his ambitious effort in the publication of a weekly newspaper known as the *Herald*, is one of the incidents that occupies a prominent position in a vast array of agreeable memories.

The second book opens with Edison at the office door of the ore-concentrating plant at Edison, N. J., presenting a characteristic likeness of the man who prefers to be known as an inventor, at a time when invention almost failed. It was at this period in Edison's life when the world discovered that his process of elimination, instead of being empirical, as some were wont to say, took on the form of a cold critical turning over of every stone for a mile on each side of the pathway which led from the birth of an idea to the absolute end.

Edison turned to the making of Portland cement when he found that his success in the magnetic ore milling field was not approved by nature. He must have concluded that if New Jersey as a State held too little of the magnetic ore to render his separator commercially valuable, that there was at least enough of raw materials to permit him to carry out a large idea, involving Portland cement, and the casting of the poor man's dwelling on a basis so well contrived that the rich man would look upon it with envy. But the scenery shifts; the great struggle for the perfection of motion pictures was entered into, resulting finally in the erection of 5-cent theaters in every hamlet, everywhere, which, as an educational undertaking, ranks next to the Bible.

Every automobilist will be interested in the storage battery development, and Edison's method of going about it, he having decided not to use all the things that seem to have crept into storage batteries up to that time, holding, as he said, to the idea that Nature must have one or two unexplored secrets. While these volumes should prove of absorbing interest to every man who has had to do with the building up of the electrical art, and to those who like a good story, there still remains scattered all through these two volumes the best exposé of the vicissitudes of the inventor that has yet been put into print. Edison not only tells of his inventions and how he perfected them, but he also offers the best school of experience of the inventor, his pitfalls and tribulations, that can be constructed from the cloth of experience.

No budding inventor can afford to risk his time, money and future happiness on a voyage bent on invention and exploitation without first ascertaining how the inventor himself is exploited by his friends and his enemies alike, and how he is likely to deceive himself at every turn with disappointment as the most promising reward. The history of Edison's work is rich in lore of the Patent Office, crammed to the brim with reminiscences which partake strongly of the wiles of those who have ever made it a practice to feed upon fat from the brains of inventors, and, with a certain nonchalance, busy themselves thereafter in weaving a romance around their alleged ancestors, paying the score from the ample fund that the inventive mind stands sponsor for. They are fine books for the inventor to read; if he has experience they are even more attractive, nor is it strange that there should be a groundwork for absorbing interest in these same books for the man who simply wishes to be amused and entertained.

"THE ART OF AVIATION," by R. W. A. Brewer. McGraw-Hill Book Company, 239 West Thirty-ninth street, New York City.

In view of the intense interest in the navigation of the air and its rapid development, the issuance of a practical handbook upon aeroplanes and their engines is a peculiarly appropriate and timely work. Mr. Brewer in his carefully compiled book traces the history of the heavier-than-air flying device from the popular viewpoint. While the technique of the volume is profound, it is purposely couched in terms easy of comprehension by the layman. A chapter is devoted to learning to fly and another to the general principles of flight, while the mechanical sections describe in minute detail the various types of engines adaptable to aeroplanes and structural plans of several of the leading varieties of machines.

"LEAVES FROM A MOTORIST'S LOG BOOK."

A most interesting account of a 4,000-mile trip through France, Spain and Italy, taken by Walter Hale and party in a stock Studebaker car, has been issued by the Studebaker Automobile Company. Mr. Hale's notes are illuminative and there are recounted dozens of entertaining and amusing incidents, all in terse style. Many valuable hints are conveyed to tourists who contemplate similar trips, for Mr. Hale's powers of description are of a high order and his observation of passing conditions was evidently comprehensive. Tabulation of the expense of operating the car during the whole trip shows that the actual cost was 2 4-5 cents for each passenger each mile. Fred Niblo, who accompanied the party, took a number of fine photographs and moving picture films, some of which are used to illustrate the book.

"IN UNFAMILIAR ENGLAND," by Thos. D. Murphy. Press of L. C. Page & Company, Boston.

As the name implies, the author has endeavored to bring out the most interesting points of England which the average tourist does not see, and about which nothing much has heretofore been published, touching lightly on what he calls "tourist frequented spots." This book will be found a most excellent guide to the tourist, and at the same time contains a wealth of information of historical interest. It deals more particularly with the author's travels in England, and also contains a brief résumé of his trip through Scotland and Wales, omitting nothing which should be of interest to the tourist traveling through these two arms of Great Britain. The book is also beautifully illustrated with sixteen full-page color plates and forty-eight duogravures of a character certainly more sumptuous than will be found in similar publications. As an appendix are included two folding inserts of maps, one of England and Wales, and one of Scotland and Ireland. These maps show in red lines a number of suggested touring routes which will be helpful to the autoist.

"REPORT OF STATE (N. Y.) COMMISSION OF HIGHWAYS."

Ever since the enactment of what is known as the "Money System Act" in 1898, by which the State obligated itself to pay to the various towns that abandoned the antiquated idea of working out the road tax a sum equal to 25 per cent. of the road taxes that were collected in cash, the highway system of New York has made a number of radical improvements in the character of the roads. These improvements are partially accountable to the operation of the so-called Higbie-Armstrong Act, which provided State co-operation to the extent of 50 per cent. in the cost of building improved roads. The road laws were amended in 1909 so that 100 per cent., instead of 25 per cent., was paid to the towns that collected their road taxes in money, and gave the State Engineer and Surveyor supervisory powers over the expenditure of the road taxes.

The foregoing is a brief résumé of the evolution of highway legislation in New York, which is detailed in the preface of the above-named volume. The work contains the first annual report of the commission, which recommends among other things that 500 miles of roadway be built annually, at a cost of $1,000,000. It shows the organization of the Highway Commission, and contains detailed reports on road construction and material. One table submitted is particularly illuminative. It shows the cost per mile of road construction in every county in the State. This ranged from $5,900 a mile in Niagara to $14,000 a mile in Oswego County. The total expenditure by the State up to January 1, 1900, for road improvements totals about $11,000,000.

Under the caption "Report of the First Deputy Regarding the Maintenance and Repair of State and County Highways" the results of experimentation with various kinds of road materials are set forth in detail, as well as a summary of the work actually accomplished. The report of the second deputy shows the supervision of town highways. According to the financial appendix the expenses of the administrative offices were $103,554, and those of the six divisions and two bureaus $394,224; those of the district superintendent $582, and for furniture and supplies $50,836, while the expenses of the Bureau of Town Highways cost $57,158 and the Bureau of Maintenance and Repair under it $49,207, making a total of $655,561 for salaries and expenses of the State supervision. The commission expended $3,771,000 on road construction. The report is the same as that transmitted to the Legislature January 12, 1910.

LIST OF EXHIBITORS DURING THE SECOND WEEK OF THE A. L. A. M. SHOW—THE PENN-UNIT DELIVERY—OTHER NEWS OF INTEREST

WITH thirty-four exhibits of freight trucks and a comprehensive show of electrics, motorcycles and accessories the second week of the A. L. A. M. show at the Garden promises to be a memorable and historic affair. The manufacture of trucks has made big strides in the recent past and the line of cars to be shown is the largest ever gathered under one roof. The full list of motor trucks is as follows:

Morgan
Knox
Hewitt
Rapid
Lansden
Packard
General Vehicle
Cartercar
Franklin
Overland
McIntyre
Brasier
Pierce-Arrow
Hupp-Yeats
Autocar
Sampson
Studebaker
Mack
Anderson
Courier
Reo
Atlas
Garford
Lozier
Peerless
Reliance
Grubowsky
White
Alco
Buick
Glide
Brush
Randolph
Kissel

The Penn-Unit Delivery Wagon

As the name implies the Penn-Unit cars are so constructed that in the event of any part of their mechanism getting out of order the particular part can be replaced in a short time without removing the load, or disturbing any other parts of the car. To accomplish this it is absolutely necessary that every part of the chassis should be made to accurate gauge, obviating any fitting on the part of the mechanic who has to replace same, otherwise the utility would be lost. It resolves itself to a question as to whether it is cheaper to keep a separate unit on hand in case of accident or breakage of any part so that the car may be kept in commission or to have to lay the car up and lose the earning power of the vehicle while it is in the shop idle. There is not only the cost of the parts to be replaced but the time the car is out of service. The makers claim that almost every part of the car is made in their own shops, so that they have a control over the standardization and they give an absolute guarantee of interchangeability of parts. The vehicle is made by the Penn-Unit Car Company, Allentown, Pa., in one model to carry a normal load of 1,500 pounds and two men, suitable alike for the owner of a fleet of cars and the small trader who has only work enough for one. The unit system will particularly appeal to both as the latter is always sure to have his deliveries made and the former require less space for repair shops, as the units can be changed where the car stands in the ordinary way. The maximum speed of the car is 18 miles per hour, and the price of the truck as illustrated is $1,900.

This power unit consists of the motor, clutch, magneto, carbureter and oiling device, all of which are assembled on a sub-frame independently of the car-frame members. By removing two bolts and breaking several connections the complete unit can be drawn forward until it is completely detached from the car. The motor is of the two-cylinder, four-cycle opposed type, 20 horsepower (A. L. A. M. rating), water cooled, 5-inch bore and 5-inch stroke. Each cylinder casting forms one-half of the crankcase, making a very rigid construction. The cylinders are bored and ground to within 1-1000 part of an inch. The valves are mechanically operated. The crankshaft is made from a one-piece drop-forging, heat-treated, and ground to size. The large main bearings are of Parson's white brass.

The motor lubricating device is extremely simple and beyond the control of the driver. A constant supply of lubricant is fed through a sight-feed manifold to the main bearings and pistons, the overflow returning to a specially formed splash chamber in the crankcase wherein a constant level of oil is maintained. Any overflow is filtered and returned to the main supply reservoir.

The clutch is a special application of the Hele-Shaw clutch, made up of 21 corrugated pressed discs alternately phosphor bronze and steel.

A Bosch high-tension, gear-driven magneto furnishes the current for ignition, thereby eliminating the use of batteries, wiring, coil box, commutator and extra set of plugs. A Stromberg carbureter of the float-feed, constant-level type is provided.

The power unit is suspended at three points. Any undue distortion of the frame or stresses that the car may be subjected to will not be transmitted to the power plant.

The transmission is of the selective sliding-gear type, with a range of three speeds forward and one reverse.

The gears and shafts are made from chrome-nickel steel, heat-treated, hardened and ground. Double-row, annular ballbearings are provided throughout. There is no chance for leakage of oil and grease from the transmission, as there are no joints below the level of the lubricant. The Penn-Unit car has a straight-line drive which eliminates the use of power-consuming universal joints and gives a longer life to the wearing parts. The transmission case is made of an aluminum alloy, the tensile strength of which is 44,000 pounds to the square inch.

The differential is included in the transmission unit and is an integral part of same. Jackshafts and bearings are enclosed within seamless steel tubing, which not only adds strength but retains the lubricant and excludes dust and dirt. The jackshafts are of the semi-floating type and can at any time be withdrawn from the car without disturbing any other part of the construction. The transmission, differential and jackshafts together form a complete unit, suspended at three points similar to the power plant and can be dismounted entirely from the car quite as readily. Final drive is by means of two side roller chains direct to the rear wheels.

The braking system provides two sets of brakes, both being positive in their action and independent of each other. They are of the internal-expanding type and are mounted in large pressed-steel drums on the rear wheels. The drums are dust and waterproof. The expanding shoes are covered with an asbestos material.

The steering mechanism is of the irreversible worm and sector

Penn-Unit Delivery, in which speedy replacements may be made without removing load type with ball thrust bearings and eccentric bushes to take up wear. The entire control is on the left side of the car, giving the driver an unobstructed passage from the seat to the sidewalk, facilitating the quick delivery of goods.

The frame is made from chrome nickel steel pressed cold with a 4 x 1-2 inch channel section, rigidly braced by a number of cross-sections and four gusset plates of large dimensions reinforce the corners of the frame.

Front springs are semi-elliptic, 2 inches wide, 38 inches long. Platform springs, 2 inches wide and 42 inches long, are used in the rear. Graphite is placed between the leaves before assembling, and all spring shackles are fitted with oil cups. The spring eyes are fitted with Tobin bronze bushings and can be replaced any time at very small cost.

Axles are forged from high-grade steel and the hubs are fitted with ballbearings.

The sizes of the front wheels are 36 x 2 1-2 inches and rear wheels 40 x 2 1-2 inches. Wheelbase 90 inches and track 56 inches.

Cooling is accomplished by the simple and efficient thermo-syphon system, eliminating the water pump. A honeycomb radiator of large capacity is mounted directly over the motor and need not be removed or disturbed in any way when removing the power plant.

The gasoline tank is placed under the driver's seat and has a capacity of 12 gallons, 2 gallons always being held for an emergency by a novel device.

The standard carrying space for freight is 80 inches in length and 44 inches in width, but if desired the platfrom can be lengthened to 96 inches.

Four-Cylinder Rapid Truck Announced

PONTIAC, MICH., Nov. 21—The Rapid Motor Vehicle Company, of this city, has begun the construction of a new truck. A sample truck, which is the design of Engineer F. C. Frank, has been in use on the streets here. The new Rapid is of two-ton capacity and has the engine under a hood on the front of the car instead of under it. The engine is of the four-cylinder type. The new model, after being thoroughly tested, will be exhibited at various automobile shows throughout the country. It is planned to ultimately discontinue the manufacture of the old two-cylinder truck.

Syracuse Dealer Swells Auto Line

SYRACUSE, N. Y., Nov. 21—The Willis Motor Car Co. plans to enlarge its sales organization during the coming year, and instead of three will represent seven cars. The Selden and Baker Electric, which the Central Auto Sales Co. has previously represented in Syracuse, will be taken over, and J. Rathbun, who has been local manager for the former company, will be garage manager of the Willis concern. The Oldsmobile and Oakland pleasure cars and the Rapid and Reliance freight automobiles comprise the remainder of the line.

Thomas Creditors Not Discouraged

BUFFALO, Nov. 22—Creditors of the E. R. Thomas Motor Company, who have been in session since yesterday, declare that they are convinced that the company is not insolvent and state that there is much to encourage them in the situation. The business will be continued and the records of the company show that orders are coming in beyond the capacity of the plant to fill.

A plan has been perfected to place the company on a satisfactory financial basis, but the details of the plan will not be announced until the latter part of the week. The meeting will continue through to-morrow, when a recess will be taken over the holiday. It is though that the whole matter will be worked out by Friday night.

New Plant for Windshield Company

The Troy Carriage Sun Shade Company, of Troy, Ohio, has just built another factory in which will be manufactured exclusively the Troy automatic windshields and speedometers.

This plant is of gray steam-pressed brick, and will contain the general offices of the system.

Brief News from the Commercial Field

—The Dixon C. Walker Automobile Company, of Baltimore, Md., has taken on the agency for the Grabowsky Power Wagon Company.

—J. V. Dillman, formerly with the Wentworth Motor Car Company, has accepted the sales management of the Atterbury truck line for the American Auto Sales Company, 5015 Euclid avenue.

—The Columbus, Ohio, Motor Car Transportation Company, of Columbus, Ohio, was incorporated recently with an authorized capital of $100,000 for the purpose of operating a number of motor buses on the streets of Columbus.

—The S. Mack Motor Truck Company, of Baltimore, Md., was incorporated in Dover, Del., with a capital stock of $50,000. The incorporators are J. J. Smith, of Baltimore; Harry C. Yarrow, Jr., George Yarrow, and W. K. Yarrow, of Philadelphia.

—A Commercial Truck Show will be given in Pittsburg from April 4 to 8, 1911, under the auspices of the Automobile Dealers' Association of Pittsburg. The regular pleasure vehicle show will be held March 25 to April 1. Both will be in Duquesne Garden.

Electric Sound Signalling

ILLUSTRATING THE DETAILS OF THE EQUIPMENT WHICH IS USED TO TURN ELECTRICAL ENERGY INTO SOUND FOR SIGNALLING PURPOSES

ENERGY, of which there is a fixed quantity in the universe, is rendered manifest in various forms and may be converted from one to the other with more or less efficiency. The greatest storage battery in nature is represented by a ton of coal, storing in its mass 28,000 British thermal units of heat, all of which originated in the sun of our universe and was transferred across interplanetary space in the form of "radiant" energy with substantially no loss. There seems to be no authoritative statement of the precise efficiency of the transmission of radiant energy in the luminiferous ether, which is a body of a jelly-like consistency that permeates all space, even into the interstices of the elements and compounds as they obtain on the earth. The fact that radiant energy is transformed into energy in the form of heat by mere contact rather goes to show that just a little of the radiant energy may be transformed into heat, electricity or other vibrations as it traverses the luminiferous ether, the latter having body and substance, however attenuated; the density of the luminiferous, ether being estimated as producing a pressure of one pound per square mile on the surface of the earth.

It might be said that all these scientific problems are remote from the proper consideration of a mere device for use in signalling work, and yet the difference between a disagreeable noise and an efficacious signal is represented in the mere adaptation of the means at hand, and the intelligence displayed in working out the details. It is true that the man who rides in the driver's seat of an automobile and who presses the button when he desires to indicate to a pedestrian that he is in too close proximity to a moving automobile may be quite satisfied if his effort produces the desired result. He may never know that the desired result has two phases, one of which is represented in the agreeableness of the sound from his point of vantage, and the other in the fact that the pedestrian is warned, which he indicates by moving out of the way. Were the sound improperly produced, it would pile up around the automobile, becoming a mere disagreeable noise to the occupant of the seat, failing utterly as a warning to the pedestrian ahead. When the sound is efficiently produced there is barely enough of it given off in the immediate vicinity of the automobile to tell the driver that he has done his part, and the major portion of the wave is projected for a distance ahead, thereby serving as a necessary warning signal. Under efficient conditions the sound produced is agreeable to the ear of the occupant of the automobile, partly because there is so little of it from his point of vantage and again on account of the rate of vibration and the tone produced.

From the designer's point of view, under the circumstances, it is necessary for him to know all there is of knowledge in relation to energy and its transformation; he traces the energy of the sun as it was vibrated across space, perhaps in the carboniferous age, or long before, resulting in the chemical reduction of vegetation, due to contact with the sun's rays, and, in view of the processes then going on in the formation of coal, which, as before stated, became Nature's storage battery.

Following along in the process it was logically deduced that the energy stored in the coal could be unlocked by the application of heat and perhaps by chemical transformations and electrolytic work, which, according to the law of the conservation of energy, could be transformed into light, heat, electricity, sound and the mechanical equivalent, work.

When James Watt unraveled the philosophy of the tea-kettle and reached the conclusion that the steam rushing out of the spout held a force that could be turned to good account he furnished the groundwork for steam engines, by means of which the energy, as it is stored in coal, may be turned into mechanical work. Analytical chemists had their curiosity aroused, and they said: "If Watt can get power out of water by turning it into steam, the question is, where does it come from?" It required no analysis to show that he put a fire under the kettle, and that coal was the fuel, and so it became a mere matter of determining how much energy there resides in coal, and the British thermal unit of heat was ultimately established as the means of definitely measuring the same. The value of this heat unit is equal to that amount of energy which will raise the temperature of 1 pound of water 1 degree Fahrenheit at the point of its maximum density, which is 39.1 degrees. In the investigation of coal it was ascertained that the heating value is not the same in all samples, and that it varies considerably under the different conditions in every commercial grade, but it was finally concluded that a good average sample of coal should give up 14,000 British thermal units of heat when it is burned to complete combustion, resulting in carbonic acid, water and ash—so much for steam.

In 1801 some of the leading physicists discovered that by chemical action and reaction it was possible to produce electricity, and the storage battery, as it is known to-day, took form. Commercially, the electrochemical art, as it is represented in the storage battery, languished until perhaps 1860, when M. Gaston Plance commercially produced a type of storage battery that made it possible to utilize considerable quantities of energy from coal, storing it in the lead plates by an oxidizing process, giving it off, more or less at will, in the form of electricity. There are definite means at hand for determining the equivalent value of the energy as it resides in coal, in mechanical work as it is produced by a steam engine, or electrical energy as it is given out by a storage battery, and then, too, there is the method of taking the mechanical work of a steam engine, utilizing it to drive dynamo-electric machines in which electromagnetic process the energy originally residing in the coal is passed through succeeding cycles, as follows:

(a) The coal is burned under a steam boiler.
(b) The steam is passed into a steam engine, and its energy is utilized to drive the same.
(c) The mechanical work of the steam engine is used to drive the dynamo-electric machine.
(d) The dynamo-electric machine delivers equivalent electrical energy.
(e) The electrical energy may be used for lighting, heating, power purposes, electrochemical transformations and signaling, as in the Klaxon horn.

It is only a step from the consideration of coal as the source of energy to the utilization of gasoline as an equivalent source of the same energy. If coal is Nature's storage battery in the solid state of aggregation, gasoline (hydrocarbon liquids) is Nature's secondary battery in liquid form. It is convenient to use gasoline instead of coal because the fire is then built directly in the cylinder of the motor instead of being kindled under a boiler, requiring a ramification before the energy can be transformed into mechanical work. Nature foresaw the many wants of man and provided for them in divers ways; not the least of which is represented in the automobile, utilizing liquid fuel rather than coal.

Having thus roughly traced the energy that is used in the propulsion of automobiles from the dawn of day down to the present time, it remains to deal with contemporary and familiar things and to come to the point, calling attention to the fact that the underlying principle of the Klaxon horn relies upon the utilization of the energy as it was radiated from our sun of remotest time, transforming it by means of a battery into electricity, and then by the horn into sound, or instead of a battery a dynamo-electric machine is connected mechanically to the automobile motor and is driven thereby, furnishing the necessary electrical energy for actuating the horn in the production of sound. Briefly stated, then, the signal as given may be traced back to the energy of the sun by the man who knows, but from the point of view of the man who does not know, it is produced by pushing a button.

It will be apropos just here to describe the Klaxon horn, showing its details of design and construction, telling how it serves as the transformer of energy, resulting in the production of controlled sound for warning purposes, utilizing electricity as the immediate form of energy.

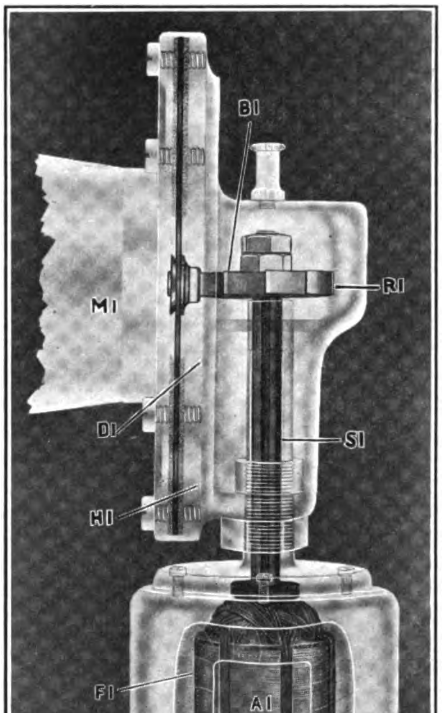

Fig. 1—X-ray of the Klaxon horn, showing the armature and knocker in relation to the diaphragm

Referring to Fig. 1, the device is shown complete, with the field F1 of the motor resting in the vertical position, and the armature A1 revolving within the field, with its spindle S1 projecting up and a ratchet R1 keyed to the end thereof. The teeth of the ratchet make contact with the button B1, which is centrally located in the diaphragm D1, the latter being in the housing H1, to which the megaphone M1 is also fastened. Electrical energy is applied to the terminals T1 and T2 when the motor becomes energized, and the armature A1 rotates in response thereto. This rotation is imparted to the ratchet wheel R1, and the latter being eccentrically disposed, the teeth thereof synchronizingly contact with the hardened button B1 of the diaphragm D1, setting up vibration therein. It is this vibration which pushes the air in and out of the megaphone, producing waves, and they, being of a predetermined length and amplitude, produce sound of the desired pitch, intensity and *Klangfarbe*. But this is not all. The sound must be produced where it is wanted. It is not wanted in the ear of the man who is driving the automobile, but it is desired to awaken the person ahead, warning him of the approach of the automobile, telling him (not to get out of the way) to obey the law, and keep to his proper side of the road, permitting the approaching automobile to go on its way in safety without endangering others. In order to accomplish this latter necessity there is a peculiar condition to be satisfied—the vibrations as they emanate from the megaphone of the instrument must be projected for a considerable distance ahead without interfering with each other, notwithstanding the fact that "complex sounds" have to be utilized. The problem is not different from that which must be solved in the cultivation of the human voice; the refined, well modulated utterances of the famed speaker may be projected for a considerable distance, and yet those who are in the immediate vicinity of the speaker are attracted by the agreeableness of the effort.

A better understanding of the ways and means for arriving at the desired result must of course come with a study of the refinements incorporated into the apparatus. It goes without saying that a crude device like the uncultured voice will evolve a noise, but the introduction of the necessary refinements, coupled with the proper harmony of the interrelating members, is what is needed for the more elevating result. Referring to Fig. 2, which is the shell-like field of the motor, attention is called to the eccentric bearing B1, to which reference was made in describing Fig. 1, showing how the teeth of the ratchet wheel or knocker were brought into contact with the button on the diaphragm. In this case the shaft S1 passes out through the bearing B1 at a point distant from the true axis of rotation, and when the automobilist essays to extend a warning, what he really does is to rotate the whole motor, thus bringing the shaft S1 in closer proximity to the button on the diaphragm, producing a greater or lesser interference, depending upon the amount of sound it is desired to produce.

In order to show some of the niceties of design and construction the armature of the motor is presented in Fig. 7, at A, showing the armature core of the built-up laminated slotted type on its spindle before it is prepared for the windings; B, showing the armature in a further state of preparation; C, presenting the same after it is wound; D, offering another view when the armature is baked ready for the commutator to be mounted into place, and E showing the armature A1 with the commutator C1 on the shaft S1, with the ratchet wheel R1 in place.

It will be understood that there is a great difference between a professionally made commutator as it is employed in standard dynamo building and the improvised affairs which accompany toy motors, and even some that are not supposed to be in the toy class. Fig. 6 shows the commutator of this motor in the finished

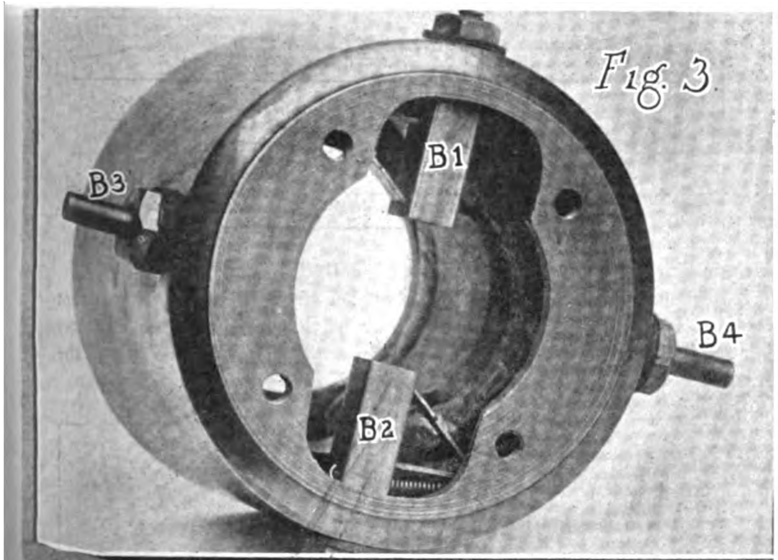
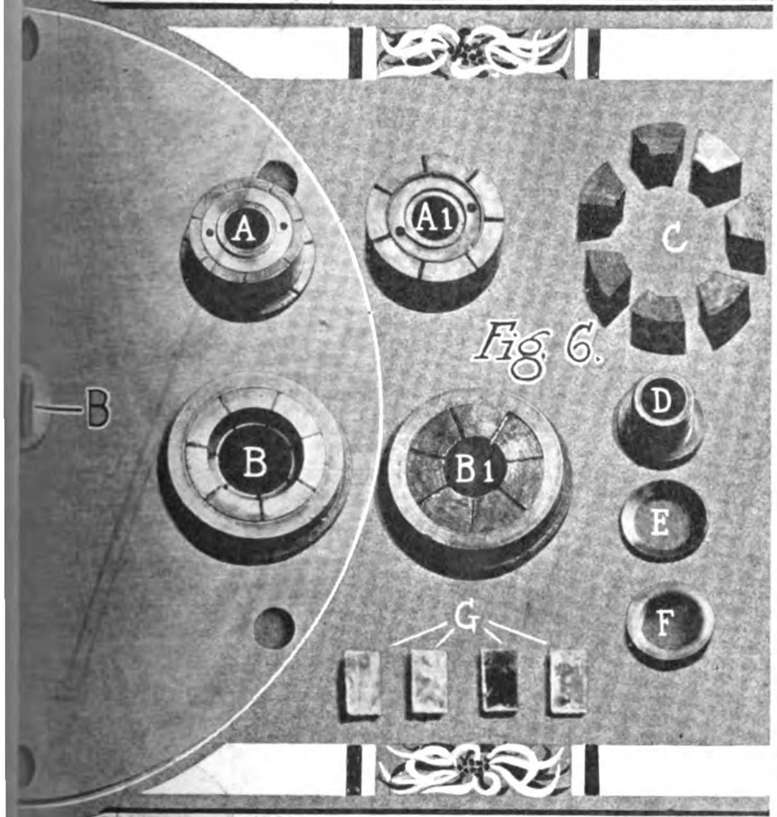
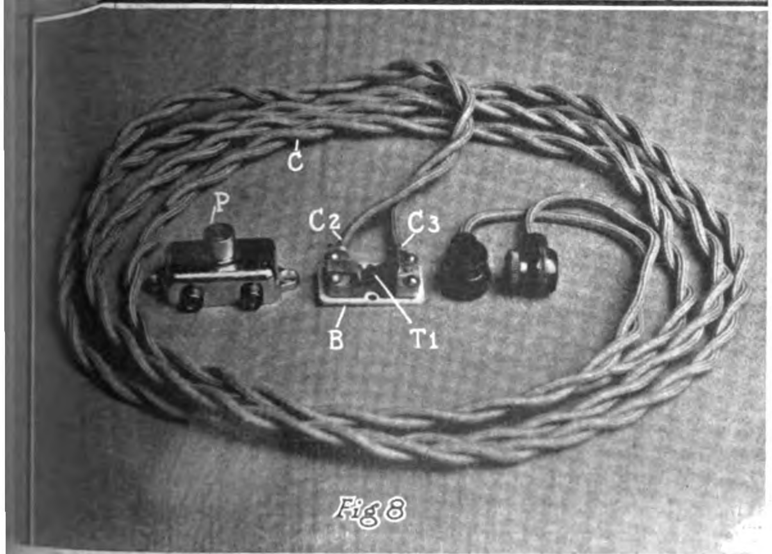
Fig. 4—Field windings in the four states of processing

Fig. 5—Diaphragm of vanadium steel with the button riveted in the center

Fig. 7—Armature shown during the various states leading up to the completed form







state at A, advanced an operation at A1, after it is turned down in the shell at B and before the turning operation at B1. The segments of the commutator are shown at C and the spool is presented at D. The washer of the beveled type is presented at E and the nut at F, while the mica insulation is shown at G. Experience has proven that the commutator of the little motor used in this work must be put together with the same care as that attending the building of commutators on the largest sizes of dynamos.

The field windings of this motor, of which there are two, look as shown in Fig. 4 during four states of construction, in which A shows the winding alone, B presents the same after it is taped, C shows it shaped up and D when the terminals are soldered on and the baking operation is done. It is the function of these field windings to magnetize the soft iron field, thereby contributing the magnetic quota, which, together with the electric current that flows in the windings of the armature, results in the torquing of the motor, ending in the desired amount of power at the proper speed, remembering, however, that the starting torque must be relatively great and this is assured by connecting the field windings in series with the windings of the armature so that the total current in passing into the armature also passes through the fields, and in view of the fact that the current in amperes increases as the speed decreases, owing to the falling off of the counter electromotive force, the very increase in current that would be fatal to a motor otherwise built saves the situation. Fig. 3 shows the field with the armature removed, presenting the brush holders B1 and B2, by means of which the current is transferred from the binding posts B3 and B4 to the commutator of the rotating member or armature. The field windings are housed in perfectly, thus protecting them from foreign matter and lubricating oil or other rotting substances. Fig. 5 is a near-size view of the diaphragm, which is made of a special grade of steel, showing the hardened button B riveted at the middle and six holding bolts, by means of which the diaphragm is clamped between the two housing members, it being flanked by two insulating pieces, the idea being to preserve the purity of tone of the diaphragm. Sound is produced by the vibrations set up in this diaphragm, as before stated, but despite the fact that it looks like a simple piece of Russia iron, blanked out in dies, the fact remains that it proved to be one of the most troublesome features in the building of this scientific sound producer. It is made of a special grade of steel, alloyed with vanadium, produced by special heats, for this specific work, and after it is blanked out in dies, heat-treated and the button is riveted in, it is then sent to a skilled workman, who lays it on a platen and by the deft use of a suitably contrived pien hammer the internal strains are relieved and it is flattened out so perfectly that the special means afforded for its keen inspection fails to disclose any defect which would interfere with its ability to measure out vibrations of the desired wave length and other characteristics, and it is interesting to observe that one of the requirements is to have the diaphragm absolutely flat, which, by the way, is a difficult accomplishment.

The electrical connections between the battery or other source of electrical energy and the horn, also the connections between the motor and the push button, must be electrically perfect and mechanically protected in order to assure continuity of performance of the instrument. Fig. 8 shows the duplex electric cable C1 that is provided with the instrument and the connections C2 and C3 to the terminals, which are screwed into the base B1, also the tongue T1, which is pressed into wiping contact with one of the terminals when the push P1 is pressed down; nor does it matter how much pressure is exerted, it will be impossible for the operator to disarrange the parts or destroy the wiping nature of the contact.

Among the Accessory Makers

SHAWMUT TIRE FOR WINTER WORK; BROWN'S COMPRESSOMETER; FLEXIBLE VALVE REMOVER AND GRINDING TOOL; GRAY & DAVIS LAMPS FOR CLOSED CARS

VALVE REMOVER AND GRINDING TOOLS

Two useful valve tools that have been placed on the market by The Flexible Valve Remover Co. of Providence, R. I., are shown in Figs. 1 and 2. The first is a combination screw driver and valve grinder 12 inches long. The knob at the top is on a swivel which lets the rod turn without moving the knob. The handle on the side moves up and down in a groove, thus enabling the operator to work with ease around piping and fittings, adjusting the handle where most convenient to use. The tool is bright nickel and the point is hardened. The price includes a spring for inserting under the valve mushroom.

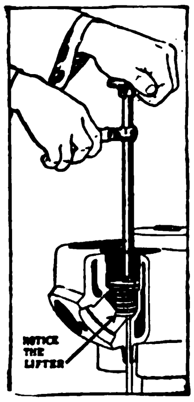

Fig. 1—Combination screw driver and valve grinder

The Flexible Valve Remover (Fig. 2) is made in two sizes, the large one being made extra heavy for big cars, and is 17 inches long. The lever has two slits, one on either side, into which the chain grips and the hooked top presses on the valve head, preventing it from rising when the spring is raised.

TIRE FOR NON-SKID WINTER WORK

The illustration here shown of the new block-tread non-skid tire as manufactured by the Shawmut Tire Co., of Boston, Mass. (Fig. 3) is intended to afford immunity from the customary troubles of Winter automobiling in addition to the service that is the normal expectation of a good pneumatic. The particular interest of the moment is centered in the efficiency of the block-tread, due to its good traction, and freedom from side slip. The tires are made in the several customary sizes, and it is the claim of the company that the fabric employed in the building up of the tire, together with the quality of the rubber and the details of workmanship, are such as to support the good work that the block-tread is responsible for, thus assuring a satisfactory mileage in addition to the other advantages.

Fig. 3—Non-skid tire for winter

REGISTERS CYLINDER COMPRESSION

The usual way to find out whether a certain cylinder has equal compression with its fellow-cylinders is to turn the motor over by the starting handle; but at best this is a poor way, although an experienced mechanic can more or less tell approximately which is the best and which the weakest. The compressometer (Fig. 4) is intended to indicate the exact amount of compression that each cylinder contains when the motor is revolved.

To use the meter unscrew a spark plug, screw the instrument in its place, and turn the motor over by hand. Under no consideration run the motor. The large hand will carry with it the small telltale hand and the latter will remain at the highest point when the meter is unscrewed. By this means each cylinder can be compared. Care should be taken to fit a washer under the meter in the same way as a spark plug; otherwise the reading will not be correct. The instrument is made by the H. W. Brown Co., of Syracuse, N. Y.

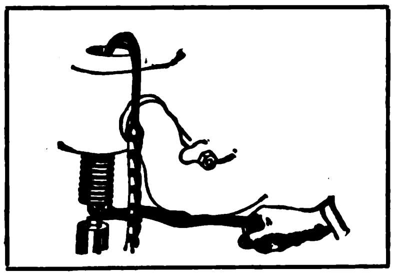

Fig. 2—Flexible valve remover

LAMP FOR CLOSED CARS

The lamp illustrated in Fig. 5 is known as a pillar lamp, and is designed for closed and limousine cars. Besides looking smart during the day, its object is to illuminate the step and door of the car, and being electrically lighted, the objections to oil lamps in this position are done away with. It can be furnished in all brass or brass with a black enamel top, and is equipped with six-volt, four-candlepower bulb and cut-out plug. It is made to take round holder or bracket. They are manufactured by Messrs. Gray & Davis, Amesbury, Mass.

TO FRUSTRATE THE MEDDLERS

Cars that are fitted with switches that one can lock in the "off" position are less likely to be tampered with than when the switch is one of the ordinary kind that anybody may turn on and perhaps start the engine. The New York Coil Co., 338 Pearl St., N. Y., has perfected such an anti-meddler switch with which genuine Yale locks are used, three keys being supplied. The switch must be turned in the off position before the key can be removed. The combination is for two sets of ignition, either two batteries or magneto and battery.

Fig. 4—The Brown compressometer

WATERPROOF AUTOMOBILE GARMENTS

A new waterproof material that has been creating quite a sensation on the European market is now being introduced into America, the sole manufacturers in this country being the Rubbinol Raincoat Company, 1777 Broadway, New York City. Besides raincoats, this concern makes capes, sleeve protectors, aprons, leg protectors, cap-hoods, gloves, etc. "Rubbinol" closely resembles rubber, but is much softer, lighter, non-crackable and better-looking. Besides being one of the lowest-priced materials on the market it is absolutely waterproof, oil-proof and gasoline-proof, the last-mentioned qualities making it more desirable than rubber. The color is black, with a dull finish.

VOL. XXIII NEW YORK—THURSDAY, DECEMBER 1, 1910—CHICAGO. No. 22

THE AUTOMOBILE

Making The Laboratory Pay

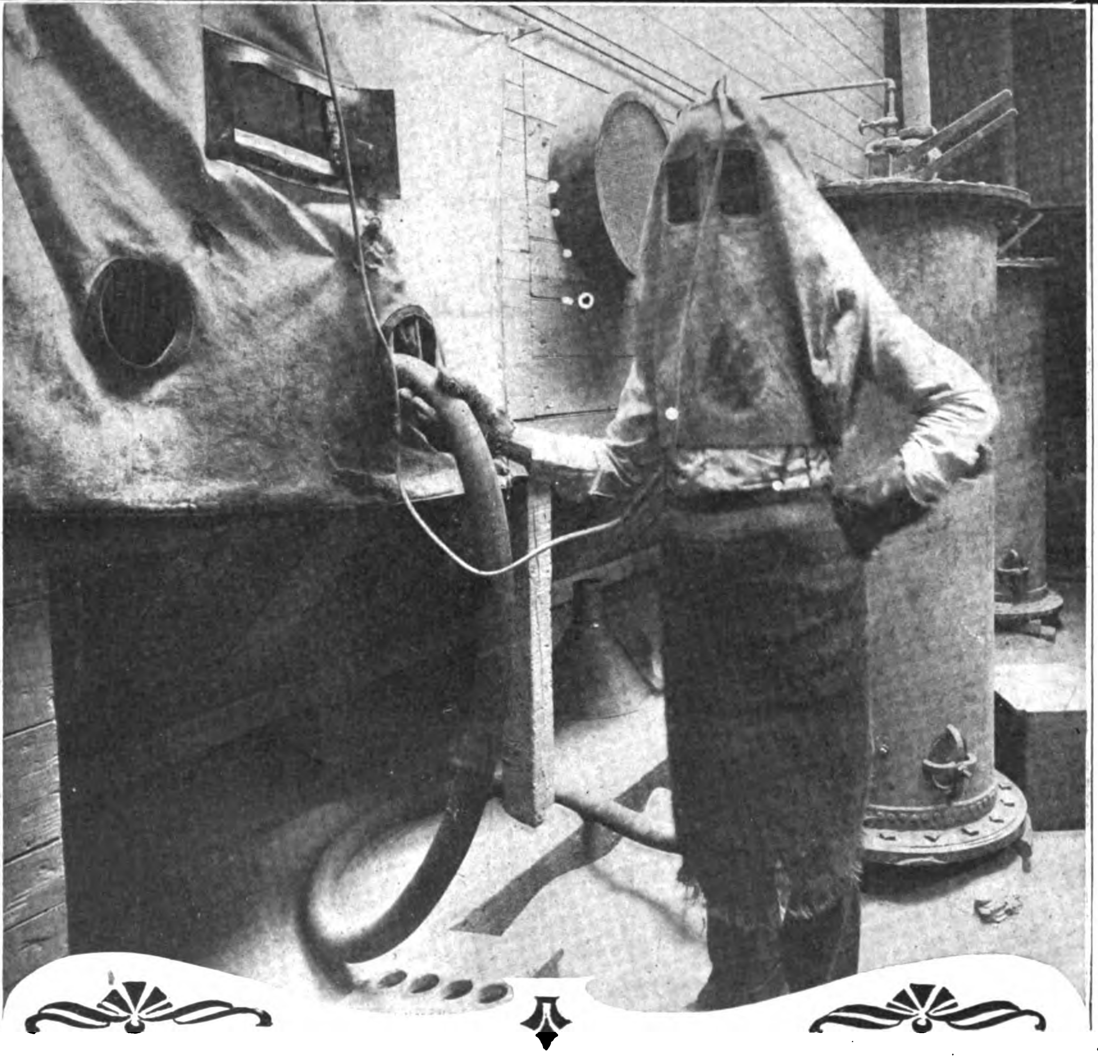

FIG. 1—SAND-BLAST EQUIPMENT VALUABLE FOR UNCOVERING DEFECTS IN FORGINGS AND OTHER PARTS, REMOVING THE SCALE, ALSO THE PRELIMINARY TO HIGHLY FINISHED WORK

HAVING decided, after long experience, that a certain type and design of automobile offers the greatest possible attraction to a given clientele, the E. R. Thomas Company, of Buffalo, N. Y., worked along the indicated lines, the result being the perfection of the six-cylinder long-stroke motor and the design of automobile that would best serve as a setting for this character of power plant. Looking at it from the laboratory standpoint, the first duty was to build the automobile as a whole, to do which required that the units composing the car be brought to a high state of perfection, inducing a condition of harmony and unity of the operating parts.

Last year, when this laboratory was pictured and reviewed in THE AUTOMOBILE, it was shown that the good work done had penetrated into the plant, and the automobiles that were manufactured under the reign of the laboratory were far more perfect than those of previous years, although the earlier products were shaped in the light of a growing laboratory experience.

But there were a large number of experiments still to be concluded, and the gist of this review will have for its basis the further elucidation of the laboratory plan, pointing out some of the things that were done and showing how they added to the quality of the automobiles made and how the cost will be lowered in future sufficiently to compensate for the large initial outlay, reducing future operations to a certainty having a marked bearing upon "overhead" charges.

The laboratory is located in a large, well-lighted wing of the concrete construction plant, comprising, in the main, the equipment as follows:

(a) Complete equipment for chemical research.

(b) A testing machine, rated at 100,000 pounds, fitted with every modern convenience.

(c) A motor-testing dynamometer fitted with a manograph, recording instruments, and checking mechanisms.

(d) Means for investigating steel and other materials for the purpose of determining dynamic qualities.

(e) Besides the strictly laboratory equipment there is a large and well-equipped test room for motors, testing mechanisms for springs, and dynamometers for proving transmission gears, live rear axles, and other component units of the automobiles.

It will be understood that the regular tests of materials went on in a routine way day after day, which character of work was inaugurated at an earlier period and was alluded to in last year's review of the undertaking. The special investigations, while there were too many of them to find space in this article, will be appreciated if some of the more important of them will be here discussed.

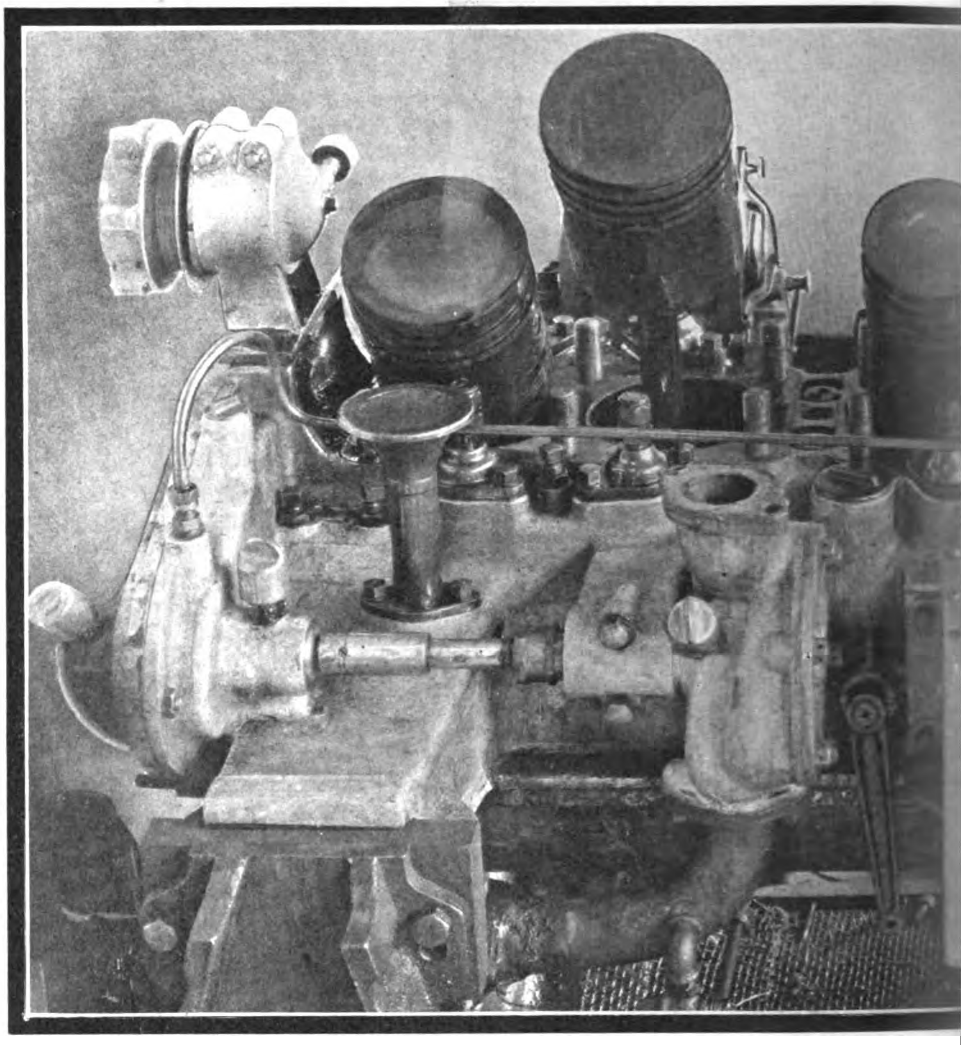

Fig. 2—Model M motor with the cylinders removed, showing the enti

The objects of the special investigations were (a) to reduce the cost of maintenance of the automobiles turned out, and (b) to lower the cost of manufacture, stopping up leaks and fixing a close limit upon so-called "dead labor." In attacking the problems of cost of maintenance the question of gasoline economy was taken up at great length from two points of view. It was recognized that the power of motors should be on the most flexible basis and it was found that carbon accumulations and other like troubles increased as the quality of automobile gasoline declined. In order to appreciate the progress that a year has brought in this important branch, reference may be had to Fig. 7 of a series of curves that are charted for the several carbureters, showing continual gains, not only in flexibility, but in total power of the motor as well. In the chart the speeds are set down in hundreds of revolutions per minute as ordinates, and the actual delivery of power is given as abscissa up to 65 horsepower. Each carbureter is given a curve and the lowest result was obtained in the curve F, showing that the power reached a maximum of 47 actual horsepower at 1,200 revolutions per minute. The curve E is quite different, both in characteristics and result. In this example the maximum power was realized at 1,600 revolutions per minute, but it may also be observed that there is little gain above 1,500 revolutions. This curve presents a gradual falling off of power with speed up to

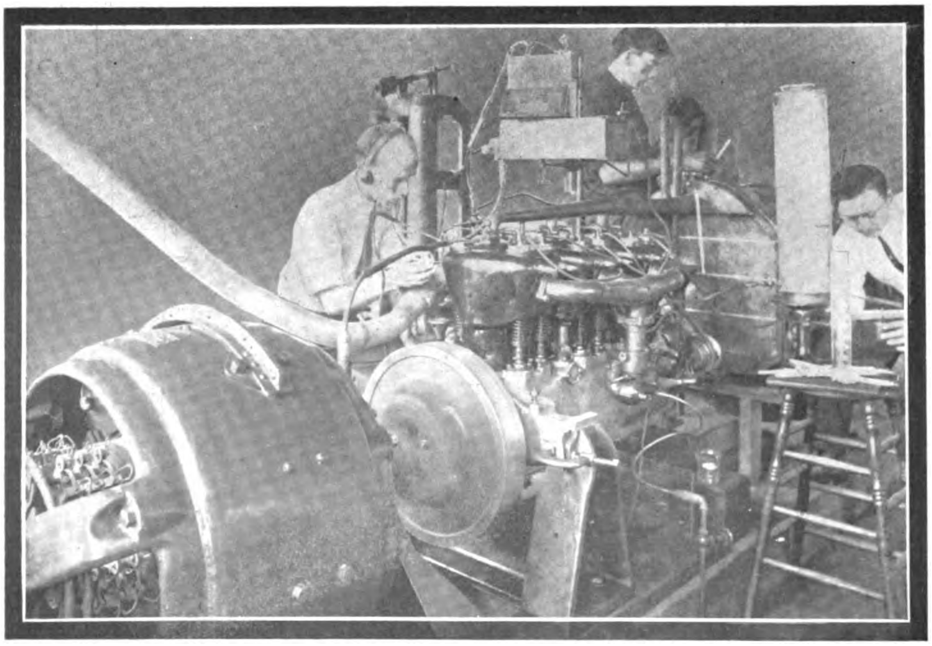

Fig. 3—Electro-dynamometer in conjunction with a manograph, fuel-weighing equipment and other facilities for use in determining the power, thermal efficiency and flexibility

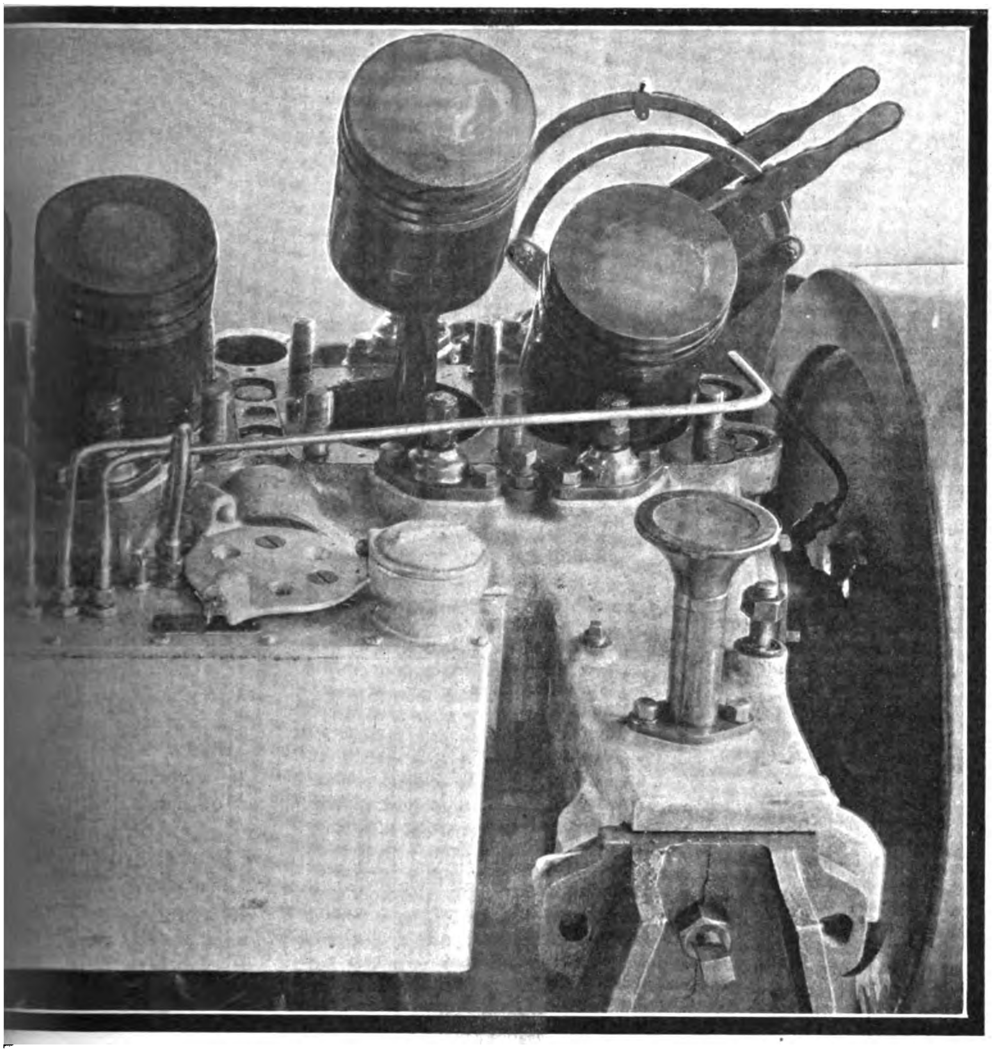

absence of carbon or other imperfections after a run of 500 hours

1,200 revolutions as compared with the curve F. In the curve D this gradual lowering is corrected in a large measure, with the result that the actual power delivered is 58.5 at 1,500 revolutions per minute, but after events showed that even this result is below the best performance when the conditions are scientifically investigated. Curve C tells a better story; the performance was practically the same as that shown in curve D up to 1,100 revolutions per minute, with a delivery of 50 horsepower. Beyond this point the results shown in curve C are considerably better, resulting in a maximum delivery of 60 horsepower at 1,500 revolutions per minute. In the curve B a distinct betterment was made, due to the power increase at the higher speed; the droop was less precipitate at 1,500 revolutions and there was a gain of two horsepower besides. The best result of all is shown in curve A, delivering a maximum of 64 horsepower at 1,600 revolutions per minute; but, what is more to the point, the stability of the motor is considerably more pronounced at the higher speeds. The drooping of the curve is relatively slow; at 1,740 revolutions per minute the delivery is 60 horsepower, and following back on the speed range offers evidence of a much more substantial torquing moment. For illustration, at 1,000 revolutions per minute the readings are:

Curves A, 47.6; B, 45.6; C, 45.6; D, 45.6; E, 43; and F, 43 horsepower.

In order to obtain a better understanding of the results obtained in the test A, Fig. 7, the chart Fig. 8 is given.

Time Test to Prove Stability and Permanence of Adjustment

The difficulty experienced in the average laboratory lies in the falling off in practice, due to an artificial excellence that is induced on account of the better care and closer adherence to the requirements. One of the ideas in this effort was to make the laboratory test conform to the practical conditions, and in a 500-hour run, which is given in detail later, the motor was tested first to observe what it was capable of when new, and after the 500-hour run it was tested out in order to note the effect of such a long run upon the adjustments and the power delivery. The curves, Fig. 9, offer conclusive evidence of the result. In this chart the two curves are superimposed. The curve marked "before the run" shows maximum power at 1,600 revolutions per minute, and the curve marked "after the run" indicates an actual prolonging of the torque, resulting in maximum delivery at 1,700 revolutions per minute.

Both curves parallel each other for the whole distance, with a slight difference, up to about 1,400 revolutions, after which the curve marked "after the run" takes the mastery. The details of this 500-hour run will tell the rest of the story, but it is worthy of special note here that the motor actually improved in performance during the run, and from the point of view of the user it was a considerably better motor at the conclusion of the long and thorough test, under peculiarly severe conditions, than it was at the beginning of the run.

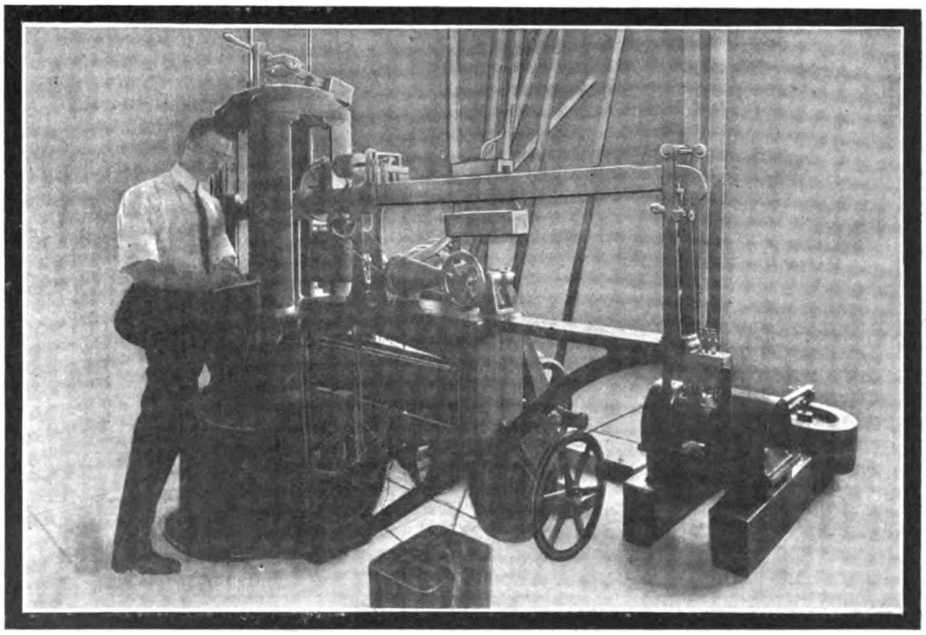

Fig. 4—Testing machine with a rated capacity of 100,000 pounds, fitted with an automatic recorder, and other means for determining the physical properties of the steel and other materials used in the automobiles

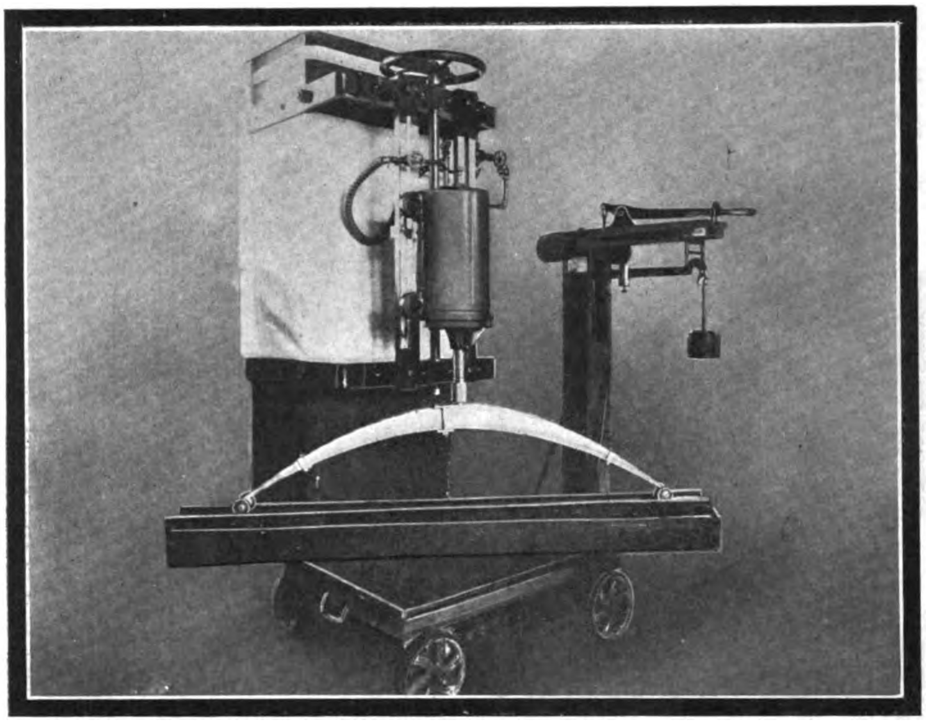

Fig. 5—Testing machine for investigating the quality and flexibility of the chassis springs, recording the deflections by means of a calibrated platform scales

The mere delivery of more power, or the better shape of the curve of power as it is shown in a chart, are relatively small matters as compared with the improving of the thermic results.

How the Thermic Conditions Were Bettered

Automobilists have had relatively little to complain of from the point of view of the general good performance of new motors, but the formation of carbon in the cylinders and the poor results obtained from the cooling systems, together with lubricating trouble, were all deferred for a time as a rule, falling like a wet blanket upon the men who were ill fitted to cope with such matters, and it was quite easy for experts to explain to them that they were careless, using too much lubricating oil or gasoline, and suffering from the practice of running upon a retarded spark.

All such explanations, although they failed in their purpose, were probably made in good faith by those who struggled without the advantages of a working laboratory, but investigation shows that the real trouble is due to the defects of design of the motor in nearly every instance, and Fig. 2 of the Model M, 6-cylinder motor, showing clean pistons after a 500-hour run, is evidence of what can be done if the problem is attacked in the laboratory and a fight is made with the stubborn facts rather than to be content with laying the trouble to operating causes.

Other Refinements Were Also Made

Passing over the timing of the motor for the moment, this being an important matter involving a study of the conditions, using the manograph and other suitable equipment, it remains to observe that the exhausting of the spent products of combustion, unless it takes place under well-defined conditions, is the source of not only a loss of power, but mal-thermic relations of a trouble-brewing nature. Unless the conditions are such that the fuel will burn to carbonic acid and water—nor can this be so if the back-pressure is excessive—the dreaded carbon formation will creep in and the power of the motor will diminish materially in service. But even this is relatively unimportant; the flexibility of performance, which is so much desired, will be gone.

What is this flexibility of performance and why is it desired? Were a motor so flexible that it would deliver power in adequate quantity at all speeds, there would be no occasion to employ a transmission gear system. Running on high-gear under all conditions of service was the dream of every automobilist not so long ago, and it was hoped that the coming of the 6-cylinder motor would deliver this benefit. Experience soon brought a realization of flexibility that thwarted this desirable end even in 6-cylinder motors, and it remained to study the problem and locate the interference with this good plan; the desired end was ultimately realized.

When the problems of carburation were investigated at some length, the plan was headed off by exhaust trouble, and it at once became necessary to look into this phase of the thermic relations and find a remedy for back-pressure and fouling of the combustion chamber space by the residuum of gas, which prevented the further complete burning of the fuel; piling up of partially burned mixture was, of course, a very serious matter.

It will be necessary to critically examine the chart Fig. 10 in order to appreciate just what this means. In this chart the speed of the automobile on the road is given in ordinates in miles per hour, and the back-pressure is plotted as abscissa in pounds per square inch above atmosphere. The back-pressure increases with the speed of the automobile on the road, also with the opening of the throttle. What does this mean? Does it not show that back-pressure interferes (a) with the speed of the automobile on a level hard road, and (b) with the hill-climbing ability at a given speed? Having investigated the relations, learning how the obstructions acted and what the consequences were, it was a mere matter of continuing the effort along intelligent and indicated lines for a time sufficiently long to bring about a remedial condition. After having reduced the back-pressure to the lowest possible point, using a silencing ejector type of muffler, it still remained to work out a form of

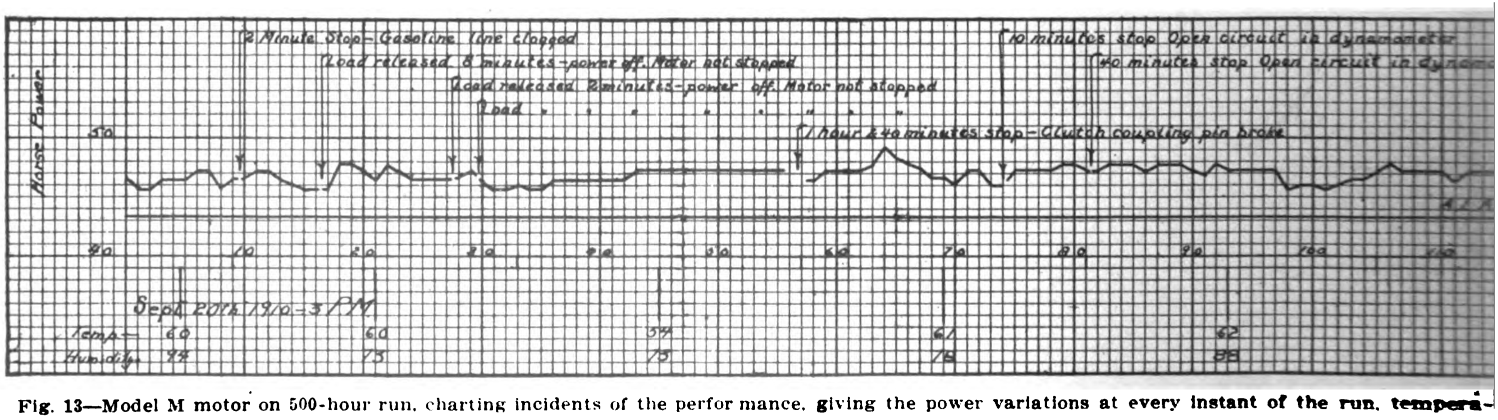

Fig. 13—Model M motor on 500-hour run, charting incidents of the performance, giving the power variations at every instant of the run, tempera-

exhaust relief valve that would really have the virtue that practice accords this form of device. The curve Fig. 11 shows the result of the latter effort, reducing the back-pressure down to a maximum of 1 1-2 pounds per square inch, and to less than half of this value under hill-climbing conditions.

Engineering Laboratory Report of 500-Hour Run

Model M engine, No. 1037, 4 1-4-inch bore, 5 1-2-inch stroke, was set up in laboratory and underwent a test run to determine if the motor could equal the record of the new Daimler or Silent Knight, as tested by the Royal Automobile Club, March 15 to 28, 1909, and recorded in their certificate of performance, No. 118.

The conditions of the Knight test were:

(1) That the engine should be tested upon the bench for 132 hours, continuous running.
(2) That the horsepower given off should at no time during the test fall below the R. A. C. rating, multiplied by 1.3, the piston speed to be 1,000 feet per minute. If a higher piston speed should be used the minimum horsepower should be increased proportionally.
(3) That the temperature of the inlet should be kept at 50 degrees centigrade during the test.
(4) That upon completion of the bench test the engine, without any of its vital parts being disturbed, should be installed in a standard touring car and run for a distance of 2,000 miles on Brooklands track, this distance to be completed in not more than 60 hours of running time.
(5) That upon completion of the track test the engine should be again placed on the bench and run for five hours under the same conditions as the previous bench test referred to in paragraphs (1), (2) and (3).
(6) The certificate should show *inter alia*—
    (1) A chart giving the horsepower readings to be taken not less than once every hour during the endurance test at the declared speed.
    (2) A record of repairs or adjustments, if any. The following, however, while they might be recorded on the certificate, would not debar the engine from continuing its test; the time for necessary repairs being noted and the motor being called upon to make good such time under general conditions governing the test: Defects in petrol supply, water circulation, ignition system, exhaust piping, brake system.
    (3) The fuel consumption per horsepower on the bench.
    (4) The degree of wear shown at finish on examination by the judges.

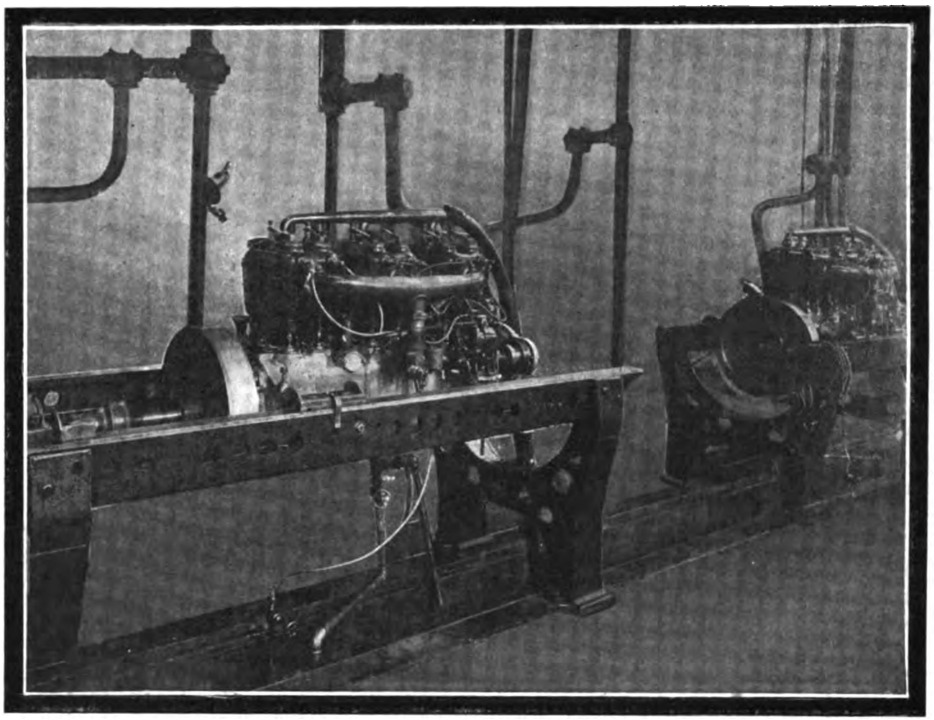

Fig. 6—Illustrating two units of the test stands which are available for testing all the motors produced for endurance, flexibility and power

The speed entered for the trial was 1,200 r.p.m., giving a limit of 50.8 horsepower, below which the horsepower was not to fall.

Engine readings, taken and recorded every half hour, are shown on the chart accompanying this report, (Fig. 13).

RESULTS OF 132-HOUR BENCH TEST

Total Time During which Load Was Eased	Duration of Tests	Stops Incurring Penalty	Stops not Incurring Penalty	Average H. P.	Gasoline Consumption	Consumption per H. P. Hour
Min.	d h m	No. Dur.	No. Dur.			Pint. Lbs.
19	5 14 15	0 0	5 116 min.	54.3	614.75	.679 .613

After this test the motor was installed in a car and run 2,159.5 miles, making about 20 miles to the gallon of gasoline. On completion of this run it was again placed on the block and run five hours under the same conditions as before.

RESULTS OF 5-HOUR TEST AFTER 2000 MILES ON ROAD

Duration of Test	Stops Incurring Penalty	Stops Not Incurring Penalty	Total Time During which Load was Eased	Average H. P.	Gasoline Consumption	Consumption per H. P. Hour

hanges during the performance, humidity of the surroundings, stating in detail the reasons for interruption, and other information of a pertinent

The engine was completely dismantled and no perceptible wear was noticeable on any of the fitted surfaces. The cylinders and pistons were found to be notably clean. The only noticeable wear in any part was caused by two point pins rubbing against adjacent parts. The ports of the valves showed no burning or wear.

The R. A. C. rating of the Thomas Model M is 43.89. The conditions of the Knight test required 43.89 horsepower × 1.3 = 57.05 at 1,000 feet per minute piston speed. As we used approximately 1,010 feet per minute piston speed, the horsepower of the motor should not fall below 58 horsepower during the test.

Owing to the small pipe supplying the laboratory with water and the varying pressure the lowest mean temperature we were able to keep the water at the inlet was 147.7 degrees Fahrenheit or 64.3 degrees centigrade as against 50 degrees centigrade required by the Knight conditions.

Motor No. 1037 was a regular stock motor taken from the assembly floor after it had completed its block test. After taking horsepower speed curve the motor was started at 3 o'clock p. m., September 20, and stopped at 3:14 o'clock p. m. on October 11, and another horsepower speed curve taken. Total actual running time of 500 hours. Outside of the above changes run was governed by the conditions of the Knight test.

The speed set for run was 1,100 r.p.m. The engine was observed throughout the trial and reading taken and recorded every hour. These records are submitted with this report.

TABULATION OF THE 500-HOUR TEST

Duration of Test	Stops Incurring Penalty	Stops Not Incurring Penalty	Total Time Load was Eased	Average H. P.	Gasoline Consumption	Consumption per H. P. Hour
d· h m		No. Dur.				Pint Lbs.
21 4 14	nil	7 197 min.	57 min	47.7	3,235.4 U. S. 2695 British	1.085 .814 U. S. .904 British

At end of run cylinders were removed and valves taken out. A close examination of cylinders showed that they were in good shape. The reader will be able to judge of the condition of the pistons as they were after the run by examining Fig. 2 of a photograph taken at the time. This is a remarkable showing, as an average showing of 47.7 horsepower for 500 hours at a motor speed of 1,100 r.p.m is equivalent to climbing 17,660 miles up an 8.8 per cent. grade at 35.4 miles per hour with a 4,600-pound car, equipped with a 3 3-7:1 gear ratio and 37-inch wheels (Model M stock equipment).

$$\frac{D \times N \times 60}{3\ 3\text{-}7 \times 5{,}280} = \text{Miles per hour of car.}$$

When D = Diameter of rear wheels in feet.
N = r.p.m. of motor.
3 3-7 to 1 is rear axle ratio on high gear.

Computing from foregoing, miles per hour of car = 35.32.
35.32 × 500 = 17,660 miles total.
Assuming 80 per cent. efficiency of transmission.
47.7 × .80 = 38.16 horsepower available at rear wheels.

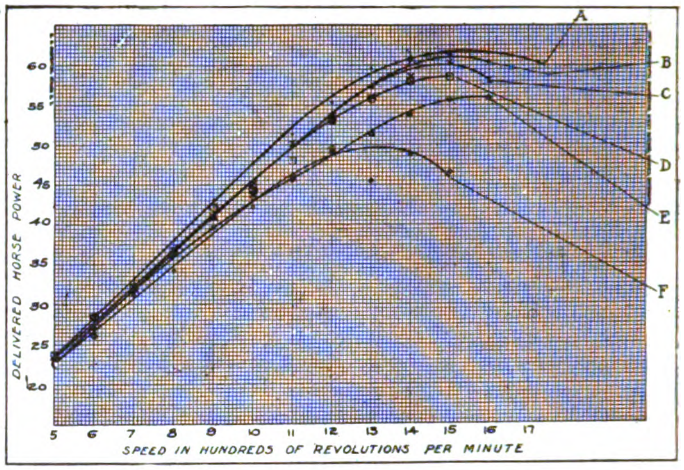

Fig. 7—Increase in power obtained by persistent investigation

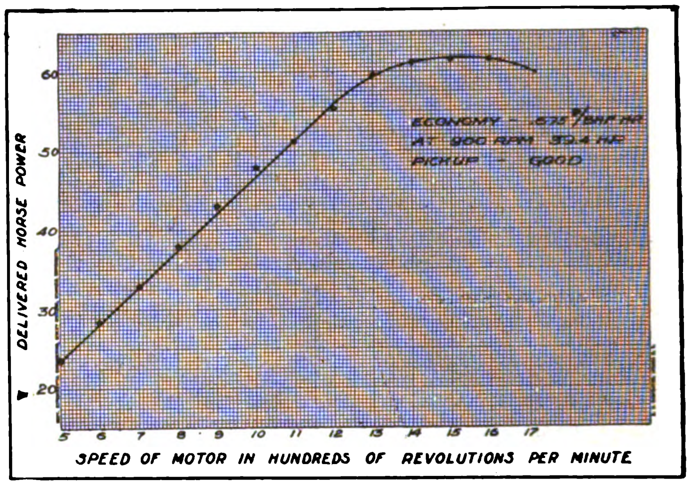

Fig. 8—Performance under conditions of perfected carburetion

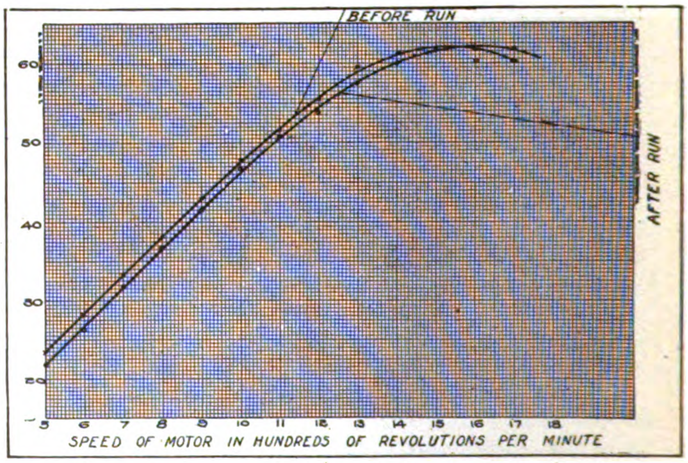

Fig. 9—Performance before and after the 500-hour test

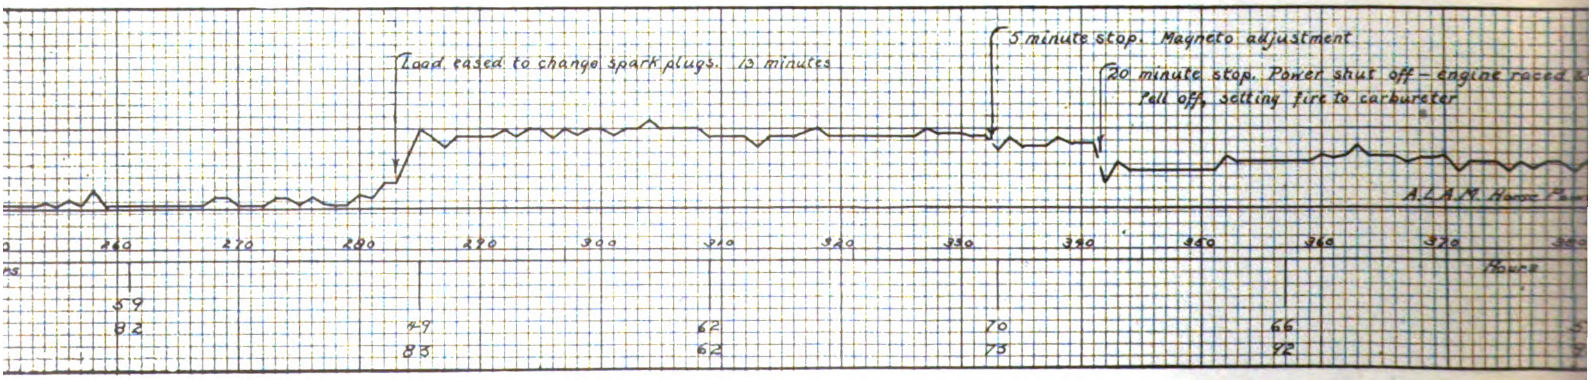

character. This chart offers the advantage of showing the whole performance not unlike a bird's-eye view, marking off the variations of every charac

Now $\text{H.P.} = \frac{DNP}{33{,}000}$ when P = pounds pull at circumference rear wheels.

Therefore:

$$P = \frac{33{,}000 \times \text{H.P.}}{DN} = \frac{33{,}000 \times 38.16}{\times 3.083 \times 320} = 405.2 \text{ pounds.}$$

405.2 pounds may be taken as the tangential pull (see Fig. 12) on rear wheels tending to push the car up a hill.

The piston heads were noticeably clean, as can be seen by Fig. 2. The shop numbers can be easily read.

The greatest difficulty experienced in this test was to keep spark plugs in the motor. With this carbureter a mixture could be obtained giving the greatest power, but so lean that the plugs could not stand the heat. One make of plugs which were absolutely tight would get so hot that the center electrode would melt off and pre-ignition would occur, continually pulling down the horsepower. Upon enriching the mixture this would cease, but the power would fall off. All six of the plugs in the battery system melted in this way and had to be removed, being replaced by solid steel plugs. Another plug used, even when not leaking, would cause pre-ignition. Upon removal the center electrode would be white hot. Three plugs of another make were tried with no better results. The pointed plugs, called "Petticoat" and "Conical," would heat up in the center, and the "Enclosed" would get so hot that the end would scale. Three plugs with glass insulators solved the trouble in Nos. 4, 5 and 6 cylinders but the three different makes of plugs in the remaining cylinders still continued to bother until finally three new plugs of one make were put in and saved the run. With this change and the air valve open a little the power increased from 45 to 50 horsepower, and the gasoline consumption fell from .916 to .74 per horsepower hour. No further pre-ignition occurred throughout the run. Motor was not stopped to change plugs.

As noted on the chart, a stop of 2 minutes occurred between the ninth and tenth readings, caused by gasoline line plugging.

Between the sixteenth and seventeenth readings the factory power was cut off for eight minutes. As this is used to excite the fields of the dynamometer the load had to be released for that time, although the motor continued to run at 1,100 r.p.m.

There is one point which is well worth noting by those who are seriously interested in automobiles, and that is that the load under which the motor had to labor for this long period of continuous operation was a much heavier burden than motors have to carry in regular automobile service.

Explanation of Figure Twelve

Referring to Fig. 12, to which attention was pointed elsewhere:

P = tangential effort on rear wheels tending to push the car up hill.

W = weight of car.

when,

$$\text{Sin. } \Phi = \frac{P}{W} = \frac{405}{4{,}600} = .088$$

$\Phi = 5° 3'$, which is the equivalent of an 8.8 per cent. grade.

and denoting the periods of interruption in comparison with the lengths of runs, making, on the whole, an exact history of the event

Economy of Production

A PROMINENT AUTOMOBILE ENGINEER POINTS OUT HOW COST MAY BE REDUCED WITHOUT CUTTING INTO QUALITY OF THE AUTOMOBILES TURNED OUT

SURELY the reason for the existence of the engineer is not alone the designing or shaping of material; he must likewise provide for the economical use of material. Savages can bridge a stream by piling enough rocks across it; but when it comes to building a Brooklyn Bridge the engineer is the one who makes the accomplishment economically possible. The farther away we get from engineering practice the more often we find ten pounds of material used to do the work that might have been done with one.

In the automobile business, as in every other new industry, the first attempt was to make something that would work. A number of the very earliest cars, however, showed evidence of clever and good design. An economical use of material was made which permitted of the low price necessary to introduce a new type of vehicle. Then the automobile slowly became a thing of luxury. Comforts unthought of in the earlier days of vehicle design began to appear. Requirements became more and more exacting. On good roads the motor car was expected to carry a man with the speed of an express train and with all the comforts of a Pullman car. These requirements were met, but to meet them it was necessary to put more horsepower in fewer pounds of steel than had ever before been done in the history of the world. This was done by making one pound of steel do the work that had previously been done by two. The development of new kinds of steels became necessary, and to-day the entire steel industry has received an impetus toward quality. Where at one time the government alone demanded steels of superior grade, now the demands are from a thousand sources.

To-day the automobile business is passing into another stage of its development. Owing to increased competition and to an increase in the value that has been given the purchaser, it has become imperative that the manufacturer reduce the cost but not the quality of his product. This has opened a large field for the engineer who has commercial as well as creative instincts.

Many economical constructions have been noted on various cars, but it may be slightly surprising to see statements in dollars and cents of the savings effected thereby. Take the "hood form," which is the metal ledge attached to the dashboard on which the hood rests; by using pressed steel for this part instead of an aluminum casting, it was found that weight would not be increased, that greater strength could be secured, and that $157 could be saved on the first thousand cars and the dies and tools paid for as well, while on the second thousand cars the saving would be $507.

By a change in the construction of cam-shaft bearings, without affecting quality, life or performance in even the slightest degree, a saving of upward of $5,000 per thousand cars was found possible, and there yet remain possibilities of still further reducing cost while actually enhancing the quality. Another apparently inexpensive part used on the engine was found susceptible of redesigning and betterment that saved $3,000 per thousand cars, while another element used elsewhere will be made to leave $5,900 in the treasury. The simple expedient of changing the cover of the transmission case from aluminum to a steel stamping will yield a return of $466 for the first thousand and $716 for the second thousand automobiles.

All economies, however, are not so easy to discover as were the ones just quoted, nor as many of such large value, but all are of importance. To cite a little incident: from the earliest days it has been the custom to keep the hood from rattling by using a leather or "rawhide" strip for it to rest upon. Everyone knows that leather is injuriously affected by heat, and not one of the men who thoughtlessly called for its use would, for example, have left his shoes on a radiator for a few hours with the expectation of finding them in good condition on his return. Yet leather was specified on the radiator of an automobile. A little "shopping around" discovered a woven cotton material far better than leather for the purpose, the use of which saved 16 cents per car.

A dozen more cases might be mentioned where a positive betterment has actually resulted in money saving. This would seem to be real economy and in actual money saved, as well as in influence on every employee, is certainly far ahead of the petty and annoying "economies" sometimes attempted and considered good management.

Of course, as is natural to his kind, the non-constructive critic who is troubled with indigestion will say, "Why weren't these economies discovered in the first place?" Such a critic, of course, does not think enough to comprehend that human progress has been made by first doing a thing, and then by bettering it. We can assert, without posing as fortune-tellers, that railway travel ten years from now will be more comfortable and more secure than at present, for have we not to-day the pressed steel passenger car, and the "Twentieth Century Limited" that ten years ago were not thought of?

The whole subject of economy in automobile work is sure to receive an increasing amount of attention as the industry develops, and both the manufacturer and the public will share the benefit.

Another Washington Story Unearthed—The anecdotes about General Washington are almost without number. The following story is one of the most authentic, and it has the additional value of being new. When the American army was most pressed by the Hessians, aided by the English, Washington was constantly receiving intelligence of a nature which caused him to doubt the wakefulness of some of the sentries, especially those of a certain colored regiment. He determined to see for himself, and one dark night, when the password was "Chenango," Washington slipped out of his tent, dodged his faithful chauffeur, jumped into the headquarters automobile and made for the outposts. For a good three miles Washington went merrily along without seeing either hide or hair of a sentinel; but upon making a turn in the road the silhouette of a sentry loomed up ahead, making a bold outline against the ink of the sky, and Washington clapped on the brakes in order not to reduce the count of an already too meager army.

The harsh grating of the darky's melodious voice awakened the echoes of the long night:

"Who comes there?" said the vigilant infantryman.

"A friend," said Washington.

"Advance, friend, with the countersign," said the sentinel.

"Roxbury," said the General, advancing on low gear.

"No, sah," replied the soldier.

"Medford," roared Washington.

"No, sah," was the response.

"Charleston," pleaded the hero of fifty turning movements.

The darky lost patience and, said he: "Look yeh, Massa Washington, you all keeps sayin' 'Chug!' 'Chug!' 'Chug!' Dat's all I kin hea', Massa Gen'l, and if youall wants to git by hea' youall 'll have tu say 'Chenango.' Dar kyant no pusson go by hea' onless he says 'Chenango.'"

Operation and Care

COMFORT IN WINTER MOTORING; IDEAS IN PRACTICAL REPAIRING; CANTOR LECTURES; DON'TS; LETTERS; QUESTIONS; CARBURETER ACTION; LAYING UP CAR FOR WINTER

WINTER automobiling is quite out of the question, excepting as a matter of business, unless provision is made for the comfort of the driver in particular, and the disengaged occupants of the automobile in general. The average owner of the class who employs a chauffeur may think because he has all the money that he should draw 90 per cent. of the comfort. This point will not be contested, but an inquiring mind would be likely to ponder over the problem, arriving at the point, perhaps, where the question would be asked, How will the 90 per cent. owner take this comfort? If the chauffeur has his circulation stilled by the bitter cold, and his intellect benumbed in the bargain, or if his vision is dimmed by exposure and the bombarding effects of missiles from the sky, it is a fair inference that this is the type of owner who would describe the very acme of all that is comfortable, as fully represented in a sojourn for infinite time within the confines of a long-forgotten cemetery.

In advocating the comforts as suggested by humane considerations for the chauffeur, it is asking for no greater consideration than is accorded a plain ordinary work-horse. The owner's safety is at stake; then it is surely not too much to expect that the chauffeur will be accorded the meager consideration that is the natural due of an army mule.

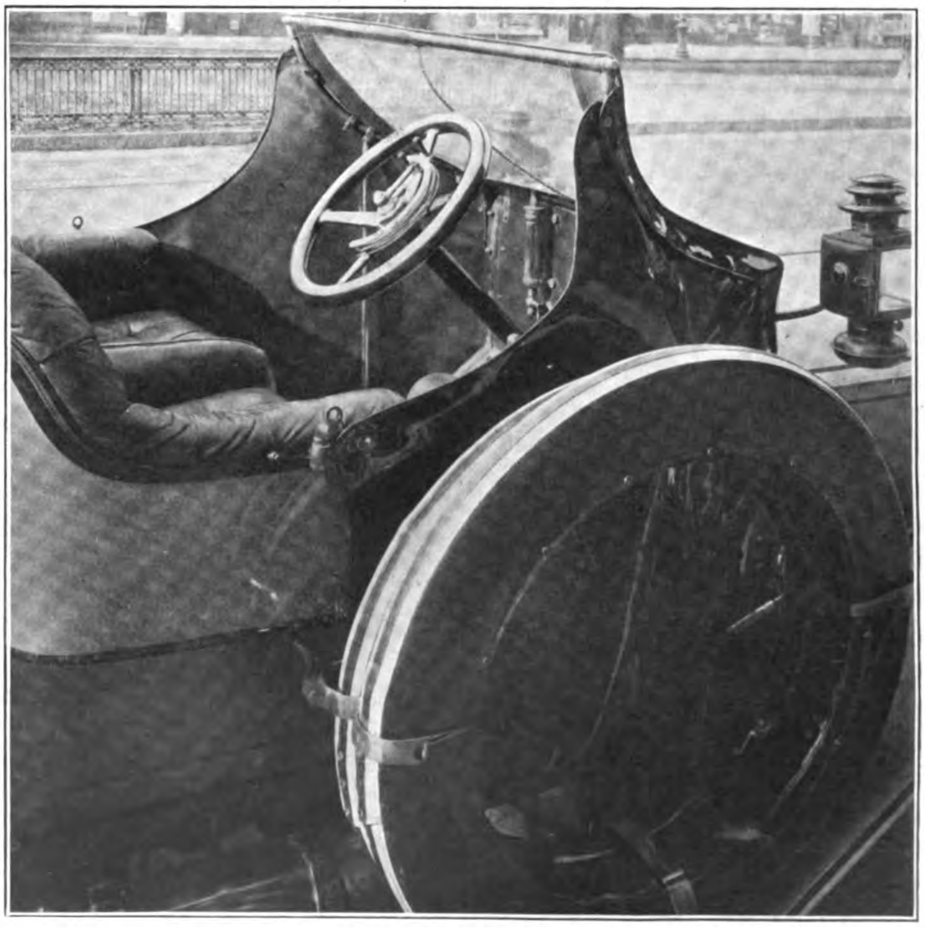
To enjoy automobiling, under conditions of inclement weather, particularly in the cold of Winter, protecting the chauffeur, or the owner, if he drives, are normal and healthy considerations. A mere windshield resides on the borderland of necessity; it is a whole lot better than nothing. The introduction of the fore-door type of body solved the problem in part, leaving the automobile with its standard body construction in the class with the old-fashioned street-car, without a vestibule. But there is no reason for struggling in the embrace of despair when a little ingenuity and a little work will bring every type of automobile up to a high standard of comfort.

Cold Weather Reminders

Some Pointers for the Autoist Whom Winter Cannot Feaze

IT often occurs that on a cold day a stop has to be made for such a length of time that the water in the cooling system becomes much too cold. If it is at all windy this operation will be effected quickly. The best way to overcome it is by following the methods in vogue at taxicab stations. The cabs have to be ready for a call at any moment, and if they are unable to start at once they lose their turn. Whenever they have to stop on the rank, off comes the driver's duster, which is placed over the radiator and hood. A car can be left in this manner for several hours in the open with the temperature below freezing point, but the heat under the hood and in the radiator is retained. Even if anti-freezing solutions are used, it is no reason for letting the engine become cold, as it takes some time to warm up again, and in the case of glycerine the liquid is turned into a semi-solidified state as the outside temperature becomes lower.

Before starting out in the morning it is a good practice to run the motor in the garage for several minutes in order to warm the engine and allow the carbureter to work under normal conditions, especially if it is not water or hot-air jacketed. It is not an uncommon sight in Winter to see the outside of the carbureter covered with a film of ice; also the induction pipe. This may stop the engine; should it do so, put a rag in boiling water, wring it out, apply it to the manifold and mixing chamber and close the air ports for starting so that the engine takes in a rich mixture; if these ports are not controlled by hand, cover them with a rag, or the naked hand will do equally as well. The practice of heating pipes by pouring gasoline on them and setting fire to it has been tried and found to answer, but is sometimes attended with unlooked-for results; the flame may become larger than intended, even going so far as to warp the whole car; a soldered union may be overheated, thus weakening the joint.



REGULAR TYPE OF AUTOMOBILE BODY EQUIPPED FOR WINTER USE

Practical Repairing

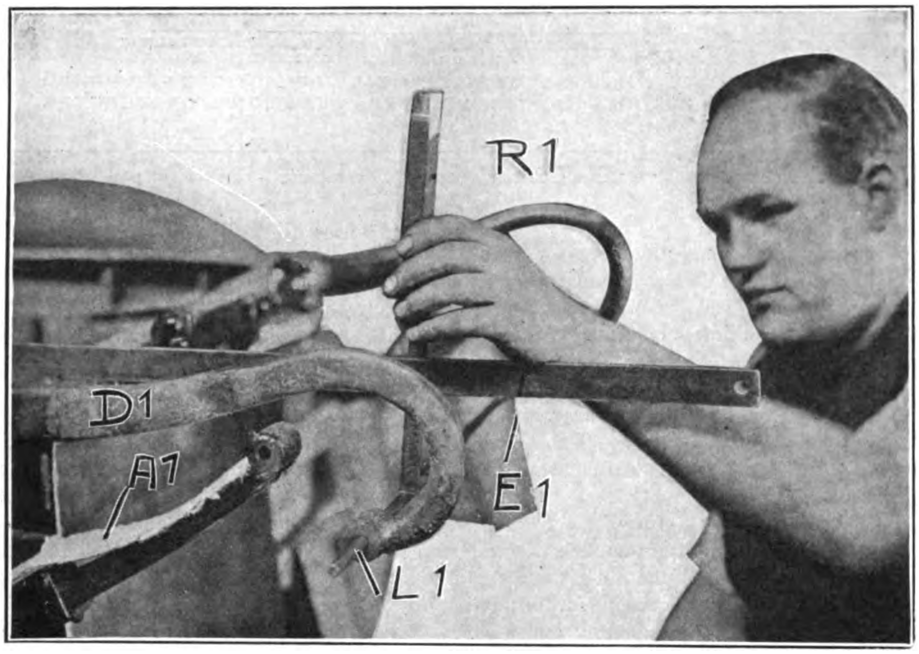


Fig. 1—Measuring height of dumb iron that has been bent and straightened by means of straight edge rule and lining rod

PRESSED steel frames have now become almost universal in automobile practice, and therefore it would serve little purpose to deal with other forms of frames that have been used from time to time, such as the armored wood and tubular varieties. Suffice it to say that in quite a number of cases the whole frame has to be taken apart to effect a repair on those two types or to reinstate the alignment.

The most common cases that the repairer is called upon to deal with are the direct cause of an end-on collision either front or rear, and these can be usually effected without the necessity of dismantling the chassis. The primary tools required are good blowers and the usual bending irons. The eventual cleanliness of the job depends upon the smith's skill and the facilities at his disposal to properly heat the bent part.

Fig. 2 shows the rear dumb iron or spring holder that has been bent down owing to a car running backward and striking a wall, the result being that the left-hand member was forced down about two inches. Restoring the frame to its original shape in this case is a very simple matter, and is effected in the following manner: The cross member of the frame is blocked up with a trestle and blocks of wood, and the spring bolt is withdrawn, allowing the left spring to drop and the weight of the rear axle to rest on the tire. Strips of asbestos that have been immersed in water are laid on the spring to protect the paint from the heat and the temper of the springs. Heat is applied to the dumb iron D1 at the point where the bend has taken place by means of the blowers F1 and F2, which are fed by gas through the pipe G1 and blast air through the pipe A1. The pressure in A1 is obtained from a compressor run off the machinery shafting by belt, and the amount of force of air and gas is regulated by two turn-cocks under the immediate control of the driver's right hand. One or two flames can be directed on the work while the smith grips the frame with lever L1 in such a manner that as soon as the heat has softened the steel it will give and bend upward, the operator having previously gauged just how much lifting is required.

The operation of finding the correct height can be seen by reference to Fig. 1. A straight edge E1 is laid on the side member of the chassis, protruding over the end of the dumb irons; a rod L1, called a lining-up rod, is passed through the spring bolt holes, and from this to the square edge the smith can see exactly by measuring with a rule R1 whether the height is correct or if it requires still more alteration. The springs in this case are attached to the frame by shackles that give as the torque is thrown on the axle. After the bending operations are completed the frame is filed up smooth and allowed to cool off, when it will be necessary to send it to the paint shop, as naturally all the paint will have been burnt off.

With the front end of the frame matters have not such plain sailing, owing to the different shapes that U section metal takes when bent; these are naturally governed by the force of the

Fig. 2—Straightening bent dumb iron of frame by blast heating and using bending iron

STRAIGHTENING FRAMES; PRECAUTIONS TO PREVENT THE EFFECT OF A BLOW; GENERAL BRAZING

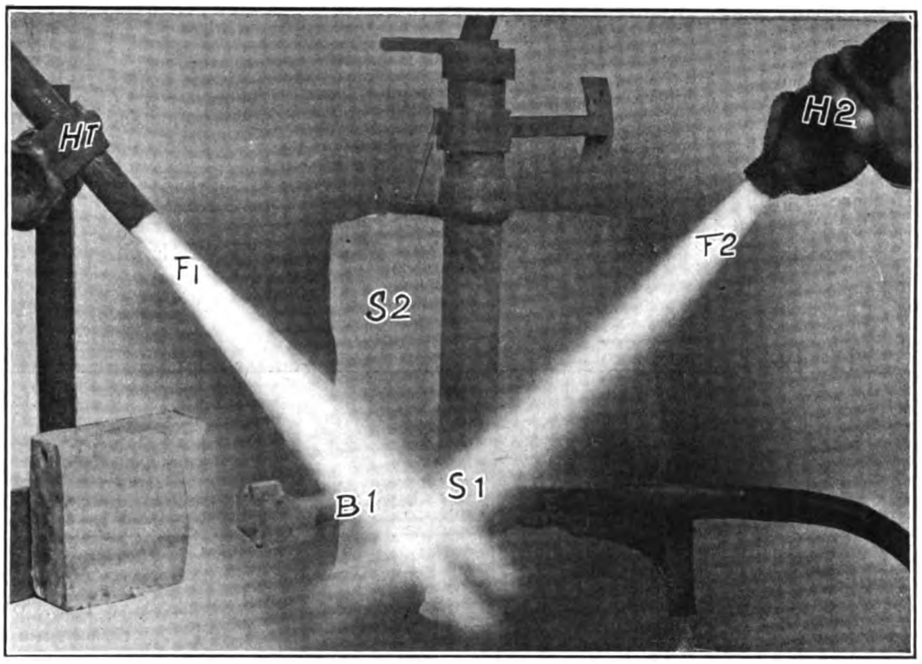

Fig. 3—Brazing new clutch pedal to transverse shaft after same has been pinned

blow and the direction from which it comes. It can be taken for granted that repairs are possible to the front end of the frame without having to fit a new side member, but this is a matter that requires more than passing thought, because it is often cheaper to have a new side member fitted if the frame is badly cracked than to have horn plates and new spring holders riveted and welded; besides, there is always the indelible mark of an accident to offend the eye and greatly depreciate the value of the car. Fig. 4 shows a frame F1 that was subjected to a violent impact with a telegraph pole, but most of the strain was taken in the cross member S1 that had been placed in front of the radiator as if by Providence. Such a cross bar would be a useful adjunct to any car, as besides strengthening the frame it protects the radiator in case of a vehicle backing. Much the same method is employed in straightening the front member as in the case of the rear, except that a certain amount of hammering is necessary to even up the U section at the point of bending. The radiator must first be removed and the engine casing protected by metal sheets and asbestos boards; there being so many parts to hold the frame rigid—as the engine arms A1 and A2, cross members and transmission arms—that it is usually only a matter of straightening the dumb irons, although the entire frame must be tested for lateral strains. It must be borne in mind that when the frame is released from the springs it has a tendency to curve inward, as it does in Fig. 4, but not to such a marked degree; consequently, when the frame is straightened allowance must be made for this. It is advisable in ordinary brazing jobs to have some means of holding the blow-pipes, and such can be seen in Fig. 3, H1 and H2. By this means the flame is directed on the part to be heated, whereas holding by hand the operator usually moves the flame, thinking thereby to hasten the heating. Such is not the case; a steady flame on one point will heat quicker than when it is moved about.

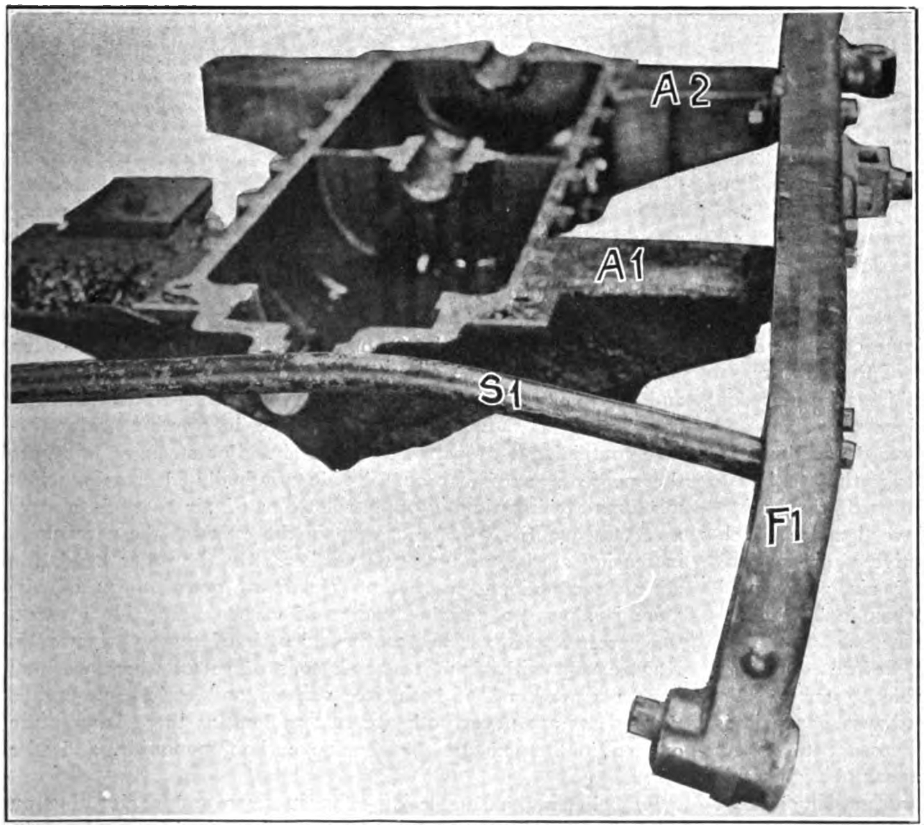

Fig. 4—Impact of a bad blow saved by the cross member fitted in front of the radiator

At the rear should be placed fire bricks or a sheet of metal, S2, and the job itself placed in such a manner that when the brazing rod or powder is applied the latter will run into the parts to be joined, S1. In this case it is a clutch shaft on to which a new pedal arm has to be fixed. The parts must first be cleaned with a file. The temperature of the flames F1 and F2 is greater in inverse proportion to their size, and the smaller a flame becomes the hotter it is and the more work it will do, provided the air is not supplied in excessive quantity. Parts such as these or the flanges on exhaust manifolds should be pinned before brazing, to overcome vibration and to hold the work together during the heating, as when the metal expands the parts may slip. Preventives against collision are so numerous that it is a matter for the autoist to choose the one that best suits his car or pocket; the point to be careful about in fitting one is to see that in case of an accident the tire cannot come into contact with the sharp ends and so cause perhaps twice the damage that would be entailed if the frame alone had to be straightened.

In Diagnosing Motor Trouble—

If the motor comes to a stop after a long run, look in the gasoline tank.

If the tank holds gasoline, see if the same reaches the carbureter.

If there is no trouble up to the carbureter, observe if gasoline passes out of the nozzle.

If there is plenty of gasoline available, it suggests the possibility that there may be too much.

If the gasoline flow is satisfactory, examine the air valve.

If the ratio of gasoline and air is right, look for water.

If there is no trouble up to this point, see if the intake manifold is tight.

If the mystery still persists, go over the ignition wiring connections and tighten them up.

If there is no relief, take out the spark plugs and test them.

If the spark is feeble in the open air, it will be worse under compression in the cylinder.

If there is a poor or no spark it is due to a weak battery or an open circuit.

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.SC., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE SIXTH INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

We now come to the consideration of the chemical nature of changes during combustion of petrol and air. The chief constituent of ordinary petrol is the hydrocarbon hexane (C_6H_{14}), mixed with a certain proportion of the other members of the paraffin series. When petrol is burnt in the presence of sufficient air or oxygen the carbon is almost entirely converted into carbon dioxide (CO_2) and the hydrogen into water. If, however, the supply of oxygen is deficient, then, in addition to carbon dioxide and water, there are also produced carbon monoxide (CO), hydrogen (H), and methane, or marsh gas (CH_4). Now these three gases (CO, H, and CH_4) are all combustible when mixed with oxygen, and hence it is obvious that the presence of such gases in the exhaust of an engine involves a waste, for we are discharging into the air part of our fuel, not, it is true, unaltered petrol, but since it is combustible it is fuel. The water produced by the combustion of petrol amounts to about one and a half times the weight of the petrol, and hence it is not surprising that when starting up an engine, so that the silencer is cold, a considerable quantity of water is often found to drip from the silencer or exhaust pipe.

If we take a certain volume of petrol vapor and air at, say, 110 deg. C., and, after firing the mixture, allow the products of combustion to cool down to the original temperature of 110 deg. C., it is found that if the pressure be adjusted to the original value, the volume of the products of combustion is greater than the original volume of air and petrol vapor. The amount of this increase in volume on combustion for different strengths of mixture is shown in Fig. 25. It will be noticed that for mixtures containing more than 14 parts of air to 1 of petrol, the increase of volume on combustion is very nearly constant. In in the case of richer mixtures, increase in volume on combustion increases rapidly with the increase in strength of the mixture.

Since the nature of the chemical changes which take place on combustion depends on the relative proportions of petrol and air present, we can, by a study of the products of combustion, *i.e.*, the exhaust gases of the engine, investigate the relative proportions of air and petrol taken in by the engine.

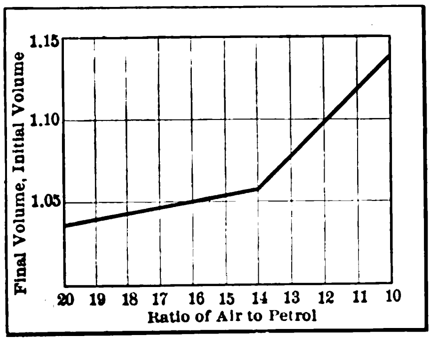

Fig. 25—Showing increase of combustion for different strengths of mixture

Before we are able to analyze the exhaust gases it is necessary to collect a sample, and this process, simple as it may seem, is one requiring considerable forethought. If a collecting vessel is simply connected, by means of a tube, to the exhaust pipe between the engine and the silencer, and the exhaust gases are allowed to blow through the vessel for some time, it by no means follows that the final contents of the vessel will be exhaust gases uncontaminated by air. The reason is that even with a four-cylinder engine, and much more in the case of a single or two-cylinder engine, the pressure in the exhaust pipe is often during a part of the stroke below the atmospheric pressure.

That this is the case is shown in Fig. 26, which gives for three different speeds the manner in which the pressure in the exhaust pipe of a four-cylinder engine varies during the stroke. It will be noticed that at all speeds the pressure sinks about 2 lbs. per square inch below atmospheric at some part of the stroke. Hence, if the collecting vessel is simply connected to the exhaust pipe by one tube, a second tube being provided to allow the escape of the air from the vessel, then while it is true exhaust gases blow through the vessel during the greater part of a stroke, yet during the remainder of the stroke, when the pressure is below atmospheric, air is sucked back into the sampling vessel. Hence, to obtain a true sample of the exhaust gases, some form of non-return valve must be fitted to the outlet from the vessel. There is no doubt that some of the very anomalous results which have been obtained, in particular the finding of oxygen in the exhaust when there is incomplete combustion of the petrol as shown by the presence of carbon monoxide, are due to faulty collecting of the samples.

The results of the analysis of a large number of exhaust gas samples, obtained when using different strengths of mixture, are shown in Fig. 27. In this figure the ordinates are the percentages of CO_2 O_2 and CO, obtained after the steam has been condensed. It will be seen that, starting with a weak mixture and increasing the strength of mixture, the percentage of carbon dioxide, as shown by the upper curve, increases up to a mixture containing 1 of petrol to 14 of air. For stronger mixtures the percentage of carbon dioxide gradually decreases. For mixtures weaker than 1 of petrol to 14 of air there is always a certain quantity of free oxygen in the exhaust, the percentage increasing as the mixture gets weaker. On the other hand, for mixtures containing more than 1 part of petrol to 14 of air, there is always a certain amount of carbon monoxide present, the percentage increasing as the strength of mixture increases. Now, except with about 14 of air to 1 of petrol where we may have 1-2 per cent. of both free oxygen and carbon monoxide. these gases are never both present; as long as there is any free oxygen in the exhaust there is no carbon monoxide, and *vice versa*.

By collecting a sample of exhaust gases and performing an analysis we can, by means of curves given in Fig. 27, immediately deduce what was the ratio of air to petrol taken by the engine at the time when the sample was collected. Hence, if samples are collected with the engine running at different speeds and with different throttle openings we are able to examine the working of the carbureter and, if necessary, adjust it, so that the strength of the mixture may remain, if not correct, at any rate within reasonable limits for all working conditions. As an example of such an investigation I may quote some results taken with my own car. After the car had been in the hands of the makers, and the carbureter had been adjusted by their tester, I took a series of samples of exhaust gases with the following results:

Speed of car	Throttle	Per cent. of CO in exhaust
18 m.p.h.	full open	9.6
23 "	½ open	2.2
Clutch out, engine turning slowly		0.4

Now, 9.6 per cent. of carbon monoxide in the exhaust represents a waste of about 36 per cent., due to incomplete combustion of the petrol, while even 2.2 per cent. of carbon monoxide represents a waste of 9 per cent. It was evident that the carbureter had been adjusted so that when the engine was running light, with the throttle almost closed, it would get a sufficiently strong mixture to work regularly, and that with this adjustment when the throttle was opened the mixture became much too rich. Further examination showed that when the engine was running light the petrol was not being properly vaporized, for a steady trickle of liquid was found to flow out of the bottom of the carbureter. By arranging a small cone of wire gauze below the jet, so that any petrol which flowed down the sides was spread out over the gauze, evaporation was so much improved that no liquid petrol escaped. The air now took up, even with the throttle almost closed, so much more petrol vapor that the supply of liquid could be very much reduced. This, together with a hand-operated extra air valve, caused the working of the carbureter to improve to such an extent that, in place of getting 28 miles to the gallon, 42 miles was obtained, while the following results for the exhaust gas analysis were obtained:

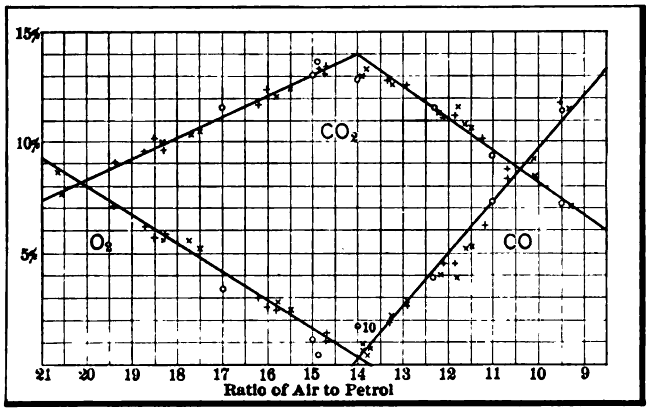

Fig. 27—Chart showing results of analysis of various exhaust gas samples, obtained from different strengths of mixture

Speed of car	Throttle	Per cent. of CO in exhaust
18 m.p.h.	full open	0.0
21 "	¾ open	0.4
21 "	¼ open	0.0
Clutch out, engine turning slowly		0.0

As another example of the utility of exhaust gas analysis when investigating the working of an engine, we may take some analyses made of the exhaust of the two-cycle engine from which the diagrams shown in Fig. 15 were obtained:

	Speed of engine (revolutions per minute) 640	1,500
	Per cent.	Per cent.
CO_2	6.8	10.0
O_2	7.6	1.6
CO	2.0	4.8
H_2	0.7	1.7
CH_4	0.2	0.2
N	82.7	81.3

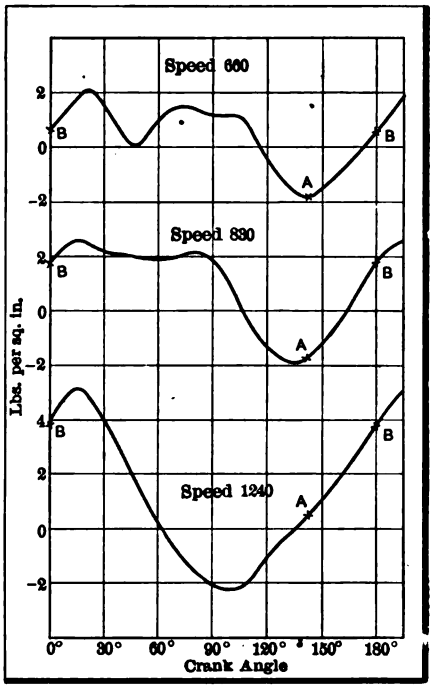

Fig. 26—Chart showing variation of pressure in exhaust pipe of four-cylinder engine

It will be observed that at both speeds we get free oxygen and carbon monoxide in the exhaust, while it will be remembered that in the case of a four-cycle engine these two gases are never found simultaneously. The reason for the difference is that while in the four-cycle engine, where the exhaust valve and the inlet valve are never open at the same time, it is impossible for the fresh charge which is entering to escape through the exhaust valve, in the case of the two-cycle engine it is quite otherwise. The exhaust port is open all the time during which the inlet port is open, and even after the inlet port is closed on the compression stroke, and although a baffle plate is fixed to the top of the piston so as to prevent the incoming charge from blowing straight across to the exhaust port, yet it is quite easy for some of the fresh charge to escape. Now, since there is some carbon monoxide in the exhaust, it follows that all the oxygen contained in that part of the fresh charge which is retained within the cylinder has been combined with the carbon and hydrogen of the petrol, and therefore all the free oxygen found in the exhaust must have blown straight through from the inlet to the exhaust port. From the percentage of nitrogen in the exhaust we can at once calculate the quantity of oxygen which accompanied this nitrogen in the air which was taken into the engine, since the proportion of nitrogen to oxygen in the air is always the same. Thus 82.7 volumes of nitrogen must have been accompanied by 82.7 x 0.266 or 22.0 volumes of oxygen. The analysis shows that 7.6 volumes of oxygen must have escaped through the exhaust port during the time the fresh charge was entering. Hence

$$\frac{\text{Oxygen which escapes}}{\text{Total oxygen taken}} = \frac{7.6}{22.0} = .345.$$

Now the oxygen which escapes bears the same ratio to the total oxygen which enters through the inlet ports, as does the charge which escapes to the total charge. Hence

$$\frac{\text{Charge which escapes}}{\text{Total charge}} = .345.$$

In other words, 34.5 per cent. of the charge, which enters the engine at a speed of 640 revolutions per minute, escapes through the exhaust port, and hence is, of course, entirely wasted.

A similar calculation made for the speed of 1,500 revolutions per minute shows that, at this speed, only 7.4 per cent. of the charge escapes. The reason for the much larger escape at the slow speed is at once evident from a study of the crankcase diagrams given in Fig. 15. The much larger charge per stroke taken into the crankcase at the slower speed, and hence the larger volume of fresh charge driven into the cylinder is responsible for the large loss of charge through the exhaust port.

If you see an automobile approaching at a brisk pace, give it sea room; it may cast a shoe just alongside of you.

If you hear a strange noise, make an investigation; it might be due to a hollow lubricating oil tank.

Don'ts for the Automobilist

FOR THE BENEFIT OF THOSE WHO NEED NUDGING; DEALING WITH PROBLEMS OF EVERY-DAY OCCURRENCE; APPLICABLE TO THE AUTOMOBILIST AND THE CITIZEN

Don't lay the blame on your collaborators if you fail in some undertaking. If you are a bungler there will be no concealing the defect in any case.

Don't imitate children; they blame others for what they do that is wrong.

Don't try to transfer the responsibility for an act that is yours if it fails to pay a dividend.

Don't attempt to assume the responsibility for an act that is not yours if it does threaten to pay a dividend; the elusive little fellow might escape after you acknowledge the child as yours.

Don't surrender your reputation for being honest by trying to escape the blame for a fault.

Don't forget that anyone would rather have an honest (though imperfect) man than a person who is smart and irresponsible.

Don't be grieved if you naturally would like to take credit for good deeds and escape responsibility for the other kind—so would all your acquaintances.

Don't shirk responsibility just because there is a good chance of failure—could your employer find a better risk than you, he would do so.

Don't expect to shine with an efficiency of 100 per cent. No man ever lived in such fierce light.

Don't be satisfied with an efficiency of less than 66 per cent. Your friends will be disappointed in you if you are.

Don't be a lone fisherman; find out what others expect of you; see if you cannot merit their approbation.

Don't try to reduce the number of your enemies; have you forgotten that it is they who urge you on?

Don't let your friends baby you too much; it is nice of them, but it spells inactivity, and, what is worse, the intellect is lulled into a dangerous sleep.

Don't forget that a good friend makes a vigorous enemy; try to draft your enemies from the outside world.

Don't invite your enemies to lash you into a fury; just arrange with them to give you a sting of the whip when you need it.

Don't be bashful; your enemies will accommodate you any time that you request them to act.

Don't be blind; masks are worn by those who need them; masked faces are not good to look upon.

Don't be suspicious; if you are in financial trouble, consult a lawyer; if you are ill, send for a doctor; but if you are suspicious of some one, consult a friend and rely upon his judgment.

Don't impose upon a democratic spirit; you might wear out your welcome.

Don't imagine that you are using influence when you are swinging a club.

Don't club intelligence; you will be annihilating your best asset.

Don't forget that intelligence would have to be clubbed to death before it would bow to such a crude device as a club.

Don't hide the real merit that resides in your effort, and then substitute brutality when you go in quest of recognition; let the good quality shine; it will bring a response.

Don't forget that brutality is the most objectionable when it is dressed for a saunter 'midst refined society.

Don't overstep the bounds of prudence; when a man gives you all that you go after, why come back?

Don't harangue a mob; tell your story to some one intelligent person; the mob will follow the intelligent man.

Don't tell a story that will not attract the notice of the intelligent, nor forget that the same story will be as Greek to the ears of the mob.

Don't overlook the pleasure that follows if the chauffeur belongs to the class who keep automobiles in good working order; the saving in dollars is but a small part of the advantage.

Don't assume that your automobile will keep well just because you run it into the garage and keep it there for the Winter; that persistent agent of destruction, rust, may be a very busy pest; it might be like planting the automobile in a grave.

Don't use your garage for a grave; a hole in the ground is cheaper; the garage might then be available as a chicken coop.

Don't put a car up for the Winter without first preparing it for its long hibernation.

Don't assume that it is a mere matter of running off the water and emptying out the gasoline tank.

Inferior Terminology

No Truth in the Claim That a Cooling System Is Thermosyphon in the Absence of Water Pump

PERHAPS it is too late to revise the most commonly used terms throughout the automobile industry, referring to those that do not adhere to accepted terminology. The word "Thermosyphon" as applied to cooling systems of the class which do not depend upon a water pump for the circulation of cooling fluid is misplaced. It is even a question of some doubt as to whether or not the compound term "heat circulation" would be descriptive of the process. The probabilities are that the circulation which takes place in a body of water, due to differences in temperature, would be far too feeble to accomplish the purpose. In some so-called thermosyphon systems steam forms over the surfaces of the combustion chamber of the cylinders of the motor, and this slug of steam rushes off through the constricted passageways of the piping toward the atmosphere entraining water, thus setting up circulation. The vigorousness of this form of circulation is equal to that of a designed water pump. It would be within the realm of reason to hold that these slugs of steam are to all intents and purposes the very equivalent of the piston in a water pump, and they do the same work. It is doubtless true that a process of molecular segregation goes on; the molecules of water that are most affected by heat expand, thus lowering the specific gravity as compared with the same property of the water in the colder strata, and a process of equalization goes on, due to the circulating influence of the shifting molecules within the body of the water. But this feeble force for circulating purposes is a bagatelle as compared with the projectile-like ravages of a slug of steam, holding in its makeup a large amount of energy, by means of which it is impelled like a meteor from the place of formation to the point of escape to a lower pressure. The lower pressure is, of course, the outside atmosphere, and the overflow of the radiator is the gate to which the steam is directed in its passageway, and it is the problem of the designer to take advantage of the force of the steam so formed, but to dissolve the same in the water ere it reaches the atmosphere outside.

It Stands to Reason

JUST A FEW OF THE POINTS THAT SHOULD BE SELF-EVIDENT TO THE THINKING AUTOMOBILIST; THAT SHOULD NOT BE UNKNOWN TO THE THINKING BUILDER

That tires will not last long if the inner tubes are not of the right size; this class of trouble lost a race for one of the contestants for the Grand Prize at Savannah.

That the inner tubes will give out if they are too small, for then the rubber structure will be stretched too much.

That the inner tube will be quickly destroyed if it is too large, for then it will lap over and crack at the seam.

That the inner tube will be destroyed if it sticks (adheres) to the shoe.

That the inner tube will adhere to the show if it is not lubricated.

That lubricant for rubber is not the same as the lubricant used in metal bearings; for rubber, use soapstone; for metal, use mineral oil.

That sprinkling soapstone into the outer shoe just before putting the inner tube in place is not lubricating the tube.

That the soapstone must be rubbed all over the surfaces of the inner tube before it is placed in the shoe; a heap of material in the shoe may be damaging.

That care must be taken not to allow dirt from the roadway to contact with the inner tube; a $2 duster, laid upon the ground every time, will save several $10 inner tubes, and, perhaps, an outer shoe as well.

That a power pump to inflate the tires is of no value unless the air valves of the inner tube are in good order.

That putting up with defective air valves is poor economy; they cost but a few cents each—keep a few in the kit.

That tire valves should be covered with dust caps.

That good tires and care in putting them on is like spilling water into the ocean if a good tire pump is not available to use in pumping them up.

That a good tire pump is of little value unless there is some means at hand to tell the pressure.

That guessing at the tire pressure is like dreaming about how much gold there is in the vaults of the Bank of England.

That pumping up to a given pressure for all the tires is not good practice, unless attention is given to the effect of the given pressure on each of the tires—some tires have to be pumped up a little higher than others.

That good ignition equipment must be used if the motor is to deliver its proper quota of power.

That temperature, as it obtains in Winter and Summer weather, is never so severe as to alter the magnetic qualities of the permanent magnets of the magneto.

That temperature does affect the carbureter because the viscosity of gasoline changes with the temperature.

That the ignition is more or less efficacious as the fuel is well or ill proportioned.

That Winter's service demands a larger opening of the nozzle orifice of the carbureter than will be required in the Summer time unless some scheme is employed to maintain the fuel at a constant temperature.

That the fuel must be held at a constant temperature as it spirts out of the nozzle of the carbureter to avail anything from the point of view of a constant flow.

That temperature affects the battery, when one is used for the source of electricity, reducing the voltage, or the output, as the temperature is lowered.

That lead-lead storage batteries should be kept at a constant temperature to obtain the best result.

That the highest efficiency of the battery is at about 90 degrees Fahrenheit.

That poor ignition service is to be expected unless all the joints of the electrical system are soldered.

That makers of automobiles should see to it that all the joints of the electrical system are soldered before the automobiles are delivered.

That an accumulation of stale lubricating oil may not spell trouble until the temperature falls low enough to make it into a rock.

That a clean automobile is the least likely to give trouble in cold weather.

That an automobile may be too dirty to run and still look as spick and span as a 4-year old.

That a dash of attar of roses will not serve as a counter-odor for an automobile; what it needs is cleaning; get rid of the old lubricant.

That wheezing is a sign of defectively packed joints; replace the packing.

That just a small leak in the intake manifold will throw the mixture out of balance and shut the motor down.

That a leak may be due to defectively packed joints.

That the intake manifold may have a flaw in it; the mixture will then be out of kilter; get it fixed.

That shellac will close up a porous intake manifold quite permanently; flow the shellac over the inner surfaces.

That the proper kind of lubricating oil for a clutch depends upon the design and construction.

Our Endless Production

The Horse Shows That No Dent Has Been Made In Natural Demand As Yet

The new census tells us that there are more horses and more horse value in the United States now than were found in the year 1900. With all allowance for the probability that values and chattels were skipped generously by the enumerators and concealed industriously by the proud but thrifty owners, the new finding still contains some valuable documentary evidence as between the bears and the bulls in automobile production. It has been almost forgotten that the automobile was to drive the horse out of work and into the zoos, as was so generally claimed before it could be proven. These days, when the steadily swelling number of satisfied owners of automobile trucks and delivery wagons has really proven that the horse eventually must give up its burdens, the lesson of the fact seems to be lost on those who view with alarm a production of 200,000 automobiles in one business year, and to be appreciated mainly by the men of large finance who are accustomed to build on the broad facts of national scope. The horses are still there. What more does the doubting banker of Thomastown want? He who has grown opulent not only through his ability and faith in his own community but mainly through the large and conspicuous fact, in which are enfolded thousands of grievous industrial and commercial sins as in a mantle of charitable generosity, to wit, that it is difficult for any sound industry to keep step, only, with the national expansion in a country whose demands for a useful or a pleasing article grows annually by a healthy birthrate increase of the population exceeding 2 1-2 per cent., and in addition by an equal increase from the influx of immigrants, from whose labor somebody derives a profit, so long as all are working. In this bountiful situation the question of production remains serenely, How rather than How Many?

Classifying Carelessness

Meager Statistics Used to Classify Causes of Tire Trouble

RULES for use in "bucking" the stock market do not always prevent the players from getting their fingers burned, but they have a certain value to the man of skill and discrimination, so that if he must "take a flyer" he at least displays the good sense of utilizing available information for what it is worth. The same idea should have some value from the point of view of the automobilist who finds himself struggling with a large tire bill. Crude statistics are responsible for the classification of these troubles, as follows:

CAUSES OF TIRE CASUALTIES GIVEN IN PER CENT.

Assignable Causes	Shoes	Tubes
Reasonable wear and tear	37.1	43.7
Insufficient inflation	17.3	6.8
Punctures	29.4	7.2
Bruising	4.9	9.5
Surface blemishes	4.3	5.8
Rusted rims	3.5	..
Creeping	1.5	..
Blow-outs	1.8	..
Decomposition	0.2	..
Nipping	..	13.0
Unassigned	..	14.0
Total	100	100

Limiting Tire Depreciation

All Other Conditions Remaining Equal, Speed Is Disastrous

HAVING purchased the best tires possible to obtain for a given automobile, making sure that the sizes are large enough to sustain under the load without flexure, observing that they are fully inflated, keeping them out of contact with lubricating oil and other rotting substances, maintaining the surfaces intact in order that water will not be the carrier of mildew into the fabric, there still remains a considerable opportunity to destroy the tires before they will have rendered sufficient service to pronounce them satisfactory.

The speed maniac may be equally described as a tire destroyer. It is speed that does it. A given set of tires on a given automobile will last four times as many miles at 20 miles per hour as they will at 40 miles per hour. Putting it another way, the mileage of a tire is approximately inversely proportional to the square of the speed of the car. In operating an automobile, the average speed of traveling, considering a distance of, say, 1,000 miles of the total effort, does not exceed 18 miles per hour; this is in the face of the fact that autoists drive at a much higher speed for a part of the time, but it is not believed that they fall below this level for an equal part of the time. What really happens, is, that for all the time gained at the higher speeds, there is an offsetting period of inactivity which does not help to sustain the average speed.

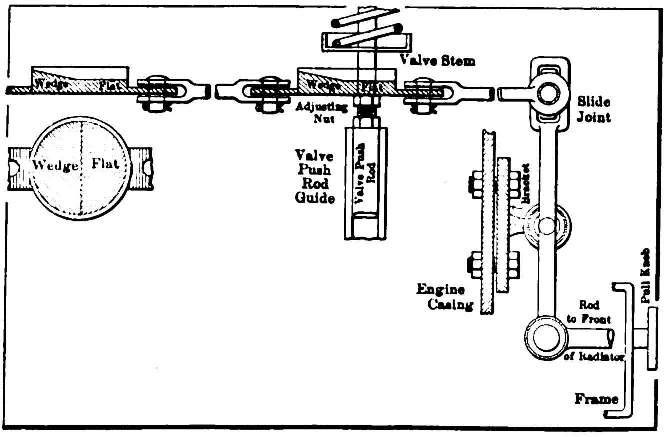

Fig. 1—Method of fitting compression release

Letters from Subscribers

High Compression Causes Difficult Starting

Editor THE AUTOMOBILE:

[2,434]—I have a car fitted with an engine with a five-inch bore and 5 1-2-inch stroke and find it very difficult to start, particularly in cold weather or when the engine has not been run for several hours, owing more to the fact that the compression is high and therefore difficult to swing. There is no compression release fitted, which makes matters worse. I have tried putting gasoline into the cylinders and after a few pulls it will start, but the difficulty is to crank sufficiently fast for the low-tension magneto. I find it more difficult to crank with the compression cocks open. What would you suggest to overcome the difficulty?

Buffalo, N. Y. F. C. RICE.

The difficulty with your car is that it should have been fitted with a compression release. To fit an internal release is a matter that we cannot suggest, as it involves a new camshaft and quite a lot of alterations. The simple compression release shown in Fig. 1 could be fitted to almost any motor. It consists of inserts placed under the valve stems in such a way that when the motor is running the flat surface only is in contact. The engine is started by pulling out a rod in front of the car near the starting crank; the wedge-shaped part of the insert raises the exhaust valves slightly, which will permit of giving the engine a good "swing." The insert should be hardened.

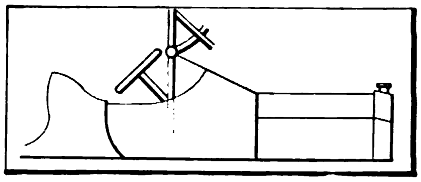

Fig. 2—Wind shield for small runabouts with scuttle dashes

Patches That Do Not Stick

Editor THE AUTOMOBILE:

[2,435]—I have just returned from a tour, and although somewhat inexperienced I had no trouble with any part of the car but the tires. The less I say about them the better, as I could fill your paper with my troubles. But they say that practice makes perfect, and I now see that a good deal of my trouble was of my own making. There is one thing, however, that I cannot manage, viz., putting patches on punctures and making them stick on. Everything seems good when I put the tube in the tire, but after a few miles the two part company. The trouble I have is to make the patch stay on the tube, as it always has a tendency to curl at the sides. I have greatly profited by your recent articles on tires and will be greatly obliged if you can help me. TIRED.

Savannah, Ga.

Your difficulty seems to lay in two things: First, you do not allow the solution to become tacky, and this takes from 10 minutes to a quarter of an hour by the watch, and not guesswork; secondly, you should have some means of keeping the tube and the patch pressed together, and such a tool as shown in Fig. 3 would answer. It consists of two pieces of hardwood and a clamp that can be purchased at any hardware store. Leave the tube in the press about ten minutes, first lightly powdering the boards to prevent the patch from sticking to them.

Heat inside the tire is generated by friction and to overcome this liberally cover the tube with French chalk before inserting it again and pumping it up to the proper pressure.

THIS DEPARTMENT IS DEVOTED TO THE ANSWERING OF LETTERS FROM SUBSCRIBERS ON ANY SUBJECT RELATED TO THE RUNNING OF AUTOMOBILES

Weight of Woods for Aeroplanes

Editor THE AUTOMOBILE:

[2,436]—Could you give me the weight in pounds per cubic foot of the following woods: Ash, beech, elm, oak, sycamore, willow, together with any remarks on them as to their properties?

Ash weighs 50 pounds per cubic foot and is very elastic and withstands weather conditions well. Beech weighs 42.12 pounds and the white variety admits of thin divisions. Wych elm weighs 35.62, and is suitable for steam bending. Rock elm weighs more than wych, viz., 41.93 pounds per foot cube, but is closer grained and better to work. Oak weighs 54.50 and is durable in exposure to weather; on account of the tannin in oak it must not be used in contact with iron. Sycamore weighs 38.90 pounds per foot cube and willow 30.37 pounds. The latter is often used for friction plates and brake blocks.

An Inexpensive Wind Shield

Editor THE AUTOMOBILE:

[2,437]—I have a racing runabout with a metal scuttle dash and I wish to fit a wind shield. I tried one fitted to the dash, and it was worse than useless, as to be of any service it had to be high, offering a large area for wind resistance. If it were possible I should like it so designed that I will be able to lift it and see underneath when it rains.

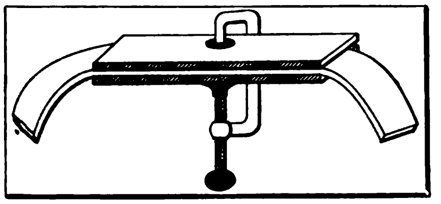

Fig. 3—A tool that every autoist should carry—two pieces of wood and a clamp

York, Pa. H. P. S.

Such a shield as you require we have sketched in Fig. 2. As you say the car is fitted with a scuttle we presume there are front doors and enclosed sides and to these the upright can be fitted. From the upright to the dash we suggest that you fit a piece of leather that can be removed and make the frame carrying the glass hinge at the top. The bottom of the frame should be fitted with bolts and thumb-nuts which will grip on the semi-circular guides. If you have a top fitted, raise this when you are measuring the height of the shield.

"Which Wire?"

Editor THE AUTOMOBILE:

[2,438]—I have a fleet of motor cabs running, and what I find gives the men more trouble than anything else is the ignition wiring. There are two separate sets of plugs connected to magneto and coil ignitions, and the men, when anything happens, often remain stranded owing to want of knowledge as to which wire to put to the proper terminal. Could you give me any suggestion as a remedy?

New York. A SUBSCRIBER.

The best method we can suggest is to mark the terminals with different colored paints, thereby making the matter of matching simplicity itself and doing away with any possibility of making mistakes. The valve caps into which the spark plugs are screwed should be painted as indicated in Fig. 4, and each wire so colored that it can be traced from spark plug to magneto or distributor with ease.

Slush in the Cooler

Water Has a Definite Freezing Temperature; Non-freezing Solutions Are Not So Definite

WATER freezes at 32 degrees Fahrenheit, under a pressure of one atmosphere, and as long as there is any water present the temperature will hold at the point of freezing, or melting, as the case may be. In dealing with water, this definiteness is advantageous. Upon adding ingredients which in themselves have a lower congealing point, they influence the freezing point of the whole, dragging it down to a lower level. It is also true of glycerine, alcohol, calcium-chloride, etc., that when added to water to make a non-freezing solution, they destroy the sharp line of freezing distinction, and instead of making a solid at some definite temperature, the product is more in the nature of "slush," a good example of which is to be found in the characteristics of ice cream. This slushing property may be taken into account advantageously. In making a non-freezing solution, the more of the foreign substance that is added, the lower will be the specific heat of the mixture as a whole, to which must be ascribed the reduced efficiency of the solution for cooling purposes. Under the circumstances, it is wise to add as little as possible of the glycerine, or alcohol, as the case may be, to attain the end, and the fact that slush forms, rather than a homogeneous body, makes it possible to limit the quantity of the foreign material to be added, knowing that while the lowest winter temperature may produce freezing, it is not likely to result in a homogeneous solid body.

Value of Graphite

Automobilists Will Profit by Its Use as Here Indicated

IT has been found that if finely powdered flake graphite is put into the crankcase in the proportions of a teaspoonful to a quart of lubricating oil the engine runs more smoothly, there is better regulation and compression is much improved. The following uses for flake graphite about the automobile are suggested:

Introduce flake graphite between the leaves of the springs. This may be done by jacking up the car so that the chassis hangs by the springs, then flake graphite and oil mixed to the consistency of a thick paste may be introduced between the leaves and the squeak will be cured for practically all time.

If the valve seats and stems are polished with flake graphite a free and easy movement is assured.

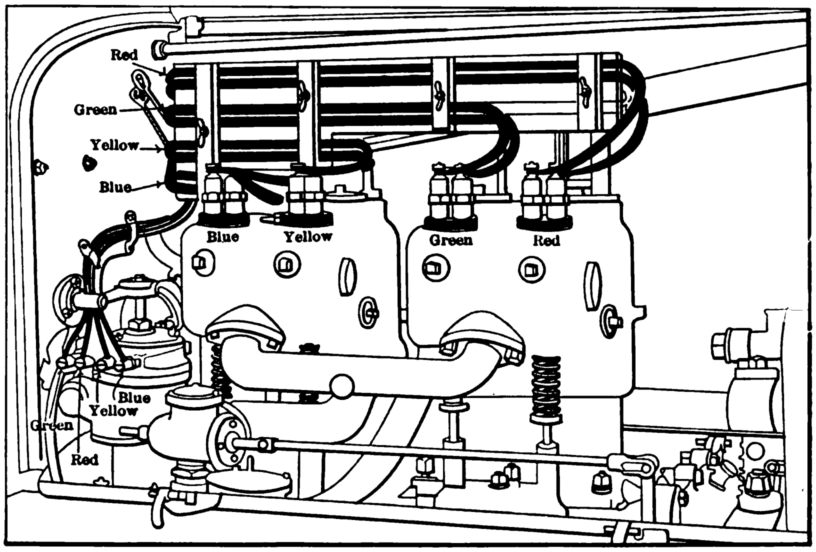

Fig. 4—Method of painting wires to facilitate finding the proper wire

As a General Rule—

If an inventor is awarded a patent, an infringer will be found for it.

If a patent is allowed, it is fairly well understood to be a license for a lawsuit.

If the inventor ever reaps a profit, he may consider himself fortunate.

If the invention is valueless it will not be copied.

If the invention proves to be an epoch making discovery there will an army of copyists.

If the inventor is wise he will exact cash from the purchaser.

If the inventor takes a note in payment it will be no good.

If the purchaser can negotiate a transfer for a note or a promise, he will do so.

If the inventor goes to law he will find it the shortest road to the poor house.

If the inventor has any other way of making a living, it will be worth his while to practice it.

If "Colonel Sellers" made all the money he hoped to, there would be no more left in the world.

Carbureter Action

BEING AN ABRIDGMENT OF A PAPER READ BEFORE THE BRITISH INCORPORATED INSTITUTION OF AUTOMOBILE ENGINEERS, BY W. MORGAN, B.SC., AND E. B. WOOD, M.A (CANTAB.) (SECOND INSTALLMENT)

VARIATION of cross-section of throat modifies the suction on the jet for equal deliveries of air and consequently modifies the carbureter characteristic. Bushes of the following diameters were used with the same jet: A, 1 1-4 inches; B, 1 inch; C, 3-4 inch, and D, 1-2 inch.

These varying velocities past the jet affect both the slope of the characteristic and the point of intersection on the air axis (see Fig. 6). The characteristics converge toward a point on the petrol axis behind the air axis.

The droop from the straight line appears to a greater or less extent on every curve taken. Fig. 7 gives the characteristics obtained with tubes A, B, C, at 500 revolutions per minute. It is seen that the maximum quantity of air per minute with A and B is the same, the curve of the droop in the case of B being slightly the flatter. In the case of C the droop is still less pronounced. Measured in percentage deviation from the straight line relationship the droops are: A, 23; B, 7, and C, 5.

The engine in cases A and B has nearly reached the maximum intake of air with half-open throttle, so that further throttle opening serves to enrich the fuel mixture without grealy increasing the quantity of air taken.

Strongly marked oscillations of pressure occur in the induction pipe of an engine due to resurgence on the opening of the inlet valves and to inertia effects generally. These same effects will occur in the partially throttled pipe, but the pressure variations will be damped by the high gas velocities at the partly closed throttle. On opening the throttle lower gas velocities are obtained with less and less damping action so that the surges of gas are more strongly felt at the jet. With open throttle this surging can be so strong as to carry petrol outward from the induction pipe. The result is that a unit volume of air in surging flow induces a larger quantity of petrol than the same volume in steady flow.

It has been suggested that the high gas velocities in a partly closed throttle serve to damp the surging. The same would be true of high velocities around the jet and this conclusion is borne out by the smaller droop observed with throat C. The authors made efforts to wipe out this droop by inserting silencers of various types between the engine and the jet with quite satisfactory results. Care was taken that a silencer was used which offered no serious resistance to the passage of air. Fig. 8 is the graph obtained with a silenced carbureter using high velocities round the jet.

Without this droop the characteristic of a plain-tube carbureter for all speeds and throttle positions would be a straight line graph. The droop for wide-open throttle positions causes the graphs for successive speed to cover a wedge-shaped area, so that with the same delivery of air various quantities of petrol may be obtained. It should be noticed that this variation is more apparent than real, for in the examples shown, up to 0.8 of the maximum air delivery possible at any speed the characteristic lies on the straight line.

The cause of the droop in the carbureter curve has been stated to be resurgence in the induction pipe which makes itself seriously felt when the throttle is wide open. It may be urged that the droop may be caused by a change in the type of air flow set up at certain conditions of velocity and throat area. If this were so it would be expected that the characteristics obtained at different speeds with the same bush would all show the graph falling from the straight line at the same point. Reference to the superimposed curves obtained with the same bush at speeds of 300, 500 and 900 revolutions per minute (Fig. 3) shows that the droop begins to be apparent at points indicating different velocities with different speeds.

Variation in back pressure may be expected to affect the characteristic, for, in general, the pressure in the cylinder, on the opening of the inlet valve is greater than that in the induction pipe, so that a rush out of the cylinder takes place, setting up surging (see Fig. 1). This effect will be the greater, the greater the back pressure, and as a consequence it may be expected that

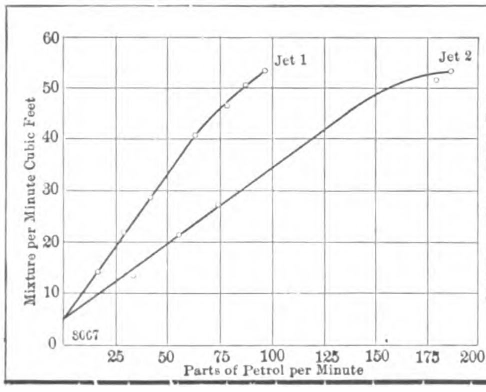

Fig. 5—Curves plotted from tests on jets of different sizes

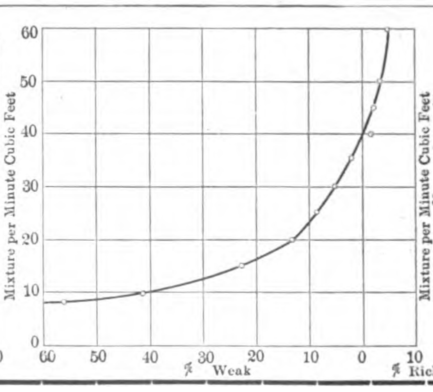

Fig. 4—Percentage variation of mixture strength

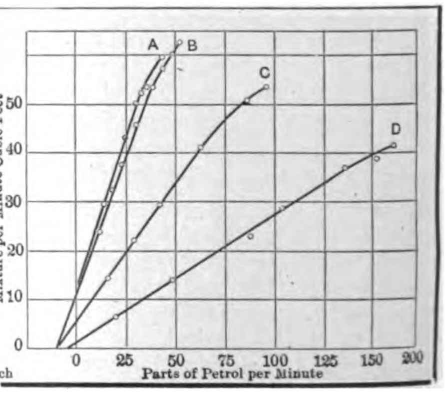

Fig. 6—Effect of varying sizes of choke tubes

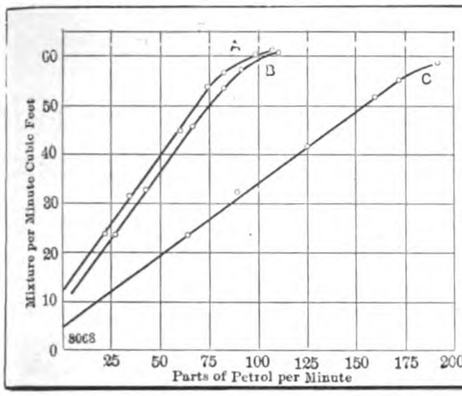

Fig. 7—Obtained with three sizes of choke tube at 500 r.p.m.

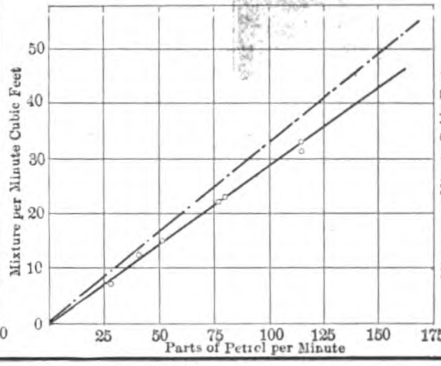

Fig. 8—This graph was obtained with a "silenced" carbureter

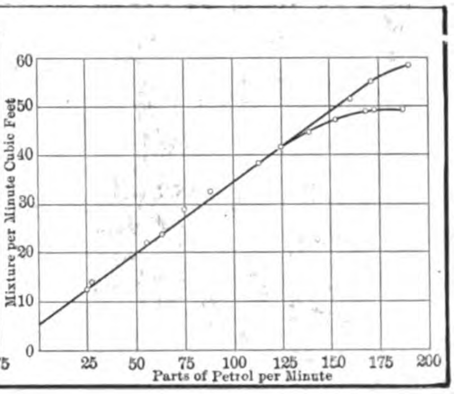

Fig. 9—The results of back pressure are plotted here

other things being equal a high back pressure will give a carbureter characteristic with a greater droop than that obtained with a low back pressure. This is brought out in Fig. 9, which shows characteristics obtained with normal back pressure and with a pressure of 5 pounds per square inch.

The adjustable tappets on the valve lifters of the engine were removed first from the two back cylinders, leaving the two front ones in action. Afterward the third cylinder tappets were removed. In this way characteristics were obtained with two cylinders and with one cylinder in action. The type of characteristic remains unchanged.

The characteristic of a plain-tube carbureter for all speeds has been shown to be a straight line (neglecting droop). The slope of this graph may be varied to any degree by selecting a suitable jet. Let the jet be adjusted so that in a given plain-tube carbureter the characteristic lies parallel with the ideal line. The mixture delivered is now weak all along the line, very weak at first, and becoming very nearly correct for large consumptions of air. Another way of stating this is to say that in such a plain-tube carbureter there is a constant shortage of the delivery of the liquid. This being so, the designing of a constant mixture carbureter is possible; allow the constant shortage to dribble into the induction pipe and the problem is solved, except for questions of convenience. The droop on the characteristic for any given speed does not necessarily lead to waste of petrol, for the graph may be set so that the terminal points of the characteristics are parallel to the ideal line; a suitable constant supply then enables the ideal mixture to be obtained at all open throttle positions. At intermediate throttle positions the mixture would be weak, but if the statement be accepted that such weak mixtures are economical this would be a desirable feature. In any event when maximum torque was required at any speed the required mixture could be obtained by fully opening the throttle; with throttled positions maximum torque is obviously not required and some weakness of mixture would not be felt.

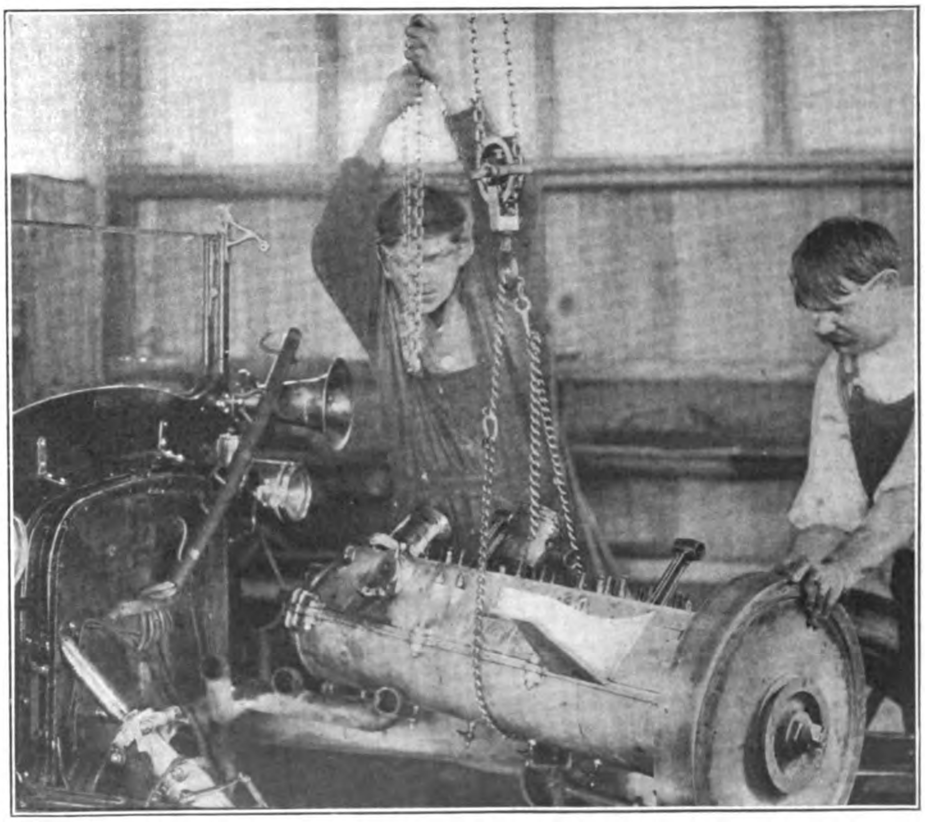
To sum up, there appears to be no necessity in any carbureter for extra air devices or the multitudinous contraptions employed other than a neat form of apparatus for supplying this constant extra supply of petrol.

It may be objected that the foregoing results have been obtained under conditions which do not occur in practice. This is true, and to estimate the effect of actual running conditions in modifying the characteristics obtained by driving the engine by an electric motor, measurements of air and petrol consumption have been taken with the engine running under its own power. The apparatus employed was the same, except that the electric motor was cut out and replaced by a rope brake. The engine speed was held constant for various throttle openings by varying the load on the brake. The results obtained bore out those obtained by driving the engine by an electric motor.

Lifting Out the Motor

Illustrating the Use of a Chain Hoist in the Repair Shop

NEXT to a file or a hack-saw the chain hoist ranks in importance in the repair shop; it comes in when units are to be lifted out of the chassis, as shown in the illustration, and, in many tight corners, it is worth more than a half dozen men. All that is required is the hoist, capable of lifting anything up to two tons, and a sling, so that while one man puts his weight on the whip end of the chain hoist, the other man steadies the work.



Illustrating the use of a chain hoist, showing how the motor base, in this example, is slung, permitting one man to lift the weight while the other steadies it

Laying Car Up for Winter

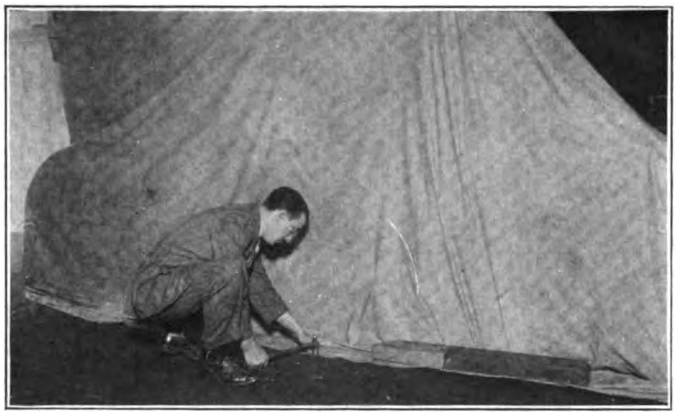


Fig. 1—Care should be taken to see that the cover is either held to the ground or tacked thereto

IT is not always because the owner does not care for driving in inclement and cold weather that the car is laid up for the Winter. Health, business and the putting of a closed car into use necessitate the open car being stored, and the owner will do well to remember that a great deal of trouble can be saved at any future time that the open car is put in service if the autoist will see that the following instructions are properly carried out. There is nothing that will depreciate the quality of a car sooner than allowing it to lay idle and unprotected for any length of time, except, perhaps, abuse; and it is for this reason that a doctor's car runs better than most cars of the same make, as he, above everybody, has to keep his car in running order, and consistent running without rough usage keeps everything in trim.

Appearance has a lot to do with it, for when appearance has to be studied the car is sure to be properly looked after, preventing filthy accumulations of oil, grease and mud.

Tires.—Place the car where it can remain without having to be moved and with some suitable means jack the wheels up and remove all the tires. Fig. 4 shows how the front wheels can be lifted by placing the jack under the center of the axle and inserting blocks of wood B1 and B2 under the spring clips. The wheels U1 and U2 may have to be turned to allow the block B1 clearing the steering arm. The rims should be looked over to see if any dents are present and these should be remedied; clean off with emery paper any rust that may be on them, and then paint the insides with aluminum or any other suitable paint to prevent them rusting while being stored. The tires should be thoroughly overhauled and all small holes cleaned out with gasoline and a pointed instrument to remove dirt and small stones, and if there are any large cuts and the autoist is not in a position to do vulcanizing himself the tires should be sent to some tire shop to have such repairs made. The tubes should be wiped over with gasoline (using only a very small quantity) and slightly inflated, well-covered with French chalk inserted in the tires, of course after all vulcanizing that is necessary has been effected. Wrap them up in cloths and store in a dark damp place. Hang up on stout wooden pegs or lay them flat on shelves; never hang tires on nails.

Body.—This should be lifted about 2 inches for the better access to the chassis. It is usually accomplished by loosening six bolts that attach it to the side members of the frame. All dirt and oil should be removed by scraping and washing. If pleated leather upholstery is fitted, introduce a wet leather between the folds to extricate dust and afterward dry off with a clean, soft rag. The white of an egg painted on with a brush will give the leather a renewed luster; this can be done when putting the car into commission again. If the cushions show signs of sagging they should be taken apart and the springs looked over and the hair restuffed. The paint work should be gone over with a renovator such as can be obtained at any coach-builder's store.

Chassis.—As above stated, to thoroughly overhaul the chassis the body must be lifted. The amount of dirt and oil that cakes everywhere in the parts covered by the body is surprising. Clean all foreign matter off with kerosene and a stiff brush, and rub with fine emery paper moistened with kerosene any metal parts that have become rusty. The latter facilitates the work and gives a smooth finish, and to prevent a reoccurrence the parts could be treated with paint; or if they are to remain bright, cover them with some thick oil, such as is used for rear axles; it is better than grease and easier to remove. Go over all nuts to see that they are tight, and if there are any missing replace them and renew any bolts that are worn.

Wheels.—Remove these; clean journals and ball races with kerosene and repack with grease or thick oil; if there is any play, which can be ascertained by shaking the wheels sideways, this should be taken up before the wheels are replaced.

Springs.—It would be as well to take the springs off, if the car has been in use for any length of time, in order to scrape the rust from between the leaves; otherwise jack the frame up, as shown in Fig. 2, when the weight of the axles and wheels will cause the leaves P1, P2, P3, P4 to separate and grease can be introduced with a flat knife, T1. If the leaves do not come apart easily prize open with a screw driver. Spring bolts and shackles wear if not made from the proper material, and these should be taken out, cleaned with emery paper and kerosene, oiled and replaced. If there are any grease holes drilled for grease cups, clean these out with some wire, so that when grease is again put through them there will be no impediment.

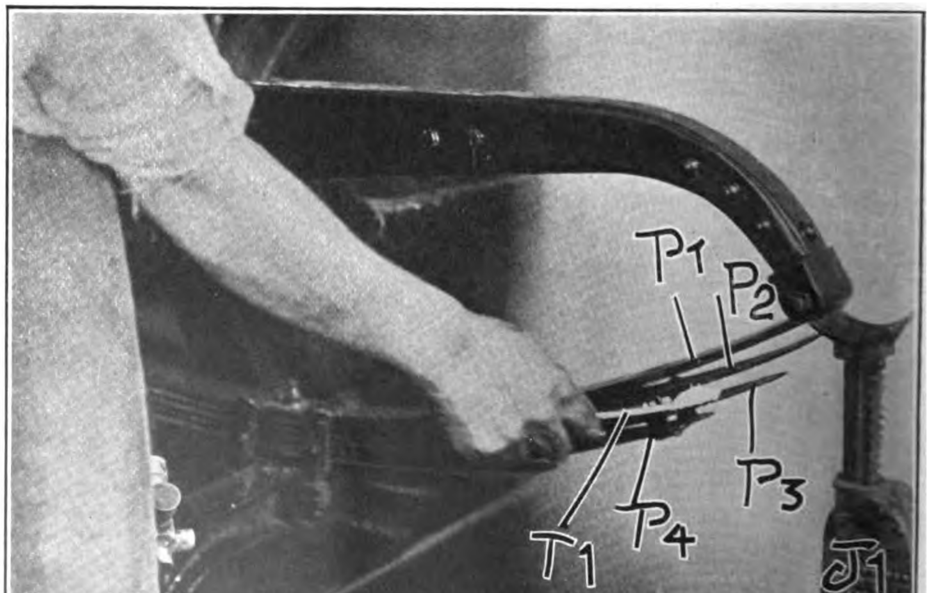

Fig. 2—Method of greasing springs that have been freed by the jack under the frame

PARTS OF THE AUTOMOBILE TAKEN SERIATIM; HOW EACH PART SHOULD BE TREATED TO PUT THE CAR OUT OF COMMISSION

Bolts.—There are different parts of the car where the threads of the bolts become rusted. They should be cleaned with a file cleaner brush, using a little kerosene and then oiled.

Lubricators and Pipes.—Wash all oil pipes with kerosene or gasoline; all grease cups should be cleaned out and refilled with fresh grease. Oil-containing tanks, lubricators and filters must be cleaned and gaskets put back, and if worn, replaced. Hammered lead makes a good joint and one that will not wear out.

Storage Batteries.—If the car is not to be used for more than two months, empty the acid, wash out with distilled water and fill with distilled water so that the plates are covered. Clean terminals from all sulphation and store in a dry place.

Magneto.—If the magneto is easily detached, remove, clean and store in a dry place.

Coil.—If the place where the car is to be stored is not perfectly dry, some rags wrapped round the box should keep this from damp.

Motor.—Grind in all valves; clean out all carbon; empty oil and flush with kerosene; clean distributor; clean off all dirt and oil with gasoline and kerosene and cover lightly with vaseline all bright parts. Better have all adjustments, repairs and overhauling to the motor done when the car is put away rather than wait for the Spring, when the repairers are busy.

Radiator and Water-Cooling System.—Empty all water; disconnect pump and engine and connect hose pipe to same, allowing a good stream of running water to pass through and clean out all impurities. Connect hose to outlet of water from radiator and run water so that it comes out of the filler. If the radiator is clogged with grease, steam will remove it.

Clutch.—If of the leather type, withdraw it and paint on some castor oil, first cleaning off with a little kerosene. Metal clutches should be washed out with kerosene and refilled with ordinary engine oil, allowing it to find its way between the plates by running the engine with the clutch out for a minute.

Gear and Transmission.—Thoroughly wash out with kerosene, using a syringe, refill with the lubricant usually employed. Pass the hands through the lubricant that comes from the gear box to discover any bits of metal that may have come from the bearings or gearwheels. If any are found, don't be satisfied till you know whence they come and have the worn parts seen to.

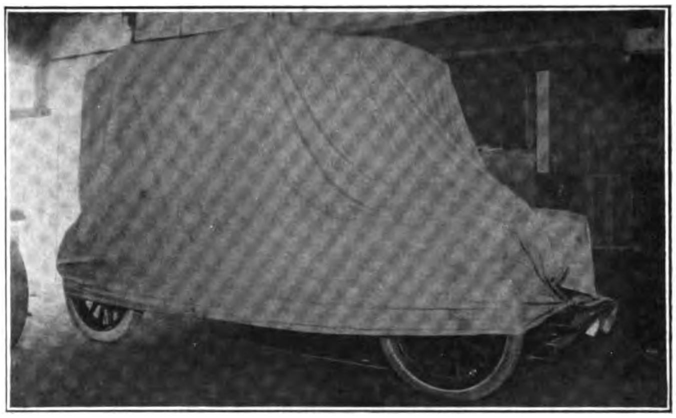

Fig. 3—How a car should not be laid up. Dust will creep in under the cover and front tires will be useless in three months

Rear Axle.—If there is a cover or filler at the top and a drain plug at the bottom, flush out with kerosene and refill with heavy oil, looking also for metal parts.

All bright parts should be thoroughly polished and covered with thick oil or vaseline, the car jacked off the ground and covered completely with sheets so that dust is entirely excluded. This can be done by tacking the sheets to the floor if it is of wood or by placing strips of wood on concrete floors and tacking the sheets to them.

Empty all gasoline and see that the float is not punctured and the float chamber is free from dirt.

If a strainer is fitted, clean it out.

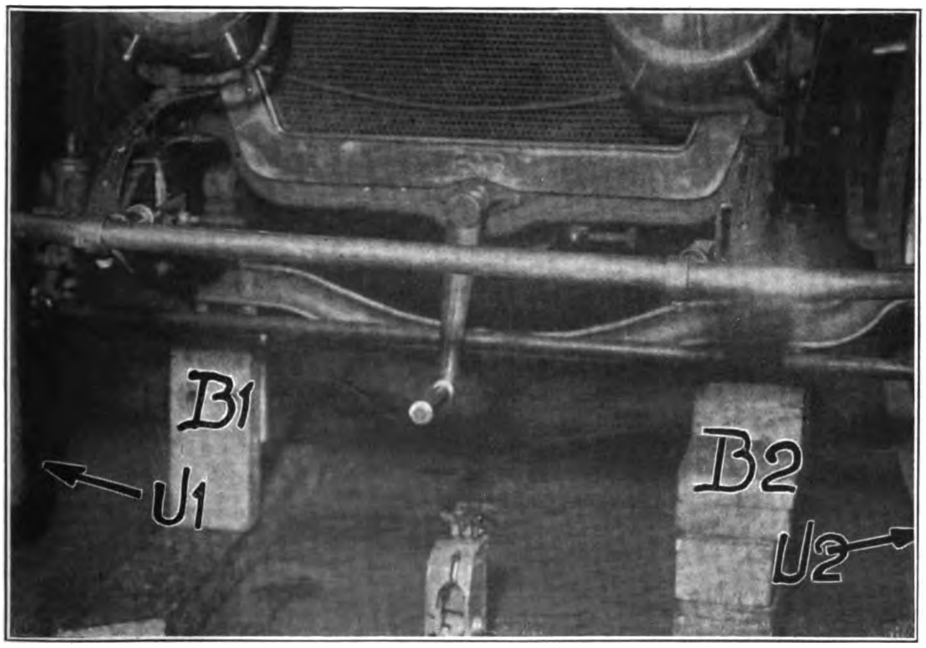

Fig. 4—Method of blocking up front axle to take the weight off the tires

Heating the Garage

A Naked Flame in a Cooped-Up Garage is a Short-Cut to a Fire

GENIUS, with all its versatility, has never succeeded in solving to the satisfaction of the prudent owner the heating problem in the small private garage. To the man who constructs a one-car garage in his back yard, there is offered the opportunity of trying to keep his automobile in commission in the Winter time, in the face of great difficulty. Insurance regulations require that the garage be located at a considerable distance from the residence, so that running a steam line from the furnace in the basement of the residence offers few attractions. Putting a stove in the garage is out of the question; even were it not in the nature of a fire hazard to do so, it would still remain for the owner to go to the garage at fixed and frequent intervals for the purpose of firing up. It has been suggested that gas be used for heating, placing a more or less automatic system in a small fire-proof "lean-to" adjacent to the garage, but separated by an impervious wall, so that inflammable mixture, should it break loose within the garage, would not be communicated to the naked flame of the heating apparatus. Even this solution is not available in half the private garages in the country because of the absence of illuminating gas. Electric lighting and heating is the obvious answer.

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FOREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[284]—How is vulcanizing done when repairing a tire?

After the patch is put on, it is heated to a temperature of about 250 degrees Fahrenheit or slightly hotter, for a length of time which depends on the amount of rubber that has to be heated. More volume of rubber must be heated when vulcanizing the patch on a tire-shoe than on the inner tube. It is not generally necessary to apply full temperature more than fifteen minutes.

Specially prepared sheet rubber and rubber cement in paste form are generally used for vulcanized tire repairs. A patch is put on in practically the same manner as in the preceding question, and then vulcanized.

Numerous forms of vulcanizers for repair purposes are on the market. The means of heating them is generally electricity, steam, gas or gasoline. A thermometer or a steam gauge often forms part of the vulcanizer. The steam pressure in the vulcanizer corresponds to a known temperature; thus, a steam pressure of thirty pounds per square inch by gauge corresponds to 250° Fahrenheit, and 45 pounds per square inch by gauge corresponds to about 275° Fahrenheit. The latter temperature is used on heavy tire-shoes.

The rubber is easily injured by overheating. Care must be exercised to prevent the vulcanizer from becoming too hot. Some electric vulcanizers are provided with automatic cut-outs, which turn off the current at the temperature to which they are adjusted.

It is advisable to experiment on some rubber which is not valuable before attempting to repair a tire.

[285]—Before putting a tire shoe on a rim, what should be done?

Clean the rim thoroughly where the tire touches it. Scrape and file off all rust and dirt. The edges of the clinch should be carefully smoothed with a file to remove roughness. The file should be fine cut so as not to leave ridges and points; clean well under the clinch.

[286]—What injury is almost certain to result by running with a tire too soft (insufficiently inflated)?

Rimcutting of the tire where the clinch of the rim bears against it. The rimcutting occurs in the groove between the bead and body of the tire.

[287]—If a tire is run completely deflated, what injury is apt to occur?

If there are tire lugs they are liable to tear the shoe and cut the tube.

When there are no tire lugs the shoe may creep around and cause the tube to pull so hard on its valve as to tear the tube at the valve.

Rimcutting is almost certain to occur in either case.

[288]—A tire that is badly worn on the tread can be repaired in what manner?

By retreading. The tire should be carefully examined, especially for rimcutting, to determine whether it is worth retreading.

[289]—How can a tire shoe that has a rather large hole through it be run?

By putting a protective lining canvas plaster inside of it and a protector outside. The latter is generally laced on; it is usually made of rubber-covered fabric or of leather, as found on the market. The patch, or lining, for the inside of the shoe is usually made of rubber-covered fabric. It is covered with adhesive rubber on the side intended to go against the inside of the shoe. Some internal patches are made to extend under the clinch of the rim.

When putting a protector over a tire shoe, the tire should be first partly inflated, say to almost 15 pounds per square inch, and the protector then laced on. Then, when the tire is fully inflated, the protector will be tight in place.

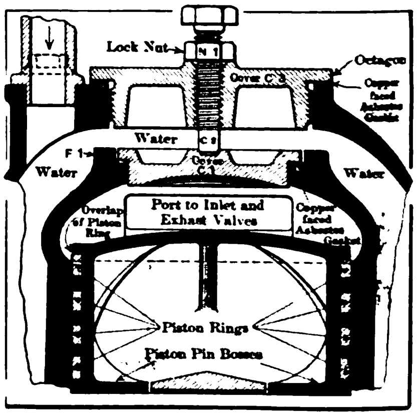
[290]—In case of a large hole, such as a blow-out, in a tire shoe, how can it be repaired?

By separating the layers of the fabric and inserting other fabric between them. The tire must be afterward covered with plastic rubber compound at the patch, and vulcanized. It is work for an expert.

Cylinder Refinements

Showing How the Questions of Expansion Are Cared For, and Other Details

NOTHING can be of greater importance than the details of design of the cylinders of a motor, nor is it possible to conclude from the evidence at hand that these matters are receiving all the attention that they deserve. The illustration here given of the upper end of a cylinder will be used to show how the inner cover may be held in place in such a way as to allow for a certain amount of expansion, it being true that the differences in temperature between cycles are so great that it is necessary to make some provision in order to abort leakage. In this example the dome of the combustion chamber is "cored" for a liberally sized opening and strength is obtained around the cored hole by means of the upward turned flanging F1, with a depression for the cover C1 to fit into, allowing for the copper faced gasket in the manner as shown. The cover C1 is held firmly in place by means of the capscrew C2, the latter being threaded through the cover C3, with a lock nut N1, which, when screwed down, prevents the cap screw from backing off. The cover C3, in turn, is screwed into the water jacket hole, which is also cored in the casting, leaving a large opening for the gases to escape during the casting process, thus assuring that the castings will be sound if the metal is of a good quality and the foundry work is well executed. Within the combustion chamber the surface is as nearly spherical as it is possible to make it, all things considered, and this conformation has the advantage of limiting the inner surface to the minimum, reducing the quantity of heat which will be permitted to pass through into the water that circulates in the jacket. The bore of the cylinder is countersunk at a point so located that the top piston ring will overlap as shown, the idea being to abort burrowing of the piston ring at the point of "dwell" of the piston at the top of the stroke. For the rest, let it be observed that the cylinder walls are of uniform thickness, the idea being to prevent the metal from cooling faster at one point than at another, and the piston is also of uniform thickness for the same purpose.



Section of a cylinder showing the covers are fastened to prevent heating trouble

Digest

EXTRACTS FROM CONTINENTAL PERIODICALS DEALING WITH SUBJECTS ALLIED TO AUTOMOBILE ENGINEERING—COST DATA ON SALT BATHS—SEPARATION OF SHAVINGS—ALTITUDE RECORDS, ETC.

Metallic and Salt Baths for Uniform Heating in the Hardening of Steel Parts—For temperatures from 650° to 700° C lead may be used. Beween 700° and 900° chloride of sodium (common salt) is available, but a mixture of chloride of potash and chloride of barium is the best medium so far found. This mixture has the advantage over common salt that it evaporates much less and does not spatter during the melting. The work and tools take a thin coating from the bath which obviates oxidation in the air, and in the water this coating cracks off, leaving the parts clean and white as silver. At the Deutz gas motor factory the bath is heated in steel crucibles, which have proven more lasting than clay or graphite pots. The bath may be heated by water gas, illuminating gas, producer gas, oil or electric furnace. For normal hardening, taking place at about 800°, producer gas gives the most economical results, especially where a number of hardening ovens are run at the same time or where the producer gas is also used for power purposes. For temperatures above 1,000°, as for high-speed steel, the gas flame oven with boxed inserts is most suitable. The cost of the different methods applied to identical work compares as follows: An electric hardening oven, 300 by 300 by 370 millimeters inside measure, uses at 800° C. at least 18 kilowatts of energy per hour, which at 20 pfennig per kilowatt brings the hour cost to 3.66 mark. A gas oven of 300 millimeters inside diameter and 450 millimeters deep uses per hour 9 cubic meters of illuminating gas, which at 12 pfennig per cubic meter brings the cost to 1.08 mark. The hourly consumption of producer gas amounts to about 50 cubic meters at 0.8 pfennig per cubic meter and this reduces the total cost to 0.40 mark, including fuel, work, amortization of investment and interest. Oil of 1,000 heat units (1 B.T.U. equals 0.252 German heat units), and costing 10 mark per 100 kilograms, brings the cost for fuel under the same circumstances to 0.55 mark.—Communication from Deutz Gasmotoren to *Werkstatts-Technik.*

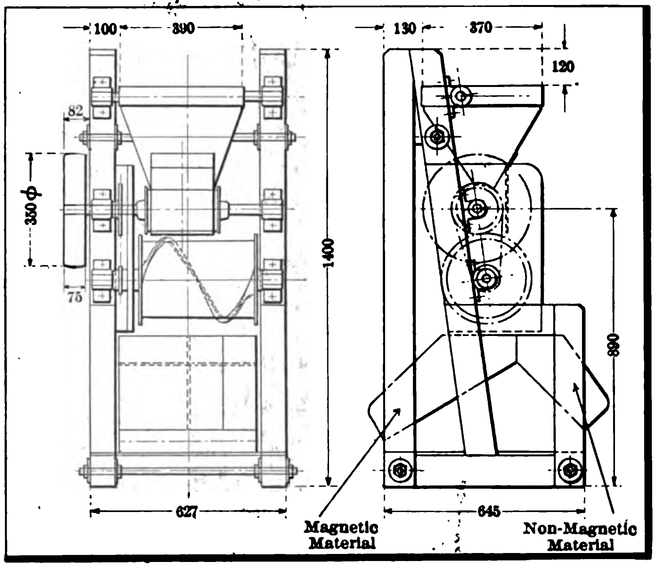
To utilize commercially the brass, bronze, iron and steel shravings which result from mechanical operations in factories where both classes of metals are worked it is necessary that there should be no admixture of iron or steel in the more valuable metals, but only in factories of the largest size is it practicable to work the different metals with different machine tools and in different locations. Hence it has become an economical necessity to perfect apparatus for separating the shavings and the electromagnet has naturally become the means for so doing. In *Werkstatts-Technik* for September several suitable machines intended for this work under different conditions, as these arise in different industries, are described and illustrated. At the same time the Siemens-Schuckert Werke of Berlin offers in the open market the separator shown in the accompanying illustration and two other types, one smaller and one considerably larger capable of separating about 800 kilograms per hour. These are operated with direct current of 140 to 500 volts and the magnets are arranged for tensions of 75 volts for each spool.

The material is placed in the hopper, made of sheet zinc and passes from the bronze feed roller in small quantities to the separator drum which is driven from a transmission mechanism or from a separate motor with clutch. The power required for a machine of the dimensions illustrated is 1-2 horsepower. For the larger machine 3-4 horsepower is needed. The brazen separator drum contains in its interior the stationary electromagnet of the usual shape, which holds all iron parts coming from the feed roller. By means of the spiral rib on the rotating drum the material which is attracted by the magnet is shoved to the end of the drum, where it is no longer under the magnetic influence and drops into the receiver for ferrous material. The drum makes 30 to 40 revolutions per minute, according to the kind of material to be sorted. The frame of the apparatus is made of wood to avoid magnetization. In the dimensions illustrated—the numerals denoting millimeters—the capacity is about 400 kilograms per hour provided the brass shavings contain about 5 per cent. of iron parts. With higher iron content the capacity is reduced, as in that case it is necessary to let the material pass more than once through the machine. The efficiency is also determined by the amount of moisture in the shavings and the amount of rust which has been formed, as when the shavings are allowed to accumulate under the machine tools subject to constant wetting from the soap water. Best results are obtained by sorting only dry material, but a special type of machine is constructed for handling grainy or pulpy masses and for separating iron pieces from molding sand or slag.

Methods for determining altitude by barometer and instrumental observation are described by Commandant Paul Renard. The accuracy of the barometric record depends very largely on comparison of the barograph reading with that of an ordinary scientific barometer before the barograph is sent up so that the daily and local variations in barometric pressure may be taken into account. True accuracy requires rather elaborate calculations which in the case of aeronautic exploits agree badly with the public's demands for immediate statements.—*Revue Scientifique,* September 17.

Just What Automobiles Do to Roads—In order to settle the vexing question as to the injury done to macadamized roads by the action of rapidly revolving automobile wheels, the War Department of France has set aside the road from Champigny to Quene-en-Brie for a series of practical tests to be begun at once.—*Bulletin Officiel,* September.

An Improvised Vise—When there is need of a vise at the roadside and none is available, it is usually possible to improvise one by placing the jack under one of the frame reaches and screwing it up until it holds the work tightly against the latter. To avoid scratching the frame reach, a piece of soft metal should preferably be put between.—*La Pratique,* October 10.



Scale sketch of German machine for separating steel from metal shavings—Figures denote millimeters

Care and Repair of Tires

TIRE LIFE DEPENDS UPON THE WAY A CAR IS DRIVEN, BUT ITS ULTIMATE LONGEVITY DEPENDS UPON PROPER INFLATION

TIRE experts, tire manufacturers, and any one with the slightest experience with tires, will agree that the pressure in tires must be sufficient to prevent flexure. Also, that a tire intended for a certain weight cannot under any circumstances be used on a car heavier than the weight for which it was intended without giving unnecessary trouble and being a source of expense to the owner. The matter is up to the manufacturer of the car, most people say, but the question of economy play's a great hand in the initial equipment. An inch in diameter or half an inch in width means the saving of thousands of dollars to a manufacturer of a quantity of cars, which means so much more profit. The blame after the car leaves his hands is not laid at his door, but at that of the tire maker. It rests with the buyers of cars to be more particular in seeing that the car has tires a half inch larger, rather than that there should be one-half inch more stroke to the engine, because, after all, what do the dimensions of an engine matter provided the result is there? The only way to obtain the result is to have tires of the proper dimensions and see that they are correctly inflated. This sounds very simple and the easiest thing on earth; and so it is, under certain circumstances. Water pressure affords a good illustration of the difference between hand-pumped tires and those inflated by mechanical means. As previously stated, CO_2 does not affect the life of a tire in a detrimental manner (this being the opinion of tire makers and those who have used this method of inflation for some time), consequently arguments against its use need to be backed with practical proof and not with hypothetical deductions. When water is wanted in a city all that is necessary is to turn on the tap and pay a small amount for water rate, which is equivalent to having a compressed air tank or other mechanical device. There are several good ones on the market. But suppose you live in the country and have to pump every drop of water several hundred feet up into a tank by hand, how often does it happen that the tank is dry just at the time you want water? What would you think of a man who had the water main passing in front of his door and could have it connected to his house at a small cost, but who persisted in using an old hand pump, unless it be that he preferred to do so for exercise sake or that the water of the well from which he derived his source of supply had particular advantages? Air is air, after all, and the only way to inflate a tire properly is by mechanical means if the pressure is to be maintained during its life. Autoists are divided into two classes—those who drive and look after the car themselves and those who employ a man—and where is the man yet born that will pump a tire to 100 pounds' pressure per square inch who can get along just as well with 80 pounds, provided it does not cost him anything by so doing? It is a well-known fact that some chauffeurs obtain a commission on tires, and it is to these gentlemen's benefit to underinflate rather than overinflate the tires. Try as hard as they can, they cannot do the latter with an ordinary hand pump, and the owner is surprised at the persistently large tire bill. The solution is to give the man the tools and see that he does his work. Cast a glance at the two methods of inflation, and say which is likely to prove the better. After pumping by hand for some time the barrel of the pump becomes hot and allows a great deal of air to pass the plunger instead of going in the tire, owing to the expansion of the metal from which the barrel is made and the wear on the leather plunger. While on the subject of heat it would be well to remember that through the heating action occasioned by friction the air in the tire is slightly heated by means of the hand pump, and consequently when it cools a contraction takes place, reducing the pressure; but the opposite is the case with carbonic acid gas, for with the heat generated by the tire while running the gas expands, giving more pressure under running conditions and in warm weather than when standing on the cold garage floor. Everything is against the unfortunate portrayed in Fig. 1, while the operator in Fig. 2 looks happy enough. The man who drives and looks after the car himself has only himself to please; so his troubles are on his own head, and there is no question of commissions to worry him. Being his own master, and having to pay his own bills, it only remains to point out that he will probably get better service from his tires if he resorts to mechanical pumping and save the cost of the instrument, whatever it is, several times over by reducing his repair bills.

Fig. 1—Inflating big tires with a small hand pump—no chance of the pressure being enough to prevent flexure—the unfortunate pumper is really working hard to increase tire depreciation whether or not it is agreeable to him.

If a tire should happen to puncture or blow out on the road late at night, or in a crowded street, don't say to yourself, "I have only a few miles to go," or "The garage is only a dozen blocks away." Procrastination in this case is directly putting his hand in the owner's pocket and taking out the equivalent of money. It is just in these few blocks that the damage is done that will cost the autoist money for repairs that would be otherwise unneecessary. One does not mind changing a tire in the presence of an interested audience, but when the cry is "All hands to the pumps!" and the small boys start snickering, "Aye, there's the rub!"

If a hand pump is used, a few drops of oil in the barrel occasionally will greatly help the leather to retain a good bearing on the barrel and will prevent it heating and drying up. Such small things as these appeal to everyone, and it is a matter that everyone knows; but how few do it? The methods employed by some drivers in pumping a tire make the work doubly hard, and the amount of air that finds its way into the tube is generally gaged by their physical endurance rather than by other factors, so that if the pumping is not carried out properly the tire suffers. The plunger must be pushed home to the bottom of the stroke, otherwise only a small quantity of the air will go into the tire, as the pump acts in the same manner as the engine on its compression stroke. The air becomes compressed in the bottom of the barrel and this compression must be higher than that in the tire to overcome the valve; otherwise it is useless to go on pumping to the distraction of nerves.

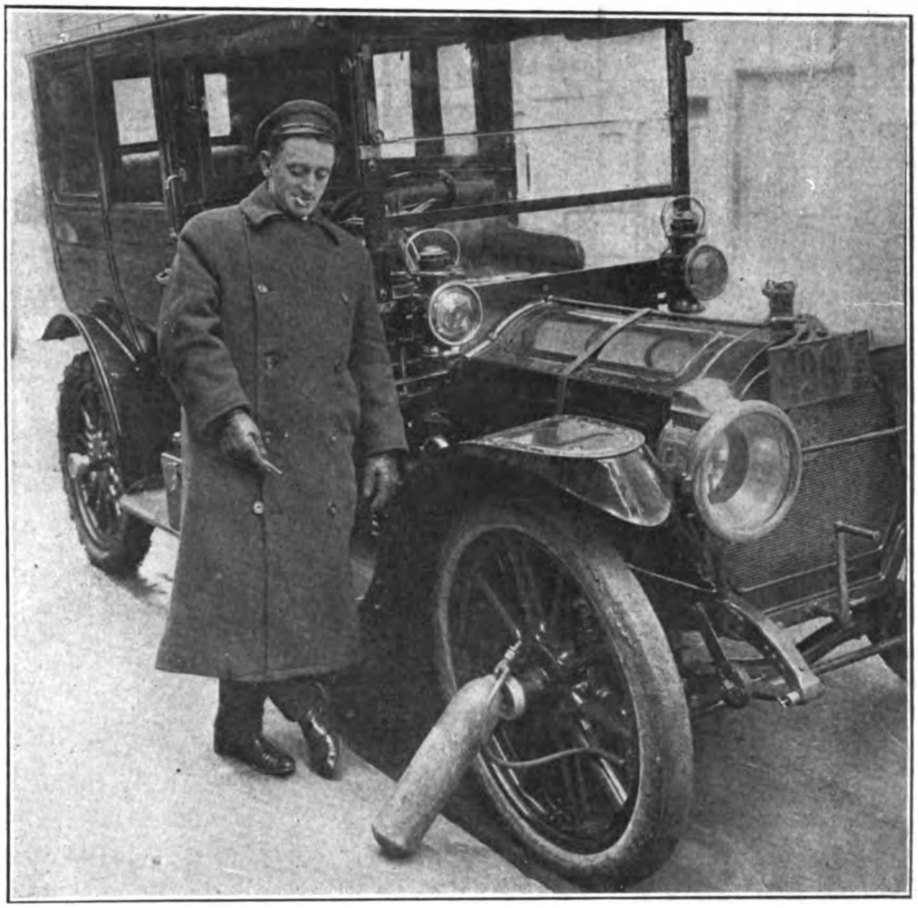


Fig. 2—A more prosperous condition—the chauffeur enjoys a happy situation—the tire is pumped up to the proper level, inducing long life, and cost is minimized

---

Aviation Opens a Promising Field to Aluminum.—Aeronautical enterprises are becoming so numerous and the machines already promise so much that prognosticators seem free to predict that the aeroplane has a useful work, representing a new art, that it will outstrip the automobile in point of numbers and importance, taking less than ten years in the accomplishment of the task. Structural materials for aeroplanes are not on a well-defined basis, but it is believed that aluminum will claim its own in this field. In some of the earlier attempts to render aluminum strong, it was also increased in specific weight sufficiently to kill the advantage derived by adding strength, but the latest effort in this field goes to show that it is possible to make structural shapes that approximate the strength of steel, without increasing the weight of the aluminum alloy over that of aluminum itself.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, RACES, HILL-CLIMBS, ETC.

Dec. 1...........Chicago, Ill., First Annual Aeronautical Exhibition in the Coliseum.
Dec. 31-Jan. 7, '11.New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14.........New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12........New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28........Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, Third Regiment Armory.
Jan. 15-21........Detroit, Wayne Gardens, Detroit Automobile Dealers' Association.
Jan. 16-21........New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A.L.A.M.
Jan. 16-21........Detroit, Mich., Tenth Annual Show, Detroit Automobile Dealers' Association, Wayne Pavilion.
Jan. 28-Feb. 4....Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-Feb. 11....Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 18-25........Minneapolis, Minn., Annual Show, Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25........Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 18-25........Newark, N. J., Annual Show, New Jersey Automobile Exhibition Co.
Feb. 24-27........New Orleans, La., Annual Show, New Orleans Automobile Club.
Feb. 25-Mar. 4...Toronto, Ont., Automobile Show, Ontario Motor League.
Feb. 27-Mar. 4...Kansas City, Mo., Fifth Annual Show, Kansas City Automobile Dealers' Association, Convention Hall.
Mar. 4-11.........Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 18-25........Pittsburg, Annual Show, Pittsburg Auto Show Association (Inc.), Exposition Hall.
Mar. 25-April 1..Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mar. 25-Apr. 8...Pittsburg, Annual Show, First week, pleasure cars; second week, commercial trucks. Automobile Dealers' Association of Pittsburg, Inc.
April 1-8.........Montreal, Can., Automobile and Motor Boat Show, Automobile and Aero Club of Canada.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

COST, as it must be counted by the man who owns and operates an automobile, will be more or less depending upon (a) the quality of the car, and (b) the skill displayed in the operation thereof. The first consideration must be uppermost in the mind's eye of the automobilist when he goes into the salesroom and makes his selection. Having picked out the character of automobile that will do the kind of work of which the purchaser has a sufficient quantity, it remains to be intelligent and deliberate, if the cost of service is to be minimized. The best statistics that are available at the present time seem to indicate that tires are only serving to the extent of 37 per cent. of the reasonable expectation, which is another way for saying that the tire depreciation, due to carelessness and abuse, represents a cruel total of 63 per cent.

* * *

TIRE misuse, while it may be classified, is mostly due to lack of proper inflation, resulting in punctures, bruises, creeping trouble, blow-outs, rim cuts, overheating, disintegration, and last, but not least, the products of flexure. It is a great misfortune that owners of automobiles cannot be brought to a realization of the fact that they do not properly inflate the tires on their automobiles; they think they do. Indeed, they are in the same fix as a well-known automobilist to whom the Editor of THE AUTOMOBILE addressed the following letter: "In our campaign of education which has for its purpose the reduction of tire cost, we are taking pressures of tires as we find them on automobiles in the street, and you might be interested to know that the pressure in your own automobile tires was found to be as follows: Left rear tire 35 pounds per square inch; right front tire 42 pounds per square inch. These tires looked all right, but the pressure as found by the gauge goes to prove that they will wear out in a very short time."

* * *

CONSIDERING the fact that automobilists fail to look after the inflation of their tires, despite the many reasons given from time to time in the columns of THE AUTOMOBILE, it is feared that they are getting used to the cry of "wolf." It is too bad that it is necessary to examine all the automobiles that are in actual service only to find that the tires are not properly inflated, and to have to write a personal letter to each owner and warn him of the impending attack on his pocket-book. It will doubtless be an enormous undertaking to thus proceed, but unless each owner of an automobile who reads the stories that are being printed as the result of actual practical experience will have the goodness to appreciate that the tire inflation problem conceals a real wolf, some strenuous method will have to be contrived such as will bring him to a fuller realization of the fact that his tires will last at least three times as long as they do if he will pump them up.

* * *

RULE-OF-THUMB methods are at the bottom of a great many failures. It is this very way of doing things that results in the under-inflation of tires. In the average garage, an air-tank, under perhaps 90 pounds per square inch, is connected up with the tires to be inflated, and the artisans reach the vain conclusion that the pressure in the tires will also reach 90 pounds per square inch. Perhaps it will in not a few instances, but it has been found in actual practice that this pressure wire-draws down to as low as 60 pounds per square inch, thus showing that the tire valve is a most wasteful little beggar, and that while it serves extremely well in the process of keeping air in the tires, it is also a most unwilling servant when it comes to letting the air get in. Some valves are greater offenders than others; it therefore devolves upon each automobilist to apply a gauge to his tires after they are inflated and find out whether or not the air pressure in the inflated tank is free to transfer to the inflated tires. If, for any reason, there is a difference in pressure, it remains to supply the loss by increasing the tank-pressure, so that the tires will be inflated up to a safe point.

* * *

SPARK plug trouble seems to creep in when motors are run for a considerable period of time continuously, resulting in the melting out of the central electrode, and in order to avoid this trouble in some of the spark plugs tried out, the E. R. Thomas Motor Company, in its 500-hour run, as related in THE AUTOMOBILE, found it necessary to adjust the mixture for a somewhat lower power in order to obtain a cooler performance, until by a considerable amount of laboratory investigation the fault in the spark plug situation was remedied, after which it was found feasible to operate on a higher power level.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

A. A. A. in Annual Meeting—Selden Suit versus Ford and Others Closed—News of the Automobile Shows—Late Autumn Run of New York Automobile Trade Association—Lozier Wins Double Event at Los Angeles—Thanksgiving Day Race Meets—Briscoe Compares American and Foreign Cars—Peeps Through Auto Goggles at Distant Lands—Floods Threaten French Motor Manufacturing Plants; French Auto Club to Re-enter Racing in 1911—Other items of interest in a personal and business way to motordom gathered from all sides.

A. A. A. Decides to Enlarge Its Boards

REPRESENTING its membership in 39 States, the A. A. A. met in ninth annual session at the Belmont yesterday morning. The day was spent in listening to reports of officers and committees and in discussing the various matters brought out in them. L. R. Speare, president, announced that he was not a candidate for re-election. In delivering his valedictory Mr. Speare submitted a number of suggestions aimed to increase the representative character of the organization. These, in a general way, provided for an enlargement of the four chief boards of the association, namely, touring, good roads, legislative and contest, by automatically providing for membership in them of the chairmen of corresponding committees in all A. A. A. clubs. This was enacted with the proviso that an executive committee should be selected to carry on the work of the boards in the discretion of the chairmen.

The other reports showed that the association now has 34,946 members, more than doubling in the past two years. There was $9,423 in the treasury when H. A. Bonnell formulated his report.

The most important work of the session was the selection of a nominating committee, as follows, which will report at 10 o'clock this morning: C. H. Gillette, chairman; F. E. Edwards, George C. Diehl, H. L. Vail, J. N. Edwards, Paul C. Wolff and L. R. Speare.

Selden Suit versus Ford Is Closed

When attorneys for both sides of the Selden litigation concluded their presentation of the facts and law involved in the suit on Friday last and bowed to the bench, upon which were seated Judges Lacomb, Ward and Noyes, the most momentous legal incident in the history of motordom was finished as far as the litigants were concerned.

Both sides had been given the utmost latitude in construing the case, and when the court took it the judges had been informed most thoroughly as to the divergent merits. The facts as they were presented were the same as in foregoing steps in this litigation, but the attorneys took some unusual tacks in arguing from them. The contention of the A. L. A. M. was narrowed to a specific base of priority of patent, and the heaviest guns of the appellants were directed toward this same point.

The merits of the patent were carefully discussed, but the case as presented will probably turn upon the question of priority.

Among other interesting happenings in the legal sphere was the filing of the answer of the Delahaye Import Company to the action of the A. L. A. M., which had alleged infringement of the Selden patents and had applied for an injunction. The answer formally denies the material charges of the complainant, and in reply states that Selden committed laches in delaying to perfect and enforce his patent and that such delay constituted abandonment within the purview of the law.

Concerning the date when the decision will be handed down, the most authentic advices are that nothing will transpire within two weeks, and it would be within the range of possibility were the decision withheld for upwards of two months in accordance with customary practice in Courts of Appeal.

Annual Meeting of the S. A. E. Fixed

According to the usual custom the Society of Automobile Engineers will hold the annual meeting in New York City this Winter. The committee on meetings and entertainment has fixed the date of this meeting for January 11 and 12, 1911, at the Automobile Club of America. There will also be a banquet, which will be held on Thursday evening at the Automobile Club of America. It is promised for this banquet that it will hold much of interest, divided up between viands that will whet the appetite and entertainment which will tickle the intellect. Further details will be announced as plans are perfected.

Licensed Dealers Elect Stewart

At the recent meeting of the Licensed Automobile Dealers of New York City Charles A. Stewart was elected general manager, to succeed James M. Carples, who resigned to go with the Daimler Import Company.

Mr. Stewart was formerly assistant educational director of the West Side Young Men's Christian Association, 318 West 57th Street.

M. A. M. Will Banquet January 13

Plans for the annual banquet of the Motor and Accessory Manufacturers have been announced. The banquet will be held January 13 at the Waldorf-Astoria. It is expected that the function will be the largest and most important of the annual banquets of this organization.

Gasoline Engine Men to Meet

RACINE, WIS., Nov. 28—The annual meeting of the National Gas and Gasoline Engine Trades Association will be held in this city from December 12 to 15. An elaborate program for the sessions and an interesting exhibition has been arranged.

Trade Credit Association to Dine

Arrangements have been made for the annual dinner of the Automobile Trade Credit Association of New York, which will be held January 18 on a scale heretofore unsurpassed by that organization. Members will be allowed to invite friends.

News Notes of the Coming Automobile Shows

WHEN the A. L. A. M. show opens in Madison Square Garden next month there will be 68 different makes of gasoline pleasure cars on display, and many of them will show considerable improvements in body design. The sloping front, which lends itself to smaller wind resistance, and therefore augments speed, is being revived. This type was given some vogue about ten years ago, but foreign patents subsequently prevented its general use. These patents have expired in some instances, and the pointed hood will be seen much more frequently than in the past. The general adoption of fore-doors will also strike the visitor, as the trade has accepted this improvement in body construction with much unanimity.

As has been outlined in the past, automobile manufacture, exemplified in the exhibits to be shown at the Garden, has been slowly dividing into two semi-distinct channels. On the one hand is the luxurious touring car and on the other the light surrey or runabout for city use or for short trips out of town. It has been demonstrated that one type of automobile is not sufficient to fill all the uses to which the motor car can be put, and many owners of touring cars have provided themselves with light cars for city work, and vice versa. Both types will be shown in much variety.

Importers' Salon Making Ready

It is announced that the Importers' Automobile Salon will be held this year at the Hotel Astor during the week beginning Monday, January 2. Three of the Astor's largest and most palatial rooms, including the celebrated ball room and the "Rose Room," aggregating a total of 16,000 square feet of floor space, are to be thrown together for this occasion, and it is the intention of the committee to make of this show a distinctly drawing-room affair. Music will be provided by a large orchestra, and private boxes for the accommodation of spectators will be one of the innovations. The Importers' Salon has heretofore always been included as a star feature of the Unlicensed Manufacturers' Show at Grand Central Palace. The cars will be shown to advantage, and, at the same time, crowding and discomfort on the part of the spectators will be avoided.

The new models of practically every well-known foreign car on the market in this country will be exhibited as follows: Panhard & Levassor, A. Massenat, Gen. Mgr., will exhibit the Panhard car; the Darracq car will be shown by Henry Ducasse & Co.; Mr. Paul Lacroix, Gen. Mgr. of Renault Frères Selling Branch, has arranged for a full exhibit of Renault cars; while six new models of the De Dion Bouton car, three of which have been especially designed for the American market, will be shown by Mr. E. Lascaris, Gen. Mgr. of the American selling branch. The Benz Import Co. has made a space reservation for Benz cars; the Itala and the Daimler cars will share the space reserved by A. T. Demarest & Co., and another reservation has been made for the S.P.O. car. Cæsar Conti, for the S.P.A., has arranged to exhibit; Emile Voigt, of the C. G. V. Import Company, will be in charge of the exhibit of these cars; while Burr & Co., the well-known body builders, will show the latest products of their factory. Another exhibit will be that of the Gnome and of the Anzani motor.

Paul Lacroix is chairman of the committee in charge of the Salon, the other members being E. Lascaris, Secy. and Treas., and Warren Demarest.

Aeroplanes at the Palace Show

Associated with the Palace show of automobiles and accessories will be a section devoted to aeroplanes. One whole floor of the building has been set aside for this feature of the show and the plans announced so far contemplate a large exhibition. Several of the aeroplanes that were imported under bond to take part in the recent aviation meet at Belmont Park will be shown. Particular emphasis will be laid upon commercial aeroplanes so far as they have been developed.

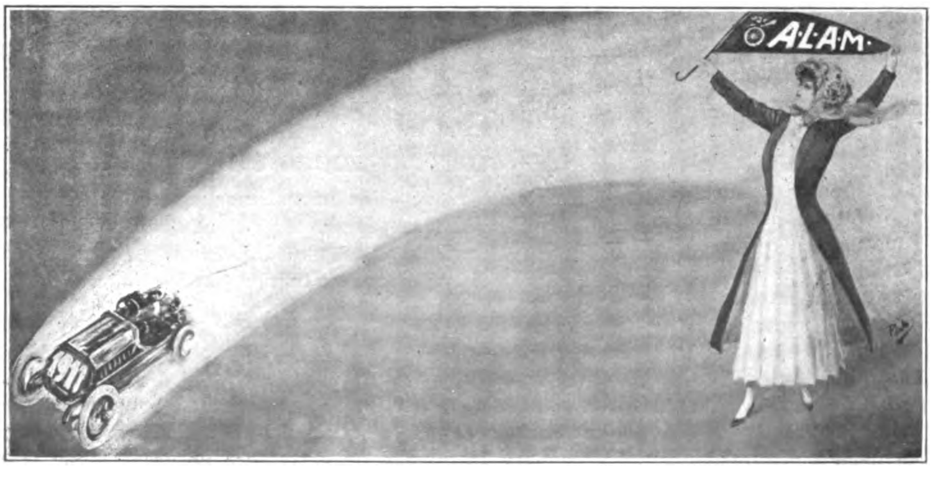
The list of motor car manufacturers signed up so far includes 66 names. The additional list since last week is as follows: Maytag-Mason Motor Co., Waterloo, Ia.; Ideal Motor Car Co. (Sage & Creighton truck), Detroit; Velie Motor Vehicle Co., Moline, Ill.; Colt-Stratton Co. (Cole "30"), New York; Flanagan Motor Car Co. (Monitor truck), Brooklyn; Otto Motor Car Co., of New York (Crown truck), and the Carter Motor Car Corporation, of Washington, D. C.

The color scheme in which the Palace will be decorated will be a groundwork of cream with crimson trimmings.

Omaha Show Plans Far Advanced

OMAHA, NEB., Nov. 28—The officers of the Omaha Automobile Dealers' Show Association are already making elaborate preparations for the automobile show which will be held February 20-25. The list of exhibitors has been prepared and the decorative scheme for the auditorium has already been worked out, containing many new features, but this is being kept quiet at present.

Two new companies have recently been organized in Omaha, and they will probably be added to the list of exhibitors, which is as follows: Capron & Wright, Speedwell automobile; Coit Auto Co., Mitchell; Cadillac Auto Co., Cadillac, Woods Electric; John Deere Plow Co., Velie; Deright Auto Co., Stoddard-Dayton, Locomobile, Waverley; Electric Garage Company, Packard, Rauch-Lang, Baker; E. M. F. Co., E. M. F., Flanders; H. E. Frederickson Co., Pierce-Arrow, Thomas, Chalmers, Hudson; Freeland-Brothers-Ashley, Midland, Maytag-Mason; Ford Motor Car Co., Ford; Huffman Auto Co., Hupmobile; Kissel Auto Co., Kisselkar; Lininger Implement Co., Oakland; Mid-West Auto Co., Cole, Westcott; Andrew Murphy & Sons, Frayer-Miller. Randolph trucks, and International; T. G. Northwall Co., Brush; Nebraska Buick Auto Co., Buick, Olds; Omaha Auto Co., Auburn; Rambler Motor Co., Rambler; Guy L. Smith, Franklin, Peerless; Standard Auto Co., National; United Motor Omaha Company: Van



Striking poster designed to advertise the coming A. L. A. M. show

Brunt Auto Co., Oakland, Marion, Pope-Hartford; Wallace Auto Co., Stearns; Apperson Sales Agency, Apperson; E. R. Wilson Auto Co., Lexington; Baum Iron Co., supplies; Central Tire & Rubber Co.; Omaha Rubber Co., Powell Supply Co., Western Automobile Supply Co.

The two recently organized companies are the Inter-State branch and S. A. Houser, agent for Croxton-Keeton cars.

Factories whose cars are not sold in Omaha have applied for space so that every available inch of room in the auditorium will be occupied.

Only One Show at Milwaukee

MILWAUKEE, WIS., Nov. 28—Milwaukee will have only one motor show in 1911. Up to a few days ago the prospects were for two shows, the first under the auspices of the newly organized Milwaukee Automobile Dealers' Association, and the second under auspices of the Milwaukee Automobile Club, which has conducted two successful shows. The dealers' association is the outgrowth of the opposition offered to the club show in February, 1910, when fourteen representative agents held private exhibitions and refused to join the club's exhibitors. The association stole a march on the club by leasing the Auditorium for the week of January 15. The club held an option for the use of the big exhibition hall during the week of February 13, this date being selected because it is the week following the Chicago passenger vehicle show, from which it draws considerable business. It was well known that Milwaukee could hardly support two shows and that the dealers were powerful enough to make the club's show the lesser of the two. After some negotiation a committee of the club and another of the dealers agreed upon one show, to be held during the week of January 15, or at the same time as the Detroit show. The show will be officially under the auspices of the dealers' association, but with the official co-operation of the club, which will participate in the earnings. Under this arrangement the 1911 Milwaukee show will be one of the biggest expositions of its kind in the United States, with the exception of the New York and Chicago shows. Frank J. Edwards, the Milwaukee Kisselkar representative, is chairman of the show committee. Bart J. Ruddle will manage the show.

Oakland Show Breaks Record

OAKLAND, CAL., Nov. 28—With eighty-one different makes of automobiles on exhibition the Oakland Automobile Show proved to be the largest ever held on the Pacific Coast. The affair was the first at which any considerable number of 1911 models were shown and was a complete success in every way.

The show opened November 19 with over $1,000,000 worth of cars on display in the show pavilion. These included eight makes of electrics, eight freight vehicles and sixty-five kinds of gasoline pleasure cars. In both the electric and commercial lines the displays were the most complete ever shown in the Far West. Among the newcomers exhibited were: Imperial, Amplex, Babb-Carter truck, six-cylinder Locomobile, Moon, Michigan and others.

The Vanderbilt Cup was a feature of the display. Idora Park, where the show was held, was arranged as a redwood forest. Carter truck, six-cylinder Locomobile, Moon, and Michigan.'

Cleveland to Have Two Exhibitions

CLEVELAND, O., Nov. 28—As a result of the incorporation during the past week of the Cleveland Automobile Dealers' and Manufacturers' Association, Cleveland will have two automobile shows in 1911, the same as in 1910. The association will hold its show at Central Armory during the week of March 13. This will allow at least one week intermission between the two shows, the other being, as announced last week, that of the Cleveland Automobile Show Co.

The new incorporation includes mostly those dealers and manufacturers who participated in the second show of 1910. The committee as announced comprises Ray M. Colwell, chairman; W. H. Barger, treasurer; Harry Smith, M. B. McLauchlin and A. R. Twelvetree. Before the meeting adjourned applications had been made for space by twenty-six exhibitors. Spaces will be awarded by drawing, the same as last year.

Pittsburgh Dealers Will Hold Show

PITTSBURGH, PA., Nov. 28—Thirty automobile dealers of Pittsburgh have formed an incorporated association to hold annual automobile shows, and have selected the Exposition building on account of its central location and adaptability for show purposes, having more floor space than Madison Square Garden, New York, where the National Auto Manufacturers' shows are held annually. The show will be held during the week of March 18-25.

Thomas I. Cochran, who was on the show committee and managed the first two automobile shows held in Pittsburgh, has been appointed manager.

A downtown office has been established on the tenth floor of the Union Bank Building. Floor plans of Exposition Hall are being prepared and a drawing of space will take place in another week, and all automobile and accessory dealers will be invited to take space and co-operate to make the show a success.

St. Louis Dealers Want Show

ST. LOUIS, MO., Nov. 28—An independent show seems to be more than a possibility in St. Louis, following the decision of the St. Louis Dealers' and Manufacturers' Association not to hold the regular exhibit. At a meeting of the association held last week there was a vote of 18 to 14 against the 1911 show. There were 33 members present, or about half the membership list.

Many of the dealers are not contented, and persons who have made a thorough canvass report that about 20 are anxious for an independent show.

Other Shows Making Progress

WASHINGTON, D. C., Nov. 28—The annual show will take place the week of February 13. It will be devoted exclusively to automobiles and accessories. The committee in charge consists of the following: W. C. Long, J. R. Thomas, J. M. Stoddard, T. B. Spence, A. G. Carter, William Jose, Claude Miller, T. C. Johnston and S. A. Luttrell. It will be held in Convention Hall.

SYRACUSE, N. Y., Nov. 28—C. Arthur Benjamin, head of the Automobile Dealers' Association, expects to announce dates for the annual show in Syracuse within a short time. The show will probably be held in March at the Armory.

HARTFORD, CONN., Nov. 28—The Hartford Automobile Dealers' Association will conduct a show as usual at the Foot Guard Armory, probably during the first week in February. Applications so far break all local records.

Boom Chicago Show with Stickers

CHICAGO, Nov. 28—The Tenth Annual Automobile Show at Chicago will be advertised by those who have taken space in it, and a peculiarly effective sticker for use in the mails has been devised by Manager S. A. Miles. This sticker is in the form of a seal in black, gold and white. It may be applied to the back of the envelope or upon the face of the correspondence letterhead of the concern interested. The little sticker is well contrived, and it is likely that a large number will go into circulation.

Sticker used to advertise the Chicago Show

As they lined up for the start, showing the White Steamer, National, Stearns, Stoddard-Dayton, Maxwell, Columbia, two of the Pullman starters, Matheson and others

Group of official cars and two of the contestants at the start. The contesting cars are a National in the foreground, and a Reo.

Sturdy Cars Make Trying Two-Day Run in Snow

PLOWING through snow and slush over roads that ordinarily would afford a pleasant ride, but which under the weather conditions of Tuesday were frightful, a column, consisting of 21 automobiles of 1911 models, started from New York on the first leg of the two-day endurance run promoted by the New York Automobile Trade Association.

The route was to Danbury, Conn., and return, 137.6 miles, and the first few stretches of the run were accomplished under favorable conditions. After that the column ran into a snow storm which covered the hills and made the going perilous. Despite the slippery and slushy roads the contesting cars made an excellent showing. No mechanical trouble was reported unofficially at the end of the day's run, and but little tire trouble was experienced. The drivers, observers and officials were so thoroughly exhausted at the end of the day that no formal report was published.

Unofficially it was learned that several of the cars had difficulty in keeping the course. Confetti in a snow-storm is impossible, and the route had to be indicated with a series of red arrows. Some of the cars missed these, with the result that the bulk of the penalties imposed for road work on the first day were for lateness at controls.

In order to show just how excusable it was to miss the road, the fact may be cited that the checkers' car, which was a contestant in the Vanderbilt Cup race this year, missed the route and had to make a detour of over ten miles, going over part of the extra loop at better than 60 miles an hour. The pacemaker, a Zust, was also well back in the procession during the return trip.

On the first day checking stations had been established at Brair Cliff and Greenwich in addition to the noon and night controls.

The route followed on the second day was to Newburgh, N. Y., and return, 139.2 miles. The roads were muddy in the morning through Hudson County, but the day was much pleasanter than Tuesday. The route lay through Ramapo and Tuxedo, over splendid highways. After leaving Newburgh a snowstorm dampened the ardor of everybody, and when the cars straggled into Weehawken the tourists were pretty well exhausted. Some little mechanical trouble developed during the run and many cars experienced tire trouble. A large number of the contestants will be penalized for lateness at control. and the technical examination is expected to develop some weaknesses. The officials have taken the scores and announce that the results will be given out next Saturday.

The prizes offered for the winners in each class were more than usually numerous. An even dozen valuable trophies were hung up by various individuals and accessory companies. A. R. Pardington acted as referee. C. H. Larson was starter.

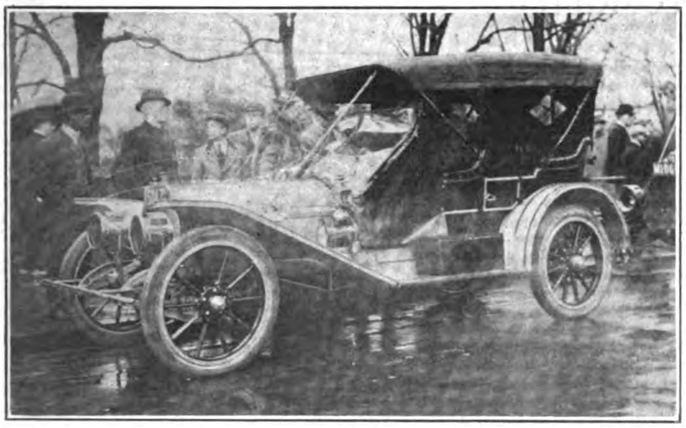
The entry list included the following:

Class A, Division 1-A—

Car	Entrant	Driver.
Ford	Ford Motor Co	D. B. Young
Division 2-A—		
Mitchell	Mitchell Motor Co	O. R. Delamater
Hudson	A. Elliott Ranney Co	A. M. Day
Division 3-A—		
Pullman	Cimiotti Bros	Roy Stains
Reo	R. M. Owen & Co	P. Haycock
Marion	Chas. E. Reiss	P. G. Thebaud, Jr.
Maxwell	W. B. Byrnes	J. Ross
Division 4-A—		
Pullman	Cimiotti Bros	Norman Gallatin
Haynes	Haynes Auto Co	R. Schmidt

The White Steamer (press) with perfect, unofficial score

Reo, No. 8, a contender in Division 3-A



Powerful Matheson 6, which did well on the slushy hills

Hudson runabout, which performed in its usual good form

Car	Entrant	Driver
Division 5-A—		
National	Union Auto Co	F. Hermance
National	Poertner Motor Car Co	W. C. Poertner
Stoddard-Dayton	Stoddard Motor Co	H. Harding
Pullman	Cimiotti Bros	Herbert Welker
Babcock	Short & Wright	C. White
Corbin	Warner Instrument Co	H. H. Knepper
Speedwell	Garland Auto Co	A. Holtzmueller
Division 6-A—		
Columbia	United Motor Co	Gordon M. Wagner
Oldsmobile	Oldsmobile Co	T. Spear
Matheson	J. C. Blanch	D. A. Hall
Pope-Hartford	Pope-Hartford Co	A. Warren
Stearns	Mrs. G. H. Wallace	G. H. Wallace

Lozier First in Star Santa Monica Events

Los Angeles, Nov. 24—Making motor history, a Lozier driven by a Los Angeles pilot, Tetzlaff, proved the winner of the Santa Monica road race of 202.006 miles, run on Thanksgiving day, broke the American road racing record with an average of 71.4 miles an hour and also won the heavy stock car race at 151.5 miles, averaging 73.29 miles an hour.

A Pope-Hartford was a fair second in the stock car race and a rather distant runner-up in the free-for-all.

Two light car events were staged prior to the big races, and a Maxwell annexed the honors in the 161-230 class; while a Duro, a Los Angeles product, was first at the tape in the 231-300 cubic inches class.

It was a perfect day on a perfect course. Not an accident marred the enjoyment of the 75,000 spectators, and the mechanical troubles of the cars contesting were not many.

The heavy stock car event was started at 9:15, and the Lozier took command at the outset and held it throughout, winning by nearly six minutes.

The car was not removed from the course before taking part in the Santa Monica free-for-all. Changed spark-plugs and a hasty manicuring constituted its preparation for the big trial. In the running of the race, the Fiat racer led for one lap, when the Lozier came along and took the pace. From there to the finish the white car stayed in front, but at one time the Fiat nearly caught it. At the end the Lozier was jogging along, taking things rather easily, to win by some 15 minutes.

The Pope-Hartford was second, having suffered trouble with a valvespring in the middle distance. While these two were the only cars to complete the course officially, the Knox was running along in its twenty-second round and the Ohio in its sixteenth when the checkered flag announced the end of the race. The Fiat, after performing creditably for sixteen laps, broke its crankcase. The Isotta entry broke a connecting rod in the sixth and The Only Car froze its piston before the end of the first lap. The Apperson did a dozen rounds before engine troubles put it out of the contest.

Dick Ferris managed the races and presented the trophy that went to the winner of the heavy stock car race. The summary:

Car	Driver	Time
161-230 Cubic Inch Class—12 laps		
Maxwell	Farcher	1:02:31
Oakland	Okerman	Out, 3d lap
Staver	Fouch	Out, 1st lap
231-300 Cubic Inch Class—12 laps		
Duro	McKeague	1:01:04 3-5
Maxwell	Smith	1.04:15
Petrel	Arthur	1:58:48
Mitchell	Greer	Out, 11th lap
Mercer	Bigelow	Out, 10th lap
Buick	Mikrent	Out, 5th lap
Cutting	Clark	Out, 1st lap
301-600 Cubic Inch Class—18 laps		
Lozier	Tetzlaff	2:04:10 4-5
Pope-Hartford	Dingley	2:10:00 3-5
Franklin	Seibel	Running, 17th lap
Knox	Brown	Out, 6th lap
Apperson	Ryall	Out, 4th lap
Free-for-all—Prize, $2,000—24 laps		
Lozier	Tetzlaff	2:49:59
Pope-Hartford	Dingley	3:04:47 1-5
Knox	Brown	Running, 22d lap
Ohio	Henwood	Running, 16th lap
Fiat	Dearborn	Out, 17th lap
Apperson	Ryall	Out, 13th lap
Isotta	Soules	Out, 6th lap
Only	Van Valin	Out, 1st lap

New type Columbia checking in at Danbury

Thanksgiving Day Races at Guttenberg Track

FAVORED with glorious weather and a large attendance, the automobile races held at the old Guttenberg race track on Thanksgiving Day for cars nominated by Hudson County auto dealers should prove the commencement of a series of good meets easily accessible to Jerseyites and New Yorkers alike.

Two of the three star performers—"Cyclone" Fiat and Grand Prize Buick—gave good account of themselves, while troubles prevented the other, a Pope-Hartford, from showing its speed. Previous to the racing proper, during a trial spin of the Fiat at a fast clip, one of the rear tires blew off and hit the driver in the face, swelling his lip badly. Later, in the 20-mile free-for-all, while leading the field by nearly a mile in the eighth lap, the Fiat was seen to turn round on the lower bend and slide through the small fence; this was caused by the snapping of a steering arm short off at the axle, rendering the steering gear useless and putting the car out of the race.

In the 15-mile race, when over a lap in the lead, the Pullman broke a wheel, but this was replaced later and the car came in second in event No. 5. The National, entered by the Union Auto Company, proved the best prize winner, finishing first in the 20-mile free-for-all and 5-mile stock class for cars with engines of from 30 to 60 cubic inches piston displacement and second to the big Fiat in the 10-mile free-for-all.

Burman's exhibition on the Grand Prize Buick proved that the track has possibilities for fast driving, although the dust was apparent when a bunch of cars came together.

In the 20-mile free-for-all one of the entrants, a Matheson, fired its right rear brake, but no damage was done.

It was interesting to note what pressures some of the tires on the racing cars were inflated to, and when tested with a gauge three showed under 45 pounds per square inch.

The method of timing employed was for the four timers to start their watches at the gun and clock off as they thought the cars finished, and discrepancies were only matters of fifths of a second.

The management of the meet was in the hands of O. D. Corbett and its success is greatly due to his hard work. The following gentlemen comprised the officials: Referee, P. T. Powers; representative of the contest board of the A. A. A., A. F. Camacho; judges, F. W. Dunham, J. F. Bernstein, E. J. Schroeder; starter, G. A. Blakeslee; assistant starter, C. W. Grant; chief timer, L. L. Niedrach; deputy timers, H. E. Adams, J. F. Johnson, Hugh Falvey and Bert Ackland. The announcing was in the hands of J. F. Drumm, and the legal adviser was W. J. MacFadden.

The paddock at the Guttenberg races on Thanksgiving Day

The summary:

Class E—Five miles for stock cars under 231 cubic inches—

No.	Car	Driver	Time
8	Maxwell	T. Costello	6.07
9	Abbott-Detroit	M. Bassle	6.09
7	Maxwell	T. C. Wolverton	6.20

Class D—Ten-mile free-for-all—

10	F. I. A. T	R. De Palma	10.16
18	National	D. C. Teetor	11.35
17	Buick	C. Beach	11.45
14	Pullman	W. Burke	12.11

Class C—Fifteen-mile stock chassis, 231 to 300 cubic inches—

19	Mitchell	V. Wilhelms	20.21 1-2
	Pullman	Broke wheel when leading by two laps; did not finish	

Exhibition—Ten miles—

Marquette Buick, B. Burman. Time, 9.57½.

Time by laps—1st, 1.07; 2d, 2.07; 3d, 3.07; 4th, 4.05; 5th, 5.04; 6th. 6.03; 7th, 7.01; 8th, 8.00; 9th, 8.58; 10th, 9.57½.

Class D—Twenty-mile free-for-all—

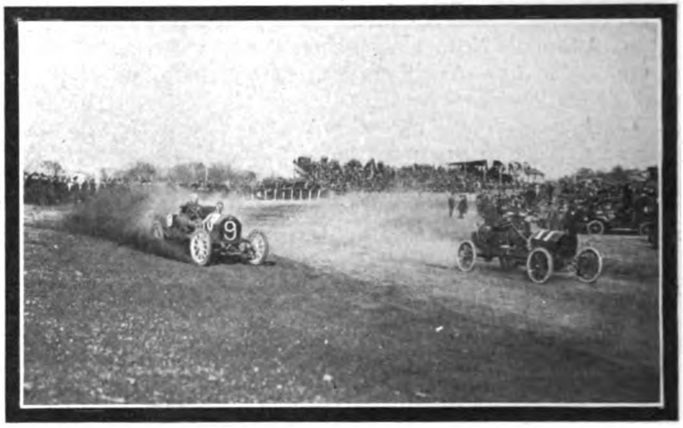
18	National	D. C. Teetor	23:00
23	Matheson	Neil Whalan	23:12
8	Maxwell	T. Costello	23:19 1-2
15	Pullman	W. Burke	23:20

Class E—Five miles, stock chassis, 300 to 600 cubic inches—

18	National	D. C. Teetor	5:32
14	Pullman	E. T. Gilliard	5:34 1-2
15	Pullman	W. Burke	5:54

First Race Meet at Bridgeton

BRIDGETON, N. J., Nov. 28—Thanksgiving Day saw the first race meeting for automobiles ever given by the newly formed South Jersey Motor Club. The races were held on the track of the Bridgeton Driving Association, a half-mile oval, and were well contested. Seven events were carded and the fields were small.



Hudson and Abbott-Detroit in the 20-mile free-for-all

The program opened with a match between a Pullman (Harvey Ringler) and a Parkin (Parkin). The latter won, the five miles being made in 7 minutes. The same car also scored in the next event against a Jackson (Blockson). In the next a Mercedes (Kelley) defeated a Kline. The Jackson won the following number from a Pullman and the tri-country race went to a Buick (Harry Hunt). The special handicap was won by a Mercedes, and in the last race of the day a Buick finished ahead of a Pullman. A big crowd was present.

Pullman Wins Big Class and Sweepstakes

HARRISBURG, PA., Nov. 28—Winning its class, 6A, as well as the sweepstakes offered in the Autumn run of two days given by the Motor Club of Harrisburg, Pullman No. 3, driven by Herbert Walker, finished with clean road and technical scores.

The other class winners were as follows: Division 3A, touring car section, Reo; runabout section, Kline. Division 4A, touring car section, no contestants; runabouts, Velie. Division 5A, touring car section, Pullman; runabouts, Pullman. Division 6A, touring cars, Columbia; runabouts, Pullman.

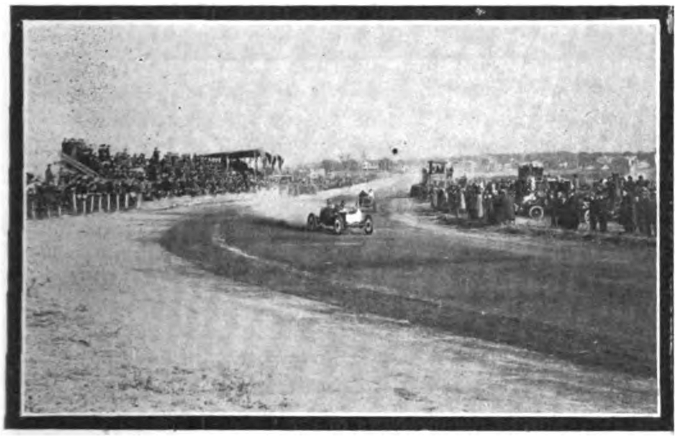
Fakers' Friend Breaks Out Again

Sane regulation of automobile racing and the protection of drivers and spectators are things so entirely to be desired that they are not debatable. Far be it from the intention of The Automobile to defend such things. But the prospects for improvement in conditions are always injured by misrepresentations, and The Automobile takes occasion to correct some statements that appeared in a New York evening paper of wide circulation, signed by the sporting editor of the publication.

In a recent article this writer says: "Two drivers and a mechanic were killed at the Savannah Grand Prize race, and it won't be long at this rate before all of the men we saw out on Long Island that fatal day are numbered among those who gave up their lives and are forgotten. Ten per cent. of the men who started in the Vanderbilt Cup race have been killed outright or died from injurious [*sic*] received in auto racing!"

It is easy enough to make wild statements that appear ridiculous after they get cold, and the above is one of these. Without considering the opening inaccuracy about the Savannah race, in which nobody was killed at all, the rest of the conclusions are based as follows: There were 43 actual starters in the Vanderbilt Cup race and light car contests. Consequently there were 86 men engaged in driving the contesting machines. Of these, two mechanicians were killed. Since that time Al Livingston met with a fatal mishap while practicing at Atlanta and Tobin De Hymel was killed in a race upon a Texas dirt track.

All of which is lamentable, deplorable and worthy of sober thought. But in the name of common sense, what is the use of slobbering over cold facts? Four men were killed who took part in the running of the Vanderbilt Cup. That is bad enough. Thus less than 50 per cent. of what the sporting editor wrote and signed was true.



Pullman leading Mitchell in the 15-mile stock chassis race

Naturally enough, that might be considered a flattering percentage of truth coming from the only sporting writer in New York who did not know that the recent Sheepshead Bay fiasco and moving-picture fake between an outlaw driver and a negro pugilist was such long before it was perpetrated upon the public. Right up to the last gasp this writer handled the nauseating publicity dope sent out by the fakers, and undoubtedly a considerable portion of the crowd of dupes that paid real money to see the "race" were attracted by his articles.

Atlanta Speedway Free to Flyers

Atlanta, Ga., Nov. 28—When the coming aviation meet is staged in Atlanta the airmen will fly at the grounds of the Atlanta Speedway. The big plant has been donated to the use of the flyers by the Atlanta Automobile Association with its immense stands, inclosure and complete equipment. Official notification of the action of the association has been conveyed to the Atlanta *Journal*, which is promoting the meet.

Hunt Jackrabbits in Automobiles

Hiawatha, Kan., Nov. 28—Over 300 automobiles were used Thanksgiving Day in the most throughly unique jackrabbit hunt ever attempted on earth. The game was started from its hiding places in the bunch grass by a wire, half a mile long, to each end of which was attached a big automobile. The cars were run across country and the wire scraped along the flat surface of the fields. Dogs did the actual hunting, a matched pair riding in the tonneau of each car until the game was flushed. They were then unleashed and "worked" the rabbit until he was captured.

Farmers from all over this country "followed the hounds" in their motor cars.

Maryland Club Maps Campaign

Baltimore, Md., Nov. 28—The Automobile Club of Maryland has mapped out a progressive program for the winter and appointed the following committees for the ensuing year: Runs and tours—Joseph M. Zamoiski, chairman; Isaac Field and H. C. Weiller. Laws and Ordinances—O. I. Yellott, chairman; C. H. Millikin and James W. Bowers, Jr. Auditing Committee—W. A. Dickey, chairman; R. M. Rother and Dr. S. C. Pennington. House Committee—James S. Reese, chairman; C. W. Strok and L. F. Lambert.

The club sent a delegation to the Police Board of Baltimore to talk over the traffic laws of the State, and an agreement was reached whereby the board and club members will co-operate.

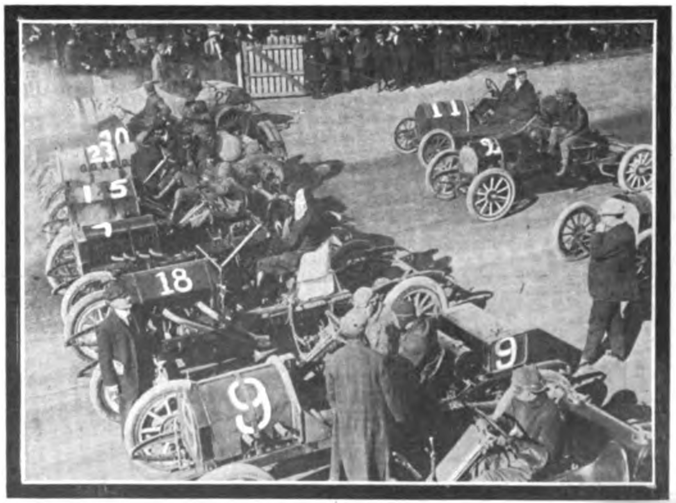
Newark Club to Give Annual Banquet

Newark, N. J., Nov. 28—The New Jersey Automobile and Motor Club will hold its eighth annual banquet in Newark in the early part of January next and Vice-President Harry D. Bowman, who has this event in his charge, expects to make this year's event bigger and better than ever.

Legislative matters will be discussed and speakers of national repute will address the assemblage, which will prove the banner social event of North Jersey.

Camden Motorists Form Club

Camden, S. C., Nov. 28—The Camden Automobile Club was recently organized with Jno. W. Corbett, M. D., president; F. M. Wooten, vice-president; H. L. Watkins, treasurer; and M. H. Heyman, secretary. The club has already gone to work to post the through roads of Kershaw County, with particular reference to the connecting link between the National and Capital highways, from Charlotte, N. C., on the National highway, to Camden, on the Capital route.



Start of 20-mile free-for-all at Guttenberg, won by National

Briscoe Compares Foreign with American Cars

LOOKING actually rested from his six weeks' trip abroad, during which he accomplished an immense amount of work, Benjamin Briscoe, president of the United States Motor Company, with Mrs. Briscoe, reached home last week on the Mauretania. He visited England twice and toured in France and Germany, established the foundation of a great factory and distributing plant—perhaps two—visited leaders in the trade and attended the Olympia show in London. Despite all of that activity, he had time to discuss the fundamentals of trade on numerous occasions for technical press and newspapers and created a favorable impression upon the British public.

The concrete result of Mr. Briscoe's trip was the formation of the United International Motors, Limited, which, as has been outlined in THE AUTOMOBILE, will be affiliated with the United States Motor Company and will build and sell several models of the American cars in foreign fields.

Mr. Briscoe's examination of the European situation developed the fact that there is a considerable potential demand for cars of moderate and low price, that may be used for business purposes by professional men, contractors, etc., and which also possess the features and advantages of purely pleasure cars.

In discussing this matter, Mr. Briscoe said:

"The average price of English-made automobiles is about $1,900, which indicates quite strongly that the English manufacturer has not grasped to the full the ultimate universal mission of the automobile. But the English public is fast becoming aware of the fact that the automobile spells economy, for the demand for moderate priced cars seems to be growing much faster than the production, although several of the British makers are turning out cars selling around $1,000. Last year 14,239 cars were made and sold in England, while in Germany and France the number was about 8,000 each. The total sales in those three countries amount to about one-sixth of the American sales, while the value is about one-half of the total amount realized from motor car sales in the United States.

"The amount represented by cars imported from the United States is very small compared with the figures from other countries. Out of a business of nearly $20,000,000 in 1909 the portion of the United States was only a trifle over $600,000. These figures might seem to indicate some prejudice in England against American-made cars and undoubtedly that does constitute an element in the totals, but the main fact that militates against the American cars is that they are made to travel American roads, which are far different from those of England. In my opinion it is impracticable for American manufacturers to place lines of cars in England (cars that are made to meet American road conditions) with the hope of doing a very large business.

"I found that there are over 240 models of cars made in Great Britain, and an average of 60 cars to the model is a fair estimate. Thus it seems as if the British manufacturers actually wished to multiply the number of models, with all the confusion to the trade that such a condition might presuppose. But I would not wish to give the impression that the trade is anything but prosperous over there, for it is extremely so.

"The Olympia show is more of a coach-makers' exhibition than it is a show of mechanical construction. The fore-door idea is practically universal and the bodies run more to curves than they do with us. The Knight engine seems to be meeting with much favor, although a spirited controversy is now going on as to the merits of the poppet valve as against the sliding valve motor.

"I noticed one remarkable and noteworthy fact with regard to the show that illustrates the difference between social conditions over there and the same conditions here. It was being gravely discussed whether the general public should be admitted to future automobile shows. It was maintained on one hand that the attendance should be restricted to those who were able and actually intended to purchase a car.

"The condition of our affairs over there is progressing satisfactorily. The site for the factory has not been announced so far, but it will be in due course. With the advantage of our organization there is no question in my mind that the company can make and sell cars on a growing scale. The experience of American makers and the vast practical application they have made of it in the line of construction will undoubtedly be of much value in putting out cars for British and foreign use. In mechanical construction the American cars, in my opinion, occupy quite as high a plane as those of other lands, if they are not superior. As our product is turned out on a wholesale scale, while theirs is largely individual, the difference in cost must be in our favor and the market must be broader.

"It will be the policy of the United International Motors to adapt American methods to foreign conditions and as the composition of the United States Motor Company is largely international it is to be assumed that the usual prejudice against foreigners will be mitigated to a certain extent as far as we are concerned."

During his trip to Germany Mr. Briscoe laid the foundation for a German branch of the international company.

Storrow Heads General Motors

At a meeting of the directors of the General Motors Company held in New York late Wednesday afternoon, four directors of the First National Bank of Detroit were ratified as members of the new board of General Motors. They are: Emory W. Clark, M. J. Murphy, Andrew Green and Thomas Neal.

Later an election of officers was held and James J. Storrow, representative of Lee, Higginson & Company, of Boston, was chosen president; W. C. Durant was re-elected to the first vice-presidency; W. J. Mead, general manager of the Olds Motor Works, was also elected vice-president, and C. R. Hathaway, secretary and treasurer.

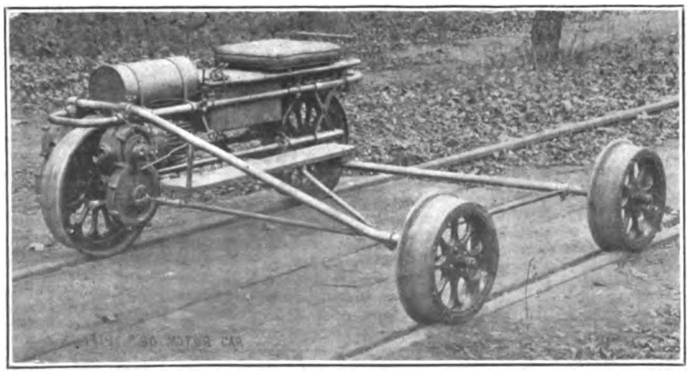
Among other matters considered was the proposed removal of the general offices of the company from New York to Detroit.

President Storrow is expected to go to Detroit within a few days to arrange the transfer and other affairs of the company.

The First National Bank of Detroit has already distributed over $4,000,000 in liquidating the debts of the reorganized company.

Takes Place of Railroad Velocipede

THREE RIVERS, MICH., Nov. 28—The accompanying photograph shows a railway automobile of unique design and much power, which is made by the Sheffield Car Company. The engine of this device develops 30 horsepower. It is used for a large number of purposes, including inspection, track repair and generally for anything that requires quick transportation upon a railroad.



Railroad automobile of compact form

Road Builders to Meet in Annual Convention

THE seventh annual convention of the American Road Builders' Association will be held at Indianapolis, December 6 to 9 inclusive. The program is assuming form. Acceptances from quite a number of prominent men are expected before a detailed arrangement of dates and hours can be fixed. Among those who have consented to make addresses or prepare papers on subjects with which they are especially familiar are the following:

N. J. Bachelder, Master of the National Grange, "The National Grange and Good Roads."

F. J. Robinson, Deputy Minister of Public Works, Province of Saskatchewan, Canada, "Pioneer Road Making in Saskatchewan, Canada."

Samuel Hill, president Washington State Good Roads Association, "Convict Labor in Road Building."

S. Percy Hooker, chairman New York State Highway Commission, address (subject to be announced).

Major W. W. Crosby, chief engineer Maryland State Roads Commission, "A Division of Road Interests for Better Results."

James H. MacDonald, State Highway Commissioner of Connecticut, address (subject to be announced).

Harold Parker, chairman Massachusetts State Highway Commission, address (subject to be announced).

Col. Frederick Gilkyson, Commissioner of Public Roads of New Jersey, address (subject to be announced).

A. B. Lea, director Public Service of Cleveland, Ohio, "Relation of the City to Its Adjacent Country Highways."

A. N. Johnson, State Highway Engineer of Illinois, "Some Features of Road and Bridge Construction."

E. J. Watson, Commissioner of Agriculture of South Carolina, address (subject to be announced).

James C. Wonders, State Highway Commissioner of Ohio, "Present Highway Laws of Ohio and the Proposed New Law."

C. D. Miller, Assistant Territorial Engineer of New Mexico, address (subject to be announced).

Jos. W. Hunter, State Highway Commissioner of Pennsylvania, "Application of the Highway Law of Pennsylvania."

Townsend A. Ely, State Highway Commissioner of Michigan, "Progress of Road Building in Michigan."

Logan Waller Page, director U. S. Office of Public Roads, "State Highway Legislation."

Geo. W. Cooley, State Engineer of Minnesota, address (subject to be announced).

Charles P. Light, Commissioner of Roads of West Virginia, "Earth Roads."

Jos. Hyde Pratt, State Geologist of North Carolina, "The Best Method of Supervision and Control of Road Construction in a State."

Samuel H. Lea, State Engineer of South Dakota, "Road Building in South Dakota."

T. R. Atkinson, State Engineer of North Dakota, "Road Building in North Dakota."

Paul D. Sargent, State Highway Commissioner of Maine, address (subject to be announced).

W. O. Hotchkiss, chief of Highway Division, Geological Survey of Wisconsin, address (subject to be announced).

P. St. J. Wilson, State Highway Commissioner of Virginia, address (subject to be announced).

W. S. Gearhart, State Highway Engineer of Kansas, "Bridge and Culvert Construction."

Good Roads Men for Organization

WASHINGTON, D. C., Nov. 28—One of the most important good roads meetings ever held in this country culminated Tuesday in the formation of the American Association for Highway Improvement with Logan Waller Page, director of the office of Public Roads, as president. W. C. Brown, president of the New York Central lines, was elected vice-president; Lee McClung, treasurer of the United States, treasurer, and J. E. Pennybacker, Jr., chief of road management, Department of Agriculture, secretary.

The executive committee is composed of a number of leading railroad presidents, automobile men and others.

Virginia Autoists Plan New Road

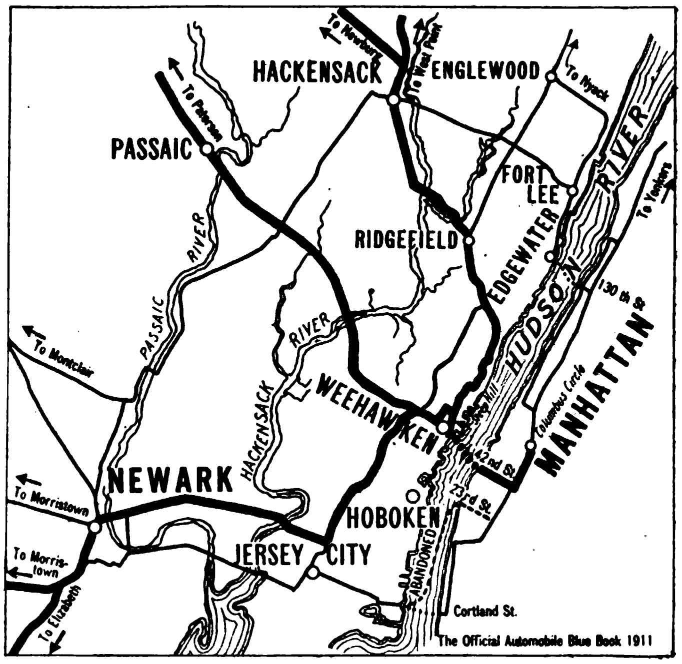
RICHMOND, Nov. 28—With the view of building a new automobile road in Virginia, which will connect Richmond and Newport News, the automobile clubs of the two cities are effecting an organization which it is thought will be completed by January 1 and ready to begin actual work upon the proposed new highway.

The distance between the cities is just eighty-six miles, and a route has been mapped out which will make the trip one of but four hours by automobile. W. F. Gordon and L. M. Foster recently selected the proposed road, posting signs along it. They were accompanied from Newport News by President W. A. Post, of the Newport News Automobile Club, and L. B. Manville. Both are very optimistic over the prospect.

The Passing of the 23rd Street Ferry

Coincident with the opening of the big new station on Seventh Avenue, the "Pennsy's" old Twenty-third Street Ferry to Jersey city has been abandoned. Users of the Official Automobile Blue Book will be glad to know that an equally good route to Newark is offered via the Forty-second Street Weehawken Ferry, with but slight difference in mileage when starting from up-town points.

Below is reproduced the complete route from the ferry to Newark, as it will appear in the 1911 edition of the Blue Book, together with a map which shows this connection and the availability of the Forty-second Street Ferry for reaching Passaic, Hackensack and Englewood.



Forty-second St. Ferry Connections into North Jersey

Peeps Through Auto Goggles at Distant Lands

MADRID has 775 licensed automobiles; but there are no automobile trucks. One reason is because gasoline costs 48 cents per gallon. Doubtless there would be a more rapid increase in the number of private automobiles if it were not for the ultra-conservatism of the old aristocratic families, the great majority of whom are inclined to stick to their horses and carriages. Again, the prices that are demanded for machines by the Madrid dealers would in many instances be considered exorbitant even in the United States. As a rule the machines used in Spain are from 10 to 16 horsepower. But as a number of these cars are out of date the owners are anxious to sell their old machines and purchase new ones of higher horsepower. There would appear to be a market there for moderate-price cars and the demand for them will grow. The roads in and around Madrid, as well as in many parts of Spain, are quite equal to the famous roads in France. Even in the face of Spanish conservatism many aristocratic families, following the wake of the sport-loving young king, are taking to automobiling as a fashionable diversion and automobile excursions have become the fad throughout various sections of the country. There is not an American car to be seen in Madrid. One reason for this is the fact that local dealers are bound by contract with European manufacturers not to handle American-made machines. Besides, the fault is, to a certain degree, with the American manufacturers themselves. It should be understood that in order to sell cars in the capital of the dons it is absolutely necessary that they should be placed on exhibition, thoroughly tried out, and the cost of delivering the machines in Madrid plainly stipulated. The catalogue and letter-writing method of doing business does not go in Spain. It is a mere waste of time and postage. It is also indispensable that the salesman representing the manufacturer shall speak the Spanish tongue. The bodies used in building automobiles in Spain are of foreign make. The Spanish customs provide for a high tariff on motor cars imported into that country.

A company has been organized for the purpose of furnishing the principal cities of Australia with an effective system of taxicab service. Four-cylinder, 15-horsepower cabs are being put into commission. With the exception of 25 of the bodies, which were manufactured in and sent out from London, the remainder will be made in Australia. Three hundred taxicabs will comprise the complement. Their operation will be regulated by the new Motor Act of the State of Victoria, which provides for the registration and the licensing of motor cabs to ply for hire. Under this act provision is also made for ranks and stands, and a schedule of rates has been established similar to those fixed for ordinary cabs.

At Dawson, in the Yukon Territory, Canada, there are now two automobiles in use: A 60-horsepower, 3-passenger car and a 20-horsepower, 4-passenger machine. There is one touring car in the Klondike, a 7-passenger, 35-horsepower machine. The passenger tariff is a cheerful item for a chauffeur to contemplate, namely, $15 for the first hour; $10 for the second hour, and $75 for the day. The car in question drinks ten gallons of gasoline each day, at a cost of 75 cents per gallon. The chauffeur receives $150 per month and his expenses. Freight rates for automobiles by the White Pass and Yukon Route are $190 per ton.

The automobiles in use in Johannesburg, which constitutes a larger market for machines than all of the rest of South Africa combined, are of various grades, including German, French and English, a very few American, and a small percentage of Italian patterns. The highest price cars in use are made in Continental Europe and in England. They range in price from $5,000 to $10,000 delivered in Johannesburg. While there are many high-price cars in commission there, and although the market for this class of cars is encouraging, the expensive machines are mainly bought by or for the parties desiring to use them. For this reason expensive cars are not as a rule kept in stock by the local dealers. There is a fifteen per cent. duty on automobiles imported into South Africa, based on the value of the machines, a 3 per cent. preference being given in favor of machines manufactured in the United Kingdom, and therefore reciprocating in the case of British Colonial trade. The popular demand is for cars of from 16 to 20 and from 20 to 28 horsepower, whose seating capacity is from three to five persons. There also is a call for cars of the small runabout class. Climatic conditions are to be considered by exporters of cars into South Africa. The climate being very dry, it is necessary that any wood used in the construction of machines shall be thoroughly seasoned. It is due to neglect in this direction that many complaints are made relative to wooden wheels. Preference is given to aluminum bodies. Bad roads obtain in the country as a rule. There are a large number of streams to be crossed while touring. Therefore, high clearance is demanded. Some of the machines have a clearance of not more than eight inches, which is not enough in the event of crossing a stream. Neither is this enough when running over roads having deep ruts and high crowns made by the wheels of wagons. The springs should be made very heavy. At least one leaf should be added to the ordinary spring for use in South Africa. Flimsy axles bend after having run over rough country roads a short time. The favored plan is to reinforce the front axle with a strong bow-string, or with a sort of truss. As the hot climate dries out the wood very rapidly, it is necessary to use the highest grade of paint.

New York Goes After Smoking Autos

Officers of New York have started a movement, headed by Mayor Gaynor, to suppress the smoking automobile. Investigators, in securing evidence of the prevalence of this abuse, have reported that about one-third of the automobiles that are driven about the city violate the provision of the Sanitary Code prohibiting excessive smoke.

The movement is based on sound sense, for a smoking automobile is not only a nuisance to the public generally, offensive to the senses and flagrantly illegal, but it is indicative of ignorance on the part of the driver and is wasteful and careless practice.

Smoke is caused by the excessive use of lubricating oil in the engine. Where such conditions exist it shows that little knowledge of the motor is possessed by the operator. In the first place excessive lubrication is a potent cause of carbon deposits in the cylinders; it decreases power when the motor is throttled down for slow motion; it lends itself to defective combustion and augments slipping gears. With excessive lubrication, flexibility, so much desired in heavy traffic, is spoiled.

Then, too, the practice is costly without adequate return.

The man who obeys the law with regard to smoke is a better driver than the one who comes under the ban. He saves expense in two ways—his oil bill is not so large and he avoids fines.

Electric Vehicle Men in Meeting

With an attendance of about 100 the first regular monthly meeting of the newly formed Electric Vehicle Association of America was held Tuesday night. C. L. Morgan made an address on the essentials of operation and care of commercial trucks. He advocated more care in inspection and periodic overhauling. The society has a membership of 250.

Floods Threaten French Automobile Plants

PARIS, Nov. 21—There is every indication that French automobile manufacturers will be as seriously affected by floods this winter as during last season. Even now, at the beginning of the winter, the river Seine is in an abnormal condition, and although none of the factories is yet flooded it only needs another foot rise to bring the water to their doors. The situation is rendered serious by the fact that practically nine-tenths of the automobile factories of France are grouped along the banks of the river Seine, just below Paris; that the river and all its tributaries are high and still rising, and that the ground is so sodden by several wet seasons that it has no further powers of absorption.

Although adequate warning has been given of the possibility of floods this winter, very few preventive measures have been taken. To remove all possibility of danger would entail an expenditure of several million dollars, and a series of changes requiring five to seven years to accomplish. Temporary measures have been adopted in the city of Paris; but in the suburbs, where all the automobile factories are located, nothing has been done by the authorities.

Profiting by last year's experience, arrangements have been made by manufacturers for putting up dikes and using powerful pumps, whenever necessary, and much valuable machinery has been removed to positions of safety. Thus, supposing the record height of last year is again attained, the damage will be less, but it will not prevent the total or partial closing down of some of the leading factories. The firms most seriously threatened are Brasier, Renault, Darracq, Charron, Gnome, Unic, De Dion Bouton, Bayard-Clement, Continental tires, and Bosch magneto. Among the few altogether out of reach of the floods are Panhard-Levassor and Delahaye, both of which are located on high ground within the city of Paris.

France now seems to regret her decision to abstain from racing, for it has just been decided that there shall be a big speed test next year, to be known as the Grand Prix de France, and to be run on a fast course in the Sarthe district, on some date between May 15 and July 15. It is the Automobile Club de la Sarthe which is responsible for the race, with the patronage and official sanction of the Automobile Club of France.

The racing board of the French club is under a vow not to promote any road race, but as the last two seasons have shown abstention to be a mistake the leaders are quite willing to turn the difficulty by backing a race promoted by a private club. The Sarthe district is the one in which the 1906 two-day Grand Prix was held. Its roads provide perfect, well-surfaced straightways of a switchback nature.

Two races are scheduled for next year, one for cars limited to 4.3 by 7.8 inches bore and stroke, and another for any type of car of any weight or power. The two races will be run on the same day, over a distance of about 370 miles. In addition to medals offered by the Automobile Club of France, there will be a trophy for the winner in each class of the value of $1,000, or this amount in cash. Entries will be received until February 1, 1911.

Objections will doubtless be made by constructors to the dimensions fixed for the limited power cars. France is much more interested in cars of 80 or 90 millimeters bore (3.1 and 3.5 inches) than in those of 4.3 inches, the great majority of motors for next season not exceeding 3 1-2 inches bore. Several firms are now producing standard touring cars with a stroke twice the value of the bore, and one French firm will confine itself next year to cars having a ratio of 2.42 to 1 stroke to bore; these, it must be remembered, are standard touring cars, as delivered to the public, and not special racing models. For these latter the ratio runs as high as 4 to 1.

The unrestricted class is not likely to reveal anything new. It is doubtful if there will be many specially constructed cars in the unlimited class; such firms as Fiat, Benz, Lion-Peugeot, Opel and a few others already having fast cars may be expected to enter them, but the old French houses have so long neglected special racers that they are not likely to come back to the game with any relish.

The raising of the bore limit to 110 millimeters will keep out an important group of the smaller firms having done a lot of pioneer work with motors of not more than 90 millimeters bore. These firms will have to build special motors to enter in either class, whereas had the limit been lower they could have entered in the limited bore class with modified stock cars costing very much less to build than a special racer. Although the Automobile Club of the Sarthe can be congratulated on taking up a work that the Automobile Club of France has long neglected, its technical regulations are far from being satisfactory.

Mercedes Patents Sustained in England

LONDON, Nov. 21—Mercedes patents upon gate change speed control, honeycomb radiator, honeycomb radiation in connection with fly-wheel fan, brake cooling device and dished axle and differential, which were called into question by the Fiat Motor Company, have been sustained and the report is current that the applicants for the overthrow of the patents already have paid over about $100,000 in royalties.

The main question raised was as to the jurisdiction of the British courts where the patented device was manufactured abroad. Throughout the litigation the courts upheld the patents. Several other actions are contemplated by the Mercedes company against British manufacturers who have been infringing upon the radiator and the gate speed control devices. The matter has been in the courts for 18 months.

Motor Taxes Are Higher Abroad

PARIS, Nov. 21—The following comparative table shows the amount that would have to be paid in taxation for one year on a five-passenger car with four-cylinder motor of less than 4 inches bore in Paris, the French provinces and Belgium. The sums spent on driving licenses are included, although in some cases a driving license once secured is good for all time.

	Paris	French Provinces	Belgium
Car tax	$35.08	$11.28	$4.80
Horsepower tax	22.80	11.28	25.00
Car registration	0.12	0.12	none
Owner's driving license	4.00	4.00	none
Chauffeur's license	4.00	4.00	none
Road making tax	none	6.24	none
Gasoline tax	54.48	17.28	none
	$120.48	$54.20	$29.80

Syracuse Chauffeurs Organize

SYRACUSE, N. Y., Nov. 28—The Chauffeurs, Automobile Drivers and Automobile Workers' Association of Syracuse is just formed, not as a trade union, it is stated, but for mutual benefits. A principal object is the watching of legislation, and an effort is afoot to have the automobile workers in other cities of the State form similar organizations.

When this is done efforts will be made to try and secure a reduction of the annual $5 fee for registration, which the drivers think excessive. The Callan bill sets this fee, which is higher than that of other States.

The Syracuse organization is incorporated, the directors being Robert W. Masters, John C. Greaves and Christopher Murphy. At the organization the members were addressed by Assembly Clerk Ray B. Smith and Senator-elect J. Henry Walters.

News in Brief from the East, West and South

New York, Nov. 28—Announcement is made by the Farrell Auto Company, of Brooklyn, that it has taken on the agency of the Beyster-Detroit business wagon.

Pittsburgh, Pa., Nov. 28—The Inter-State Company is preparing to move its Pittsburgh headquarters to 5817 Penn avenue.

Denver, Col., Nov. 28—The world-touring Hupmobile which left Detroit two weeks ago reached this city in good condition and started West, after a short rest for the party.

Los Angeles, Cal., Nov. 28—The Premier car, in charge of Ray F. McNamara on its transcontinental trip, has reached this city after a series of experiences that run the whole gamut of motoring fortune. The car was in the midst of a terrific storm in Arizona last week and was out of communication with civilization for several days.

Philadelphia, Nov. 28—Taking advantage of the fact that there were many changes wrought in the Pennsylvania Legislature at the last election, the Pennsylvania Motor Federation has become unusually active in urging sane automobile laws and good roads. A number of candidates were pledged to the cause of adequate laws on these subjects before they were given the support of the Federation.

Detroit, Nov. 28—David Hunt, Jr., general manager of manufacturing for the E-M-F Company, was killed Sunday, when his car turned over near Yale, Mich. The car skidded on the edge of a steep embankment. He leaves a widow and daughter.

Detroit, Nov. 28—Representatives of the Chalmers Motor Company met in annual convention here to-day and will remain in session until December 1. Over 150 salesmen were present.

Chicago, Nov. 28—R. S. Fend, superintendent of agencies of the Woods Motor Vehicle Company, has left on a tour that will include the Pacific coast territory.

Indianapolis, Nov. 28—The Croxton-Keeton Motor Company, of New York, Inc., will control the sale of Parry cars in the city of New York for the season of 1911. The salesrooms are located at 1662 Broadway.

Mexico, Nov. 28—The United States and Mexican Trust Co. has been appointed sales agent for the Lozier cars in the Republic of Mexico.

New York, Nov. 28—Chas. E. Miller announces the removal of the Brooklyn branch of his company to 1420 Bedford avenue, corner of Prospect place.

Syracuse, N. Y., Nov. 28—The Automobile Dealers' Association of Syracuse, at a meeting of its board of directors this week, elected John H. Valentine treasurer to succeed Harry Conde, who resigned to leave Syracuse and engage in the automobile business elsewhere.

Garage and salesroom of the W. C. Moore Auto Company, which has just been completed at Wilkes-Barre, Penna.

Boston, Nov. 28—The Massachusetts Motor Company has been formed in Boston and incorporated under the laws of Massachusetts to handle the Oakland car in the Bay State east of Hampshire, Franklin and Hampden counties. G. B. Williams is president; F. D. Stranahan, vice-president; W. H. Tucker, treasurer; F. S. Snow, secretary, and F. A. Daly, manager. Mr. Stranahan formerly handled the Buick in Boston. Salesrooms have been opened at 591 Boylston street.

Boston, Nov. 28—Dr. Charles G. Percival and Montague Roberts, who are doing 100,000 miles in an Abbott-Detroit car, reached Boston in time to have Thanksgiving with some of the former's relatives. On Friday they were introduced to Mayor Fitzgerald by E. P. Blake, the Boston representative for the Abbott-Detroit, and handed him a letter from the Mayor of Detroit. Then they started for Maine. They had traveled 17,000 miles when they reached Boston.

Portland, Ore., Nov. 28—Business men, farmers and automobilists throughout Oregon have joined hands in the road-bettering movement in a definite way since the adoption of the amendment at the recent election making it possible for counties to provide funds as they elect for road construction.

Boston, Mass., Nov. 28—Peter Cole, formerly of Chicago, has just accepted the position of superintendent of the maintenance department of the Velie Motor Vehicle Co., of the New England States, with headquarters at No. 8 Waltham street, Boston.

New York, Nov. 28—The Havoline Oil Co. has made an arrangement with the Indian Refining Co. whereby the latter will act as distributing agent for Havoline automobile lubricants.

Meriden, Conn., Nov. 28—The Connecticut Telephone & Electric Co., of Meriden, Conn., is distributing 1911 catalogs covering automobile and motor boat ignition specialties. This catalog describes the new Connecticut Magneto in detail. Other types which are illustrated are the new Connecticut Shock Absorbers, Hinged Bracket Spark Coils, Magneto Lock Switch, new type Steering Wheel Switch, new 1911 Pocket Meters and Connecticut Auto Lock.

South Bend, Ind., Nov. 28—Ground has been broken for the new building which will be occupied by the United States Motor Car Co. as a garage and salesroom. The building will be two stories at the present, although the foundation will be constructed capable of supporting a ten-story structure.

Omaha, Neb., Nov. 28—C. L. Gould, manager of the Omaha branch of the Ford Motor Car Company, has contracted with the following new agents for 1911 cars: Glass & Evans, Cushing, Neb.; Johnson & Nelson, Newman Grove; Campbell Auto Company, Campbell; Lichliter & From, David City; Reeves & Linn, Madison; West Brothers, Wisner, and C. A. Darling, Lyons.

Cleveland, Nov. 28—F. S. Gassaway, formerly manager of the New York branch office of the Willard Storage Battery Co., has been transferred to the main office at Cleveland, where he will act as general manager of sales.

New York, Nov. 28—Among the passengers arriving on the *Mauretania* last week were Charles Y. Knight, inventor of the "Silent" Knight motor.

Indianapolis, Nov. 28—The G. & J. Tire Co. announces that it has made arrangements with the Oriental Rubber Company, of 1140 Bedford Avenue, Brooklyn, N. Y., whereby the latter company will in future act as sole representative for G. & J. tires for Kings County, New York.

Kansas City, Nov. 28—The Winton Motor Car Co. has established a permanent branch house at 3328-3330 Main Street, with George Arbuckle as manager.

Rockford, Ill., Nov. 28—The Cotta Transmission Company, of Rockford, Ill., maker of the "Cotta Transmission," has reorganized and resumed operation under new management.

What the Makers and Dealers are Now Doing

PORTLAND, ORE., Nov. 28—During the past week the Portland Automobile Dealers' Association held their third annual banquet at the Portland Commercial Club. Seventy-five automobile dealers, representing practically every automobile sold in Portland, were present and celebrated the completion of the best year that the automobile industry has known in Portland.

The toastmaster of the evening was Charles F. Wright, of the firm of Ballou & Wright, president of the association. The guest of honor of the evening was E. Henry Wemme, the leading spirit in the automobile industry in Portland since its inception.

To Manufacture Two Inventions

BOSTON, Nov. 28—Carmine Basile, a young Italian engineer who has been in America a few years and formerly worked in some of the big motor factories, has formed the Basile Automobile Company at Boston, capitalized under the Massachusetts laws for $150,000, for the purpose of putting on the market some of his inventions.

One of these, for which patent papers are pending, is a device to gain economy of operation. Another device is an automatic arrangement to be attached to each wheel so that a motor car may go over obstacles or depression in the road without the body of the car being changed from its horizontal position.

Elmore Plant Nearly Finished

DETROIT, MICH., Nov. 28—The roof of the Clyde plant of the Elmore company has been completed, and machinery from the old factory is now being removed to its new location. The addition of this big factory to the plant of the Elmore gives a capacity of 3000 cars during the coming year.

Coggswell Company to Start Work Jan. 1

GRAND RAPIDS, MICH., Nov. 28—The "Coggswell 35," a four-cylinder, five-passenger car with bore of 4 inches and stroke of 4 1-2 inches, is to be made by the Coggswell Motor Car Company. The company, which was formed recently, is capitalized at $250,000 and active work will commence about January 1. It is intended to assemble the cars only at first, letting out the manufacture of parts to various concerns.

Automatic Machinery Makers Merge

DETROIT, Nov. 28—Through a deal just consummated Detroit becomes headquarters for the largest automatic machinery company in the world. The deal involves a consolidation of the Potter & Johnston Company, of Pawtucket, R. I., the large manufacturers of automatic machinery in America, and the Grant & Woods Manufacturing Company, of Chelsea, Mich., manufacturers of automatic screw machinery and balls for ball bearings.

The Potter & Johnston Company is capitalized for $1,500,000, one-half of its product going abroad. The Grant & Woods Company, organized a few months ago by Detroiters, has a capital of $1,000,000, all paid in. The company has a large plant at Chelsea, a few miles from this city, and is engaged in manufacturing automatic machinery for turning out nuts, bolts, cap screws, piston pins and bushings. Bearing balls are made at Chelsea after the German method on Grant machines, which are controlled in this country by the Chelsea concern.

The Potter & Johnston Company will continue to operate in Pawtucket, but it is understood that as a result of the consolidation the Chelsea plant will be materially enlarged. The executive and selling headquarters for both companies will be located in Detroit.

New Six-Cylinder Nance

Nance Motor Car Company, of Philadelphia, Pa., Introduces a New Car

INTENDING to supply the wants of a discriminating clientèle of the character which expresses its preference for six-cylinder, long-stroke motors, the Nance Motor Car Co., with headquarters at 1209-1217 Vine street, Philadelphia, Pa., is ready for business. The general appearance of the new automobile is shown in the accompanying illustration. The body is of the fore-door type, and is regularly equipped in the manner shown, including a top. The wheelbase is 122 inches, with a tread of 56 inches, and the regular tire equipment is 34 inch. The power plant is of the unit type, 4-cylinder, water-cooled, and the motor is rated at 35 horsepower, at 900 r.p.m. The cylinders are 3 5-8 inches bore by 4 1-16 inches stroke. The carbureter is of the Stromberg type, and ignition is by the Bosch Dual system. The radiator is of the true honeycomb type.

The power plant is platformed by a cold-pressed channel section frame, narrowed at the front with a drop over the rear axle. The front axle is a drop-forged I-beam of stout dimensions. The rear axle is of the full floating type, equipped with internal and external hub brakes. The shaft drive is straight line. The steering gear is of the irreversible screw and worm type with an 18-inch steering wheel. The rake of the steering post is 30 1-2 degrees.

The company announces that it is prepared to offer two options to its purchasers, the first of which is in the form of a 5-passenger touring model and the second in the shape of a runabout. The power plant and other mechanical features remain the same in both cases. When it is considered that the price of this car is $1,900, and due allowance is made for the excellence of design and construction, it will be readily appreciated that the company is preparing to "popularize" six-cylinder automobiles from the price point of view, and taking advantage of the state of the art, including the most modern and well thought out facilities, the undertaking must be regarded as ambitious.

New six-cylinder Nance car, which is the latest Philadelphia offering with a $1,900 price tag

Among the Accessory Makers

THOMAS AUXILIARY SPRING; SIMPLEX VACUUM BOTTLES; SECOND-MAN TIRE TOOL; MICHELIN NON-SKID TIRE; HAGSTROM BLOW-OUT PATCH

BOON FOR WINTER AUTOISTS

The Simplex vacuum bottle (Fig. 2) serves two purposes, viz.: to keep liquids hot or cold, as may be desired. At this time of year a warm drink often relieves the occupants of a car from the biting cold, and the makers of this bottle claim that it will keep its contents hot for thirty hours. The principle of the two bottles shown is the same, the difference being that the cheaper one, the Junior, is covered with a plain japanned metal case, whereas the better quality has a metal body which is securely fastened to an aluminum or nickel top by means of four catches. The bottle may readily be removed for cleaning and sterilizing. It is made by the Simplex Vacuum Mfg. Co., 369 Washington Avenue, Newark, N. J., and the New York City branch is located at No. 156 Fifth Avenue.

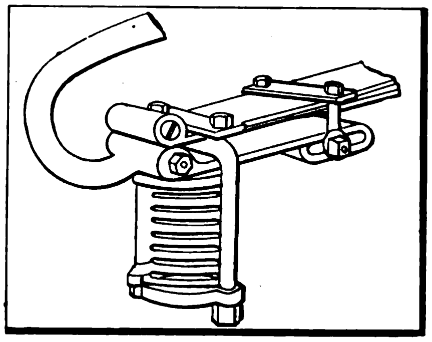


Fig. 1—The Thomas auxiliary spring

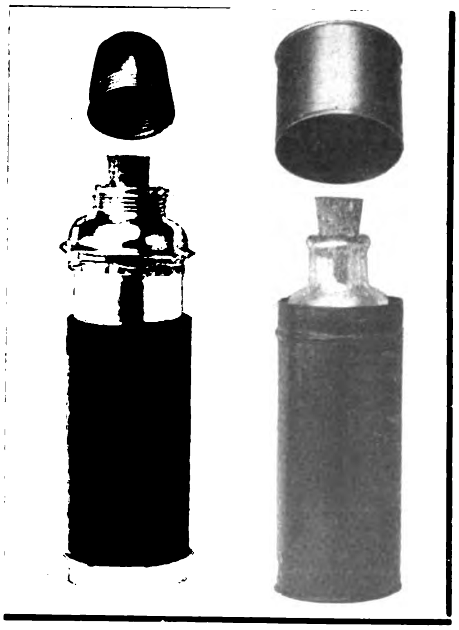

Fig. 2—Simplex and Simplex Junior Bottles

AUXILIARY SPRING TO ABSORB SHOCK

As the name implies, the Thomas Auxiliary Spring (Fig. 1) is an attachment to be fitted to each of the chassis springs of a car to prevent all the shock from road inequalities being transmitted to the latter. The device consists of a coiled spring attached inside a cage, so that when the shackle gives with the flexure of the spring the rebound action is taken up in the concertina movement of the auxiliary spring. These springs are made by the Thomas Auxiliary Spring Works, Canisto, N. Y.

A HANDY BLOW-OUT PATCH

Every autoist should carry in his kit some means of repairing a blow-out. The Hagstrom patch (Fig. 5) is designed to get a car home after a blow-out, and the sides are constructed in such a manner that the metal hook will grip the rim and prevent creeping and so uncover the hole. The patch is made by Hagstrom Bros. Mfg. Co. (Inc.), Lindsborg, Kan.

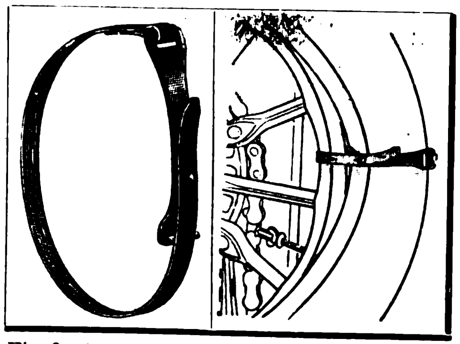

Fig. 3—A useful tire tool, and how it is applied

SECOND-MAN TIRE TOOL

How often has a motorist wished he had another hand so as to grip the tire and prevent it leaving the rim when both of his hands are in use! A useful accessory to effect this is made by the Gus Balzer Co. (Inc.), 1777 Broadway, New York, and the illustrations (Fig. 3) practically speak for themselves. The device consists of a band partly of steel and partly of leather; the leather part has eyelets and these can be hooked over a stud after the band has been passed round the felloe of the wheel, holding the tire firmly to the rim.

MICHELIN "SEMELLE" NON-SKID

The idea depicted in Fig. 4 is being marketed by the Michelin Tire Company, of New York City, and it is based upon the use of diagonally placed non-skid tires on one of the two front and rear wheels, respectively, of an automobile. It is claimed for this plan that it prevents skidding of either the front or rear ends of the automobile, requiring the use of but two non-skid tires. The non-skid tire furnished by the makers for this work consists of a strip of specially prepared leather and steel studs that cover the part of the tire that touches the road. The makers claim that the use of this non-skid does not reduce the resiliency in the least, as the leather does not inclose the entire casing. The experiences so far with this form of non-skid, coupled with this method of applying, have worked out well.

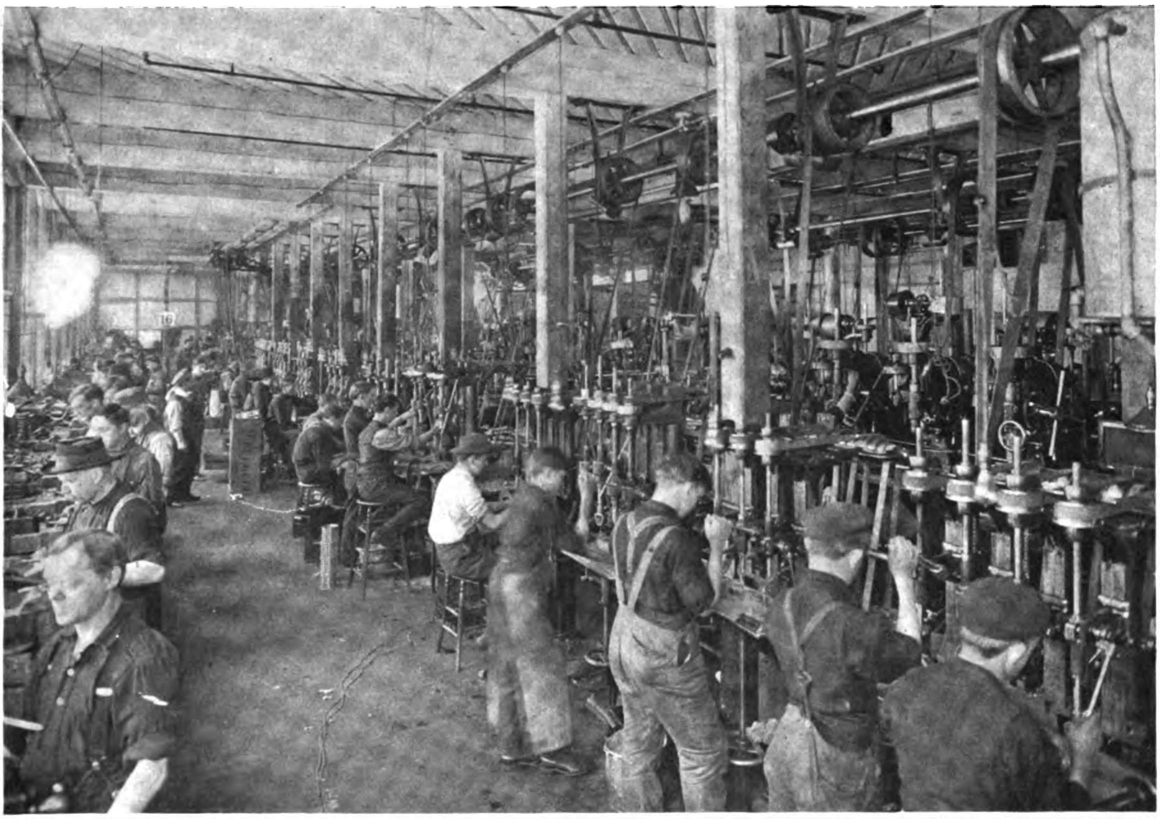
Vol. XXIII. New York—Thursday, December 8, 1910—Chicago. No. 23

THE AUTOMOBILE

LEADING UP TO 1911 SHOWS



EMBLEMATICAL OF ACTIVITY IN THE PLANTS OF THE MAKERS WHO ARE PREPARING THE 1911 AUTOMOBILES FOR THE GROUP OF APPROACHING SHOWS

APPROACHING the 1911 automobile shows, those who have long been given to the practice of noting improvements and advances are exhibiting a rare brand of curiosity. All are agreed, however, that the only way to obtain real advantage by visiting automobile shows is to have clearly in mind the points of interest which are to be examined, going there with a definite aim, with a clear understanding of the whole situation rather than to ignore the project and then attend the show on a purely curiosity basis. But if it is proposed to display discriminating intelligence at show time, it remains to coach up on the subject.

Granting that it would be too formidable an undertaking to discuss the details of design and construction of all of the automobiles that are listed in the coming exhibition, second choice lies in picking out more or less at random a number of the cars and subjecting them to a sufficient analysis to enable the interested reader to grasp their significance, and fix in his own mind a foundation that will serve him in good stead at the propitious time.

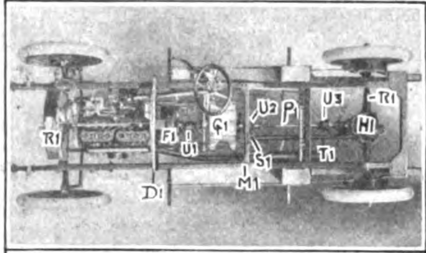


Fig. 1—Kissel Kar Chassis

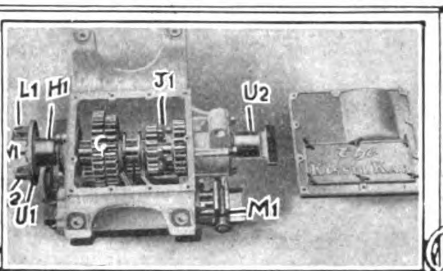

Fig. 2—Kissel Kar Transmission

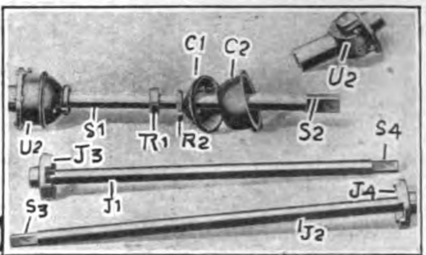

Fig. 3—Kissel Kar Details

The method of procedure in this undertaking will include a brief discussion of the relatively new ideas, coupled with an exposé of the leading underlying mechanical principles, and a tabulation is also made up in such a way as to afford precisely similar information about the several makes and the models thereof in such convenient form that it will be but the matter of a moment to observe the differences, if such there are, between the respective makes, or if the situation permits, arrive at a substantial understanding of the trend in design and fashion of the cars of the year.

In the process of depicting the particular automobiles here taken, no attempt has been made to delve into any particular school of design, nor is it the idea to make any comparison between the respective designs, leaving such matters to readers.

It is better to see things just as they are without any attempt at constructing a theory with the hope, perchance, that it will serve in the guidance of the buyer, with the expectation that he will get more nearly what he wants or more value per dollar. In all truth, the mind must be dressed in the cloth of practicability when an automobile is to be purchased, and in order to take advantage of this process it goes without saying that the fixed considerations govern. The primary fixed consideration is the work that the automobile must do but the mere selecting of a car that may be designed to accommodate a given traffic will barely suffice on the assumption that the road condition does not have to be taken into account as a general rule.

But the road must be considered. There is a great difference between town car work in a great metropolis, and overland touring service. It is even possible to view the road situation on a localized basis. A man who desires to use his automobile over the flat macadam roads of Long Island would not have to wrestle with the hill-climbing problems which would surely confront an automobilist whose radius of travel might be confined to the rough and ready roads of the Ozark Mountains.

Of the ten cars here taken, but one complete model of each make is illustrated. The table, however, will suffice to indicate that each maker has a considerable number of models, and it is noteworthy that the fore-door type of body is offered as one of the options in each case. For Winter service, this type of body lends itself advantageously, and while experience with completely enclosed bodies in the Summer time is meager, the fact remains that there would be no insurmountable difficulties involved in removing the fore-door if it becomes troublesome, although the consensus of opinion is that it is more of an advantage than otherwise, due to the fact that if it does prevent the circulation of air currents to some extent, it also keeps the silt of the road out.

Referring to the wheel-base length of the various automobiles, it will be seen that the town cars are provided with a chassis with a wheel-base between 90 and 110 inches, with a tendency to

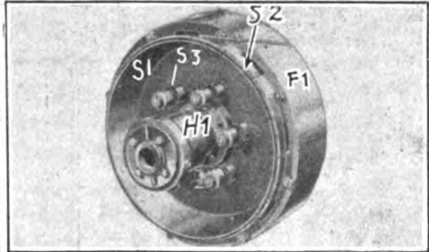

Fig. 7—Cadillac 30 Clutch

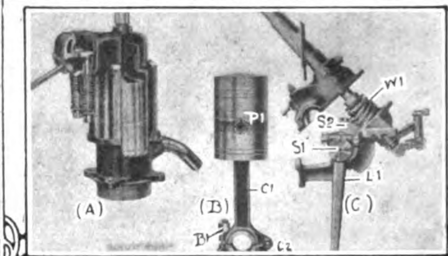

Fig. 8—Cadillac 30 Cylinders, etc.

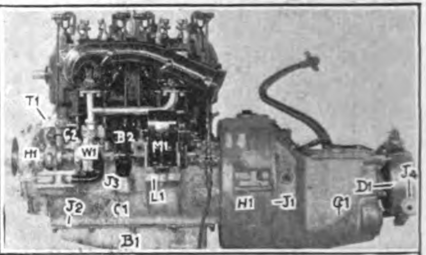

Fig. 9—Left Side Chalmers 30 Motor

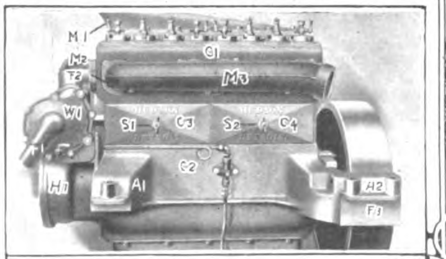

Fig. 13—Left Side Hudson Motor

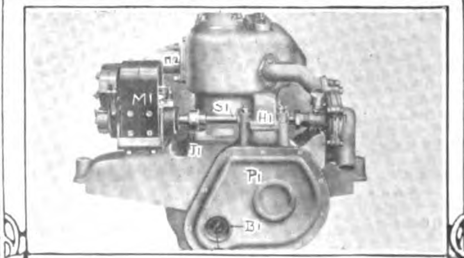

Fig. 14—Front End Hudson Motor

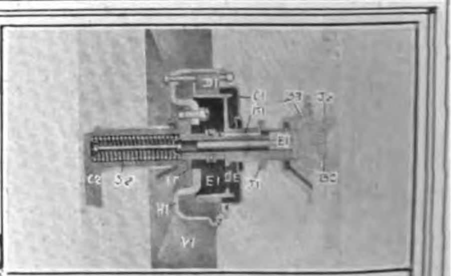

Fig. 15—Section Hudson Flywheel

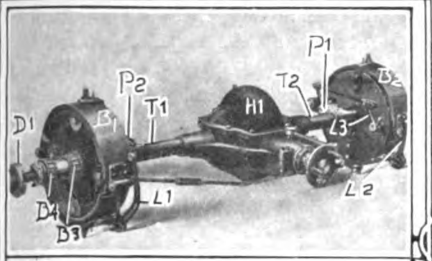

Fig. 4—Kissel Kar Live Rear Axle

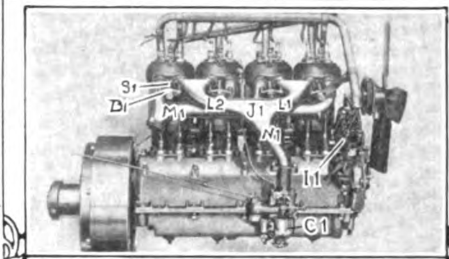

Fig. 5—Right Side of Cadillac 30 Motor

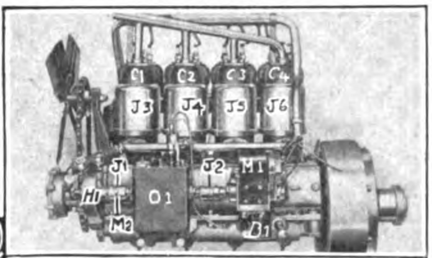

Fig 6—Left Side of Cadillac 30 Motor

make it as long as possible consistent with a "street-width" turning radius. It will be understood that it is extremely difficult to so cant the front wheels that an automobile can be turned in a circle within the width of an ordinary street without an undue locking angle if the wheel-base far exceeds 110 inches.

For general touring service, the wheel-base this year seems to be greater than in former practice, with a maximum of 142 inches, quite a number of examples between 120 and 124 inches, and a goodly sprinkling between 115 and 120 inches. The good adjustment of the wheel-base length of the various cars coupled with relatively large diameter tires and a power plant relation in keeping with the requirement, seems to have made it unnecessary to extend the speed changes in the transmission gear, notwithstanding which fact, however, quite a number of the models shown are provided with four speeds.

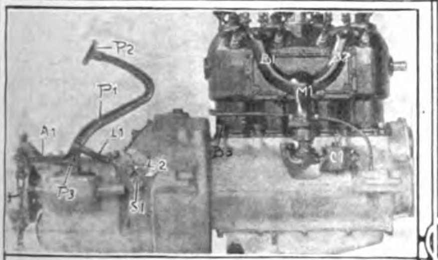

Fig 10—Right Side Chalmers 30 Motor

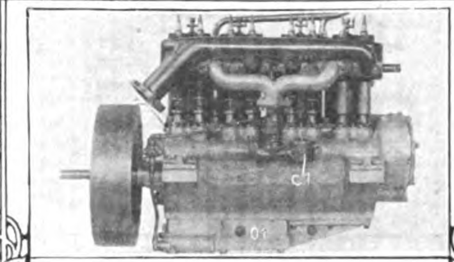

Fig 11—Right Side Chalmers 40 Motor

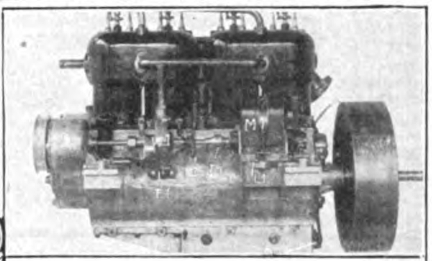

Fig 12—Left Side Chalmers 40 Motor

The ignition systems are uniformly high tension, with a battery auxiliary, and the high character of the workmanship involved in the installation of the ignition equipment should be regarded as one of the advances. The cooling problem is shown in the several approved ways in the models depicted, resort being had to cellular radiators with a centrifugal pump in some instances, tubular radiators, combined with centrifugal pumps, in other cases. The honeycomb type of radiator is well represented, and thermo-syphon cooling is continued in some examples.

The price question ranges all the way from $600 to just under $5,000, with intervening increments but a few hundred dollars apart. The motors are of the 4-cylinder, water-cooled type for the most part, with only one example of the 2-cylinder opposed type of motor, and seven examples of 6-cylinder motors as produced by three of the ten makers involved. It will not now be possible to depict the trend from the motor point of view, due to the fact that considering only ten makes would be insufficient to satisfy a statistical theory, hence relating matter must be put off until space permits considering a sufficient number of all the automobiles made to establish an arithmetical mean.

Mechanical Points of Kissel Kars

Referring to the tabulation, it will be observed that the Kissel Kar is first on the list, and that the four models of power plants afford 15 options to the purchaser. The general designing of Kissel Kars will best be appreciated by examining Fig. 1 of one of the chassis showing the 4-cylinder motor of the L-type so located with respect to the front axle that the radiator R1 comes directly over the axle, and the flywheel F1 comes back of the dash line D1. A universal joint U1 occupies a position in the tumble shaft, connecting with the transmission gear G1, and a second universal joint U2 takes care of the angularity of the propeller shaft P1, there being a third universal joint U3 adjacent to the housing H1 of the rear axle R1, and torsion is resisted by a long circular torsion tube T1.

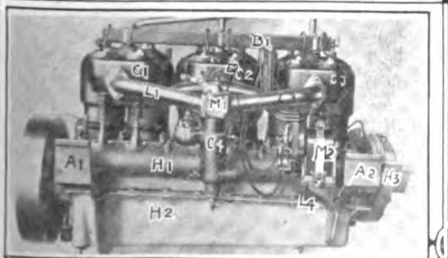

Fig. 16—Locomobile Model M Motor

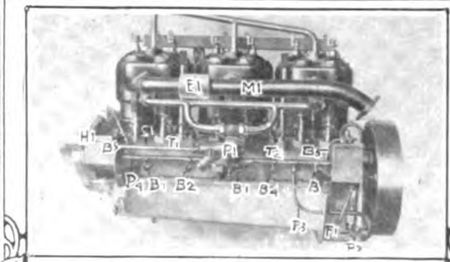

Fig 17—Locomobile Model M Motor

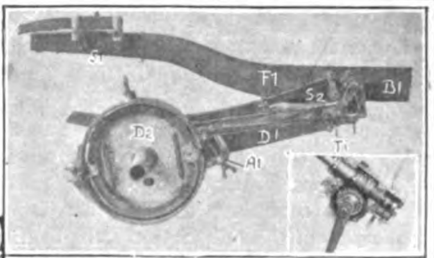

Fig. 18-19—Locomobile Model M Details

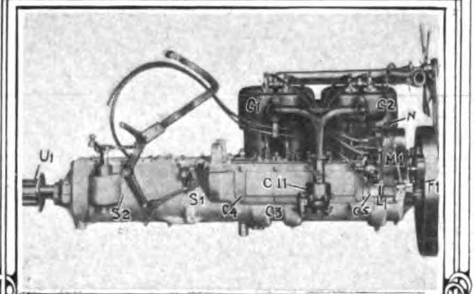

Fig 20—Maxwell Model I Power Plant

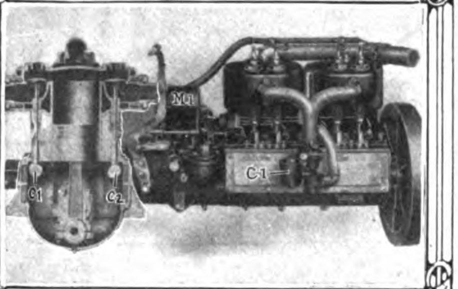

Fig. 21-22—Maxwell Model G Power Plant

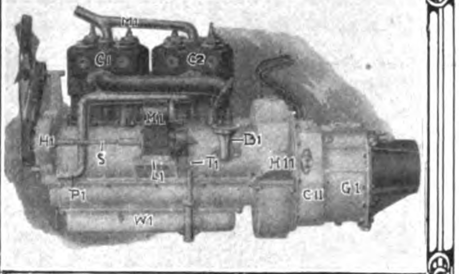

Fig. 23—Left Side Ohio Motor

The transmission is shown in Fig. 2. It is of the three-speed selective type with a jaw J1 for the direct drive, and large diameter gears G meshing with the lay-shaft gears below. The shifting mechanism M1 is an ingenious and substantial contrivance. A universal joint U1 comprises a flange with lugs L1 and L2, which are related to mating members in the other half. The hub H1 of the universal joint fetches up on a taper and is held by a nut N1. The universal joint U2 at the other end shows the mating half to that of U1. The transmission gear case has a tight cover which may be removed for the purpose of exposing the gear-set, but a handhole is also provided with the cover held down by studs secured by wing-nuts, the idea being to permit of quickly getting at the gears for the purpose of cleaning and inspection.

Refinement in point of detail is the trend in this car, and referring to Fig. 3 an opportunity will be afforded for observing with what minuteness and care each little part has been schemed out and brought to a high state of perfection ready for manufacture under fixed and advantageous conditions. In this illustration, the propeller shaft S1 is shown with its universal joint U1 at one end and the square shaft S2 at the other, with the universal joint U2 removed, and the cover members C1 and C2 slipped up on the shaft showing how they overlap each other, making tight, flexible joints; the covers are held in place by the ring members R1 and R2. The jackshafts J1 and J2 are also shown with square ends S3 and S4, while the jaws J3 and J4 through which power is delivered to the rear road wheels are exhibited at the other extremities.

Still another example of Kissel Kar practice is depicted in the live rear axle assembly as shown in Fig. 4; of the jack, and propeller shafts in detail. The enlargement H1, for the accommodation of the differential and bevel drive, is of neat design and light construction, with liberal provision of bearing surface and support for the tubes T1 and T2, which extend out, terminating in the brake spiders, with spring perches P1 and P2. The brake drums are of large diameter with internal expanding and external constricting brake-bands. The constricting brake bands B1 and B2 are actuated by levers L1 and L2, while the internal expanding bands are actuated by levers L3, and a similar lever at the other extremity, which does not show in this illustration. The Timken roller bearings B3 and B4 are selected as to size for long and severe work. The jackshaft is squared at the differential, fitting in broached holes in the sun gears, and it being of the full floating type the drive is transmitted through dog members D1 to the road wheels.

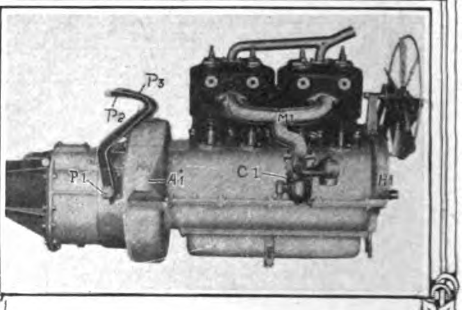

Fig. 24—Right Side Ohio Motor

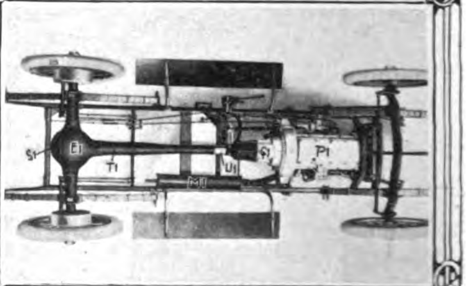

Fig. 25—Underside Ohio Chassis

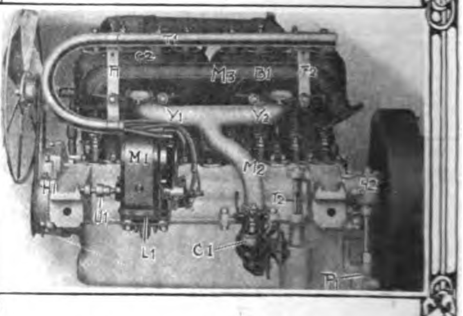

Fig. 26—Left Side Regal 30 Motor

Mechanical Features of the Cadillac Thirty

The general appearance of the Cadillac motor will be gleaned from an examination of Figs. 5 and 6. Referring to Fig. 5, the carbureter C1 of the Schebler type is located sufficiently low down to demand the use of a long neck N1 of the intake, and to make it feasible to use a gravity feed. The intake manifold as it reaches up from the carbureter through the neck N1 reaches a flaring junction J1 and spreads out therefrom with one leg L1 reaching to the front two cylinders and the remaining leg L2 passing back to the rear two cylinders. The shape of this manifold is out of the ordinary, and in addition to aborting back-firing it has the virtue of reducing losses so that the total depression on the intake side is reduced to the barest necessity as it relates to carburetion. The method of securing the intake manifold and the exhaust manifold M1 involving the use of studs S1, a bridge piece B1 for each cylinder in common to the two manifolds is not unusual, but the details are worked out to a fitting conclusion. The distributer I1 for the uni-sparker system is located on the right side to the front of the motor, and it is set outboard from the vertical plane with a view to accessibility.

Referring to Fig. 6, the magneto M1 is mounted on a bracket B1 and is driven in common with the oiler O1 by a shaft fitted with a pinion, taking power from the half-time system in the housing H1. Oldham joints J1 and J2 are placed, breaking the continuity of the shaft so that the oiler O1 and the magneto M1 may be regarded as flexibly mounted. These Oldham joints are well contrived with a floating member M2, which not only adds to the freedom of motion, but silences the joint as well. The four cylinders C1, C2, C3 and C4 have copper jackets J3, J4, J5 and J6 enclosing the cooling water, which is a regular Cadillac feature that has served admirably in several models. It offers the advantage which comes from being able to machine the cylinders all over so that they may be inspected for blemishes and the thicknesses of the walls may be uniform, eliminating the misfortunes of floating cores and other foundry incongruities.

The details of the Cadillac clutch are shown in Fig. 7, comprising the flywheel F1 and the truncated cone member of pressed steel S1, this being a noticeable practice in clutch work in view of the fact that it is customary to use cast aluminum for this character of service. The conical steel member is leather faced, and being somewhat flexible it accommodates itself to the conical face in the flywheel, but the latter is split S2 at equidistant points around the periphery for the purpose of compensation. Instead of using one spring there are six clutch springs S3 occupying equidistant positions around the face of the steel member outside of the housing H1. The remaining details of this clutch will be obvious from examination.

Referring to Fig. 8, (A) shows a section of one of the cylinders, clearly indicating the method of attaching the copper jacket and indicating how the valves are located T-fashion, cast integral with the cylinder, occupying a position above the stopping-off point of the cover packet. (B) of this illustration shows the long piston P1, and the I-section connecting rod C1 with a swivel crankpin cap C2, and a lock holding bolt B1. (C) of this illustration presents a detail of the steering gear with a lever L1 fitted to the square shaft S1, utilizing a split hub and a clamping bolt. The details of the mechanism clearly show that this gear is of the worm and sector type, but it differs from ordinary practice in that the sector S2 has its teeth cut to diverging radii, and it floats on an eccentrically bushed bearing with a means for adjusting the sector S2 with respect to the worm W1, altering the distance between the pitch line on the sector S2 and the same line on the worm W1, as the exigencies of service demand in the process of taking up lost motion. In other respects, the details of design will scarcely have to be commented upon since they conform to the Cadillac practice of interchangeability of parts throughout the makeup of the whole automobile; and while the 1913 models are in close accord with last year's practice the general get-up is smarter and refinements abound.

Two Types of Chassis Will Come from the Chalmers Plant

Patrons of this company will have seven options with the Chalmers "30" motor as shown in Figs. 9 and 10, and nine options using the "40" motor as shown in Figs. 11 and 12. The "30" motor is of the self-contained design with the crankcase C1 integral with the flywheel housing H1, with a flanged joint J1 connecting the transmission gearcase G1. The crankcase C1, instead of being split on the horizontal center, has an oil basin B1 which is flanged to the case and by removing the holding bolts at the flanging J2 the base B1 may be dropped down, exposing the internal mechanisms including the crankshaft, etc., permitting of the taking up of "shake" and doing such other work as may be required in the proper maintenance of the motor. The magneto M1 is located on a ledge L1, and is driven in common with the water pump W1 by a shaft which is geared to the halftime system within the housing H1, with an Oldham joint J3 breaking the continuity of the shaft between the water pump and the magneto. The service brakes with the drum D1 are mounted upon the prime shaft, where it extends out of the transmission gearcase G1, and a quick adjustment J4, through the good offices of a hand wheel accessibly provided. An inspection of this illustration will disclose a series of little refinements, as the grease cup G2 for the timer T1, and the breather B2 with a means for preventing the wasting of lubricating oil, whereby the air pressure is equalized in the crankcase. Referring to Fig. 10 of the "30" motor, the carbureter C1 is flanged to the manifold M1, the latter having branches B1 and B2 which extend up and are fastened by faced flanges to the block casting of the four cylinders at points midway between the front two and the rear

[1] Wheelbase, wheels, gear ratio and carbureter on Kissel Kar semi-racer optional

For the convenience of those who may care to address the various makers whose automobiles are depicted here, and for which data is given in the tabulation above, the home addresses of the companies are set down as follows:

Kissel Kar—Kissel Motor Car Company, Hartford, Wis.
Cadillac—Cadillac Motor Car Company, Detroit, Mich.
Chalmers—Chalmers Motor Company, Detroit, Mich.
Hudson—Hudson Motor Car Company, Detroit, Mich.
Locomobile—Locomobile Company of America, Bridgeport, Ct.
Maxwell—Maxwell-Briscoe Motor Company, Tarrytown, N. Y.

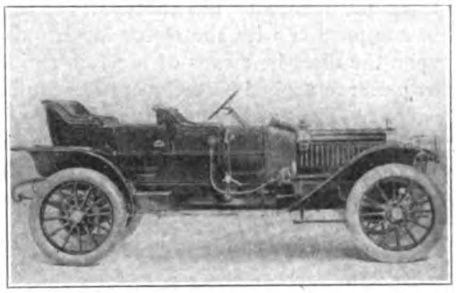
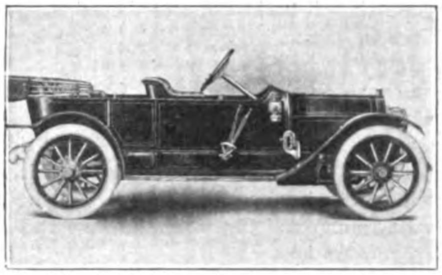
Ohio—Ohio Motor Car Company, Cincinnati, O.
Regal—Regal Motor Car Company, Detroit, Mich.
Corbin—Corbin Motor Vehicle Company, New Britain, Conn.
Everitt—Metzger Motor Car Company, Detroit, Mich.

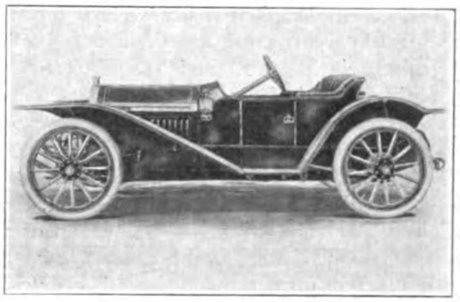
Note:—In addition to the information given in the table it will be found that the illustrations have been selected for the purpose of bringing out the characteristics of the various makes rather than to show each car complete in all its details.. Experience has shown that purchasers express a preference for just enough information to whet the interest.



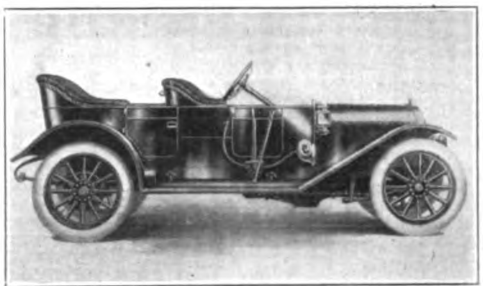
Maxwell Model G touring car



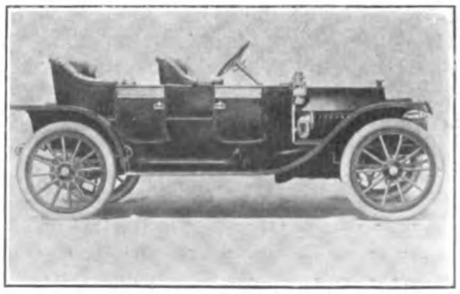
Ohio "40" touring car with smooth exterior torpedo body



Side view of the Regal "20" roadster



Model "30" Corbin touring car of the fore-door type



Everitt "30" fore-door close-coupled touring car pair. The block casting is fastened to the crankcase by means of six holding bolts B3. The clutch is of the multiple disc type nested in the flywheel. It is actuated by the pedal P1, the latter having a rocking pad P2; it rotates on the pin P3 and by means of an adjustable link L1 motion is communicated to the lever L2, thence to the shaft S1, from whence to the yoke in conjunction with the clutch shell, ultimately putting pressure upon the discs by means of a clutch spring or relieving the same by pressure applied by the operator with his foot, pressing on the pad P2. The extension of the pedal P1 in the shape of an arm A1 communicates to the linkage L3, which actuates the service brake bands of the constricting type. This motor has a ball bearing crankshaft utilizing two annular type ball bearings at the extremities.

Referring to Fig. 11 of the right side of the Model "40" motor, the carbureter C1 is attached to a symmetrical two-branch manifold, and flanges to the cylinders below the exhaust manifold. A further examination of this side of the motor will disclose the oil basin O1, and the scheme of oil pump and connections by means of which lubrication is rendered profuse, taking care of each bearing throughout on a basis of certainty. Fig. 12 shows the left-hand side of the same motor with the magneto M1 setting on a ledge L1, and the water pump W1 bolted to a machine face F1. A common shaft drives the water pump and magneto, taking power by a pinion from the halftime system within the housing H1, with an Oldham joint J1 between the water pump and the magneto, thus rendering the latter immune from vibrations.

New Ideas Prominent in the Hudson Output

The product of the Hudson plant will be appreciated by examining the tabulation accompanying this article, and mechanically the scheme of the designer is reflected in the motor as depicted in Figs. 13 and 14. Referring to Fig. 13, the block casting C1 of the 4-cylinder water-cooled motor is flanged to the crankcase C2, and inspection covers C3 and C4 are fitted to openings of a rectangular shape above the line of the crankcase, which is rather a new idea. The covers are held against finished flanged faces by studs S1 and S2 fitted with wing nuts. The water connection M1 on the top of the block casting flares from the vanishing point at the rear end of the motor to a circular conformation at the other extremity for the attaching of the flexible hose connection leading to the radiator in front. The water pump W1 is of the centrifugal type, occupying a position over the halftime gear housing H1 in front, and is driven by a laterally disposed shaft, which also serves to actuate the magneto M2. Water returning from the radiator enters the pump W1 through the central fitting F1, and is forced through the outlet fitting F2 into the block casting of the cylinders through the flanged orifice O1. The exhaust manifold M3 is flanged to finished faces of the block casting C1. The motor is mounted on the chassis frame by arms A1, of which there are two at the front, and offset arms A2 which connect to the chassis frame through a ledge and a face F3 in the plane of the flywheel F4. This construction includes an advance in engineering work, resisting the gyrations of the flywheel in the most direct way, thereby limiting the torquing moment of the chassis frame by the difference between this direct application of the stress and that which would transpire with an intervening lever arm. Fig. 14 is a front end view of the motor showing the lateral shaft S1 actuating the magneto M1 through an Oldham joint J1, taking power by means of a helical set in the housing H1, and the shaft protrudes through the opposite wall, the stub end of which enters the water pump W1 for purposes of driving. The halftime gears are get-at-able through the plate P1, which is screwed to a finished face, and the starting crank is guided by the bushing B1, entering the journal thereby formed until the dogs which are cut on the extremity of the starting crankshaft enter into engagement with the pin P2. The carbureter is back of the magneto M1, but its manifold M2 shows.

It will be necessary to examine Fig. 15, which is a section of the flywheel F1, with veins V1 serving as a fan, connecting the rim with the clutch housing H1. The clutch discs D1 are enclosed in the oil-tight chamber formed out of the clutch housing H1 and the cover C1 for the same. This construction is novel and as simple as it is substantial. Power comes from the crankshaft C2 through the flange F1 to the housing H1 to the driving discs communicating to the driven discs of the set D1, thence to the spider S1, from whence to the key K1, delivering the torque to the square end E1 of the tumble shaft, with a thrust ball bearing B1, resisting the clutch spring S2, and a radial ball bearing B2 at the universal joint J2, with a second radial type ball bearing B3 which takes the pedal pressure and communicates it to the clutch spring in the process of opening the clutch.

How the Locomobile Will Look to a Mechanical Eye

Among the particularly interesting features of the Locomobile exhibition will be the type M 6-cylinder water-cooled motor rated at 48 3-5 horsepower, the right side of which is shown in Fig. 16, presenting a certain symmetry of design, with three pairs of cylinders, C1, C2 and C3, of the T-type, flanged to a manganese bronze upper half H1. This crankcase is flanged on the center line, and the aluminum lower half H2 slopes back toward the flywheel, bringing the lowest point of the oil well under the last main bearing, and a plug P1 is fitted in a flaring enlargement so that upon removal of the plug the contents of the oil chamber will run out. The manganese bronze upper half has arms A1 and A2 which are provided with ledges and finished faces where they engage with pads, the latter being fitted into the channel section side bars, thus securing the motor to the chassis and sustaining the same laterally. The carbureter C4, of the Locomobile make, flanges to the manifold M1, and three legs L1, L2 and L3 radiate off to the respective pairs of cylinders. The magneto M2 of the high tension type (which, by the way, is a 1911 Locomobile feature, it having been the previous practice to employ low tension wipe-spark magnetos) sets on a ledge L4, with a quick release fastening strap to hold it down, and it takes its drive from a pinion in the halftime gearset in the housing H3. The wiring from the magneto reaches up to a box B1, through which the high tension wires are distributed to the respective spark plugs.

Referring to Fig, 17 of the left-hand side of the type M motor, the enlargement E1 over the exhaust manifold M1 is the jacket of the heater of all the air which passes through the auxiliary valve to the carbureter. Water circulation for the cooling system is maintained by the pump P1, which is driven by the shaft S1 from a gear which meshes in the halftime train within the oil-tight housing H1. Lubricating oil is circulated by the pump P2 through the piping P3 to the standpipe P4 and leads off therefrom to the respective bearings through branches B1, B2, B3, B4, B5, B6 and B7. The oil leads into the pump from the lowest point in the oil well through the flanged fitting F1. In addition to the connections as above noted, there are other oil connections besides, and lubrication, taking it as a whole, is adequately cared for. Pressure in the crankcase is equalized through breathers T1 and T2, with long connections leading up to the top of the motor and means for preventing lubricating oil from being cast out.

Characteristic Features of the Maxwell Cars

The Maxwell idea is shown in Fig. 20 of a 4-cylinder water-cooled motor, with the cylinders C1 and C2 cast in pairs, and the carbureter C11 leading up through a narrow-necked manifold to flanged faces between the intake valves of the respective pairs of cylinders. The magneto M1 sets on a ledge L1 near the front end of the motor and is fastened down by a quick detachable strap with a wing nut N1 for take-up purposes. The flywheel F1 is at the front end of the motor; the crankcase C3 is provided with large openings and covers C4 and C5, which may be taken off if it is desired to examine the mechanisms within. The crankcase is not split in the horizontal plane, but it extends back, maintaining a substantially circular shape, taking in the space for the clutch S1, terminating in the part which holds the transmission gear S2, bringing the power shaft out through the rear, ending in a universal joint U1.

As a modification of the Maxwell scheme, which holds closely to the general plan, reference may be had to Fig. 21 of the 4-cylinder water-cooled, 22-horsepower motor, as used in the Model G car. In this case the carbureter C1 is located in substantially the same position as shown in Fig. 20, but the magneto M1 is situated back of the last cylinder over the position occupied by the clutch, thus bringing this magneto just under the footboards when the body is in place, and by a trapdoor, which is provided in the body design, it is possible to get at the magneto without getting out of the car. Fig. 22 is a cross-section through the cylinders of the motor showing the location of the camshafts C1 and C2, also the relations of the valves to the cylinder, and a certain symmetry of design which is in conformity with the Maxwell plan of lightness with strength.

Ohio Includes a Self-Contained Power Plant

The cars of this make comprise four models with self-contained power plant in common for all, and referring to Fig. 23, which is the left-hand side of the 4-cylinder water-cooled motor, with cylinders C1 and C2 cast in pairs, the magneto M1 rests on a ledge L1, and is driven by a shaft S1 from a gear in the housing H1. Lubrication is regulated with the oil in a well W1 and a telltale T1 affords a means for noting the quantity of lubricating oil available at any given time. The breather B1 is trumpet-like with a screen at the top and so shaped as to prevent oil from shooting out. Water circulation is maintained by a centrifugal pump forcing the water through the piping P1 into the water jackets, and thence through the water manifold M1 back to the radiator. The flywheel is enclosed in the housing H11, and the transmission gearcase G1 is enlarged at C11, finally flanging to a face of the flywheel housing H11.

Looking at the other side of the motor, as shown in Fig. 24, the carbureter C1 of the Schebler type is connected by a manifold M1 to the respective pairs of cylinders. The pedals P2 and P3 turn on a shaft P1, they being the means for actuating the clutch and service brakes respectively. The motor is suspended on three points, two of which by arms A1 in the plane of the flywheel at opposite sides, the remaining support coming in front in the plane of the halftime gear housing H1.

The general scheme of the Ohio chassis is shown in Fig. 25, which is turned upside down for convenience, presenting the under side of the crankcase with a plate P1, which may be removed, thus affording accessibility to the space within for the purpose of adjustment. The live rear axle has a spherical enlargement E1, a screwplate S1 at the back, and a tapered torsion tube T1 enclosing the propeller shaft, terminating in a universal joint U1 back of the transmisison gear G1. The muffler M1 is located in the fore and aft plane, fastened to a chassis side bar in juxtaposition to the running board. The front axle is an I-section forging, and the various levers and links in the control system are of straight line design with an orderly arrangement of the components.

Regal Will Come to the Show with Expanded Line

The Regal "30" will be well known to the patrons of the company excepting that it has undergone the refinements a year's service has dictated. The magneto M1 (Fig. 26) is located on ledge L1 driven by a shaft from a gear in the housing H1 and a universal joint U1 establishes a condition of flexibility. The wiring from the magneto leads up to the spark plugs through a yoked tube T1 with fastenings F1 and F2, making a substantial and neat arrangement. The carbureter C1 has an offset manifold M2, with branches Y1 and Y2 leading to the twin cylinders C2 and C3 at a point under the exhaust manifold M3 and the two sets of manifolds are held in place by bridges B1. Lubrication is by means of a circulating pump P1 driven by a shaft in the vertical plane from a gear in the housing H2, and a telltale T2 shows the oil level.

Fig. 27 presents the left-hand side of the "20" motor showing the carbureter C1 in the mid position, and the magneto M1 at the back on a shelf S1. The lower half of the crankcase C2 carries the oil pump P1 and the excess of oil. The magneto is driven by the shaft S2 with a coupling C3 near the magneto so that the long end of the shaft comes out of the housing H1, taking power from a gear which meshes in the halftime train.

Mechanical Refinements of the Corbin Car

An excellent idea of Corbin engineering is shown in Fig. 28 of the right-hand side of the Model 40 motor with a Stromberg carbureter C1 a little to the back of the mid position with an offset manifold M1 connecting to the pairs of cylinders C2 and C3 through branches Y1 and Y2. The magneto M1 sets on a shelf S1 and is driven by a short shaft with a coupling U1 taking power from the halftime train through a gear in the housing H1. The motor is suspended to the chassis frame by arms A1 at the rear and similar arms A2 at the front. The flywheel F1 is flanged to the crankshaft C4. The lower half of the crankcase C5 has an oil well W1, and a drain D1 is placed to let the stale oil run out.

The opposite side of the Model "40" motor is shown in Fig. 29. The water pump W1 is driven by the shaft S1, taking power through a gear in the housing H1, and a wide flat belt B1 runs over a shrouded pulley on the water pump shaft to a reduced diameter shrouded pulley on the fan shaft. The oil pump P1 is driven by a vertical shaft S2, taking power from the camshaft, and a telltale T1 comes out of a well W2, indicating the amount of the lubricating oil present at any given time.

Reference will be had to Fig. 30 of the live rear axle disassembled in the further process of showing the care with which the Corbin car is wrought to a state of 1911 completion. In this unit the differential gears of the bevel type are in the housing H1, and the bevel gear G1 is flanged thereto. This unit rolls on annular type ball bearings B1 and B2, nesting in the journals J1 and J2, which are fastened to the shell S1, which in turn is flanged to the axle member M1, and a cover C1 protects the other end. The axle tubes T1 and T2 terminate at the dog plates D1 and D2 through which power is flexibly transmitted to the road wheels. The spring perches P1 and P2 are free on the tubes T1 and T2 so that the bounce of the body as it is taken by the springs is not permitted to transmit torsion to the axle tubes. This type of axle is a good one to manufacture, and it affords the requisite strength for serious service.

Refinements of the Everitt "Thirty" Plant

In the Everitt scheme of design, as shown in Fig. 31, the block casting C1 of the motor is integral with the upper half of the crankcase C2, and the exhaust fitting E1 connects with a common transfer port reaching all of the cylinders without the use of a separate manifold. The magneto M1 sets on a shelf S1 and is driven by a shaft with an Oldham joint J1 which passes through the water pump W1 to a gear in the housing H1. The motor is suspended on the chassis frame by means of I-section forgings F1 and F2, the latter just coming in front of the flywheel F3. The motor is water-cooled, worked 4-cycle, and represents a scheme of design of which there is no other example just like it.

Referring to Fig. 32 of the live rear axle A1, the housing is integral with the gear housing H1, and a cover C1 permits of access to the gears. The torsion tube T1 reaches up to a yoke Y1 and a universal joint U1 is the terminal of the propeller shaft. The torsion tube is braced by diagonals D1 and D2. The rear wheels are fetched up on tapers T2 and T3 on the extremities of the jackshafts, and in addition to keys with keyways K1, castellated nuts are screwed up on the ends of the jackshafts for the further purpose of securing the wheels thereto. The chassis frame F1 has a kickup at the rear, and the three-quarter elliptic scroll type springs are secured thereto on brackets B1. The brakes are internal expanding and external contracting on the rear road wheels.

Operation and Care

LIKELY CLUTCH TROUBLES; OUR WOMEN DRIVERS; CARE AND REPAIR OF TIRES; QUESTIONS; LETTERS; DON'TS; CANTOR LECTURES; PRACTICAL REPAIRING, ETC.

DIFFICULTIES overtake the automobilist who just graduates from the realm of the horse, with the same impartiality that they cling to the man who is contemplating the purchase of his fourth automobile. The time was when the internal combustion motor was regarded by inventors and engineers alike as one of the seven wonders of the world of impossibles. It will be understood that it is not natural to an internal combustion motor to work at widely varying speeds nor to go in the reverse direction at the will of the operator. Couple this constant speed type of power plant to a vehicle which must go at all degrees of speed, and in both directions, and the missing link at once renders its absence manifest; in other words, there must be a clutch as a prime requisite, and a speed-changing mechanism to work in conjunction therewith.

The clutch problem is a serious one, and it has a marked influence upon the life of the automobile, with particular reference to the wear and tear upon tires. When a clutch grips, it is said to be "fierce," and when this disorder takes up its abode in the mechanism the automobile is subjected to the character of rack which spells ruin. The suddenness with which the power of the motor is applied to the car under conditions of a gripping clutch is sufficient to wither the inherent strength of the parts and destroy the harmony of inter-relations, and, unfortunately, every bolt and stay throughout the car is strained and distorted in the process, until the torquing moment finally arrives at the point of contact of the tires with the road, putting it up to them to accelerate the weight, but they slip betimes, and the epidermis of the tire is chafed.

Likely Clutch Troubles

A TO Z SUGGESTIONS OF THE MOST LIKELY FORMS OF CLUTCH TROUBLE AND A DEADLY PARALLEL OF HOW TO FIX THEM

UNTIL ingenuity contrives a type of internal combustion motor which will be capable of running at all speeds, furnishing power in proportion to the requirement under the several road conditions, the clutch and the transmission gear will remain as component parts of the power units. If it will be remembered that the clutch is the most used, and probably the most abused mechanism in the train of units, it will remain to suggest that certain forms of trouble are expectant heirs, and the problem of the automobilist on the road remains within the realm of speculation until difficulty, if it arises, is accurately classified and a precise remedy is applied. Unfortunately, a "fierce" clutch has a most exasperating influence upon the life of a car. A clutch that has this disorder grabs when it is thrown in, and the terrific rate of acceleration thereby induced racks the mechanism of the car from the tip of the toe in front to the end iron at the back—nothing escapes. A slipping clutch is a monument to refined stupidity; the motor becomes absolutely valueless, and the automobile ranks as an economic waste. A clutch that will not release quickly is a silver-tongued advocate before the bar of Paradise—the occupants of the automobile are breathing an atmosphere of imminent danger.

Clutch does not grip	How to cure it
(a) Leather face oily.	Wash with kerosene or gasoline and sprinkle fuller's earth when dry.
(b) Leather face charred.	Fit new leather caused by overheating or slipping.
(c) Leather face hard and does not press uniformly.	Take out clutch, turn level in lathe and apply castor oil.
(d) Clutch spring weak.	If tightening is no good, fit new spring.
(e) Clutch out of alignment.	Realign till shaft runs true.
(f) Sliding bearings are dry.	Wash with kerosene and apply oil.
(g) Leather worn and will not advance to a bearing.	Fit new leather.
(h) Clutch band broken.	If possible, re-rivet; if not, fit new band.
(i) Clutch lever bent.	Straighten same.
(j) Dog bent or worn.	Straighten, true-up or re-bush.
(k) Toggle with excessive lost motion.	Re-bush.
(l) Foot lever strikes deck.	Cut part of deck away.
(m) Take-up all in.	Take out and cut more thread on rod.
(n) Disc facings worn out.	Fit new discs.
(o) Discs adrift from keys.	Take clutch apart; refit discs; if keys worn fit new ones.
(p) Cork inserts worn below surfaces.	Fit new cork inserts.
(q) Clutch cone worn.	Take out and true up in lathe.
(r) Wedge cut away.	Fit new wedge.
(s) Screw worn.	If adjustment all in, fit new screw.
(t) Excessive oil.	Leather, wash with kerosene; metal, drain some oil or add kerosene.
(u) Dirt impediment.	Wash out with kerosene.
(v) Take-up backs off.	Improvise locking device.
(w) Engine or transmission out of alignment.	Re-align till shaft runs true.
(x) Spiral band too long.	Shorten and re-rivet holder.
(y) Affected by centrifugal force.	Mechanical fault; angle of cone insufficient or weak spring.
(z) Brakes either on or too tightly adjusted.	Loosen brakes.

Clutch sticks	How to cure it
(a) "Frozen" shaft.	Keep running and apply castor oil or graphite.
(b) Lack of lubrication.	If scored, take out and clean up.
(c) Congealed oil (cold weather).	Apply hot rags, run engine and let clutch slip.
(d) Sag in chassis frame.	Have it straightened and fit strengthening plate.
(e) Shaft twisted.	Straighten, if possible, or fit new one.
(f) Spring broken.	Requires new and stronger one.
(g) Disc deformed.	Straighten steel discs, but renew bronze.
(h) Broken motor or gearcase arm.	Have it welded, if possible.
(i) Deformed driving arm.	Straighten.
(j) Thickened leather or other facings of disc clutches.	Turn down leather face; true-up metal faces.
(k) Damage due to thrust.	Fit new thrust races; if possible, larger.
(l) Bent crankshaft.	Straighten shaft.
(m) Bent planetary shaft.	If caused by weakness, fit shaft of stronger metal.
(n) Deformed linkages.	If weak, fit stronger ones.
(o) Stuck dogs.	Soak in kerosene, dismantle and readjust; fit oiler.
(p) Worn screw.	Fit new one.
(q) Tight spiral band.	Slack off slightly.
(r) Dent in housing.	Hammer out carefully.
(s) Shifted motor.	Tighten up bolts and fit lock nuts or washers.
(t) Shifted transmission.	Tighten up bolts and fit lock nuts or washers.
(u) Dirt (foreign substances).	Wash out with kerosene.
(v) Bent pedal.	Straighten, and if weak, reinforce.
(w) Insecure locking devices.	Fit one of better design that does lock.
(x) Centrifugal force trouble.	Faulty design up to makers under guarantee.
(y) Torn leather facings of leather clutch.	Fit new leather.
(z) Worn facings, changing the distance of travel.	Fit new facings.

Washing the Car

Pure Water and a Little Judgment Superior to Any Other Combination

THERE is nothing better with which to wash a car than pure water—and the more the merrier. A coach builder who has completed a fine piece of varnishing work, after allowing it to dry, takes a turkey sponge and several pails of water undiluted and pours it over without rubbing, drying it with a chamois leather. His chamois leather, however, is absolutely clean. He washes the car to harden the varnish and keep it bright. Scratches on varnish are caused exactly in the same way as a diamond cuts glass—by rubbing a sharp instrument over the surface. The instrument in this case is fine particles of sand and dirt that attach themselves to the varnish. The only way to get them off is to apply plenty of water to soften them. This can be done either with a hose or with a soft sponge. If force is used with the hose the particles will be driven into the varnish instead of washing them off, so the conclusion is obvious that the stream of water must be gentle and the volume of water from the nozzle large. Inch piping requires no nozzle, the fingers will form what is wanted in this respect, and if a sponge is used it must be soft and frequently cleaned. The bucket should contain absolutely clean water and the only way to keep it clean is to put the hose in it and allow the water to run slowly all the time. Another disadvantage of using water with force behind it is that when the front of the car is washed quite a lot of water finds its way (especially through hoods that have slits in them) into the motor parts such as the magneto, carbureter and distributor. Occasionally a small quantity of good soft soap, well lathered, helps to remove grease stains, but the practice of using gasoline or a dry rag for this cannot too strongly be condemned. Parts of the car that collect grease and oil can be washed with water to which a small quantity of kerosene has been added, but there is no necessity of using this mixture on the body parts. The upholstery should be wiped over with a damp chamois leather, taking care to get under the tucks and go over with the chamois nearly dry. Always hang a chamois leather up to dry. Each wheel requires to be jacked up in turn and the dirt removed.

About Non-Freezing Solutions—There are three bases of chemical change that must be watched in the use of non-freezing solutions in order to be sure of the aborting of freezing. They complicate the problem. True, if water freezes it will disrupt some part of the system on account of the larger bulk that ice, over water, assumes. But if an acid solution is used it will corrode the parts of the radiator and tend to destroy it. If alkaline solutions are used, hydrates of the metal parts may be produced, but no matter which reaction takes place, electrolytic decomposition of the metal is to be looked out for in any event.

Our Women Drivers

ADELEINE VOUGHT SETS FORTH THE MODUS OPERANDI OF COMFORT AND ENJOYMENT OF WINTER DRIVING, ADVOCATING THIS FORM OF RECREATION FOR WOMEN AUTOMOBILISTS

WITH the advent of Winter our women motorists are very apt to look pensive, shudder and then order their cars put up for the season. Such, however, need not be the case. Motoring in Winter is really delightful, especially to lovers of outdoor life, and oftentimes the automobile is an absolute necessity. A good motor car will ask no favors of the weather. Owners who pack their cars away with the first descent of Jack Frost are indeed fewer than ever. They have realized that a car is an all-year necessity, and as pleasurable in one season as another. Who is afraid of the bracing cold days or the stinging Winter air? To drive in such weather adds new charm to life. The bracing cold and snow stimulate an unconscious superiority which makes light of the heaviest burdens. The allurements of Winter motoring should appeal to any whole-souled woman. She —and her friends—will enjoy the car more completely than ever before, and all will agree that the good times far surpass those afforded by the motor car even during the superb days of Spring and Fall, with their kindred attractions.

To thoroughly enjoy Winter automobiling one must be amply fortified against the onslaught of the biting cold and wind. It is proposed to offer here some suggestions toward making Winter driving the more pleasant and comfortable, and, perhaps, enable those who are undecided to join the multitude and add to their own pleasure and vigor—for Winter motoring is undoubtedly the greatest of health-giving sports.

One need not have a limousine to venture forth—just the same old touring standby, which served so comfortably on long trips during enchanting Autumn days. Any changes or alterations? No; a few additions, possibly. Leather protectors extending from the dash to the seats are necessary to keep out the cold draughts, unless the car is equipped with a fore-door body. Any one of a number of good wind shields can be attached, but the ideal arrangement is that shield which acts as a wind

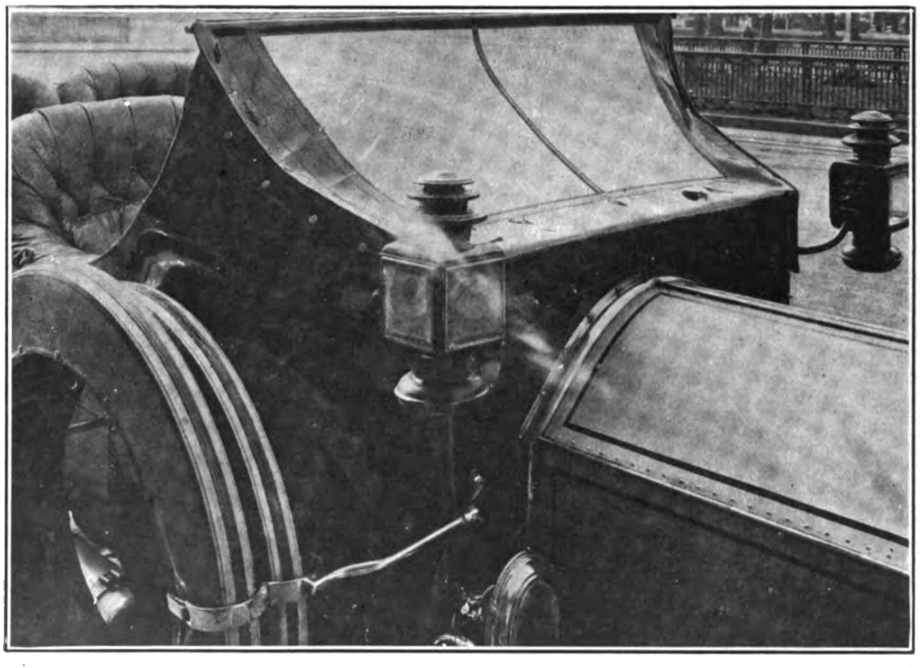


Fig. 1—Presenting a condition of comfort through the employment of an ideal windshield, lamps that are in good order, the spare tires incased and ready for instant application, also a suitable horn, and robes for the fair driver and her guests

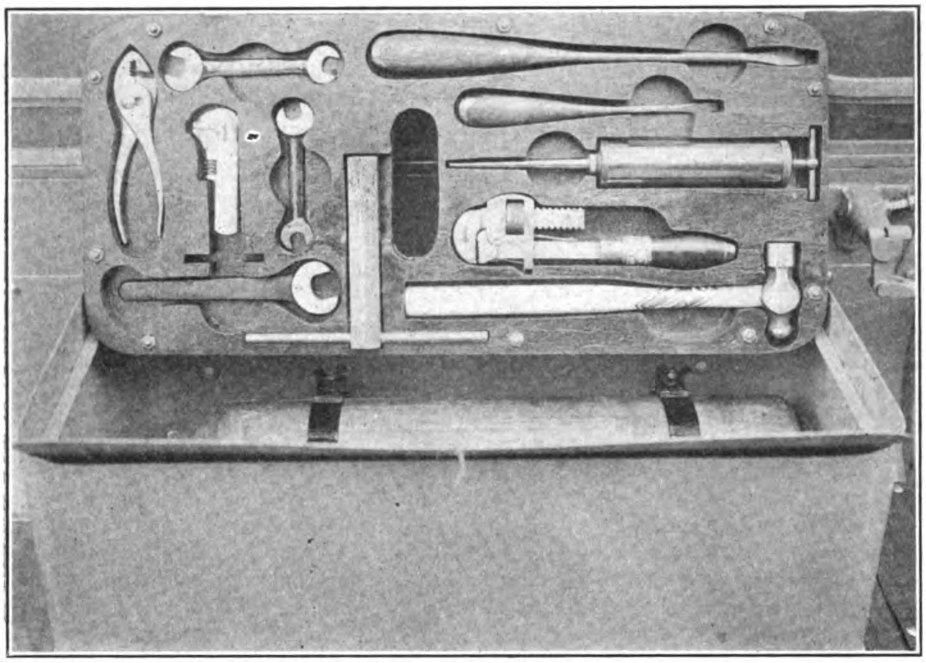

Fig. 2—Showing how the Franklin tool-box is arranged, with a place for everything and everything in its place; this is important in Winter driving; when the weather is inclement it is no time to hunt around for necessary tools

deflector, sending the currents of air above the driver. Such an equipment will render the front seat occupants immune from drafts and virtually protected from the cold. The top need be used only during a snow or rain fall.

Arrange to have a priming rod—should the car not already possess this detail—extend through the radiator, so that the same is handy when about to crank the car. Priming is, as a rule, very necessary in cold weather to enable easy starting, and a more convenient method is thus available than that of raising the hood. And in this connection, have the exposed surface of the radiator reduced in area, so as to lessen radiation and conserve the heat in the cooling system. The average touring car radiator will function properly in the Winter with its effective area reduced by one-fourth or one-fifth. This can be done accurately and cheaply by your garage-man, and should present a respectable appearance.

No adjustments are recommended, and, in fact, are seldom needed, save to the carbureter to enable regular running until the motor warms up. Experience recommends a change to a lighter grade of oil for the motor—for the viscosity of the oil varies with the temperature. Oil, like molasses, becomes thick or thin, depending as the weather is cold or warm. When the weather becomes cold, the oil, like the molasses, flows sluggishly, and some provision must be made to enable a sufficient quantity to reach the working parts of the motor. The remedy is a lighter oil. Likewise the semi-solid lubricants in the transmission and bevel-gear housing. Thin them to fair consistency by the addition of some oil.

So much for the car itself. As additional equipment always carry chains or other anti-skidding devices. The cost is slight, and the benefits great. Safety is actually increased and greater speed can be made. Or have studded shoes fitted—one to a front wheel and one to a rear, on opposite sides. This combination will successfully render the control of the car easy and safe at all times, and prove economical, as there will be no need to remove the shoes in the Spring unless retreading or replacement is absolutely necessary.

The value of an anti-freezing solution in the circulating system of a car which is kept in continuous service is not questioned. Its advantages to the woman driver are many, but whether her car is used often enough to require such a solution is, of course, indeterminate. For those who might desire to use one, the following will be of some help. Do not use any poorly prepared mixtures. They are expensive when poorly made and often injurious. A good solution can be made for less than half the cost, and in the making the driver acquaints herself with the composition and peculiarities of the different mixtures, and this close association tends toward a certain interest and observation on her part which are necessary to the accomplished chaffeuse. Alcohol solutions are recommended. A 20 per cent. solution of denatured alcohol (procurable at any drug store) will withstand a temperature of 5 deg. Fahrenheit. A solution of three parts water and one part alcohol (a 25 per cent. solution) will require a temperature of more than 2 deg. below zero before it is susceptible to freezing. To make this solution in quantity sufficient for the average car a total of about 75 cents only need be expended, and but several minutes are required to mix the solution. This is cheap insurance, but the solution must be watched and occasionally more added to replace the loss due to evaporation. Those who have good facilities for keeping their cars, including heat, need not use this solution, but it is best, when not using any anti-freezing mixture, to keep the motor slowly running when leaving the car at the curb. Of course, a car can be drained when brought in if water alone is used to keep the motor at the proper temperature, but this is a disagreeable little task and good for soiling one's hands and garments.

Having prepared the car, let us look to the outfitting of its occupants. It is very important that the hands be warmly and comfortably gloved, as the accurate guidance and control of the car depend largely upon these members. One-fingered mittens of leather, lined with lamb-skin or fur, are always roomy and warm, and are really not clumsy at all. Wear heavy shoes and the feet will have little opportunity to complain. For the rest, a greatcoat of heavy material, over a heavy woolen sweater or V-neck, or perhaps the use of a fur coat, which will more than suffice for protection and warmth. Thus equipped, Winter motoring becomes, instead of a hardship, a delight.

Efficacy of Glycerine and Water.—Using pure water in the cooling system of a motor presents two classes of trouble, the first being due to the water boiling at 212 degrees Fahrenheit. This low boiling point is responsible for the loss of cooling water and the growth of a crust formation in practice. Water is added from time to time to re-establish the proper level, making up for the loss and adding the material incrustration; foreign matter is in the water and it goes into the radiator with it. Then, the thermal efficiency of a motor is maximum at a temperature higher than 212 degrees Fahrenheit in most motors, but on account of the low boiling point of the water it is not expedient to run the motor at a high enough heat to realize the highest thermal efficiency.

To add to the troubles due to the use of water, there is the high temperature at which it freezes. In winter time the temperature is frequently considerably lower than 32 degrees Fahrenheit. This leads to complication and requires that some means be utilized for preventing the cooling solution from freezing.

It has been suggested that hydrocarbon oil grades so as to be (a) thin when the temperature is low, (b) with a high boiling temperature, (c) with a low congealing point, (d) with a high specific heat, and (e) not likely to deteriorate in cooling service. Experiments have not as yet resulted in a suitable mixture of the hydro-carbons.

As a General Rule—

If you take your best young lady out for a ride and you want to show off, just drive at a safe speed.

If you are driving a peppery automobile and some "junker" offers an opportunity to place you in a winning race, pass it up.

If your automobile suddenly stalls, keep cool; perhaps the gasoline has all been drunk up by the motor.

If your last shoe comes to a blowout, never mind; wrap a clothes line around it; patch the inner tube; inflate; run 100 miles on the fixing if you so desire.

If there is lost motion in the steering equipment, have it removed.

If the road ahead is obscured by trees, have them cut down, or cut down the speed of the automobile.

If a cross-road is being approached, look out for your brother in his wagon; you might bump into him.

If a railroad crossing is to be negotiated, let the locomotive go by first; you might damage it.

If a mud-hole appears in the offing and you are speeding along, pocket your curiosity; the hole might be a foot deep.

Care and Repair of Tires

AMATEUR VULCANIZING ON THE ROAD AND IN THE GARAGE WITH AN ALCOHOL VULCANIZER, SHOWING THAT THE WORK CAN BE DONE BY A NOVICE

WHILE taking a run it may happen that a tire receives some damage that renders it inadvisable to run on the tire for fear of increasing the size of the cut and letting in moisture and dirt. Such an occurrence may happen to any one when out of reach of help and a spare tire cannot be obtained. A vulcanizing outfit is an accessory that can easily be stored in the tool box. It takes no longer to vulcanize an inner tube than it does to stick a patch properly. The outfit consists of the parts shown in Fig 1. V1 is the vulcanizer proper, and the heater H1 is attached to this by the small arm A1. The bracket B2 is screwed to the table or to the step of the car, if the repair is to be carried out on the road, to hold the vulcanizer V1 while it is heating and while the repair is being prepared. C1 is a container for alcohol for the heater H1. The heat of the vulcanizer is ascertained by inserting the thermometer T1, registering from 250 to 300 Fahrenheit, which is carried in a small wooden box. The cardboard box S1 contains wax paper W1, rubber compound R1, and the vulcanizing cement S2. The plate P1 is inserted in the bracket B3, which is screwed in a similar manner to B2. In the plate P1 is fixed a bolt, and together with the bolt B1 the vulcanizer is clamped to the plate after the tube has been inserted. The vulcanizer V1 has two sides—the concave side shown for outer casings, and the other, which is flat, for inner tube repairs. The six books of instructions I1 are comprehensive and should be carefully read and followed. To carry out a repair to a casing it must be first examined to ascertain if the canvas has been damaged. The damage in Fig. 2 was not so deep as to require taking the casing off, although it is on the side of the tire, and the following different processes, which can be effected while the vulcanizer is heating, must be faithfully carried out in order named to ensure the vulcanization having the desired effect. Fig. 2 shows the method of cleaning a cut C1 with a stick or penknife, as was used in this case, I1, the tire T1 having previously been cleaned off with gasoline around the part C1. With the aid of an oil gun G1 and a piece of rag R1 and some gasoline the cut can be cleaned in a short space of time, and half the battle rests right here, for cleanliness in this operation is essential, and unless rubber is clean it will not vulcanize, or if it looks apparently good it will not last. The next thing to do is to cover well every part with the compound S1. This should be stirred before using and applied with some instrument T1 in the manner indicated in Fig. 3, so that the inside of the cut C1 is entirely covered. Allow the first coat to dry, which takes about two or three minutes, and apply another coat lightly over the first. Fig. 5 shows how the Para rubber P1 is cut in strips and forced into the cut C1 with the instrument I1; the cut should be well filled but not quite to the level of the tire, and as the rubber is soft and gives to the instrument it can be pushed right home into the cut.

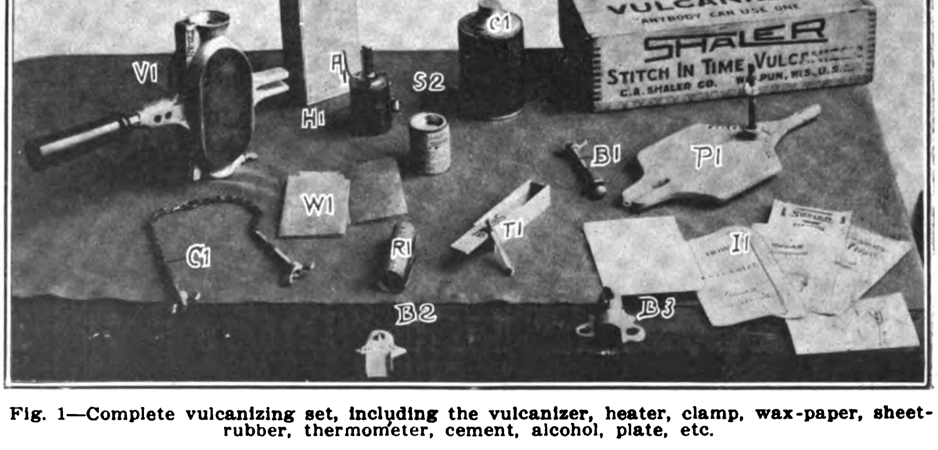

Fig. 1—Complete vulcanizing set, including the vulcanizer, heater, clamp, wax-paper, sheet-rubber, thermometer, cement, alcohol, plate, etc.

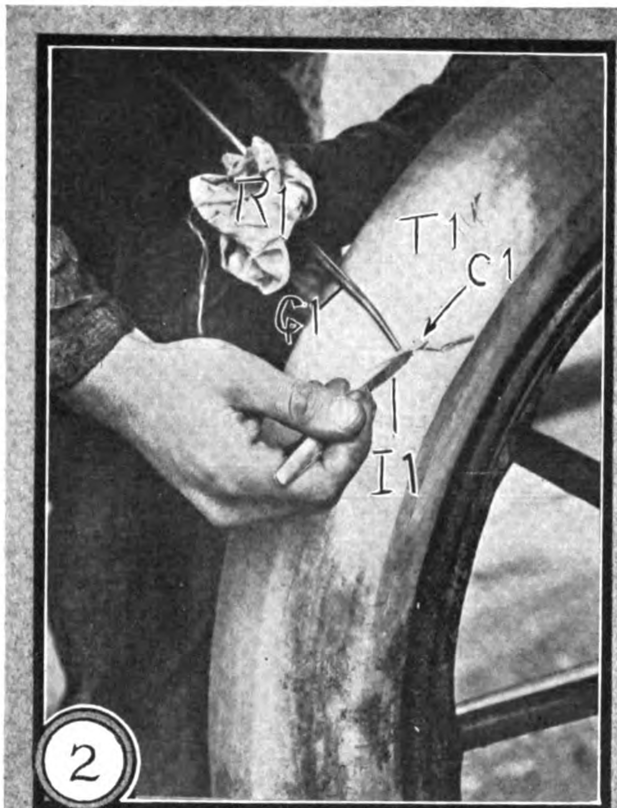
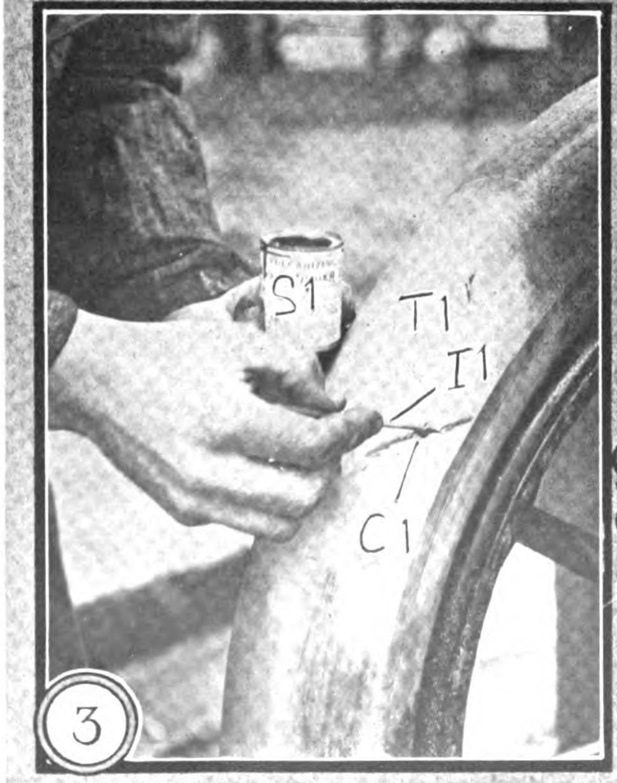
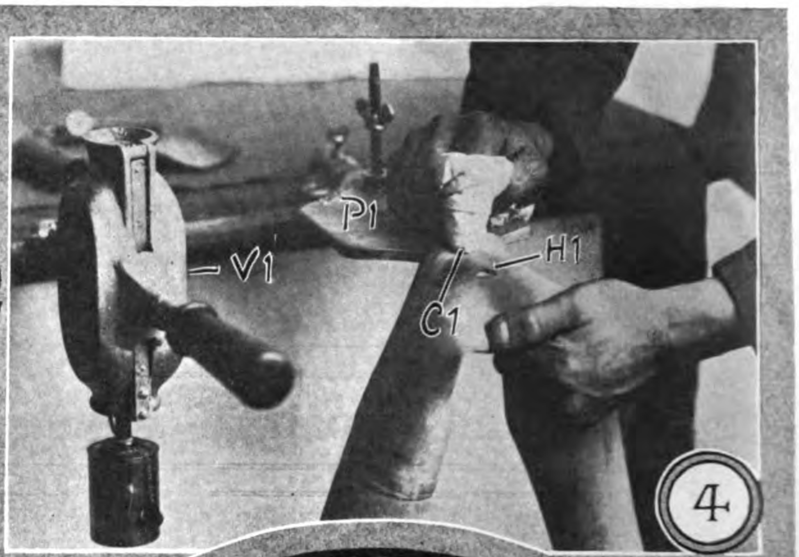
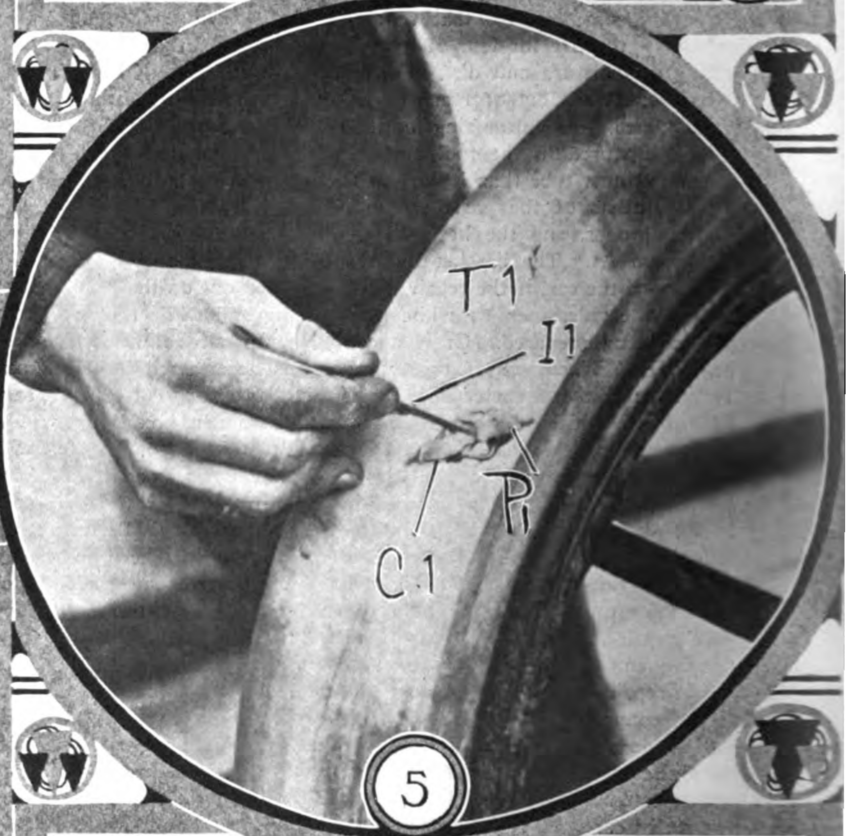
During these operations the vulcanizer will have had time to heat, and should register on the thermometer T2 265 degrees. To set the vulcanizer V1 for heating attach the burner H1 by the set-screw H2, shown in Fig. 11, with the wick protruding about one-quarter of an inch, and it will give a flame 3 inches high; see the damper works freely before lighting lamp. The temperature is controlled by a thermostat that opens and closes the damper, more or less, as may be required, automatically. In case adjustment of the thermostat seems necessary the method of altering same will be shown later.

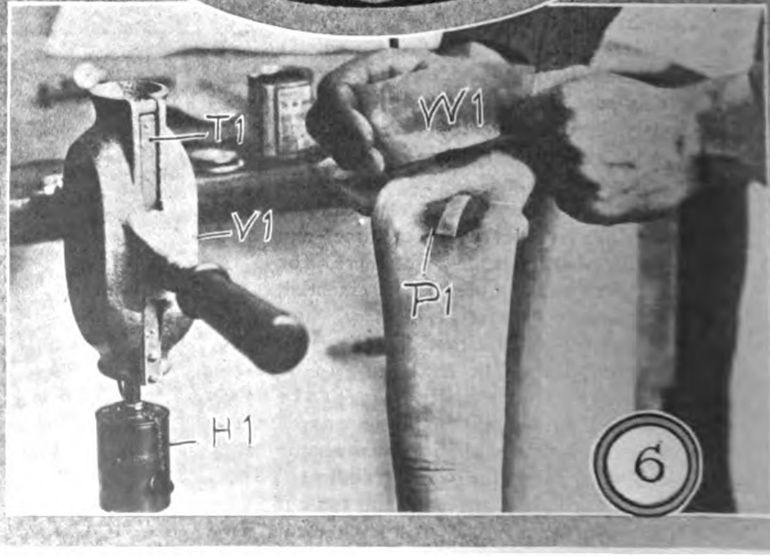
With the vulcanizer at the proper temperature, a small piece of wax paper W1, commonly known as grease paper, is inserted between the vulcanizer V1 and the part to be repaired, and snugly clamped on by the chain and bolts B1 and B2, Fig. 11. Should the section of the tire be smaller than the concave shape of the vulcanizer, let out sufficient air for the two surfaces to properly touch. There is no fear of burning oneself if the handle H1 alone is touched, and the length of time required to effect the repair depends upon the depth of the cut; this varies from 20 to 40 minutes. If the finger nail pressed on the vulcanized part leaves an indentation the work is not completed, but if no mark is left then the work is finished and the rubber cured. When the vulcanizer has been removed and the part allowed to cool off some sandpaper might with advantage be used to clean around and level off the repair to the same thickness as the casing.



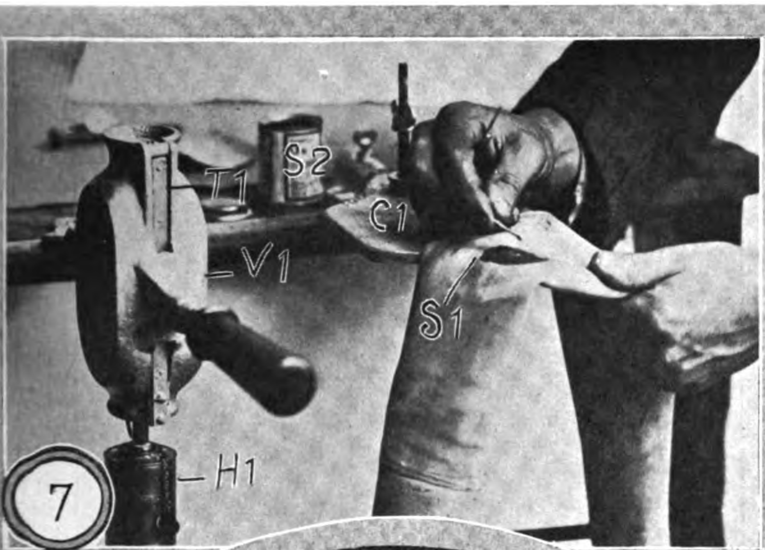




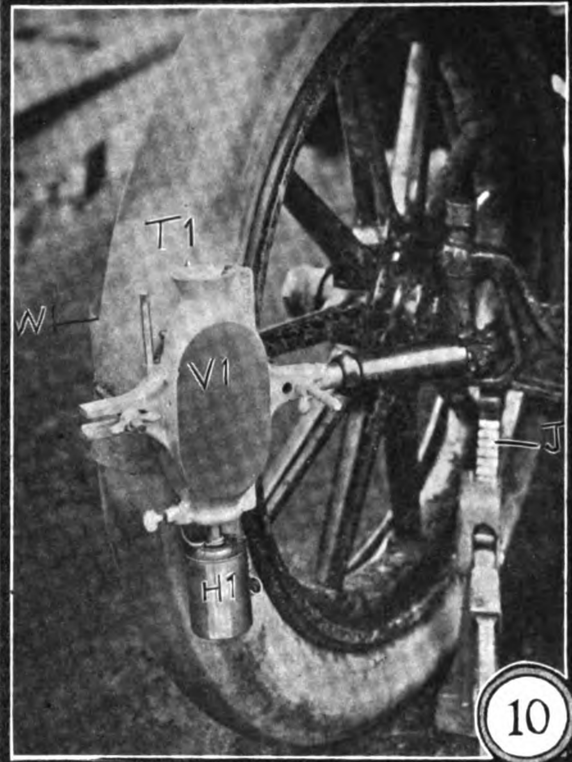




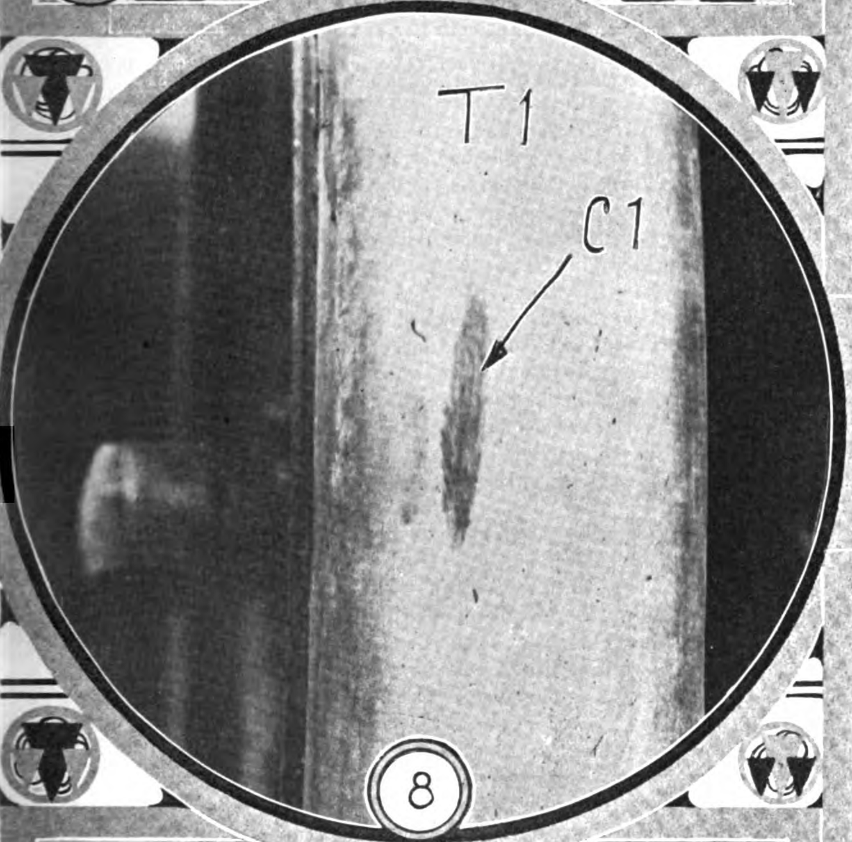
STEP BY STEP IN THE PROCESS OF REPAIRING TIRES AND CASES, BEGINNING WITH THE EXAMINATION AND CLEANING



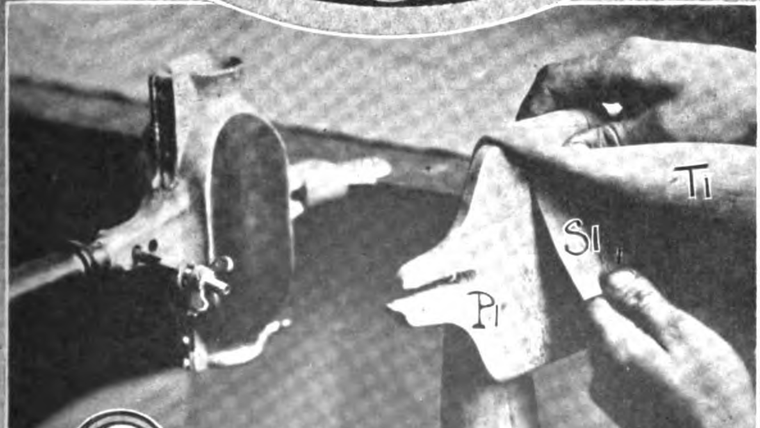
7



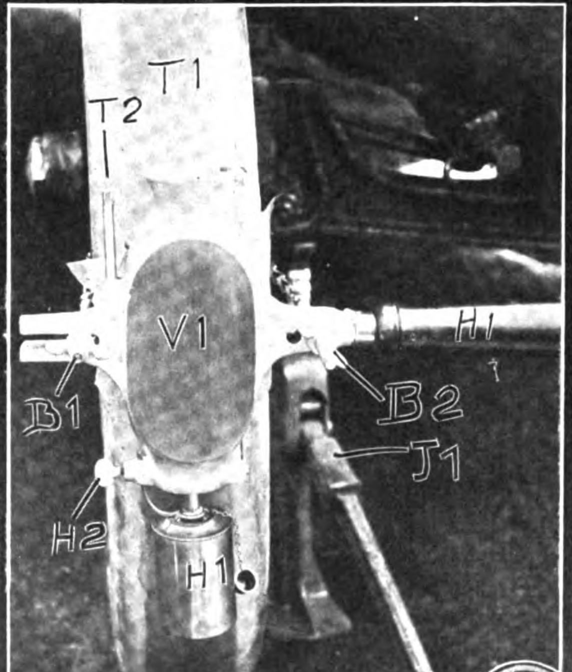
10



8



9



11

OF THE WOUND, LEADING THROUGH THE OPERATIONS, AND ENDING WITH THE REPAIR AS DESCRIBED IN THE STORY

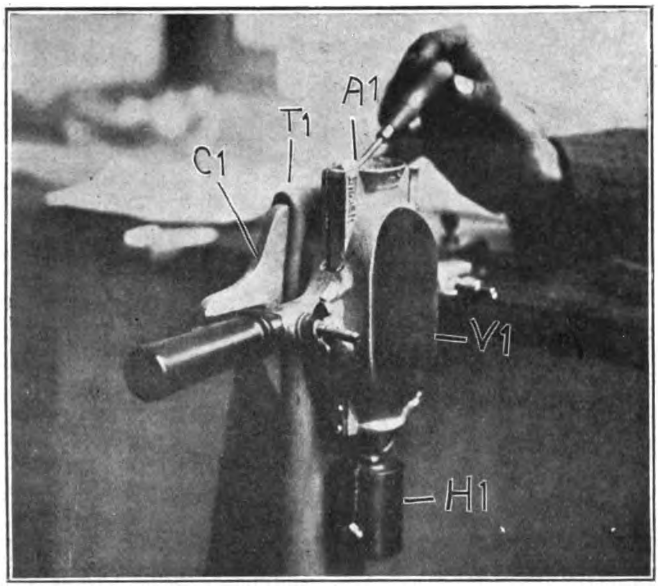


Fig. 12—Vulcanizer clamped into place; adjusting the thermostat for the proper control of the heat

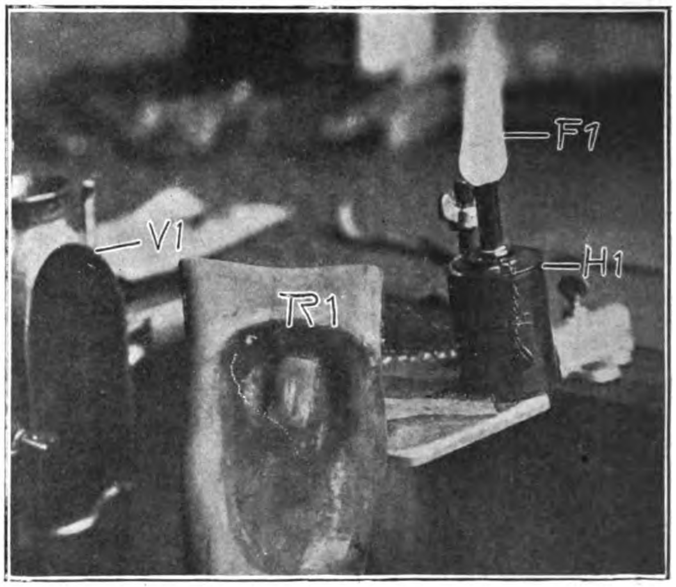

Fig. 13—Showing the inner tube after the repair is completed; the heater is shown also with a 3-inch flame, which is correct

Cleanliness in connection with tube repairs plays an equal part if the work is to be crowned with success, as with the outer casings the rubber must be cleaned with gasoline as shown in Fig. 4, holding the cut open in order to better get at the job. The part must be roughed up, and the best way to do this is to use sandpaper. The cloth C1 is moistened with gasoline and rubbed over the hole and about an inch around, the plate P1 being used as a rest, while the vulcanizer V1 rests on the bracket alongside. Apply, as in Fig. 7, thin coating of cement solution S1 over the hole and on the lips of the same and allow to dry; this takes about four minutes, and then apply another coat of solution and let dry as before. If a simple puncture, take a small piece of Para rubber and work it into the hole with a match. If a small hole, fill to surface with layers of Para rubber cut to size of hole, making sure the Para sticks to the tube around the edge. Then cut a piece of rubber one-eighth of an inch larger than the puncture or cut and apply over same. Then cut another patch P1 one-half inch larger than the hole and apply over all (Fig. 6). The tube is now ready for vulcanizing. By this time the temperature should have reached 265 degrees if the thermostat T1 is correctly adjusted. The method of adjusting this, as shown in Fig. 12, should it require same, is to loosen the locking screw and turn the adjusting screw A1 in to raise and out to lower the temperature. Do not make more than one-fourth turn at one time, and do not expect temperature to change immediately when you make the adjustment. Apply a piece of paraffin paper W1 (Fig. 6) over the patch to prevent it sticking to the vulcanizer, and underneath, next the plate P1, which has been turned in a vertical position, insert a strip of pasteboard or rubber (a piece of an old tube will do) several times larger than the patch, but narrower than the flattened tube, so as to bring the pressure on the patch and relieve the edges of the tube from pressure (Fig. 9).

Clamp the vulcanizer V1 (Fig. 12) to the plate C1 with the tube T1 inserted, leaving the heater H1 alight. When the repair is effected, which takes from 15 to 20 minutes, the patch should have a gray color and should not retain an impression from a finger nail. If it looks brown and stays dented put it back in the vulcanizer and leave for a longer time. Remove the paper by rubbing with a wet cloth.

Fig. 13 shows the repair complete, which took twenty minutes from the time the tube was taken out of the tire, and no amount of pulling would dislodge it after cooling, and examination showed that the patch had virtually become part of the tube.

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FOREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[291]—How is the necessity of removing a tire-shoe from its rim obviated on the road?

A.—By the use of a detachable rim, a spare wheel, etc.

[292]—How can a tire be inflated on the road without the labor of pumping air into it by hand?

A.—By carrying a tube of compressed air. They can be obtained in various sizes, ranging from that which will inflate a large tire once to that which will give several inflations.

Air pumps that can be driven by the motor are also obtainable.

[293]—How can a liquid (gasoline, oil, etc.) be best poured from a can without a spout?

A.—Tip the can quickly so that the top passes beyond a vertical position with the opening at the highest part. The liquid will then flow clear of the can without dribbling. This method also gives the most free access of air and the smoothest flow with absence of surging.

[294]—What precaution should be taken when pouring gasoline into the automobile tank?

A.—Stop the engine and extinguish all lights that burn with a flame. This should be especially observed in a closed room.

[295]—Where should the gasoline tank pipes and carbureters be placed in an automobile?

A.—In positions such that it is not possible for gasoline to drop on the exhaust pipe or muffler in case of leakage. The tank should not be close to the exhaust outlet or any part that will warm it much.

[296]—How can water be separated from gasoline when filling the tank of the automobile?

By straining it through a closely woven cloth, felt or chamois skin, taking care that the strainer is wet with gasoline before the water touches it. The gasoline will then pass through freely while the water will be retained. Cloth which will give much lint should not be used.

Water in gasoline always settles to the bottom, so that by pouring the gasoline out carefully, no water will be carried with it, except the minute quantity which is held in suspension.

[297]—If gasoline vaporizes in a closed room, where does the vapor gather?

At the floor. Gasoline vapor is heavier than air.

[298]—Where should openings be made in a room to allow gasoline vapor to escape?

In or near the floor.

[299]—Will ventilator shafts leading upward from openings at the floor of the room remove gasoline vapor in all kinds of weather?

No. In clear weather, the circulation of air will ordinarily be enough to carry the gasoline vapor with it, but in very damp, foggy weather, there will generally be no circulation in the ventilators and the vapor of gasoline will remain at the floor.

[300]—What is the only sure method of preventing the collection of gasoline vapor in a garage?

To ventilate it thoroughly with a forced draft, drawn out through openings in or near the floor. The ventilation may be forced either by a fan or steam coil.

[301]—When gasoline vapor is present in a closed room in moderate quantities where is the greatest danger of fire?

At or near the floor.

[302]—What are some of the possible sources of ignition of gasoline vapor in a garage?

The spark at the trembler of an induction coil; a "flash" at the timer; a flash at the brushes of a magneto or electric generator on the automobile; the exhaust when there are any cracks or openings in the pipe connections near the engine; sparks blown from the exhaust openings; the exhaust when muffler explosions occur; skidding of iron-shod wheels on a cement floor, or even on a wooden floor with nails in the boards or with sand covering them; the spark from a nail in the heel of a shoe striking a cement floor, or from a metal tool dropped on the floor.

[303]—From what source is gasoline vapor apt to come in a garage?

From a leaky carbureter, gasoline tank or a pipe connection. The carbureter frequently starts flooding when the car is standing in the garage, and corrosion of the tank, eating away of the solder, etc., sometimes open the tank, so as to allow considerable of the contents to run out.

[304]—What are some of the precautions that should be taken to prevent fire in a garage?

Above all it should be well ventilated. Gasoline should be turned off at the automobile tank valve; only incandescent lights with keyless sockets should be used for examining the car; all electric switches, key sockets, etc., placed high in the room. Never strike a match or use a candle or lamp to examine an automobile containing gasoline in a garage.

[305]—When a small fire is burning over liquid gasoline on the floor, how can it possibly be extinguished?

By putting sand or earth on it with a side throw across the floor. By smothering it with a wet blanket thrown over it.

[306]—What danger to life may arise from running an internal combustion engine in a closed room?

Asphyxiation by the exhaust gases, especially in heavy, damp weather. Much care should be taken to avoid this, since there is no warning odor, and fainting may occur before one realizes the danger.

Remedy for Carbureter Jet Trouble

Editor The Automobile:

[2,439]—Could you help me to solve a difficulty I have with my carbureter and give me some advice as to the best method of overcoming it? The carbureter fitted to my car is of the single-jet type, and the air is admitted through a sleeve which opens with the opening of the throttle. The consumption being excessive, I closed the jet slightly; but then I got blowing back, and with the outrushing air there came a quantity of gasoline, which seems to me to show that it was not vaporizing properly. I opened the jet as it was before, and now there is always a lot of black smoke exuding from the exhaust pipe.

Newark, N. J. Subscriber.

Your trouble seems to be caused, as you say, by the gasoline not vaporizing, as is the case where there is no air valve to work in accordance with the suction and speed of the motor. In order to deliver sufficient gasoline with one jet the size of the hole has to be from one to two millimeters—that is, about 1-25th to 1-16th inch in diameter. At slow speeds the suction is insufficient to cause the stream from the jet to break up in small particles, as it does at high velocities, and you are taking almost crude gasoline into the cylinders, with just sufficient air to form a combustible mixture. Have a jet made similar to A or C in Fig. 2. A will do for a motor up to 5-inch bore, but for a larger motor the mushroom-top type will be better. B in Fig. 2 shows your jet as it is at present, and comparison with the other shows how the holes should be drilled.

Curious About the Properties of Gasoline

Editor The Automobile:

[2,440]—I would like to ask through your columns "Letters Answered and Discussed" if naphtha is suitable for use in automobiles. I have heard of some people using it in stationary gas engines with apparent good results, and it is about two cents cheaper here. If it will operate fairly well in automobiles, what are the disadvantages, or advantages, if any? As a subscriber to your valuable journal I would be glad to have you give a small treatise on distillation or production of gasoline and similar products, the advantages and disadvantages of their use.

Booneville, Miss. L. D. Rinehart.

The hydrocarbons of which automobile gasoline is made belong in the range including butane, pentane, hexane, heptane, octane, nonane and decane. Hexane is apparently the most desirable, the formula for which is C_6H_{14}. The molecular weight of hexane is 86. In actual practice automobile gasoline is made up of varying proportions of pentane, hexane, heptane and octane. The three naphthas are represented in this mixture to some extent, and it is believed that the proportions are varied from time to time over a considerable range. In addition to all the variables as above indicated there is the further fact that hydrocarbon fuels have different characteristics, depending upon the geological source of supply. Under such conditions it is difficult to see how any information can be given you such as will be of any great value, unless you go into the detailed study of the fuel problem and at great length.

Relief for Cold Feet Sufferers

Editor The Automobile:

[2,441]—While driving in the cold weather I suffer very much with the cold. I have fitted my car with side-doors and a curved shield and notice a considerable improvement, but after an hour or so my feet become numbed and I can hardly feel the pedals. I manage to keep my hands warm with a good pair of gloves lined with wool, and would be all right if I could keep my feet warm. As I do most of my own driving this is very annoying. I would be very grateful if you can give me any suggestion by which I may overcome it.

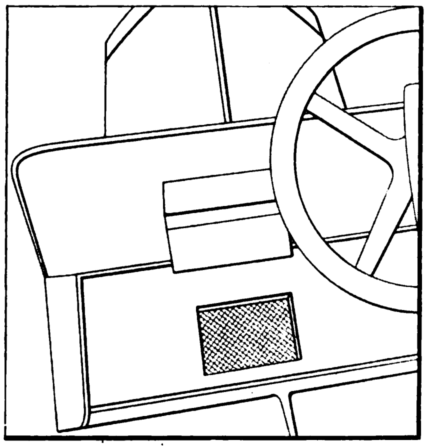

Fig. 1—Showing trap door open to allow hot air to pass

E. A. T.

Montreal.

We should suggest your fitting a trap-door in the floor boards of your car as shown in Fig. 1, with a hinged lid that can be opened at will. The hot air that in the ordinary way passes out from the pan can be directed through this opening and will be found very beneficial in cold weather. When the motor is turning fast, however, the draft may be too strong and the baffle plate shown in Fig. 6 can be fitted. The hot air will rise and warm the feet and legs of the occupants of the front seats. To prevent any oil finding its way through, a fine wire gauze screen should be fitted. It is an inexpensive matter to fit, and if it becomes too warm the trapdoor may be closed.

A Very Troublesome Repair Undertaking

Editor The Automobile:

[2,442]—The spring clips on my rear axle work loose. They have been repaired once by the maker by reaming the holes and riveting with large rivets. Kindly suggest a way of repairing that will prevent their working loose. Sketch shows the clip with spring hung below axle. There are no radius rods or torque rod on the car. To remove clips from axle would necessitate the removal of brake drums, which are in perfect condition. Clarence A. Davis.

Quechee, Vt.

Referring to the illustration Fig. 5 it is there suggested that a set-screw be used if the thickness of the wall W1 will permit, and it is also pointed out that a pad of oak tanned leather (sole leather) be placed under the bracket so that when the U-bolts U1 and U2 are clamped up the leather will be compressed, to prevent further creeping. It is just possible that the U-bolts are made of soft iron and too small of section to withstand the strain. If so, put in a heavier set.

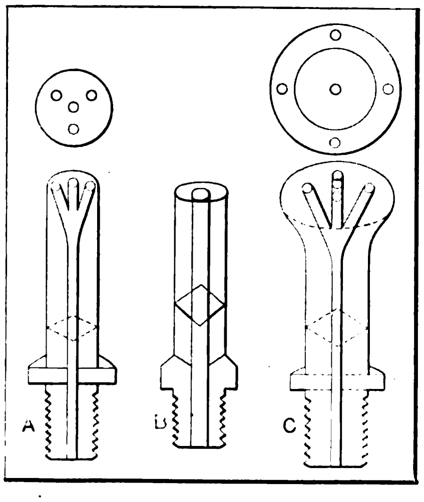

Fig. 2—Different methods of drilling jet to increase evaporation

Easy Method of Increasing Clearance

Editor The Automobile:

[2,443]—I wish to raise the clearance of my car, as at the present moment there is a space of but 6 inches between the ground and the pan, and I fear that some day I shall strike something in the road, such as a stone, and damage the flywheel and crankshaft. I have thought of fitting larger wheels, but the makers do not recommend this, as they say the car is geared high enough already and it will mean altering the two bevel wheels. Is there any other means of overcoming the difficulty?

Frankfort, Ky. L. James.

The method we should suggest fitting wooden or fiber blocks under the springs, between them and the axles, in the method shown in Figs. 3 and 4. The thickness of these blocks depends upon the clearance required, and for ordinary purposes eight inches would suffice, although for some parts where the roads are bad and the wheels sink into ruts 10 inches is not too much. The grain of the wood should run lengthwise with the springs. Oak should not be used owing to the tannic acid it contains. Red fiber has been used recently with success, and this material would be preferable if it can be obtained in the required thickness.

Desires the Addresses of Makers of Coil Springs

Editor The Automobile:

[2,444]—I am a reader of your weekly devoted to automobiles, and would like to learn what companies make coil springs. As I am getting out a new shock absorber, I would be very thankful for the information.

Could you tell me the tensile strength a spring 1 inch (spiral) would have to be to support a weight of 800 pounds?

Would it be possible to get a spring that size strong enough?

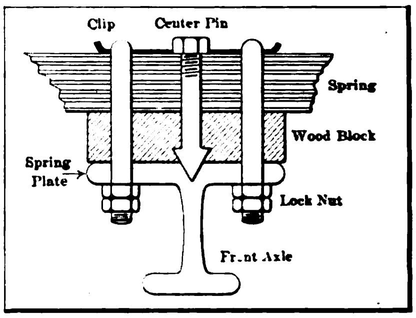

Fig. 3—Showing method of fixing block between springs and front axle to increase clearance under pan

Walter H. Church.

Lee, Mass.

A spring capable of supporting a weight of 800 pounds should be made of 3-8-in. diameter round steel wire, wound in a coil 1 1-2 inches in diameter, counting 10 complete turns. A 1-inch diameter spring with 10 complete turns would only carry 392 pounds were it made of 1-4-inch diameter round wire.

Steel wire used for this purpose must have a modulus of elasticity for shearing of 10,660,000. This quality of steel wire for use in making springs is readily obtainable on the open market, and the dimensions of springs as above will support the weights given, but any increase in weight beyond the amount stated for each spring will overload it. For exact information in further relation to this matter consult The Automobile of August 12, 1909, opening on page 269.

Tires Are Whitened to Give a Smart Appearance

Editor The Automobile:

[2,445]—will you kindly tell me why pipe-claying of tires is done and if it has any injurious effect on the tires?

Keswick, Va. L. Pugh.

As to "claying" tires after they are washed, using tepid water and castile soap, there is just as much sense and utility in making the tires look smart as there is in blacking one's boots for the same purpose. There is no possible danger attached to this process, unless the pipe-clay is so profusely applied as to conceal the surface wounds in the treads of the tires, whereas they should be repaired before the pipe-clay is applied.

A Fierce Struggle with the Lubricating Problem

Editor The Automobile:

[2,446]—You may have had articles in your magazine which would answer the question that has occurred to us, but, if so, we have not seen a direct answer and would therefore be greatly indebted to you for same.

What is it in lubricating oil that makes the carbon in the cylinders? Is there any laboratory or other practical method of making a test other than by using it in one's car to find the per cent. of what makes carbon in any given oil?

A salesman offers oil which he guarantees practically free from carbon. Is there any way to prove this other than by trying it, and if gasoline produces more or less carbon would it not be a better test to try the oil in some other way so that one could tell whether it was the oil or the gasoline which was producing the carbon, and how much of each? We are referring wholly to cylinder oil, of course.

Detroit, Mich. A Subscriber.

It is highly improbable that the proper amount of good lubricating oil used in the cylinders of a motor will produce carbon trouble. In every case that we have examined with sufficient minuteness to know what we are talking about, the carbon formations were quite clearly traced to poor mixture, due in some cases to inferior carbureters, but in nearly every instance to bad adjustments.

Trouble with Inner Tubes

Editor The Automobile:

[2,447]—I have had a great deal of trouble with my inner tubes. They break on the side next to the rim, making a slit from two to eight inches long in a straight line. Do you know of anything that will prevent it? It is not done by blowouts of the casings or anything cutting through the casing from the outside.

Wm. Jenson.

Brigham City, Utah.

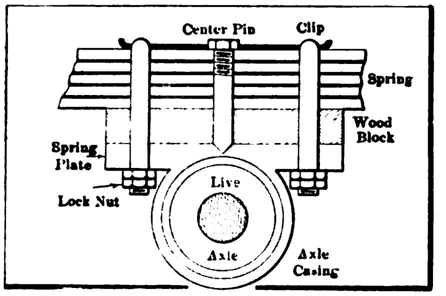

Fig. 4—Method of fixing block under rear axle springs

As a doctor cannot diagnose the patient's complaint without knowing all the symptoms and the age of the individual, and whether male or female, so with anyone trying to give another advice the giver should be in possession of all the facts. First, you do not say whether you have quick detachable or clincher rims fitted to your car, or even the size of tire. The first thing that suggests itself to us is that the sizes of the outer casings and the tubes are not the same, which in itself will cause trouble. Again, we have heard of indifferent tires going this way owing to the poor quality of the rubber and the softness of the bead. The principal cause, however, is rot, caused by water finding its way between the cover and the case at the bead, which will produce the trouble you complain of. A strip of fine canvas vulcanized on the tube on the part affected might cure it, or a piece of canvas solutioned on the edge of the bead will make it more water-tight, as when the bead is drawn together there will be less room for the water to penetrate. If security bolts are used, always see that these are kept tight and the tires pumped up to the proper pressure.

Wishes to Apply Principle of the Davy Lamp

Editor The Automobile:

[2,448]—So many automobiles get afire from back-firing through the carbureter that I would like to know whether or not a fine wire screen placed in the intake manifold between the carbureter and the motor will prevent this back-firing. It is my idea that a fine mesh copper screen so placed will work precisely as it does in a miner's safety lamp as invented by Sir Humphry Davy. What do you think? W. A. Bates.

Mansfield, Pa.

In the first place there will be no back-firing at all unless the manifold is too big for the motor. The reason why the mixture takes fire in the intake manifold is because the speed of flow of the mixture is lower than the rate of flame travel in the mixture. These undesirable relations will be at once upset if the manifold is reduced in area, thereby increasing the speed of flow of the mixture in the direction of the combustion chamber sufficiently to overcome the speed of flame travel in the molecular structure of the mixture. It is not believed that a fine wire screen, which is nothing but an obstruction, should be placed in the manifold. It is only a matter of a short time when an obstruction such as this will wax up, and then the mixture between this obstruction and the combustion chamber will surely take fire, and the screen will be blown from its anchorage down into the carbureter, where it is not welcome.

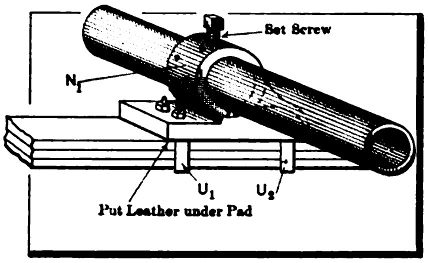

Fig. 5—Sketch of a spring perch which is giving trouble in practice

Automobiles in a Bad State of Repair

Editor The Automobile:

[2,449]—I have a 4-cylinder, air-cooled motor in my car, which is very serviceable, but lacks power and speed; that is, the motor will turn over 22 miles an hour whether going down a hill or on the level. It doesn't seem capable of turning over fast enough, and yet it has not the power to be geared higher, being geared 3 1-2 to 1. It is a 30-horsepower motor. I have ground the valves, tested them with gasoline to see that they do not leak and put in new valve gaskets. Could you please help me by answering in your columns, as I am a satisfied subscriber. Robert Kelly.

Hartford, Conn.

Time the motor. Substitute a magneto for the worn-out battery ignition system, or if a magneto is on the car, find out if it is any good—test it. Examine the carbureter; you are either not using enough fuel to obtain more power or the fuel is going to waste due to poor ignition, bad compression or lack of ability of the carbureter to produce a homogeneous mixture having the right proportion of air. Finally, go over all the bearings and find out which of them are serving as brakes rather than for their intended purposes.

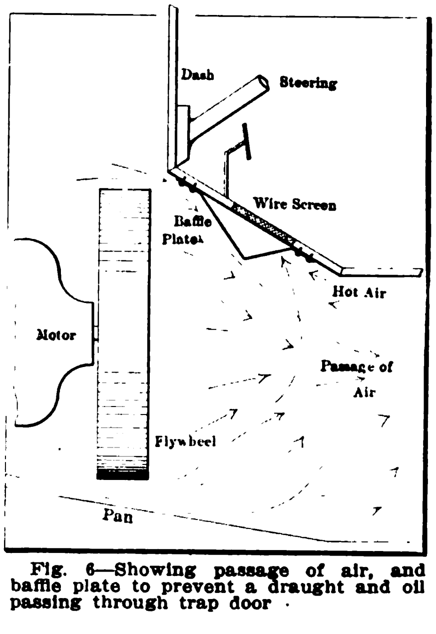

Fig. 6—Showing passage of air, and baffle plate to prevent a draught and oil passing through trap door

Don'ts for the Autoist

AN ASSORTMENT OF INJUNCTIONS COVERING A VARIETY OF SUBJECTS, SOME PERSONAL, MORE IMPERSONAL, BUT ALL PERTINENT

Don't let the wheels go to rack; if they are loose at the miter and cannot be tightened, remove the hub flanges and pack the space, then put back the flange and tighten up on the hub bolts.

Don't drive a hundred miles at the rate of 60 miles per hour to attend a convention of experts for the discussion of how to prevent dust.

Don't experiment with alcohol as a fuel, and finding that it is not efficacious in a low-compression motor, drink it in disgust.

Don't run away with the idea that gasoline is being used for fuel in automobile motors just because you order benzine by that name.

Don't forget that the way to make sales is to give a man just what he asks for; when you order (automobile) gasoline, you get it; you go away pleased, despite the fact that what you do get is benzine for the most part.

Don't stay up nights inventing a carbureter to burn kerosene oil; there are a large number of them in service to-day; automobile gasoline is a compound of a number of "fractions" including kerosene.

Don't put your feet up against the finished back of the front seat. Supposing you don't own the car?

Don't start out for a ride in a friend's automobile garbed in a peek-a-boo waist and a glad smile; if it starts to snow you will have to come home in his overcoat.

Don't accept an invitation to ride in a friend's automobile and stand upon the varnished tool box just because it occupies a place of convenience on the running-board; there remains enough room for good-sized feet on the same board.

Don't accept an invitation to ride and then volunteer to crank the motor; you might get your head kicked off.

Don't tinker with anything that you don't understand; think of tickling the fetlocks of an army mule.

Don't confess your sins to the chauffeur; he is not sworn to secrecy.

Don't parade the family skeleton anyway; let the wired bones disintegrate and mingle with the dust of ages.

Don't go around collecting family skeletons; the blame things store badly.

Don't be grieved if there are things that you do not understand; the longest list is in the keeping of the wisest man.

Don't destroy your standing among your friends by suspecting their motives; you may not be big enough to attract their notice.

Don't stop at a farmer's house and flash a dollar when you ask him to trot out a glass of milk; he might not have less than an "eagle" with which to make the change.

Don't be arrogant in any event; you are not so much just because you borrow an automobile to ride in.

Don't acquire the hallucination that you have the right to litter up the tonneau of your neighbor's automobile just because he is not the possessor of enough land to make you use a telescope.

Don't play poker with a mercerizer and then suddenly discover that the tires on your automobile are too costly.

Don't use kerosene oil as a cooling medium, although it has some virtue for that purpose.

Don't look at your troubles through a magnifying glass; just meet them face to face.

Don't forget that the child with a lost doll is in a hopeless state of dispair.

Don't see things with the eyes of the fellow who just lost the favor of a pink-cheeked maiden.

Don't be a "symptomite"; doctors feed on such vermin.

Don't forget that the pessimist looks through one end of the telescope and the optimist squints through the other and that both of them are in bad; use a cold, critical eye and a little refrigerated judgment and the end will be satisfactory.

Don't see your automobile as the fellow who just lost his job looks at the world.

Don't scan the horizon through the tear-dimmed eyes of the small boy whose mamma would not take him to the circus

Don't underestimate trouble; it is always real, but it is never so much in earnest that it can resist real earnest effort.

Don't trade the real for the imaginary—you might better have a horse dealer as an agent, and let him act for you.

Don't serve in the capacity of a lean-to; architecturally no great edifice is so incumbered.

Don't scatter the faculties; use a choke-bore mental gun; aim at the heart of the object.

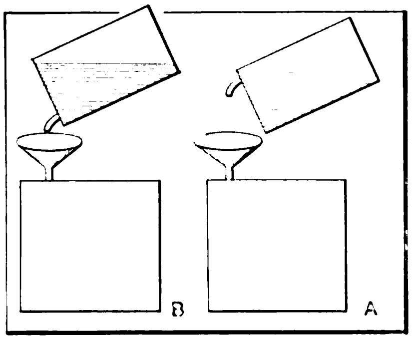
Don't overlook the fact that the lovely flower with its short life performs a great service; it becomes substance for the mighty oak.

Pouring Without Spilling

There Are Two Ways of Pouring Liquid From a Can with One Vent, the Right and the Wrong

ONE has to knock things into people's heads with a sledge hammer sometimes and after you have told them once the correct way to do a thing they will persist in reverting to the old way if they are not watched. A chauffeur was pouring some gasoline the other day in his tank through a small vent in the manner indicated in the illustration B with the result that the liquid spluttered and gurgled, part going in the tank and about the same amount going on the ground. Imagine the effect had some one come along just then and thrown a match down anywhere near, for by this time the gasoline had formed a small stream about twelve feet long in the gutter. If the can is held in the manner shown in A, the can will be emptied sooner and without the loss of a single drop, as by this means the air has a chance of entering the tank over the gasoline flow and taking the place of the vacuum formed by the exit of the liquid.

The chauffeur was shown how to pour the gasoline properly but his only reply was, "Oh, I know all about that stunt, if it does not all go in the tank this way, at any rate it goes in quicker. I don't pay for the gas." The consumption of the particular car will not be increased and a man who does things of this description will be equally careless about the rest of the car. If the car were to catch fire he would probably say, "Let it burn."



B—Wrong way to pour gasoline. A—The right way

It Stands to Reason

SHORT PARAGRAPHS DEALING WITH MATTERS WHICH SHOULD APPEAL TO THE REASON, TO SERVE AS REMINDERS OF DUTIES TO BE PERFORMED

That making a living is one of the main concerns; the new automobile becomes a nuisance if it interferes with the process.

That the man who thinks that he must hobnob with royalty in order to progress has another think coming to him.

That the man who purchases an automobile to help him climb to social eminence must have a poor opinion of society.

That the society which bars a man out until he invests in a car is not worth a hang.

That it is not expensive to own a modest automobile unless it rolls the owner up to a gambling hell.

That the tire bill is mere chicken feed in comparison with two hours of "observatory" practice before the bar of injustice of some remote roadhouse to which the automobile is too frequently rolled.

That many a man's happiness has been wrecked by the sweet-running qualities of a well-made automobile misdirected.

That the first thousand dollars should be invested in a bank for savings, the second thousand should be planted down on a home, and the third thousand may then well go to purchase an automobile.

That a man of brains and small means can easily extend his earning capacity if he purchases and uses an automobile, having a care to put it to good use.

That the world does not look down on the man who does not try to imitate. Moreover, a real ape is Nature's handiwork, but an imitation ape is the recipient of every man's most choice brand of contempt.

That it is no crime to generously disagree with the methods of those who use a 13-inch searchlight on the deck of a runabout; it puts them in the "glare" of sound public opinion.

That a "horn" on the automobile ceases to be of utility after the chauffeur spills a "horn" into his stomach.

That the chauffeur is not the only person who deals in horns somewhat too promiscuously.

That the word promiscuous relates to horns as well as kissing, with equal force.

That the very happiness which is sought after on a promiscuous basis is lost in the shuffle.

That warning signals are not musical manifestations.

That the warning may come too late, be a musical lull, or deceive the unlucky pedestrian into the belief that he is passing a boiler shop, which he will not think to get out of the way for.

That the man who matches a glaring red necktie with a cream-colored pair of trousers must be prevented from using a 50,000 candle-power headlight, a 45-caliber horn, and a speedometer that is blind below 55 miles per hour.

That smoke is a sign of waste, both of gasoline and of lubricating oil; it pays handsomely to comply with the smoke ordinances.

That the enforcement of the law in relation to smoke is desirable, because it compels respect for the rights of others from those who have no respect for economy.

That a man who cannot be reached through his pocketbook is beyond coaxing—give him the letter of the law.

That leniency is a term which can only be applied in regulating the affairs of the considerate and the intelligent.

That the police force should not accept Thanksgiving turkeys from unknown givers; perhaps some taxicab concerns are looking for special privileges; what the public demands is good service.

That the automobile industry should shake off the public crib bread line that is putrifying a fester in its fattest part.

That appropriateness should be studied, not only in the automobile, but in its equipment, use, and to the avoidance of its abuse..

That the Callan law, regulating automobiles in New York State, is the instrument of immature thought from the taxpayers point of view, and the device of deliberation from the standpoint of those who feed at the public crib.

That a public institution ceases to be one as soon as it is conducted for private gain.

That a private gain plant, if it puts on a public benefit front, is perpetrating a fraud.

That the automobilists of the Empire State will have to fight for emancipation in the long run.

That corrupt leaders will invariably deliver the goods to the wrong address.

That in union there is strength, but the grave danger lies in the advantage it affords to the corrupt leader.

That water in the gasoline is like a sore thumb; it hits against everything, and hurts.

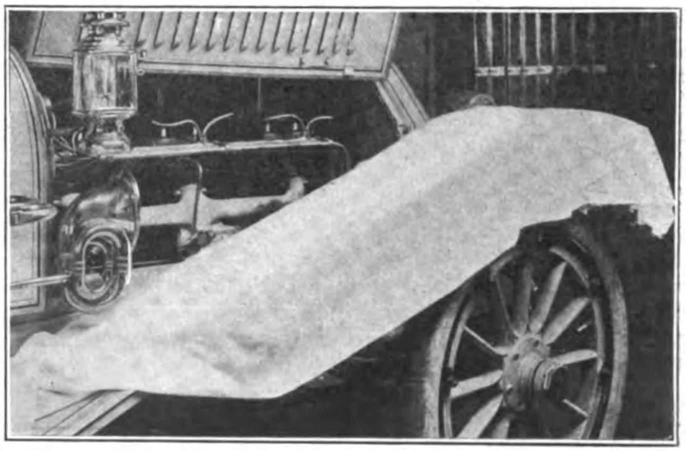
That the best way to get rid of water is to take it out of the gasoline before the same is dumped into the tank.

That spark plugs have to be taken out of the cylinders and cleaned at regular intervals if the ignition system is to be kept up to a fitting standard.

Preserving Paint

To Prevent Scratching, a Cloth Should Be Laid Over Parts Against Which Coat Buttons May Rub

PAINT is applied to the metal parts of the automobile in layers that are worked into one another, each coat being allowed to dry before the next is applied, the whole forming a homogeneous mass that is liable to damage, and should some sharp instrument strike it the paint will chip off, leaving the metal bare. Rust creeps in and rots a good deal of the paint around the original bruise. Whenever an adjustment or repair is to be made to the engine the mudguards can be protected by laying cloth over them, as shown in the illustration. If a blow has to be struck on bolts that have been painted, some soft material, such as leather or a rag, should be interposed to protect the paint. The paintwork on the car is subjected to sufficient bad treatment in washing, and in order to retain a good appearance it is necessary to resort to these little helps.



How to preserve the painted surfaces when adjusting or repairing

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.SC., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE SEVENTH INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

I NOW propose to deal with the relation between the work done by a petrol engine and the amount of energy with which the engine is supplied in the form of fuel. The ratio of the work performed in a given time to the energy supplied in that time is called the efficiency.

When considering the efficiency I shall take the indicated horsepower as a measure of the work done by the engine, and in this way avoid the consideration of the losses due to friction in the engine itself. These losses vary considerably with the make of engine, and even with a particular engine, depend in a great measure on the condition of the lubrication.

In order to determine the amount of energy supplied to the engine in the fuel we require to measure the weight of fuel consumed, and also the quantity of heat which can be developed by burning unit weight. The quantity of heat developed by burning unit weight of fuel is called the calorific value of the fuel. A piece of apparatus I have used for the investigation of the calorific value of petrols is shown in section in Fig. 28. The petrol under examination is contained in a glass bulb, N, of known volume, and flows through the capillary tube, G H, to the jet, A. The air enters the bulb, N, through a fine tube, which terminates near the bottom of the bulb, and hence the head of liquid which causes the flow through the capillary tube. G H, remains constant, and thus, since the temperature of the tube, G H, is maintained constant by means of a water jacket, the rate at which the petrol flows from the jet, A, is quite uniform. The drops of petrol, as they fall from A, strike a series of discs of wire gauge contained in the tube, B, this tube being heated by a steam jacket. A stream of air is driven in at the tube, C, and this air vaporizes the petrol, the mixture passing through the tube, D, to a Bunsen burner, E, where the mixture is burnt. The burner, E, is inside a Boys' gas calorimeter, and the heat developed by the flame is absorbed by a stream of water, which circulates through a long coil of tube, so that when the products of combustion finally escape into the air they have been cooled down to atmospheric temperature. The stream of water passing through the calorimeter is kept constant, and the temperature of the water is noted as it enters and leaves. When the constant state has had time to be set up, the increase in temperature of the water will be constant, and if we measure the quantity of water which flows through the calorimeter during the time the known volume of petrol contained in the bulb, N, is being burnt, we can calculate, from the weight of water and the increase in temperature, the heat developed, that is, we can obtain the calorific value of the fuel. During the time required for the constant state to be set up the flame is fed with petrol supplied from the bulb, M, a threeway cock, K, being suitably turned, and it is only when this constant state is reached, *i.e.*, when the thermometers in the calorimeter come to a steady reading, that by turning the cock, K, the petrol is allowed to flow out from the bulb, N. When the surface of the petrol reaches a graduation just above the bulb, N, the water flowing through the instrument is turned into a measuring vessel, the collection of the water being stopped as soon as the level of the petrol reaches a second graduation just below the bulb. Any water produced by the combustion of the petrol, and condensed in the calorimeter, is collected and measured, since an allowance has to be made on account of its latent heat which has been communicated to the water flowing through the calorimeter. In this way we obtain the calorific value of the fuel without counting the heat which would be obtained by condensing the steam produced by the combustion, *i.e.*, what is called the lower calorific value. Since, in the engine, the steam produced by the combustion of the petrol is never condensed to liquid in the cylinder, we are justified in using this lower calorific value.

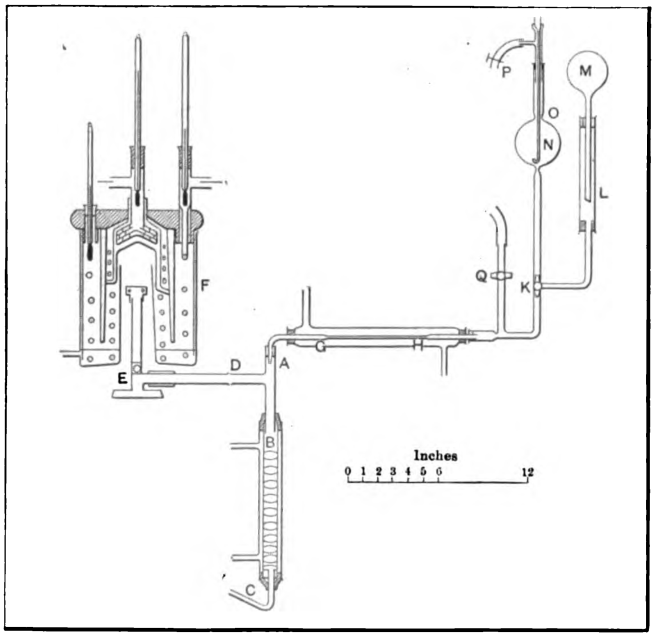


Fig. 28—Apparatus for determining the calorific value of petrols

The calorific values of a number of commercial petrols are shown in the following table:

CALORIFIC VALUES (LOWER)

Petrol	Density at 15° C.	Calorific Value (Lower) Calories per grm.	Calories per c.c. at 15° C.	B. T. U. per lb.	B. T. U. per gall. at 15° C.
Bowley's special	.684	10,660	7,290	19.190	131,500
Carless	.704	10,420	7,340	18,760	132,300
Express	.707	10,020	7,080	18,040	127,600
Ross	.714	10,370	7,400	18,670	133,600
Pratt	.719	10,340	7,430	18,610	134,100
Carburine	.720	10,380	7,470	18,680	135,000
Shell (ordinary)	.721	10,400	7,500	18,720	135,300
Dynol	.725	10,290	7,460	18,520	134,600
Simcar Benzol	.762	9,490	7,230	17,080	130,400
.760 Shell	.767	10,140	7,780	18,250	140,300
Coaline	.846	9,270	7,840	16,690	141,500
Pentane	.630	10,230	6,450	18,410	116,300
Hexane	.680	10,480	7,090	18,770	127,900
Heptane	.736	10,400	7,650	18,720	138,100

It will be observed that, on the whole, the calorific value per unit of weight decreases as the density of the petrol increases. As, however, it is usual to purchase petrol by volume, the calorific value per unit volume is of interest. In this case it will be noticed that the values for the different petrols differ very little, so that from the point of view of the heat which can be obtained by burning a given volume of petrol there is practically nothing to choose between the various kinds given in the table.

Coming now to the question of efficiency, the first thing to consider is the effect of the compression of the charge, before ignition, on the efficiency. That such compression will give increased efficiency we can at once see from the following simple argument. Suppose we have a cubic foot of gas contained in a vessel at atmospheric pressure and a temperature of 0° C. and that we supply sufficient heat to the gas, say by burning, to raise the temperature to 273° C. Owing to the rise in temperature, since the volume is kept constant, the pressure will be doubled, because for every degree the temperature is raised the pressure will be increased by 1-273 of its original value. Since the original pressure was atmospheric, namely 15 pounds to the square inch, the final pressure will be 30 pounds to the square inch. Next, let us start with the same quantity of gas, but compressed to a pressure of 100 pounds per square inch, the temperature being again 0° C. If now we supply the same amount of heat as before, since the quantity of gas is the same, the rise in temperature is the same, viz., 273°. Hence, since for each degree rise of temperature the pressure increases by 1-273 of its original value, the final pressure will be double the initial pressure, namely, 200 pounds per square inch. Hence we see that if the gas which we have been considering were contained in the cylinder of an engine, while, if there were no previous compression, the maximum pressure exerted on the piston would be 30 pounds per square inch, when the gas is compressed to 100 pounds per square inch, before firing, the maximum pressure would be 200 pounds per square inch, and this greatly increased pressure would be obtained with exactly the same supply of heat, say by burning the same quantity of petrol vapor. Of course work has to be done to compress the gas in the latter case, but, even allowing for this work, there is a large gain, as will be seen from a study of Fig. 29. Here what happens in the two cases is shown by means of indicator diagrams, the gas being supposed enclosed in the cylinder of an engine, the walls of which are absolutely impervious to heat, so that the gas loses no heat by conduction and radiation to the walls and piston.

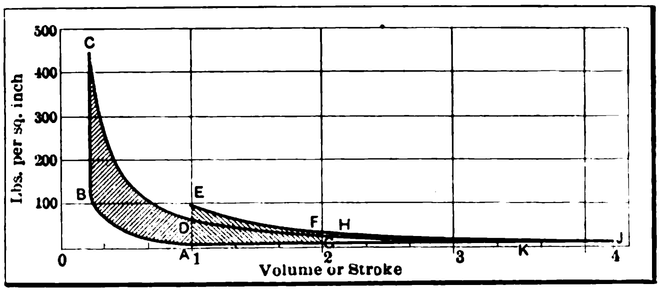

Fig. 29—Indicator diagrams showing how the temperature increases with the increase of compression

If the front wheels wobble at high speed, go slower.

Practical Repairing

DISCUSSING THE OVERHAULING AND REPAIRING OF MOTORS, VALVE TIMING, REAMING MAGNETO SHAFT BUSH AND RUNNING MOTOR IN BY BELT ON FLYWHEEL

TO thoroughly overhaul a motor every part must be gone over *seriatim*, nut for nut and bolt for bolt, without leaving anything to chance, although they look all right and have no evident signs of wear. Just because a part is not pitted is no reason that it is not worn, and several experienced repairmen make it a rule to carefully calibrate parts that are polished, more than others, as there has evidently been a great amount of friction at that part of the machinery and consequently it should be a perfect fit. If micrometer calipers are not at hand, oil should be washed out of bearing surfaces to find the exact amount of play. The viscosity of the oil often prevents an accurate gauging of slackness, as the parts do not leave each other freely; and when contact on the opposite side is made, the cushioning effect of the oil is often mistaken for a good fit. This should be borne in mind when scraping bearings and reaming out bushes. In order to find whether a connecting rod has any play, or which one it is that knocks, the oil in the bearing can be expelled by using a gasoline gun; then, taking the rod in one hand and the piston in the other after the cylinders have been removed, lift the whole up and down in a vertical plane without side-sway, and if there is any looseness at all the bearing requires tightening. Presuming this to have been done, the bearings, that are made of some antifriction metal, should be a good fit—so good that they are on the tight side, making it slightly difficult to turn the crankshaft by the flywheel. If reference is made to Fig. 3, it will be seen that a six-cylinder motor that has had its bearings scraped and, incidentally, the cylinders lapped, is fitted to a block, B2, with the cylinders, C1, below. The flywheel, F1, is being driven by a belt, B1, turning the crankshaft at a speed approximating 350 revolutions per minute, and the operator is feeding the bearings and cylinders with oil every few minutes. This illustration was taken at the Knickerbocker Garage, where every motor that is thoroughly overhauled is subjected to this treatment. It finishes off the bearings and brings out any defects, as the white metal with continual running molds itself to the crankshaft. A slight inequality in scraping will make the bearing feel tight to the touch, but after running some time, and when the roughness has been smoothed off, the holding bolts will stand half a turn with advantage. In the position indicated in the illustration this can easily be accomplished. If machinery is not avail-

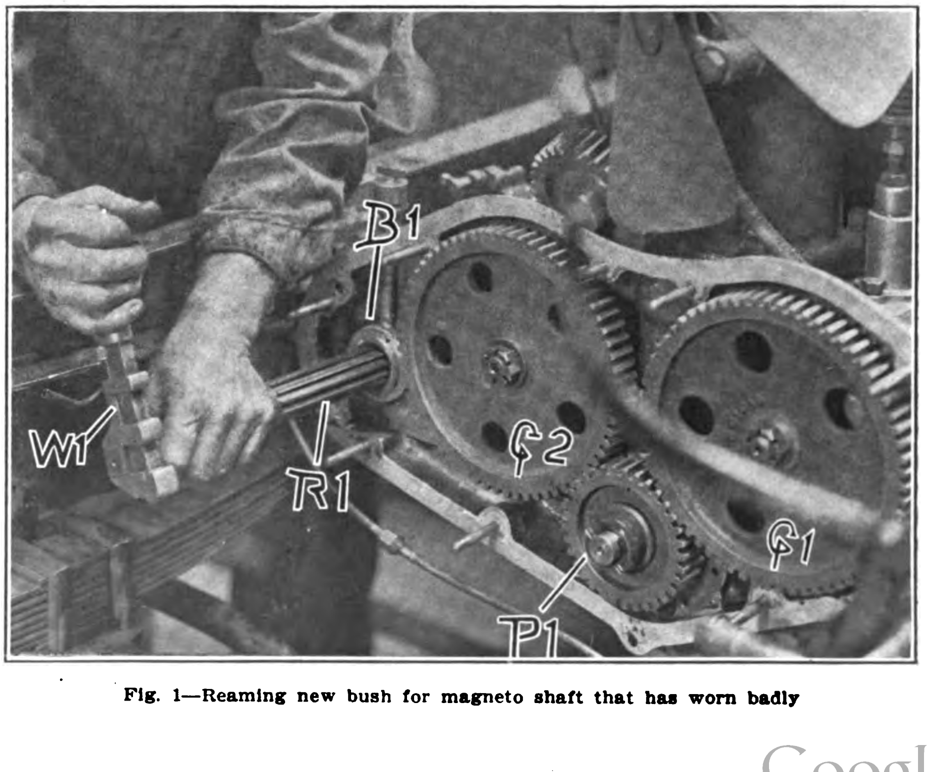

Fig. 1—Reaming new bush for magneto shaft that has worn badly

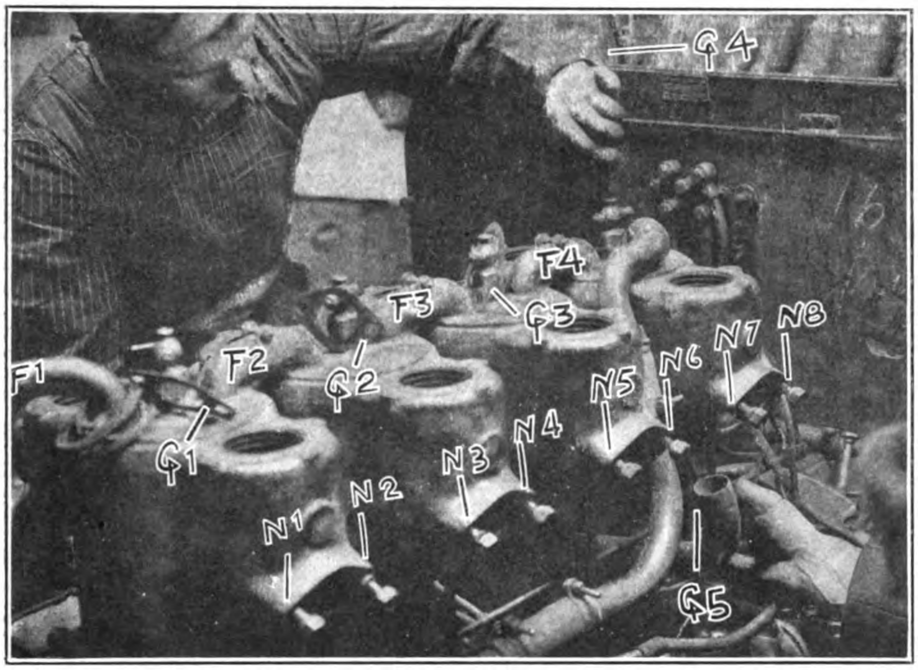

Fig. 2—Testing timing of motor, and showing how all fittings should be placed where they belong

able for this means of driving, the engine can be fixed on a stand or in the frame and run, but the results cannot be expected to be as good as by the other way. Supposing the crank to be stiff, the principal difficulty to overcome is the starting under power. Once this has been accomplished the motor should be filled to about 1 inch higher than its proper level with clean oil and allowed to run for five minutes; then stop it for ten minutes to cool off; start again and run for a quarter of an hour or a little less, and stop for a like period. The water may have become hot through the car standing still, and if it is not possible to connect a cold water supply into circuit, drain out part of the water in the radiator and replenish with cold. For obvious reasons this operation must be carried out slowly so as not to allow the cylinders to cool off too quickly. The running and stopping should be continued for about 12 hours, adding oil from time to time to keep it up to the before indicated level. Should the plugs foul up at, say, 300 to 400 revolutions, the rings are not a proper fit; they should prevent the oil passing into the combustion chamber. Valves require grinding more often than bearings require scraping, or, at any rate, they should if the bearings are made of the proper material. There are two points to remember in grinding a valve. One is that it cannot be hurried unless a cut is taken off the seat, which can be done with some of the tools recently put on the market. The other is that if something is taken off the top, the bottom will drop a trifle and require adjustment to compensate for this. Fig. 4 shows two men working on an engine at the same time; the one on the left using a screwdriver, S1, to grind the valves in, while the man on the right is using a scraping tool, S11, to remove the carbon from the piston heads. One does not interfere with the work of the other and the operation is performed twice as quickly. This photograph was taken at Messrs. S. B. Bowman & Co.'s workshop on an Apperson car, for which they are agents. Fig. 2 shows the method of timing an engine whose flywheel is not marked. A gauging rod, G4, is passed through the petcock and the operator on the right is watching the rise of the valve push rod, at the same time determining the amount of clearance between this and the valve stem with a feeler gauge that cannot be seen in the illustration. The best way to easily find the parts of a car that has been dismantled and be sure to put the right one back where it belongs is to replace the nuts on the bolts where they belong, as N1, N2, N3, N4, N5, N6, N7, N8, and the exhaust gaskets, G1, G2, G3 on the respective cylinders. Parts that cannot be replaced, such as manifolds and piping, should be carefully stored in a box on the side of the car, and it is advisable to have a lid fitted to such boxes, in which to place removed fittings, so that any one working on another car cannot borrow them. There are as many good intentions in the garage as anywhere else, but the unfortunate mechanic who loses parts or tools has to go along a very narrow road to find them, especially if they have found a new location in another man's tool box. Two tools that should be in constant use while dismantling a car are a hammer and center punch. Before removing a fixture that there is the slightest likelihood of being replaced wrong, put a center-punch mark on it, and in the case of bolts of the same size the nut should be punched as well. Take, for example, the four holding down bolts for the motor. One may be slightly shorter than the other to miss a certain fitting; it sometimes occurs that three have been fitted and when the fourth has to be placed it is too long and the others have to be removed to find the right one for the right hole; or, again, the nut may have to be thinner or smaller for the particular requirements. In some makes of cars a system of numbering parts, such as above indicated, is carried out when the car is erected, and whenever the car has to be taken apart a considerable amount of time is saved.

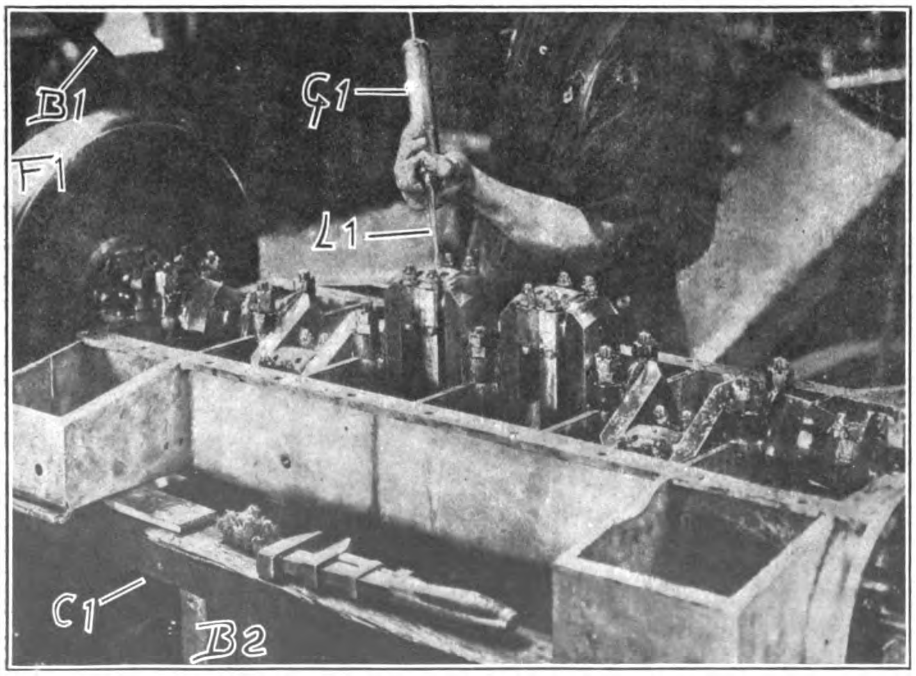

Fig. 3—Running engine inverted from machine shaft with belt after scraping bearings and lapping cylinders

Noisy timing gears can sometimes be quieted by fitting bushes for the magneto and pump shafts to permit the gear wheels on them to be more or less in mesh, as the case may require; they will hum if they are imbedded too much or not enough. A worn bush that allows the shaft to play will cause the gear to mesh improperly, and the way to overcome the trouble is to turn a new bush so that it will require driving into the aluminum casing. This contracts the inside diameter, and it will probably be found necessary to ream the bearing hole out, which operation is shown in Fig. 1. If the original meshing was not enough or too much, the hole should be drilled slightly eccentric to the outside diameter and so inserted that the shaft takes a new center. This may necessitate altering the pump or magneto setting on their respective bases, which can usually be effected by slotting the holes through which the holding-down bolts pass with a rat-tail file. There is no necessity to alter the height, it being only a matter of lateral setting.

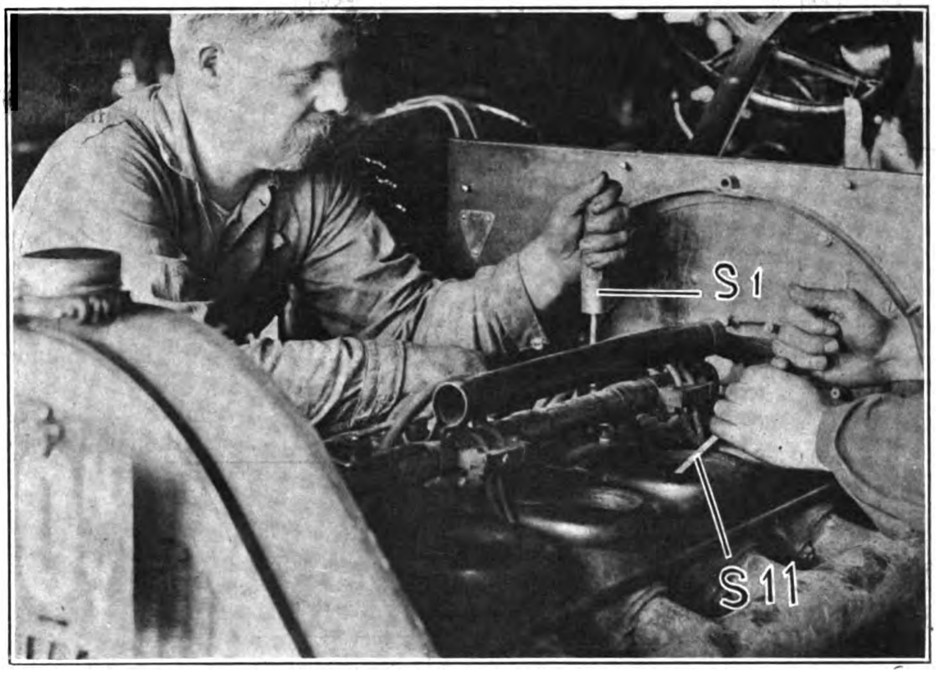

Fig. 4—A frequent operation—grinding valves and scraping out carbon

A Purchaser's Quandary—"I am a subscriber of The Automobile and would like to ask you the following question:

"I am contemplating the purchase of a car next Spring, but am at a loss to know how to decide as to the most desirable car. Some have the transmission in front, others have it a unit with the rear axle. Will you give me an opinion as to the most desirable arrangement, also the advantages of both arrangements.

"L. M. Monroe."

Many communications come to the editorial office, all of which are substantially of this tenor, and a discussion of this important matter should be of unusual interest to the many. Who but the users of automobiles, those who have made their selections and by actual experience have the result at their fingers' end, are best qualified to tell the real story? The columns of The Automobile are open to all who may care to relate their experience for the purpose of helping the "prospective" in his quandary.

Thrown in for Good Measure—The auctioneer waved his arms akimbo in front of an automobile.

"What am I offered for this 1902 model Scalawag automobile? It has one cylinder in good order, a carbureter that is buoyed up by a float, a pair of wish-bones on the front axles, a differentiating gear which is guaranteed to keep one rear wheel locked if the other rotates, and a thousand and one other points of unusual interest to busy the man who is mechanically inclined."

"Four dollars," said a dried-up old veteran of a hundred hard-fought road struggles.

"It is yours," the auctioneer cheerfully responded. Turning to his assistant, he added: "Give the gentleman those volumes of 1902 agricultural reports to read between times."

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, MEETINGS AND OTHER EVENTS

Dec. 31-Jan. 7, '11	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12	New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, First and Third Regiment Armories.
Jan. 16-21	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A.L.A.M.
Jan. 16-21	Detroit, Mich., Tenth Annual Show, Detroit Automobile Dealers' Association, Wayne Pavilion.
Jan. 28-Feb. 4	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-11	Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 18-25	Minneapolis, Minn., Annual Show, Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25	Brooklyn, N. Y., Annual Show, Brooklyn Motor Vehicle Dealers' Association, 23d Regt. Armory.
Feb. 18-25	Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 18-25	Newark, N. J., Fourth Annual Show, New Jersey Automobile Exhibition Co.
Feb. 24-27	New Orleans, La., Annual Show, New Orleans Automobile Club.
Feb. 25-Mar. 4	Toronto, Ont., Automobile Show, Ontario Motor League.
Feb. 27-Mar. 4	Kansas City, Mo., Fifth Annual Show, Kansas City Automobile Dealers' Association, Convention Hall.
Mar. 4-11	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 14-18	Denver, Col., Annual Automobile Show, Management Motor Field, Colorado Auditorium.
Mar. 18-25	Pittsburg, Annual Show, Pittsburg Auto Show Association (Inc.), Exposition Hall.
Mar. 25-Apr. 1	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mar. 25-Apr. 8	Pittsburg, Fifth Annual Show, Duquesne Garden, First Week, Pleasure Cars; Second Week, Commercial Trucks. Automobile Dealers' Association of Pittsburg, Inc.
Apr. 1-8	Montreal, Can., Automobile and Motor Boat Show, Automobile and Aero Club of Canada.

FRANCE:—L. Baudry de Saunier, offices of "Omnia," 20 Rue Duret, Avenue de la Grande Armee, Paris.
GERMANY:—A. Seydel, Mohrenstrasse 9, Berlin.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

THE cardinal principle in railroading is to first know that you are right and then go ahead; the same principle fits fairly well in every other walk. Quoting verbatim the letter of a valued subscriber for the purpose of illustration, it is pointed out that the Editor of THE AUTOMOBILE either disregarded the above principle or the subscriber overlooked the fact that, being an honest driver of an automobile, it is not his duty to defend the class of chauffeurs who are not satisfied with their employ and their stipend, and who take commissions for the purpose of patching out. The subscriber says: "Being a paid auto driver, I thought from your editorials that I was an undesirable subscriber. I am glad such is not the case because I value your paper very much. Your Editor, being a theorist, is not to blame for what he don't know, and some of his tire religion is on a par with his advice on skidding a few years ago. His experience with chauffeurs is evidently bounded by the North and the East rivers between the Battery and Harlem, because in this part of the State are to be found some drivers who are both able and honest.—Carl A. Johnson."

THE AUTOMOBILE compliments itself upon having a subscriber of such sound judgment and sterling worth. It is quite proper that a reader of discrimination should accept the doctrines that are agreeable to his understanding, and reject those that do not appeal to him. It is highly improbable that the Editor's views of four years ago on the question of skidding were as good as they ought to be, but the fact remains that dishonest chauffeurs, of which it is believed there are only a few, are as a scar on the landscape, and those in the class with our chiding subscriber can scarcely afford to take umbrage at our poor attempt to help them maintain the purity and intelligence of the company they keep. As a further venture in a field that seems to be studded with uncertainties, it is suggested that the driver whose intelligence will permit him to absorb the part of a magazine that appeals to him as beneficial, and who has valuable ideas on the subject of skidding, should put high on his list of the duties to be performed a reminder of the fact that upwards of 400,000 automobilists are in need of just the information of which his store-house seems to have a surfeit. It is admitted by everyone that automobiles do skid betimes, and the question is, How is this undesirable performance to be prevented?

* * *

STILL another subscriber of THE AUTOMOBILE, one, however, whose judgment shows up poorly by comparison, writes as follows: "Please discontinue THE AUTOMOBILE. I do not use my car during the Winter." It is not the purpose here to maintain that this subscriber displayed bad judgment in the mere discontinuance of the paper. No editor can hope to please every member of an ever-expanding family, but there are other considerations from the subscriber's point of view. Supposing that this subscriber's investment amounts to $3,000, and let it be assumed that he proposes to lay up his car for three months; he will be out of pocket as a result the sum of $45, which is 6 per cent. interest on $3,000 for three months, and $225 more, which is 30 per cent. depreciation of the investment, and he will fail to appreciate the reasons for this rather high depreciation of his investment during the Winter hibernation of his car because he cannot see his way clear to pay 75 cents, which is all it would cost him to continue his subscription for the few months of the year involved, during which time, were he to spend ten minutes per week, he would learn of twenty reasons why depreciation is a thief in the night, and the owner of the automobile is the victim.

* * *

TAKING a vacation is the excuse offered for one of the readers of THE AUTOMOBILE, who states that he proposes to store his car and forget all about automobiling, and all matters regarding it. There are many angles to a vacation; some go to the mountains in the Summer time, where they accumulate a surfeit of ozone, others cross the Western Ocean, perhaps because they believe that the *mal der mer* which they will undoubtedly have is a cure-all; then, there is the staid citizen who sends his wife to the country; but however free the interesting methods are of complication, it remains to observe that putting the automobile out of commission, with a view to taking a vacation, is like carrying money around in a pocket with a hole in it. During the period when the automobilist is resting the automobile will be accumulating a quota of rust, and it will suffer from neglect, so that it will be in far worse shape at the expiration of this vacation than it would be were it left in commission, and the automobilist's vacation, so-called, will be nothing more or less than the piling up of cost and the destroying of his greatest source of pleasure and recreation, while he lies back in fancied security.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

Government Buys French Automobiles for Use in the Philippines—List of Exhibitors at the A. L. A. M. Show—Portland, Ore., Opens the Yearly Round of Exhibitions; Other Show News—Hooper President of the A. A. A. —Secretary Wilson Reports on National Highways—News of Maker and Dealer in Many Fields—Peeps Through Auto Goggles at Foreign Lands—Brief Trade News From All Over the Country.

United States Buys French Automobiles!

ACCORDING to announcement made by Mr. Lascaris, manager of the American branch of the De Dion-Bouton Company, shipment has been made direct from the factory of the De Dion-Bouton Co. at Puteaux, France, to Manila, P. I., of the cars purchased last September by the Bureau of Insular Affairs of the War Department on the recommendation of Mr. W. Greene, Director of Public Works in the Philippine Islands.

This shipment comprises three 8-cylinder, 50 horsepower cars for mail and passenger service. Four 40-horsepower trucks. One double-decker 34-passenger auto-bus, a duplicate of the auto-buses used by the Fifth Avenue Coach Co. on Fifth avenue, N. Y., and four trailers of two tons each carrying capacity.

The 8-cylinder cars are fitted with a stock 8-cylinder model, V-shaped, of 90 millimeter bore by 120 millimeter stroke. They are fitted with a new 8-cylinder Bosch magneto, instead of with two magnetos, as in all the 1910, 8-cylinder De Dion-Bouton cars.

The shape of the radiator and hood has been modified as shown in the illustration, to afford a bigger cooling surface and larger water carrying capacity.

The service brake on these cars, which acts direct on the propeller shaft, is water cooled in the usual way. In addition to the regular brakes every one of these cars is provided with brake shoes acting direct on the tires on the rear wheels and actuated by a third lever in the middle of the floor board on the left of the driver.

The omnibus and the trucks are provided with a 4-cylinder, cast separate, motor of 120 millimeter bore by 130 stroke; high-tension Bosch magneto, and except for the radiators and hoods, which are of the same design as those used on the 8-cylinder cars, the construction of these vehicles does not differ from the usual De Dion-Bouton cars.

In reply to telegraphic inquiry, THE AUTOMOBILE received the following wires from General Leonard Wood and General Edwards:

Washington, D. C., Dec. 7, 1910.
Editor, THE AUTOMOBILE,
239 W. 39th St., New York:

United States Army has not purchased any De Dion-Bouton Automobiles for military use in Philippine Islands.
LEONARD WOOD, Chief of Staff.

Washington, D. C., Dec. 7, 1910.
Editor, THE AUTOMOBILE,
239 W. 39th St., New York:

Our advices are that eight De Dion automobiles were purchased by the Philippine Government for use in the Philippines. No advices as to shipment.
EDWARDS.

Type of De Dion-Bouton automobiles purchased by the United States Government for insular service

Reeves Quizzes Velie Officials

General Manager Alfred Reeves, of the A. L. A. M., and legal representatives of that organization paid a visit to the plant of the Velie Motor Vehicle Company at Moline, Ill., last week. The purpose of the visit was to examine the Velie officials with regard to the allegations of the bill filed by them in the Wisconsin courts, charging the A. L. A. M. with conspiracy to ruin the business of the complainant company. The complainant asks for heavy damages.

One of the points considered by the attorneys was the statement of the Velie Company that through the action of the A. L. A. M. the Velie cars have been barred from racing. According to Mr. Reeves this contention was disproven by the examination. At best the case is still several months away from court and in the meantime depositions will be taken in various parts of the country.

Chicago Motor Club Election

CHICAGO, ILL., Dec. 7—The following officers were elected to conduct the affairs of the Chicago Motor Club for 1911 at the annual meeting held last night: President, David D. Beecroft; first vice-president, Thomas J. Hay; second vice-president, Henry Paulman; secretary, N. H. Van Sicklen, Jr.; treasurer, Chas. E. Gregory. Directors, C. G. Sinsabaugh, F. E. Edwards, J. P. Frisby, W. J. Zucker, John H. Kelly. Auditing Committee, L. L. Halle, L. R. Campbell, Louis Geyler.

The meeting was one of the greatest in the history of the club, 249 votes out of total membership of 500 being polled. The election was one of the most hotly contested in the history of the club.

Imposing List of Exhibitors at Garden Show

EXHIBITORS to the number of 387 make up the imposing list of those who will show during the first week of the Eleventh Annual National Automobile Show at Madison Square Garden, which opens January 7. Of this number, 67 will exhibit complete cars while 320 are to be displays of parts and accessories.

Never in the history of the A. L. A. M. has such a collection of exhibits been assembled and the Garden itself has been increased in capacity by 22,600 feet over its capacity of last year. The total amount of space is slightly over 100,000 square feet.

As is shown in the accompanying diagrams, the space to be occupied by each manufacturer and each exhibitor of parts and accessories has been arranged according to definite plan. The bulk of the standard cars will be shown on the main floor, Elevated Platform, Balcony and Exhibition Hall. The accessories are to be shown on the Elevated Platform, Balcony, Concert Hall, second tier and in room 7, in addition to the big basement.

During the first week nothing but pleasure cars and accessories will be featured, the show having been divided into two periods. In the final week, the trucks, delivery wagons, commercial cars of all sorts, electrics and other forms of motor vehicles will have their inning.

Preparations for the show are progressing rapidly and the management declares that the arrangements have been perfected to such a degree that it will require only a brief space of time to complete the decorations and to instal the exhibition spaces.

The program of extra entertainment has not yet been announced but the show committee is now busy securing a number of novel features that will be used to attract big crowds to inspect the cars and other exhibits.

Following is the complete list of those who will show during the first week of the event:

MAIN FLOOR.

1 F. B. Stearns Co.
2 E. R. Thomas Motor Co.
3 Olds Motor Works.
4 H. H. Franklin Mfg. Co.
5 Dayton Motor Car Co.
6 Oakland Motor Car Co.
7 Lozier Motor Co.
8 Elmore Mfg. Co.
9 Winton Motor Car Co.
10 Locomobile Co. of America.
11 Hudson Motor Car Co.
12 Mitchell-Lewis Motor Co.
13 Stevens-Duryea Co.
14 Packard Motor Car Co.
15 Buick Motor Co.
16 Cadillac Motor Car Co.
17 Willys-Overland Co.
18 Reo Motor Car Co.
19 Peerless Motor Car Co.
20 Pierce-Arrow Motor Car Co.
21 Chalmers Motor Co.
22 Maxwell-Briscoe Motor Co.
23 E. M. F. Co.

EXHIBITION HALL.

50 Daimler Import Co.
51 Mercer Automobile Co.
52 Moon Motor Car Co.
53 Simplex Motor Car Co.
54 Corbin Motor Vehicle Corp.
55 Nordyke & Marmon Co.

ELEVATED PLATFORM.

101 Knox Automobile Co.
102 American Motor Car Co.
103 Matheson Motor Car Co.
104 National Motor Veh. Co.

FIRST SHOW

SAN FRANCISCO, Nov. 29—In a forest of evergreen the Oakland Automobile Dealers' Association last week held probably the most artistic as well as one of the most successful automobile shows that ever took place in the West. The exhibition was held in the great oval skating rink at Idora Park, in Oakland, which for the occasion had been transformed into a wilderness of redwood.

The show contained about 175 cars, representing practically every manufacturer doing business on the Coast. The cash value of the cars placed on the floor was a trifle over $250,000. The machines displayed ranged from the baby runabout, selling for $450, to the $8,000 limousine and the 5-ton motor truck.

In addition to the endurance run a motor truck contest was held under the supervision of United States Army officers. It was the first contest of the kind ever held in this part of the country. The conditions were severe, as the cars were required to carry their full scheduled load of dead weight from San Francisco to Oakland around the southern arm of San Francisco bay, an even 100 miles. They were allowed 8 hours and 15 minutes to make the trip and were required to maintain an average speed of 12½ miles an hour. Accompanying each car was a representative of the regular army, who kept an official record of the amount of gasoline and oil consumed and made notes of all details of the trip. All the cars completed the circuit and five reached Oakland with perfect scores. The Cartercar, which did not make a perfect score, covered the distance in an hour and a half less than the time allowed and was penalized for arriving ahead of time. The cars that made perfect scores with the cost per ton-mile for the 100-mile trip were as follows: Gramm, 1.23c.; Frayer-Miller, 1.36c.; Autocar, 1.46c.; White, 1.53c.; Hart-Kraft, 6c. The other cars in the contest, all of which made almost perfect scores, were the Avery, Rapid and the Brush car.

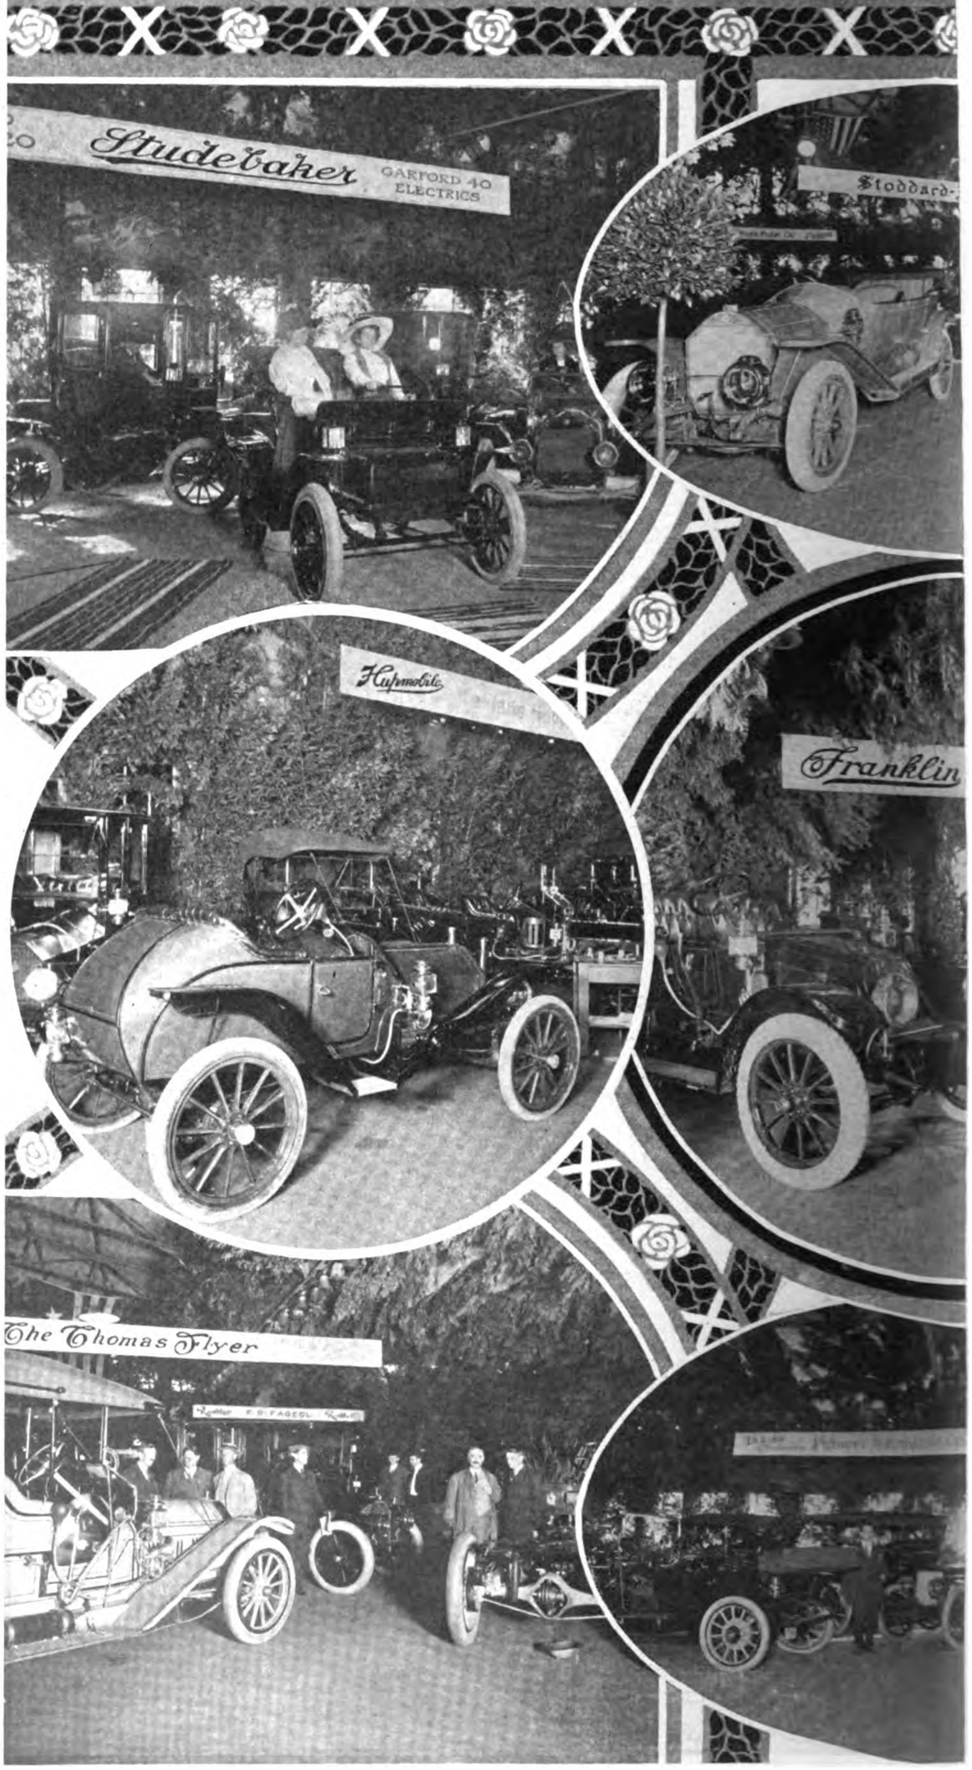
Although the gasoline cars naturally occupied most of the space and received the most attention at the show, the electrics came in for considerable notice.

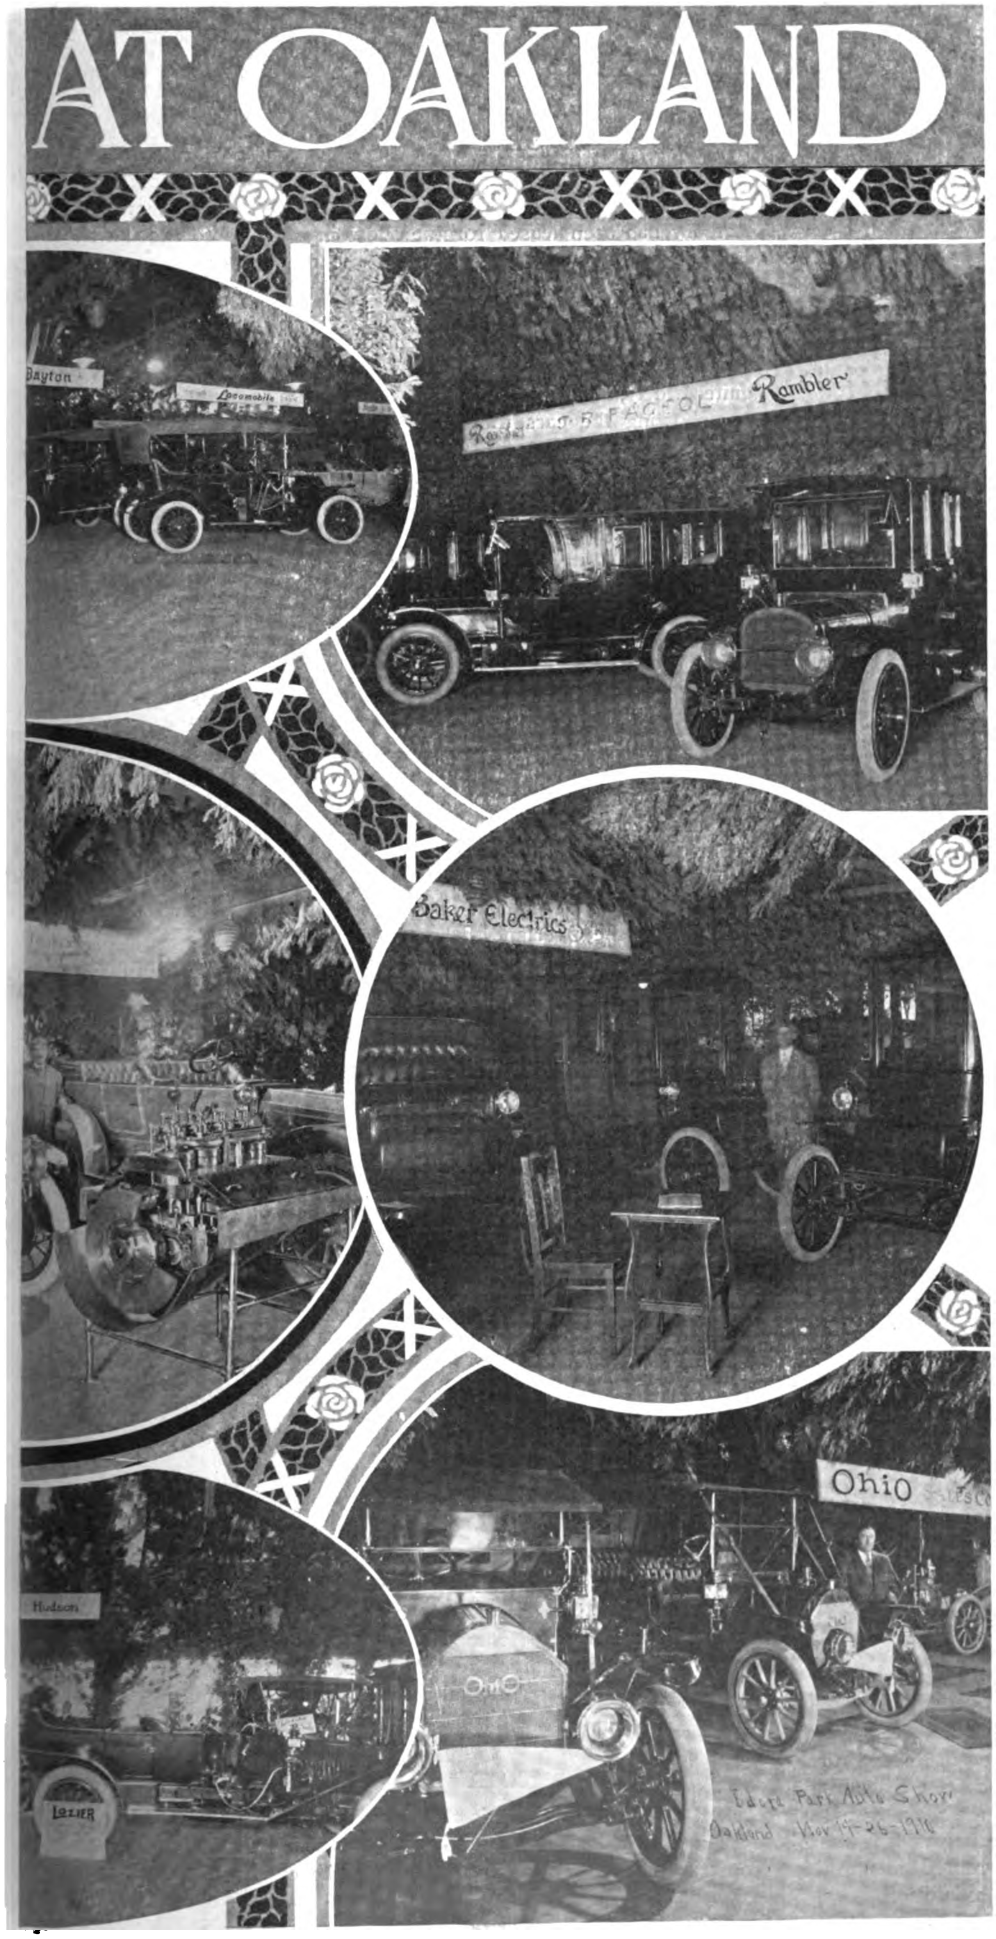
One of the features of the show was the display of stripped and polished chassis. The Peerless, Rambler, Haynes and Thomas stripped cars made a fine showing.

Among the big exhibitors at the show was the Pioneer Automobile Company, in whose booth the models of the Lozier, Chalmers and Hudson were found. The exhibit ranged from the little Hudson roadster to the big Lozier torpedo. The Hudson touring car and the new Chalmers "30" and "40" attracted much attention.

The exhibit of the Winton Motor Carriage Company consisted of "sixes" only, although there were various types of bodies among the cars shown. The new Winton pony tonneau was notable in this section.

In the center of the hall was the exhibit of the Stoddard-Dayton Motor Company.





While there were eight models of this car in the exhibit, ranging from a "30" roadster to a 50 horsepower limousine, the car that attracted the most attention was the five-passenger touring car which was recently placed on the San Francisco market.

H. O. Harrison Company used 2,000 feet of floor space for the display of the Peerless and Everitt cars. The largest area of floor space of any exhibit at the show was taken for the use of the Rambler.

The Mitchell exhibited, besides the standard four-cylinder, five-passenger touring cars, a complete line of the larger cars, including a big six-cylinder close-coupled touring car. All of the new touring cars displayed were of the fore-door type.

The Franklin exhibit attracted much attention because of the new type of hood.

The Studebaker Company displayed a complete line of E-M-F, Studebaker and Flanders cars. Among the other exhibits particularly worthy of mention were those of the Locomobile, with its powerful new six-cylinder model, the Elmore two cycle, the little Hupmobile, both roadster and touring car, the Pope-Hartford, four-cylinder model, the Haynes, Ohio, Baker Electric, the Regal, the Maxwell and Columbia, the Corbin, the Knox and the Ford and Velie.

One of the most attractive and complete displays was that in which the Thomas Flyer was shown. This line has always been popular on the Coast and from the time the doors of the show were opened until the last day the Thomas exhibit was thronged.

One of the chief features of this exhibit was a stripped and polished chassis in which the big engine was in full operation to illustrate its silence in working and its mechanical precision.

The line displayed consisted of six complete cars, including a seven-passenger, fore-door standard touring car, limousine, runabout, close-coupled body and a big 6-40 flyabout in pearl gray.

There were the usual exhibits of magnetos and accessories.

Following is the list of cars exhibited:

Gasoline pleasure vehicles—Alco, Apperson, Autocar, Black Crow, Buick, Cadillac, Case, Chalmers, Corbin, Columbus, Crawford, Cunningham, Columbia, E-M-F, Empire, Everitt, Flanders, Ford, Franklin, Great Western, Haynes, Hudson, Hupmobile, Imperial, Inter-State, International, Kissel-Kar, Krit, Knox, Jackson, Locomobile, Lozier, Marmon, Matheson, Marion, McFarlan, Maxwell, Mercer, Michigan, Mitchell, Moon, Oakland, Ohio, Oldsmobile, Overland, Palmer-Singer, Peerless, Pope-Hartford, Regal, Rambler, Renault, Reo, Stoddard-Dayton, Studebaker, Thomas Flyer, Winton, Velie.

Commercial Trucks—Alco, Buick, Babb-Carter, Frayer-Miller, Gramm, Grabowsky, Hart-Kraft.

Electric Pleasure Cars—Babcock, Baker, Columbus, Detroit, Firestone, Ideal, Rauch-Lang, Woods.

News Notes of the Coming Automobile Shows

PITTSBURG, Dec. 5—The Fifth Annual Pittsburg Show will be held in Duquesne Garden from March 25 for two weeks, instead of the usual single week. The show committee consists of the following: W. N. Murray, Standard Automobile Co.; Robert P. McCurdy, McCurdy-May Co.; Frank D. Saupp, Hiland Auto Co.; and A. X. Phelan.

Among the companies signed up so far are the following: Chicago-Staver, Pittsburgh-Interstate, Atlas, Lozier, Pittsburg-Mitchell, Stoddard-Dayton, Marmon, Winton, Woods Electric, Peerless, Maxwell, Columbus, Pierce-Arrow, Franklin, R. & L. Electric, Pope-Hartford, Stevens-Duryea, Elmore, Marion Flyer, White Steamer, White Gasoline cars, Packard, Buick, Baker Electric, Pittsburgh-Chalmers, Michigan, E. J. Thompson, L. Glesenkamp Company, and the Locomobile, Hudson, Jackson, Cadillac and Stearns. With this array of cars the exhibition promises to be by long odds the most comprehensive ever held in this city.

The independents, who will show in the Exposition building, are also active and the prospects are favorable for fine exhibits of motor trucks, in addition to the lines of pleasure cars displayed at both shows.

Twin Cities to Hold Exhibitions

Minneapolis, Minn., Dec. 5—While no time has been set for the drawing of space at the 1911 Minneapolis automobile show, the association under whose auspices the exhibit is to be held is arranging for blueprints of spaces, and it is expected that dealers will be given opportunity to "draw their lot" within a short time. The big display will be held at the Armory, the same building that has housed those held in former years, during the week of Feb. 18 to 25. To arouse interest in the motor business and to stimulate buying, the St. Paul motor car dealers are to have their first show this winter, and it is to be purely a local exhibition, except that Minneapolis companies having branches and agencies in St. Paul will make showings.

At a meeting on Wednesday night Harry E. Pence, president of the Minneapolis Automobile Show Association, made an address at a meeting of the St. Paul dealers. The show, which is to be in the Auditorium, will be held Jan. 25-28.

Brooklyn Exhibition Now Assured

Brooklyn, Dec. 5—Brooklyn's automobile show was assured at a recent meeting of the Brooklyn Motor Vehicle Dealers' Association when the Twenty-third Regiment Armory was secured in which to hold the show during the week ending February 25. The association is laying plans for a large and interesting show.

Novel Reciprocal Advertising Scheme

The management of the Eleventh National Automobile Show, which will be held at the Madison Square Garden, January 7 to 21, 1911, has designed and had printed a neat little sticker, which will be furnished in quantities to all exhibitors, who, by attaching them to the backs of all their correspondence from now until show time, may thus remind their clientele that they will be represented at the big exhibition.

Quaker Show in Two Armories

Philadelphia, Pa., Dec. 5—Manager J. H. Beck, of the coming automobile show, has announced that the First Regiment Armory has been leased for the show in addition to the Third Regiment Armory, which had been secured earlier in the season. The show will be held the week of January 14.

This action on the part of the Licensed Dealers' Association was rendered necessary on account of the great pressure to get space on behalf of exhibitors. The two armories are separated quite widely, and in order to equalize the advantages of both for showing the cars the management has arranged to divide the tickets of admission into two coupons, one good for admission at one armory and the other for the other section.

A line of sightseeing automobiles will be run between the two shows during the exhibition to accommodate the patrons.

St. Louis Show Makes Progress

St. Louis, Mo., Dec. 5—Plans are now under way for an automobile show in St. Louis in February, in spite of the action of the Automobile Dealers' and Manufacturers' Association in voting against the project. The association gave as a reason that there was no place in St. Louis large enough adequately to house the exhibit. The management of the Coliseum, where the show was held in 1909, platted the building and then made the announcement that an automobile show would be held there Feb. 13 to 18, immediately after the close of the Chicago display. It is now declared that twenty firms have applied for space, and the management says space has been allotted to the agencies for the Overland, Speedwell, Regal, Reo, Fal, Waverley Electric, Kissel Kar, Henry, Victor, Stearns, Kline, Simplex, Marmon, Haynes, Cole, Velie and Ohio Electric.

More Trucks for Chicago Show

Chicago, Dec. 5—Among the latest additions to the list of trucks that will be exhibited at the annual show are the following: Willys-Overland, Reliance, Peerless, Atlas, Mercury, Dayton, Stearns and Schmitt. The Gramm will not show and neither will the Harder or the Randolph. The Gramm has been announced as among the trucks that will be exhibited at the Palace show in New York, and the Harder and the Randolph could not be prepared in time for the show, according to the statements of officials of the N. A. A. M.

The Falcar will be shown among the pleasure vehicles, despite reports that its makers are signed up for space in another show.

Independents to Organize

According to official announcement an organization of independent motor car manufacturers is projected. A meeting has been called for next week, when it is expected that a large number of unlicensed companies will be represented. The first step in order after organization will be to take over the management of the automobile show that will be held at the Grand Central Palace from December 31 to January 7. It is announced that in addition to this object the organization, which is to be known as the National Association of Motor Car Manufacturers, will promote shows in several of the larger cities.

Paris Automobile Show Opens

Paris, Dec. 5.—The Paris Salon, more complete than ever before and exhibiting the latest refinements in French motor car construction, opened Saturday and will be conducted until December 18.

Successful Three-Day Show in Peoria

Peoria, Ill., Dec. 5—The Peoria Auto Show, which has just closed an exceedingly successful three days, marks an epoch in the history of the motor car business in Peoria. It has proven to the satisfaction of the most skeptical that Peoria occupies an important place in the realm of motordom and that the motor car is a very important factor in Peoria business life.

Originating in the fertile brain of R. E. Lawrence, Peoria's veteran motor car enthusiast, and largely financed and managed by his able hand, the show has been made a marked success, never equaled by anything in the West in a town of this size. Mr. Lawrence did not receive a penny for his share of the receipts, but very generously gave his entire share to the Automobile Dealers' Association, which just recently sprang into existence. The purpose of this organization is to further the interests of the automobile trade in this city by gathering the various dealers together at stated intervals and talking over the vital points of the trade here.

There were over 150 cars on the floor of the Coliseum on the opening day of the exhibition and many more came in on the morning of the second day. This is an excellent showing and has never been equaled in a city of this size. Many exhibitors who have no established agencies here took advantage of the opportunity thus afforded to establish regular places of sale here. There are in Peoria over thirty dealers selling over 100 different makes of cars, and this factor alone is a very important one in the business life of the city.

The paid admissions on the second day of the exhibition numbered over 5,000, which sets a record of attendance in a town of only 70,000 inhabitants. The actual labor of boosting the attendance, apportioning the places to the various dealers and attending to the advertising and general business management was carried out by Mr. A. H. Whigam, who has had a great deal of experience in the motor car business.

The Peoria Automobile Show will, in all probability, be an annual event in Peoria motor circles and if the first attempt of the kind is any criterion there is no doubt that those held in the future will be more successful than those of any other city in the Middle West.

A. H. Whigam, with Manager R. E. Lawrence, has completed arrangements for a show to be held in Springfield during the Christmas holidays. Sixteen of the Peoria exhibitors have signified their intention of participating. Mr. Whigam left Peoria Monday for Springfield to look over the plans for the exhibition, which will be held in the armory.

Worcester Dealers Plan Show

Worcester, Mass., Dec. 5—According to the present plans of members of the Worcester Licensed Automobile Dealers' Association, Worcester will have its first automobile show during the month of February in the new Auditorium building recently completed. The success of the association's open-air exhibition of motor cars at the New England fair this summer proved so successful that it was voted at a recent meeting to hold an annual automobile show and invite manufacturers to exhibit.

Promises of support indicate that the show will be on a scale commensurate with the association's early efforts.

Armories for Canadian Show

Toronto, Dec. 5—The Canadian Government has granted permission to use the armories in Toronto for the National Automobile Show to be held under the auspices of Ontario Motor League from February 25 to March 4.

The building will be elaborately decorated from a military standpoint, and an effort will be made to show the uses of automobiles, motor cycles and commercial vehicles for military purposes.

The manager is E. M. Wilcox.

Portola Race on January 2

San Francisco, Dec. 7—Under the name of the Panama Pacific Road Race, in deference to San Francisco's fight to capture the Panama Exposition in 1915, the oft-postponed Portola Road Race will be held over the San Leandro course on Monday, January 2, under the auspices of the Oakland Automobile Dealers' Association and the Portola Racing Association. The contest will be under the immediate management of Dick Ferris, who successfully conducted the Santa Monica road race on Thanksgiving day, and Walter B. Fawcett of Oakland. The course has been cut down to one-half the distance of the 1909 contest, being practically a parallelogram of 10.923 miles.

Entry blanks are now out and according to advices received the race will bring together many drivers of national fame. Among those counted to take part in events are National racing team, Marmon (Dawson), Marquette-Buick, Lozier, Pope Hartford, Apperson and Fiat. Three races are scheduled. The first event for light cars will be run in divisions and the first division will be for cars of less than 230 cubic meters displacement; second division will be for cars of the 231 to 300 class, distance 100 miles. The second event will be at 152 miles for cars of 300 to 600 cubic inches displacement and may prove one of most important heavy car races of the season. The third event will be a free-for-all, at 207 miles.

Mitchell and Velie Tie for Honors

San Francisco, Dec. 5.—The first forty-eight hour endurance run ever held in this State was conducted under the direction of the Oakland Automobile Dealers' Association. Of the eleven gasoline cars that were entered only two—the Mitchell and the Velie—came through with perfect scores. The one electric car —a Columbus—which was entered under separate rules, came up to every requirement. The cars finished as follows:

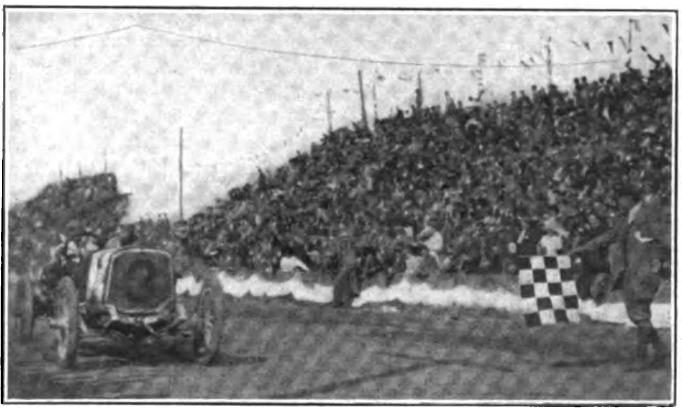
Mitchell, perfect score; Velie, perfect score; Corbin, 3 points; Winton, 4 points; White, 5 points; Maxwell, 17 points; Buick, 18 points; Ford, 361 points; Moon, 762 points; Cartercar, 2,320 points; Reo, withdrawn.

The contest was held over what is known as the San Leandro triangle, in Alameda County, across the bay from San Francisco. The course is 54.6 miles in length and the cars were required to make 24 laps, with two side trips to Idora Park, a total distance for the 48 hours of about 1,347 miles.

Elgin to Stage Stock Car Races

Chicago, Dec. 5.—Assurance that Elgin again will be the scene of a series of National Stock chassis races has been received by the Chicago Motor Club, when it was learned that the Contest Board had agreed to sanction the events.

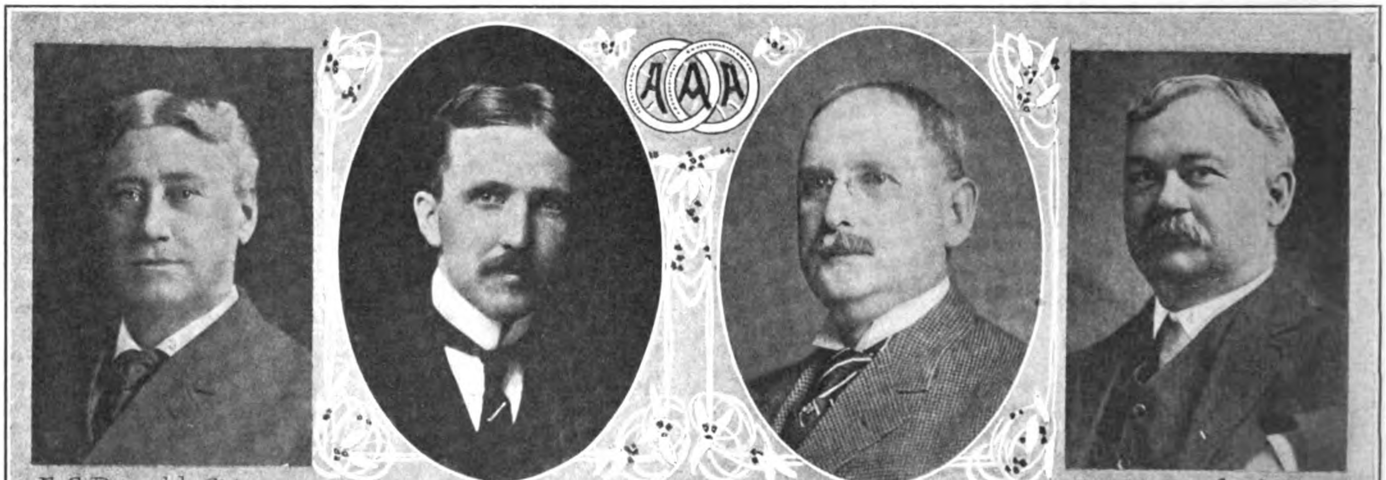
There will be two days of racing; the first for light cars and the second the 300-mile grind for big cars, which carries with it the stock car championship for the Elgin trophy.



Lozier car that broke American road race record in Santa Monica double event

Robert P. Hooper, of Pennsylvania, President A. A. A.

AT the ninth annual meeting of the A. A. A., just concluded in New York City, the report of the nominating committee, of which C. H. Gillette served as chairman, was accepted, resulting in the election of Robert P. Hooper, of Pennsylvania, president; Frank M. Joyce, of Minnesota, first vice-president; F. C. Donald, of Illinois, second vice-president; C. L. Bonifield, of Ohio, third vice-president; F. G. Webb, of New York, fourth vice-president; F. L. Baker, of California, fifth vice-president; John N. Brooks, of Connecticut, secretary; H. A. Bonnell, of New Jersey, treasurer; and the executive committee is composed of: A. G. Batchelder, of New Jersey, chairman; Lewis R. Speare, of Massachusetts; A. H. Knoll, New York; J. P. Coghlin, Massachusetts; Frank G. Webb, New York; A. D. Converse, Massachusetts; H. L. Vail, Ohio; C. H. Robinson, Connecticut; M. C. Moore, Wisconsin; J. P. Walker, California; John Bancroft, Delaware; F. C. Betty, Georgia; Ralph W. Smith, Colorado; E. C. Smith, Vermont; David Beecroft, Illinois; Stedman Bent, Pennsylvania; C. H. Gillette, Connecticut; J. H. Edwards, New Jersey; Paul C. Wolff, Pennsylvania; Edwin S. George, Michigan; H. M. Rowe, Maryland; James T. Drought, Wisconsin; C. A. Quigley, Utah; S. D. Capen, Missouri; Sam T. Atkinson, Virginia; H. L. Gordon, Ohio; Charles M. Doe, Rhode Island; F. E. Edwards, Illinois; A. E. Lerche, Massachusetts; S. M. Miles, of the National Association of Automobile Manufacturers, and Alfred Reeves, General Manager of the A. L. A. M.



F. C. Donald, *Chicago*, Second Vice President

Robert P. Hooper, *Philadelphia*, President

Col. Frank M. Joyce, *Minneapolis*, First Vice President

Dr. C. L. Bonifield, *Cincinnati*, Third Vice President

The new president upon taking the chair announced that Howard Longstreth, of the Philadelphia A. C., would succeed Powell Evans, of the same club, in the capacity of chairman of the Touring Information Board. The hold-overs are: George C. Diehl for Good Roads; Charles Thaddeus Terry, Legislation; and Robert Bruce, Touring Information.

It will be understood that none of these elections or changes will have any effect whatever upon the status of Chairman S. M. Butler, of the Contest Board, whose work, involving the supervision of contests, is conducted independent of other A. A. A. activities.

Among those who participated in the meeting were the committees which reported progress along their respective lines, including John Bancroft, Delaware; F. E. Edwards, Illinois; Doctor H. M. Rowe, Maryland; A. D. Converse, Massachusetts; Edwin S. George, Michigan; Col. F. M. Joyce, Minnesota; J. H. Edwards, New Jersey; F. G. Webb, New York; H. L. Vail, Ohio; Paul Wolff, Pennsylvania; John N. Brooks, Connecticut; Sam P. Atkinson, Virginia; M. C. Moore, Wisconsin; and S. S. Ballard, Vermont.

L. I. A. C. Marks Tenth Milestone

BROOKLYN, Dec. 7—Ten years of active life have been passed by the Long Island Automobile Club, and the tenth anniversary of the formation of the club was fittingly marked to-night at the headquarters of the organization, 920 Union Street. There was an elaborate dinner, an interesting program and the annual election.

Among the speakers were Judge Luke D. Stapleton, Thomas Peters, Edward M. Bassett, the Rev. D. J. Hickey, Allan C. Alderman, retiring president, and William C. Schimpf, the leading candidate for presidency in the organization. The following ticket was submitted by the nominating committee: William C. Schimpf, president; Henry H. Price, M., D., vice-president; Charles Herrmann, secretary, and C. H. Galt, treasurer. Board of Governors, class of 1912, W. P. Richardson, Herbert G. Andrews and Edward Ashford.

The club was the second automobile organization to be formed in the United States. To-day it is rated high as a factor in motordom in its field and throughout the State of New York. Its garage is most complete from every standpoint.

Club Hears About Gasoline

HARTFORD, Dec. 5—The first of a series of semi-monthly winter meetings of the Automobile Club of Hartford was held at the club rooms on Trumbull Street Friday evening. E. W. Marshall, of New York, gave a talk on gasoline and performed a number of interesting experiments. At the next meeting, which is to be held two weeks hence, Herman F. Cuntz, patent attorney of the A. L. A. M., will tell all about the Selden patent.

Willimantic Club Elects New Officials

WILLIMANTIC, Dec. 5—The annual meeting of the Willimantic Automobile Club was held in the rooms of the Board of Trade Thursday evening and the following officers were elected for the ensuing year: President, George A. Bartlett; vice-president, Walter B. Knight; secretary, Harry Cotter; treasurer, Edward J. Tryon; board of governors, above named officers and E. R. Chesbrough, E. T. Bugbee and F. L. Powell.

Wilson Reports on National Highways

WASHINGTON, D. C., Dec. 5—"By reason of a rather remarkable combination of conditions, the immediate present may be considered the most important period in the history of road improvement in the United States," says Secretary of Agriculture Wilson in his annual report to President Taft. "The old systems of road administration, involving the principle of extreme localization, are fast breaking up, and new systems, involving the principle of centralization, are taking their place. Road administration is, therefore, in a transitional or formative stage, and it is of the utmost importance that the movement be directed along right lines.

"It is a curious coincidence that the introduction of the motor vehicle at about the time when these changes in administration began has brought about traffic conditions which have necessitated an equally radical departure from old methods of construction and maintenance. It will thus be seen that the entire subject of road improvement, involving administration, construction and maintenance, is passing through an exceedingly important period, in which the educational and scientific work of this branch of the service should prove of the greatest value.

"During the past year the office of public roads has continued giving instruction in the methods of road building peculiarly adapted to each locality. This instruction has been given through the medium of object-lesson roads built at local expense under the supervision of an engineer from the office. The advisory work of the office during the year covered a wide field relating to construction of various types of roads, surveys, use of convicts in road work, bridge construction, maintenance, use of the split-log drag, road materials, effect of motor vehicles on roads, the issuance of bonds for road improvement, the drainage of roads, and other work along similar lines.

"The office is assembling reliable data as to the progress of road improvement in the United States and the relation of roads to agriculture. Through an organization composed of special agents in all parts of the United States, the office will soon be in a position to receive prompt reports of progress along all lines. This information will be disseminated in such a way that the work in the various States can be so correlated and coordinated as to minimize the duplication which is now so much in evidence. In the routine testing and examination of road materials great progress has been made along established lines.

"The need for better culverts and bridges for our public highways is becoming evident, both from the point of economy and safety for the public. Information on this subject in suitable form has been in the past and still remains fragmentary and scattered. Detailed information is now being collected.

"During the past year the work of the office relative to the investigation of the problems of dust prevention and road preservation has advanced rapidly. Routine tests or analyses of bituminous road materials made in the laboratories during the past year were more than double the number made during the preceding year. A number of these examinations were made in conjunction with the experimental field work of the office. Through its laboratory work the office has been able to offer valuable advice in regard to specifications for bituminous road binders, and in many instances to frame such specifications upon request of various public-service bodies. A number of the State highway commissions have profited by this opportunity."

A. S. C. E. to Discuss Roads

Road Construction and Maintenance will be the topic for discussion at special meetings scheduled in connection with the annual meeting of the American Society of Civil Engineers which will convene January 18 at 220 West Fifty-seventh street, New York City. The annual meeting will occupy two days, but after it is finished, three special meetings will be held January 20 and 21.

A representative attendance is assured and the subject, which is of vital importance, will be treated from all sides by speakers who have made it an intimate study.

Kentucky Seeks Good Roads Law

LOUISVILLE, KY., Dec. 5—Important steps looking to a system of good roads for Kentucky were taken at the recent meeting of the Kentucky Good Roads Association.

A law was drafted in synopsis form for submission to the Legislature, providing for a State Highway Commission; a 5-cent tax to be levied upon each $100 valuation of assessable property; a county tax for the maintenance of new roads and highways after completion and a definite provision for the State to pay a maximum of 50 per cent. of the cost of the construction.

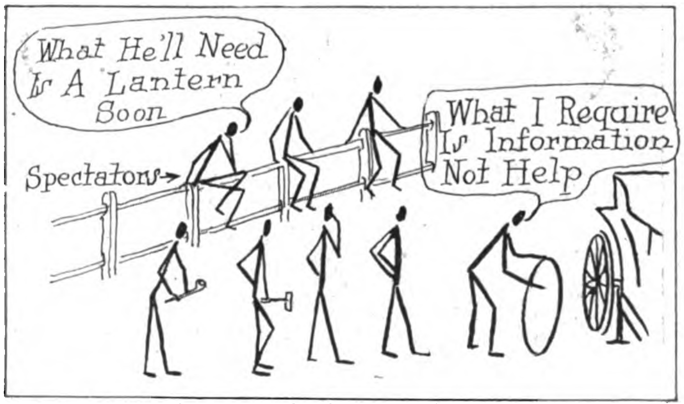
This draft will be submitted to the Good Roads Congress that meets here this month and a bill will be framed after approved by that body.

N. Y. Dealers' Run Decided

A. R. Pardington, referee in the recent two-day endurance run of the New York Automobile Trade Association, filed his long-deferred report on the event late yesterday afternoon. The reason for the delay was the fact that only nine of the entrants who completed the run had filed stock car certificates covering the models entered. This, together with the fact that entries were received right up to the night before the start, prevented a technical examination of the cars, as provided in the rules governing Group 1 endurance runs. It was determined to conduct the affair anyway under Group 4 rules, which do not require a technical examination.

After the run was completed it was discovered that certificates were lacking in a majority of the entries and in order to find a basis upon which to distribute the advertised prizes it was necessary to gain the consent of all the competing entrants to waive their right of protest on that score. This was done and the winners, according to Referee Pardington's report, are as follows: Class A, Division 1A, Ford, number 1; Division 2A, Hudson, number 4; Division 3A, touring cars, Maxwell, 10; runabouts, Pullman, 7; Division 4A, touring cars, Haynes, 14; Division 5A, touring, Corbin, 21; runabouts, Pullman, 18; Division 6A, touring, Oldsmobile, 26; runabouts, Matheson, 27.

Chairman Butler, of the Contest Board, severely criticised those responsible for the mix-up, but no action was taken to disqualify the event.



Plenty of help—but it don't go on

News of Maker and Dealer in Many Fields

THE formal opening of the new premises of the United Motor New York Company, at 7 West Sixty-first street, in the United States Motor Company building, on Saturday evening last, was one of the significant events of the week.

There was an unusually large gathering of guests, whose attention was about equally divided between the new models of Maxwell and Columbia cars and the excellent manner in which the United Motor New York Company is equipped to take care of its customers, under the management of Col. K. C. Pardee.

The new salesrooms were artistically decorated and the lights that gleamed from the finely finished bodies made a spectacle closely resembling a section of a great automobile show. An orchestra enlivened matters during the evening, and a caterer contributed further to the entertainment of the guests.

There were exhibited models of Columbia gasoline cars, Mark 48 and 85; two Columbia electrics, a victoria phaeton and a brougham, and all the Maxwell 1911 line.

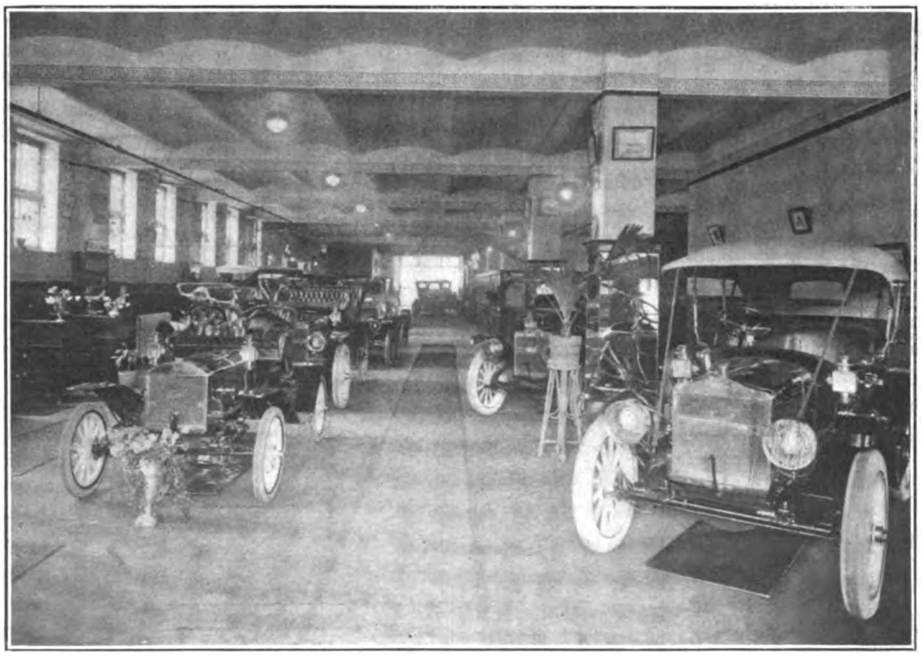
Truck Contest Body Forming

Temporary organization has been effected of a body that will be known as the Commercial Vehicle Trade Association, which is being formed for the purpose of conducting truck contests. James A. Hemstreet was named as temporary chairman, with E. A. Levy as secretary.

The committee on rules and by-laws, which was charged with the preparation of a constitution, was named as follows: C. E. Stone, F. B. Porter, R. F. Alcutt and G. Hartman. E. L. Ferguson, now in charge of the transcontinental trip of an Ohio car, was nominated as chairman of the contest committee. Another meeting has been called for this week.

Fine Home for Haynes in Syracuse

SYRACUSE, N. Y., Dec. 5—Upon a site that was formerly a professional ball park, and which for the past year has been a city dumping ground, is being erected what is claimed to be one of the most modern and up-to-date fireproof garages yet built in the State for the Haynes line. The building has a frontage of 125 feet on Taylor Street and 38 feet on South Clinton Street. The showroom, fronting toward South Salina Street, will be 37 by 36 feet in dimensions. This showroom front is but 150 feet from South Salina Street, the main business artery of the city.



United Motor New York Company's new Columbia salesroom in United States Motor Company Building, 7 West 61st St., opened Saturday, December 3

Gibney Goes to London, Paris and Berlin

Mr. John L. Gibney, of the firm of Jas. L. Gibney & Bro., Philadelphia and New York, sailed from New York on the S.S. *Mauretania,* Nov. 30, to attend the Paris Automobile Show.

The Gibney Co. have extensive connections abroad, where the Gibney Elek-Trick Vulcanizer is well and favorably shown.

While in Europe Mr. Gibney expects to visit London, Berlin and other European capitals in connection with their export business, which has grown to very large proportions.

Corbin to Make One Cheaper Model

Following the trend that has been apparent in some manufacturing quarters, the Corbin Motor Vehicle Corporation has determined to put out one cheaper car in 1911. This model will be identical in all particulars with the other models, save for the fact that the wheelbase will be shorter, with a corresponding lightening of the car, and the price will be materially lower.

Merger Planned for Ohio Electric

TOLEDO, O., Dec. 5—Negotiations are pending which if successfully concluded will give Toledo one of the largest electric carriage plants in the country. The plan proposes to merge the Ohio Electric Car Company with the Milburn Wagon Works, and committees of the two companies have been working on the proposition for some time. The Milburn Company has a capital of $700,000 and is engaged in the manufacture of farm wagons, buggies and automobile bodies. The Ohio Electric Car Company was organized about two years ago with a capital of $75,000, which was later on increased to $150,000. Its officers are: President, A. M. Chesborough; vice-president, R. R. Lee; treasurer, James Brown Bell; secretary, F. D. Suydam, Jr., and general manager, H. P. Dodge. Heretofore the Milburn Company has manufactured the bodies for the cars turned out by the Ohio Electric, its motors and other parts being made in other plants. It is now planned to have the new company make all of the parts used in the car. If the merger is not successfully concluded the Ohio Electric will expand and will build a new plant of its own in the near future.

Stuyvesant Plans Outlined

CLEVELAND, O., Dec. 5—The Gaeth Automobile Company has been purchased by the Stuyvesant Motor Car Company, and after the cars on hand have been sold the Gaeth will appear with several refinements. The Gaeth motor will be retained, but the frame of the car as well as the body will be lowered. The price will be reduced to $3,200 and $3,000.

The Stuyvesant Company will manufacture the Stuyvesant Six and will establish agencies throughout the United States for both lines.

The Stuyvesant Six is built with six cylinders cast en bloc. The motor is 4½ by 6 and intake, exhaust, water manifolds and oil lines are cast integral. The car has a wheel base of 130 inches.

The large plant formerly occupied by the Warren Electric Company at Sandusky, O., has been purchased, giving the company 140,000 square feet of floor space. The Stuyvesant Six will be made there. The officers of the company are: President, F. E. Stiverson; vice-president, C. J. Castle; secretary and treasurer, A. C. Newton.

Chalmers Salesmen in Convention

Detroit, Dec. 5—Sales representatives of the Chalmers Motor Company assembled in annual convention last Monday, remaining in session for four days. The attendance was over 150, including dealers and salesmen from all over the continent, with a sprinkling from more distant places.

The convention opened with a trip through the plant of the Chalmers Company. The remainder of the convention was devoted to business sessions, both morning and afternoon.

It proved to be the consensus of opinion among the men who are dealing directly with the automobile buying public, that the industry was never on a better basis. The reports of a slump and panicky anticipations of a general crash in the industry found no support among the Chalmers dealers.

C. C. Hildebrand, assistant general manager for the company, acted as chairman of the convention.

Among the principal speakers were Mr. Chalmers, on "The Future of the Automobile Industry" and "Selling Chalmers Cars;" Mr. Lee Counselman, vice-president of the company, gave the "History of the Chalmers Company and Chalmers Cars;" George W. Dunham, consulting engineer, on "The Construction of Chalmers Cars;" Carl H. Page of New York, on "The Future of the Automobile Dealer;" Charles E. Whitten of Boston, on "The Advantage of Taking Care of Users;" James Levy of Chicago, on "Selling and Delivering Cars in Winter;" H. W. Ford, on "Chalmers Advertising;" George W. Hipple of Philadelphia, on "The Instruction of Automobile Salesmen;" George Grant of Detroit, on "The Arrangement of Salesrooms." The other speakers were W. S. Keeler, Kansas City; S. S. Primm, St. Louis; J. H. McDuffee, Denver; H. H. Taylor, Hutchinson, Kan.; E. A. Gilmore, Boston; J. S. Swindemann, Toledo; George Paddock, Newark, and H. L. Keats, Portland, Ore.

The convention closed Thursday night with a banquet to the dealers and guests of the Chalmers Motor Co. Two hundred and twenty-five sat at table.

The following is a list of the Chalmers dealers who attended the convention: W. H. Woods, C. C. Sturtz, George W. Woods, E. C. Sawyer, Floyd W. Northcutt, Arthur Stanley Zell, Charles E. Whitten, E. A. Gilmore, Mason B. Hatch, Ferdinand Sheagren, F. H. Trego, E. B. Finch, A. B. Gibbes, F. J. Gibbes, A. B. Whitney, I. P. Madden, R. P. Atkinson, S. B. Featherston, D. I. Hoch, James Levy, J. E. Warren, J. H. Ratliffe, C. Arbogast, Charles M. Kelso, Benjamin H. Ooley, W. L. Mason, George D. Grant, Charles A. Grant, William A. Ryan, J. H. McDuffee, Forrest Holmes, William G. Holmes, Asa W. La France, Coleman T. La France, J. E. Fields, L. A. Cooper, W. S. Farrant, Harry Unwin, A. C. Burton, Robert L. Montgomery, E. C. Irvin, A. E. Stitt, H. H. Taylor, S. W. Elston, Lloyd S. Johnson, Mr. Mallard, T. G. Burkhardt, V. L. Young, A. L. Blake, W. S. Keeler, John A. Nelson, W. S. Boone, C. M. Marshall, George A. Jamison, Frank C. Neuman, Charles E. Hathorn, F. S. Weir, H. I. Martin, E. J. Phelps, Joseph J. Barclay, F. L. Caulkins, H. A. Peterson, Charles H. Durheim, A. H. Dorsey, G. G. Quimly, L. D. Robertson, W. G. Hirsig, A. C. Pollard, Wilbur A. Maynard, George Paddock, Edward J. Thurber, John Weigel, Jr., Walter L. Garside, Carl H. Page, W. W. Burke. George Stowe, Mr. Sammis, Mr. Downer, W. M. Quimby, Mr. Rose, Mr. Hibbard, George Conlon, Joseph Bell, C. Moller, H. E. Frederickson, M. F. McCoole, E. A. Fordon, Mr. Villari, H. L. Keats, D. A. Harrington, R. G. Kennedy, F. R. Cook, John Van Benschoten, M. E. Parott, George W. Hipple, Arthur J. Mills, A. A. Mills, T. C. Nichols, T. P. Blain, Lee A. Folger, E. S. Youse, E. P. Brinegar, O. W. Hatcher, J. H. Valentine, Harold Conrad, Heath Gregory, H. T. Herbele, L. H. Smith, B. A. Burtiss, S. S. Primm, H. A. Wetmore, J. G. Swindeman, W. S. Hubbell, T. C. Ferguson, A. Cotching, Edeson A. Perkins, F. A. Close, A. H. Westcott, G. W. Donaldson, F. C. Sibbald, F. H. Bryant, G. H. Schollenberger, M. H. Schollenberger, M. H. Wood, M. E. Wood, E. R. Kiess, R. H. Milnor, J. S. Harrington, Joseph Speidel, R. H. Anderson, I. Van Baelin, Charles S. Snyder, W. Cannon, E. A. Beecher, Charles Chalmers, H. L. Johnson, T. A. Crisman, E. L. Anthony, J. C. Lewis, F. J. Collingwood, C. A. Baird, W. L. Mason, R. B. Jacobs, Harry Woolaver, O. La France, J. H. Martin, Harry Pyke, W. B. Westcott, J. W. Ball, H. C. Droge, C. W. Landers.

Banquet of First Annual Convention of Chalmers dealers at Hotel Pontchartrain, Detroit, Dec. 1, 1910

Peeps Through Auto Goggles at Distant Lands

SCOTLAND has her preference in the matter of automobiles and is not backward in expressing her mind. Generally speaking, the automobile that she prefers is one of about 20-horsepower, which retails at from $1,500 to $2,000. Motor cars larger and more powerful are found there, but the 20-horsepower machine has the preference. French automobiles had a fair sale in Scotland a few years ago; but blood is thicker than wine and as soon as the British manufacturers showed an inclination to improve their cars, the home-made product began to get a grip on the Scotchman. Besides, the reduced price of the English machine has a good bit to do with it. Sentiment, too, must not be forgotten. It plays an important part in the deal, inasmuch as the cry of "Great Britain for her sons, be they English, Scotch or Welsh," is growing daily through the land.

While it is true that American dealers are quoting prices lower than those for British-made cars of the same power and type now being offered in the British market, "it is to be feared that these moderate prices will not by themselves help much in securing a market here, for it is generally believed that the British-made cars are sold as low as possible consistent with good workmanship and material and it is the firm belief of practically everybody in this country that automobiles can be made much cheaper in this country than anywhere else. When an automobile is offered at a price considerably lower than that of a British-made machine of the same power and type, the customer will very likely be slightly skeptical as to its quality and durability and it is very unlikely that he can be convinced otherwise, especially if business is sought only through the medium of correspondence and the sending of catalogues and price lists." There is but one way to introduce foreign-made automobiles successfully, in Great Britain, and that is by assigning a competent salesman to the localities which the foreign manufacturer wishes covered, with a number of cars which may be seen by dealers and other interested parties, in order that they may ascertain how the machines are made and judge for themselves what they are capable of doing. Yet in spite of all of the attractions, it is true that many people who have made up their minds to purchase automobiles much prefer to go up to London for them. It is also true that frequently they get a better bargain in the capital than they could have secured in the cities of the North. Although there are no fixed standard gauges for cars in Great Britain, the most common sizes range from 4 feet 2 inches to 4 feet 7 inches between the middle lines of the tires. There are 2,823 motor cars, 37 motor wagons and 797 motorcycles registered in the Dundee district of Scotland.

From Manchester comes the news that "the mode of procedure of certain American automobile salesmen is being severely criticised and it is suggested that the methods to be adopted by them in the near future will not appeal to the British public." Reference in this connection is made of "two schemes to which objection has been taken, viz., 'Every sixth purchaser of a car will have its essential parts renewed at the end of twelve months.' And, again, 'the purchaser who can show the biggest mileage for twelve months gets a new car.'" This form of advertising at once arouses suspicion in the mind of the intending English purchaser and it is hinted that the prospect for the cheap type of American car—which is no doubt alluded to—is by no means convincing.

British automobiles of the 1911 models show an increase in the number of cars, both in the matter of high and low power. Such of these as are fitted with four speeds, instead of three speeds, are very conspicuous. A noted growth in the use of the worm drive is reported, not only in the number of manufacturers who employ the worm drive, but also the number of cars of higher power thus fitted. An authority says that "semi-mechanical lubrication, that is, by pump-filling troughs beneath each big end continues to increase in favor, which also applies to the system of complete mechanical lubrication—forcing the oil under pressure through a hollow crankshaft." The high-tension magneto has, to all intents and purposes become universal relative to ignition. It is used on the smaller cars in its simplest form, while on the larger automobiles it is employed in the dual form to give easy starting. The fitting of the two entirely separate ignitions is becoming rarer and is now confined almost entirely to the more expensive and larger types of cars. There seems to be a leaning toward "tires fully up to their weight." The falling back to smaller tires with larger diameter wheels, with the idea that they would equal in wearing properties the thick tires and smaller wheels, is halted on the theory that it increases troubles with tires and expenses to a great degree at the same time that it reduces comfort.

A British maker is quoted as saying that the American car should sell well, and the newspaper in which the statement is published advises the home manufacturers to "standardize a given type of car and push it for all it is worth, as is done in the United States." It is said that while the automobile industry is in a flourishing condition in Great Britain, the cars cannot be produced so economically because of the greater productiveness of the American automobile manufactory, which enables it materially to reduce the cost. This being the case, it has been suggested that there will no doubt be a large shipment of American cars to the British market this season. To this end it is imperative that the American automobile manufacturers should send to England only thoroughly tested cars of proved character, that is, of a kind which will reflect credit upon the American automobile manufacturing industry as a whole.

In England the automobile is being made wide use of as a means of transportation during political campaigns; not solely for the purpose of carrying speakers from point to point, as is also done in America. But "special motor cars convey verbatim reports of Mr. Balfour's speech to the Home Secretary at Sheffield, enabling him to study the address on the train."

Comparatively little attention has been given to the electrically propelled vehicle in the United Kingdom. Every tendency in connection with the shaftless carriage over there has been along the lines of the gasoline motor.

Seventy-eight automobiles were imported into Siam last year, valued at $146,019. Only three of these machines were manufactured in the United States, and their aggregated value was $2,113.

Collier New Aero Chief

Robert J. Collier has been elected president of the National Council, the body which was formed to control in large measure the American aero clubs and organizations. The following executive committee was also named:

Arthur T. Atherholt, Pennsylvania; Cortlandt F. Bishop, representing the New England Aero Club; Robert J. Collier, Aero Club of America; James King Duffy, Aero Club of New Jersey; Dr. J. C. Eberhardt, Aero Club of Dayton; Clifford B. Harmon, Aero Club of America; George B. Harrison, Aero Club of California; Jerome H. Joyce, Aero Club of Baltimore; A. B. Lambert, Aero Club of St. Louis; George M. Myers, Aero Club of Kansas City; James E. Plew, Aero Club of Illinois; George A. Richardson, Intercollegiate Aeronautical Association; Allan A. Ryan, Aero Club of America, John M. Satterfield, Saratoga Springs Club, and Dr. A. F. Zahm, Washington (D.C.) Club.

The executive committee named as vice-chairmen Messrs. Clifford B. Harmon, George M. Myers, J. C. Eberhardt and Cortlandt F. Bishop; Secretary, Mr. James King Duffy; Treasurer, Colonel Jerome H. Joyce.

News in Brief from the East, West and South

RED OAK, IA., Dec. 5—Aleck Peterson has taken the agency for Buick cars and is erecting a large new garage.

PHILADELPHIA, Dec. 5—The local branch of the Michelin Tire Company has been removed to larger rooms at 1304-06 Race street.

INDIANAPOLIS, Dec. 5—G. O. Simons, formerly of the Dayton Motor Car Co., Dayton, O., has been appointed superintendent of the Parry Auto Co.

NEW BRITAIN, CONN., Dec. 5—L. M. Barnes has purchased the New Britain garage and intends to put in a full line of supplies and accessories.

JACKSONVILLE, FLA., Dec. 5—Joseph H. Walsh, 12 East Adams street, has secured the distributing agency for Firestone Tires and Demountable Rims.

BATH, N. Y., Dec. 5—C. B. Kirkham, general manager of the Kirkham Motor Mfg. Co., has resigned and has entered the manufacture of aeroplanes and aerial engines.

WHEELING, W. Va., Dec. 5—The Reppetto-Oakland Motor Car Company announces that it has secured the agency for the Oakland for Ohio and Marshal counties in West Virginia.

SYRACUSE, N. Y., Dec. 5—The Kerr-Doane Motor Company is about to move into its new garage at So. State and Cedar Streets. The building is 60 x 120 and is constructed of steel and tapestry brick.

HASTINGS, NEB., Dec. 5—E. A. Brandes, formerly of Jones & Brandes of this city, will handle Auburn cars for this territory this year, having signed a contract with the Omaha Automobile Company.

PHILADELPHIA, Dec. 5—The Swinehart Tire & Rubber Company, of Akron, Ohio, is moving into its new branch at 320 N. Broad Street, Philadelphia, Pa. Frank D. Wait is manager of the new branch.

OMAHA, Dec. 5—The officers of the Omaha Speedway Association have already started men to work on the one-mile dirt speedway, determined to make it one of the finest tracks in this section of the country.

HUDSON FALLS, N. Y., Dec. 5—Work has been commenced on a two-story brick garage for Smith & McCoy, distributers of the Maxwell, Columbia and White cars for Washington, Warren and Saratoga counties.

MILWAUKEE, WIS., Dec. 5—The Auto Supply Co. has just opened at 127 Second street and will handle a full line of accessories and supplies, dealing in the same exclusively. This company has taken the State agency for the Rayfield carbureter.

PHILADELPHIA, Dec. 5—H. E. Allmang, for many years connected with the sales force of the Autolight & Motor Supply Company, was recently appointed manager of the automobile accessory department of the Keim Supply Company, 1227 Market street.

SYRACUSE, N. Y., Dec. 5—T. E. Willis has taken over the agency of the Baker Electric, Selden, Oakland and Oldsmobile. The Central Auto Sales Company formerly handled these cars. Mr. Willis will conduct his business in a six-story garage at 628 Montgomery Street.

NEW YORK, Dec. 5—Vice-President J. I. Handley, of the United States Motor Company, has just returned to New York from an extended Western trip. He reports an optimistic situation relative to 1911 motor car sales and believes that the 1911 season is to be a record breaker.

TOLEDO, O., Dec. 5—The Rassel Motor Company was recently incorporated with a capital stock of $125,000 to do an automobile manufacturing business. The incorporators of this latest Toledo concern are Edward C. Rassel, Richard D. Longan, William E. Brown, Edwin Tait and Nicholas W. Rassel.

PHILADELPHIA, Dec. 5—Thomas H. Smart has been appointed district manager of the Willys-Overland Company, his territory embracing Virginia, West Virginia, Maryland, Delaware, North and South Carolina and the District of Columbia, with headquarters at Washington. George W. Bennett is assistant manager.

NEW YORK, Dec. 7—Fire in the offices of the Dorian Demountable Rim Co., in the Thoroughfare building, Monday, caused considerable loss and forced the company to remove to temporary offices at 225 West Fifty-seventh street. In about a week the company will move into its permanent offices at 1804 Broadway.

DETROIT, MICH., Dec. 5—C. W. Dickerson, formerly vice-president of the Columbia Trust Co., of Middletown, Conn., and at one time president of the Sterling Cycle Works, has become identified with the executive force of the Timken Detroit Axle Co., and has assumed the position of assistant treasurer.

INDIANAPOLIS, Dec. 5—The new Premier catalogue not only shows the Premier six-cylinder and four-cylinder cars in their various models, but also gives a number of photographs of the mechanical details, the illustrations of the chassis and partially assembled parts being especially interesting. It is elaborately and handsomely handled throughout.

NEWARK, N. J., Dec. 5—Remedial motor legislation embodying the resolutions adopted by the New Jersey Automobile and Motor Club have been whipped into legal shape by Vice-President Harry D. Bowman and will be thoroughly discussed and debated upon by the many motorists interested prior to their presentation to the next Legislature.

CLEVELAND, Dec. 5—The Regal branch opened an agency in Coshocton county this week. F. B. Thomas was appointed agent for the full Regal line. C. C. Crawford joined the sales force of the Studebaker Company during the past week. J. C. Anderson, E. 110th Street and Superior Avenue, has accepted the agency for a commercial line of motor vehicles.

TRENTON, Dec. 5—J. C. Matlack has been appointed secretary and general manager of the Ajax-Grieb Rubber Company. The executive offices are now located at 1777 Broadway, New York, with the factories at Trenton. By New Year's Day the New York offices will be moved to larger quarters across the street in the new Ehret Building.

BOSTON, Dec. 5—Under the new arrangement of the selling forces of the Jacobson-Brandow Company, the products of that company will be handled by the Pettingill-Andrews Company, Boston; J. Stewart Smith, New York; Horace C. Mills, Detroit, and by C. A. Mattison, assistant manager, Pittsfield, Mass. The Pettingill-Andrews Company until recently had the exclusive selling agency.

PORTLAND, ME., Dec. 5—The Mank-Stuart Motor Car Co., distributors of the Cadillac line, have taken over the former Portland Motor Mart, on Forest avenue opposite the Congress Square Hotel, and will improve and remodel it. The garage will be 270 by 130 feet and equipped with modern devices in every department. The company will carry a full line of high-grade parts and accessories.

BOSTON, Dec. 5—An agency for the Enger car has been opened in Boston with L. J. Coburn in charge. It is known as the Coburn Motor Sales Company. A. L. Bennet, special representative of the Westcott car, has been in Boston several days looking over the field with a view to placing an agency in the Hub. James A. Braden, of the Diamond Tire Company, has been inspecting the new building being erected in Boston for that company on Boylston Street.

BALTIMORE, MD., Dec. 5—Among the recent trade announcements in Baltimore, Md., are that the Lozier agency has been placed with Edwin Weischmann under the name of the Lozier Motor Car Company. The Moon car is being taken care of by the Cooper and Upton Company, while the Shaab Automobile Company, Stoddard-Dayton agents, are preparing to move into their new and more spacious quarters, opposite the present store, on Mount Royal Avenue, west of Maryland Avenue.

Among the Accessory Makers

THE NEIL WARNING SIGNAL LAMP; DIXIE AUTOMOBILE HORN; APCO RUBBER PEDAL COVERS; THE MUNCIE BRAKE DRUM

WARNING SIGNAL LAMP

The device shown in Figs. 1 and 4 consists of a combined signal and tail lamp in connection with a special forked bracket so made that it will carry both the lamp and number plate.

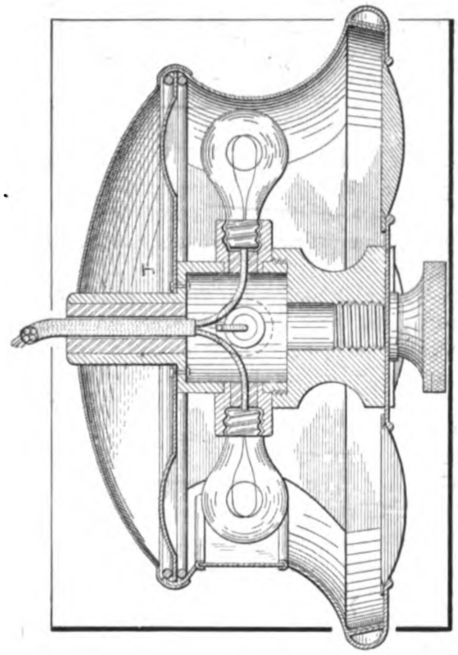


Fig. 1—Cross section of the warning signal lamp

The front or face of the lamp is fitted with four bullseyes, the upper one being green, the lower one red and the remaining two plain white. The upper three constitute the signal device, the lower one acting as the tail lamp or danger signal and also casting a white light through the glass covered aperture in the bottom of the lamp directly upon the number plate.

The signal device can be used either by day or night and at the front as well as the rear of a vehicle.

The system may be operated either by means of a switch located within the rim of the steering wheel or at any other convenient place desired, or automatically. The stop signal can also be operated automatically. The lamp is manufactured by Geo. E. Neil, of Cleveland, Ohio.

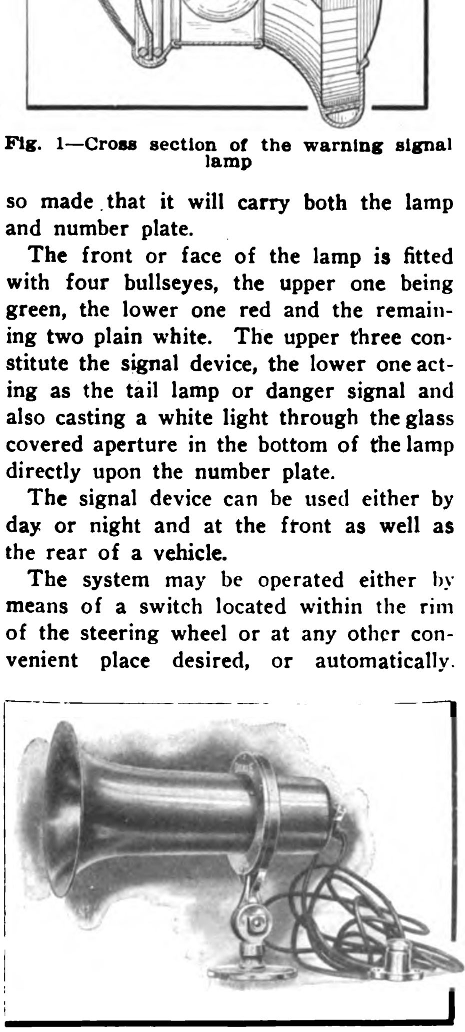

Fig. 2—Vibrating type electric horn

THE DIXIE AUTOMOBILE HORN

A new atuomobile horn, known as the "Dixie," is now on the market. It is designed to operate on a standard ignition set of four dry cells or a six-volt storage battery.

The "Dixie" is quick in action, being of the vibrating type, and substantially constructed. It makes enough noise to secure the right of way without depriving the inoffensive hearer of the power of locomotion. Either the elbow or steering wheel button is supplied complete with operating cable. An adusting screw in the rust-proof diaphragm gives a high or low tone, as desired.

The "Dixie" horn is manufactured by Edwards & Company and sold by all first-class supply houses and garages and by the Western Electric Company, 463 West St., New York City.

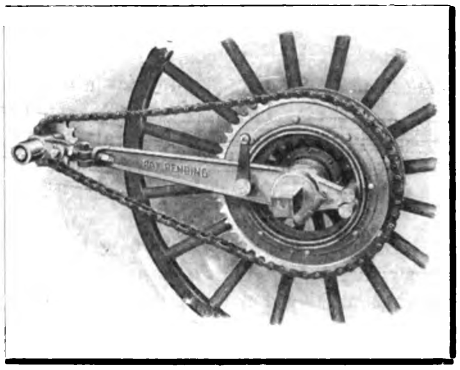

Fig. 3—Chain adjuster and brake drum

RUBBER PEDAL COVERS

To overcome the inconvenience caused by the pedals becoming slippery with wear and the likelihood of the feet slipping off, the Apco Pedal Grips should fill a long-felt need. They consist of rubber pads with bolts and nuts attached, as shown in Fig. 5, and are fitted to any pedal by drilling two holes. The rubber is corrugated and the surface is a cushion, the foot closing down on it with such a secure hold that there is no fear that if the brake pedal is pushed down hard the foot will slip off. The pedals are made by the American Pedal Co., of 1733 Broadway, New York City.

MUNCIE BRAKE DRUM SHOWN

Referring to Fig. 3, of the Muncie brake drum, attention is called to the improved form of design and the straightline effect which is known to give strength and so distribute the strains that rupture is not at all likely. This assembly shows one of the several in the line which is turned out by the Muncie Gear Works, of Muncie, Ind., and in this example it will be observed that the sprocket wheels are exactly spaced by a distance rod of the graduated I-section design, with means for altering the length between centers to compensate for any differences that may creep in during long service. The distance rod also passes across the center and serves as a support for the pull of the brakes when they are applied. Among the products of the company is a line of brakedrums, connecting-rods, adjustable chain-tighteners, and, in fine, everything that can be used to advantage in the assembling of automobiles. Concomitant with the other work is a line of bevel gears and pinions, they being made after the most approved fashion, and in the cutting of the teeth the matter of noise is given due consideration, it being recognized that this is the day of noiseless performance.

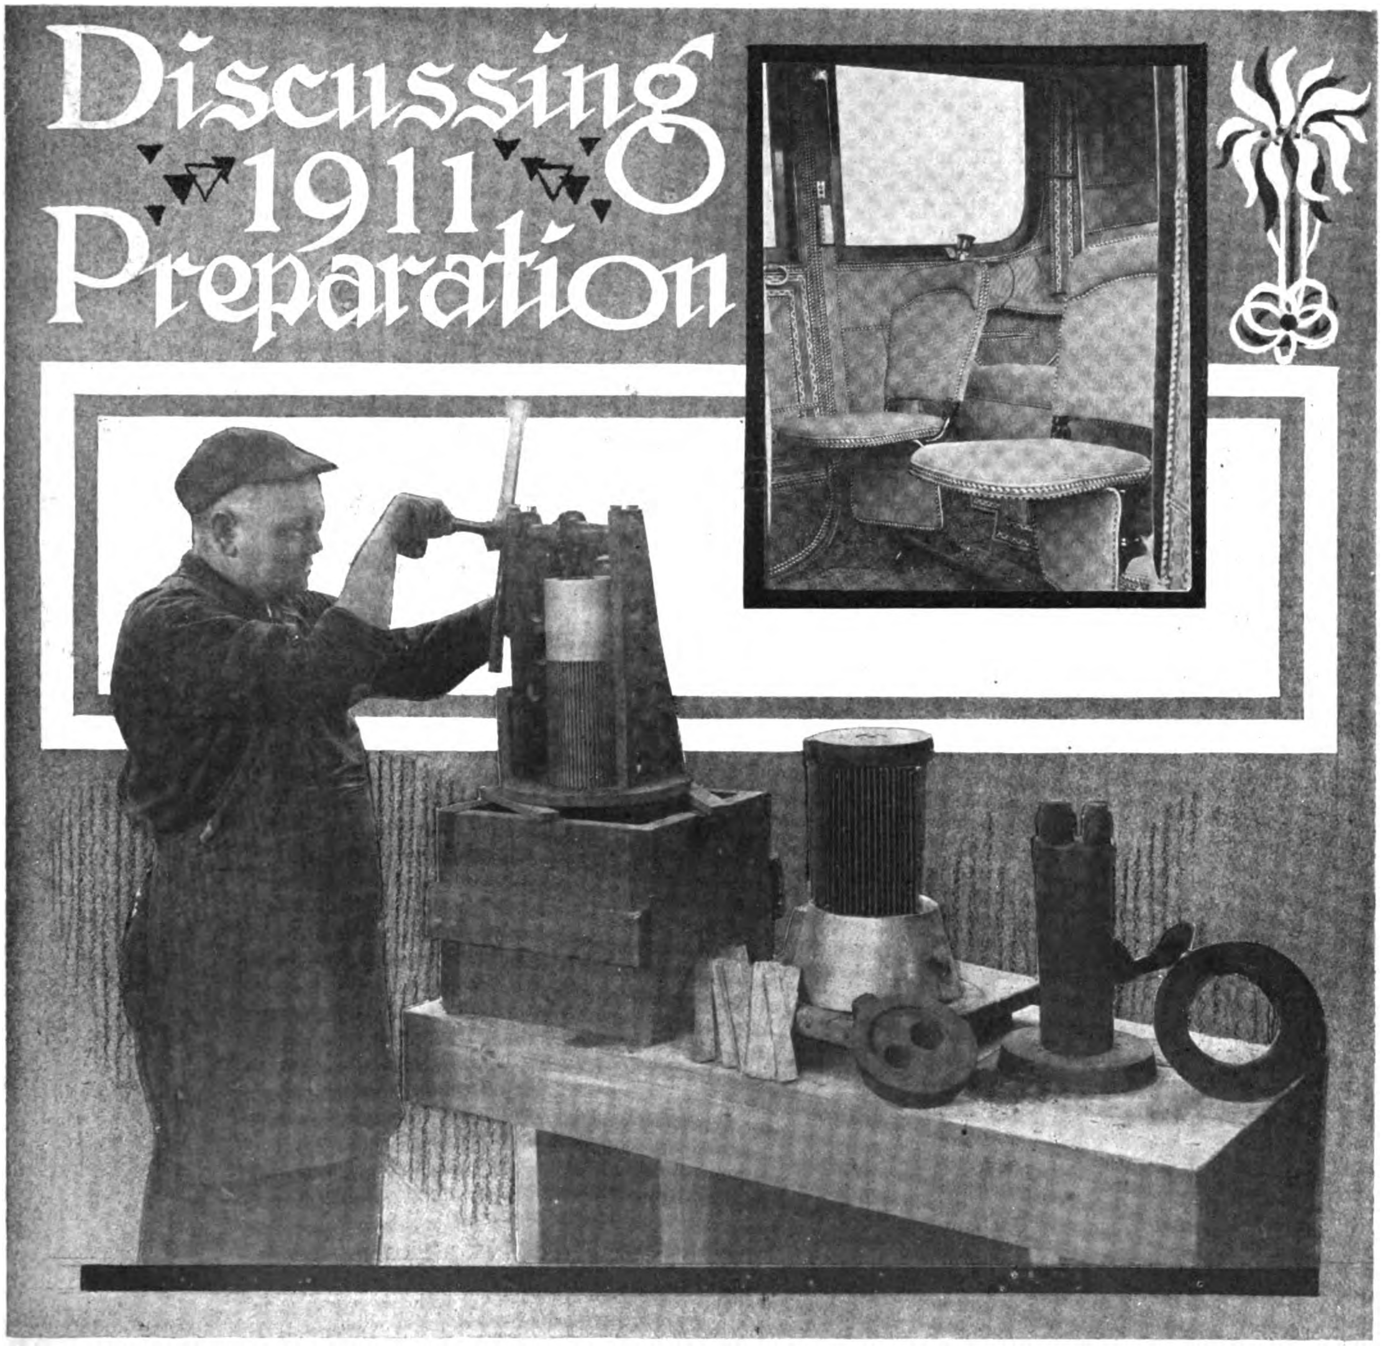
VOL. XXIII NEW YORK—THURSDAY, DECEMBER 15, 1910—CHICAGO. NO. 24

THE AUTOMOBILE

Discussing 1911 Preparation



HOW THE FRANKLIN CYLINDERS ARE MANIPULATED IN THE FOUNDRY TO WELD THE VENTILATING STRIPS TO THE CASTINGS—INTERIOR VIEW OF THE THOMAS-FLYER TOWNCAR BROUGHAM

CONTINUING the plan which has for its motive the idea of imparting to automobilists and those who may take a 1911 interest in the art, it will be the purpose here to present with brevity for the sake of clearness, the second series of the automobiles that will be placed on exhibition during the automobile show season. In order, however, to impart the information along broader lines, the occasion is taken to portray the methods in vogue in a couple of the plants devoted to the manufacture of automobiles, in order that the interested reader will have before him something of the preparation which has to be made before it can be said that automobiles will be on an interchangeable basis, which detail, however important it may be, is not to be appreciated when the user's effort is confined to a mere inspection of the finished product.

It is of course impossible to show in any one issue how all the automobiles are manufactured, nor is it the purpose to infer that the manufacturing is conducted in the several plants on a common basis. It would not be too much to state that there are distinct differences and that several schools of design are responsible for the various automobiles that are now being built for 1911 use. But this is not to say that the quality of the product will be better or worse, depending upon the school of design that is responsible for it; the point will be adequately illustrated by calling attention to the number of universities that are responsible for the education of the men who make their mark in the world. They seem to be endowed with reasoning power, skill, and scope, on a competitive basis as they are whittled out at the respective universities, and so it may be said of the automobiles; they serve their respective ends with a fidelity that is commendable, and the only chance the purchasers will take lies in the wisdom or lack of it that accompanies the selection.

The great question, then, will be to go to the shows dressed in a discriminating state of mind, nor will it be a question involving discrimination as between good and bad automobiles so much as it will be a question which will have for its foundation the putting of the cars into good or bad service. To be able to select the particular kind of car that will best perform in a given service requires that the individual making the selection shall first have a definite and clear idea of the service to be rendered, and then, by virtue of knowledge obtained beforehand, find the very automobile that will be conspicuously capable in that service. Indications point to the coming shows as being of unusual interest, and it is predicted that the display of cars will be wide and varied.

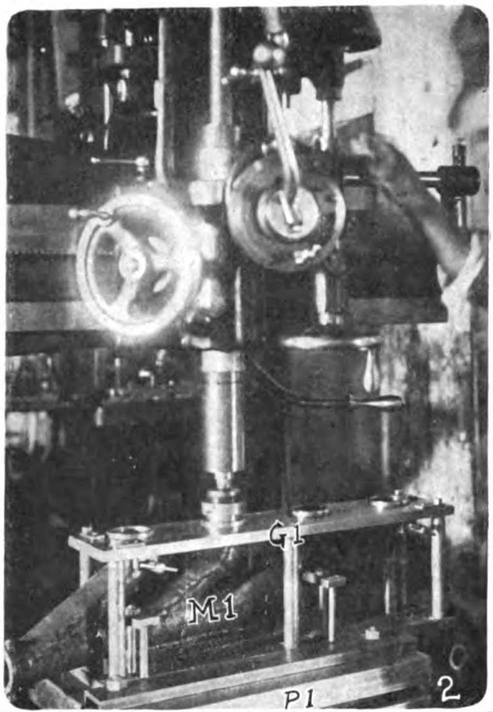


Fig. 2—In the Elmore Plant with a jigging fixture G1 holding the manifold M1 on the platen P1 of a special drill so arranged as to accurately finish the four faces of the manifold M1 at one time.

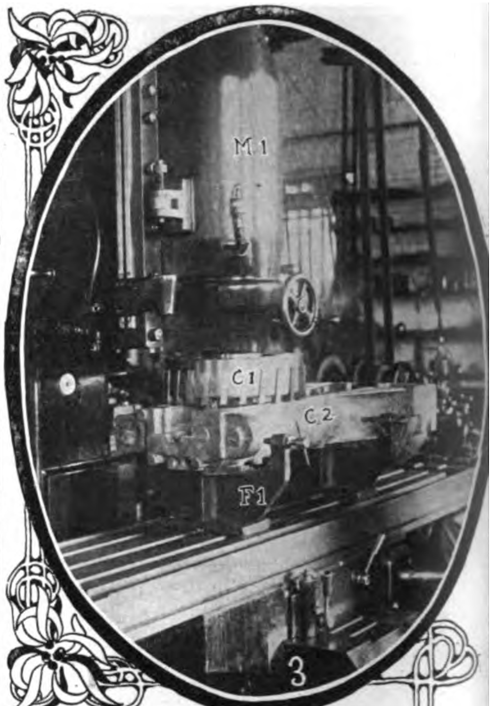

Fig. 3—In the Elmore Plant, showing a No. 4 Cincinnati Vertical Milling Machine M1 with a multiple cutter cat-head C1 facing off a crankcase C2, the latter being held in a fixture F1 with means for centering, adjusting, and holding the work.

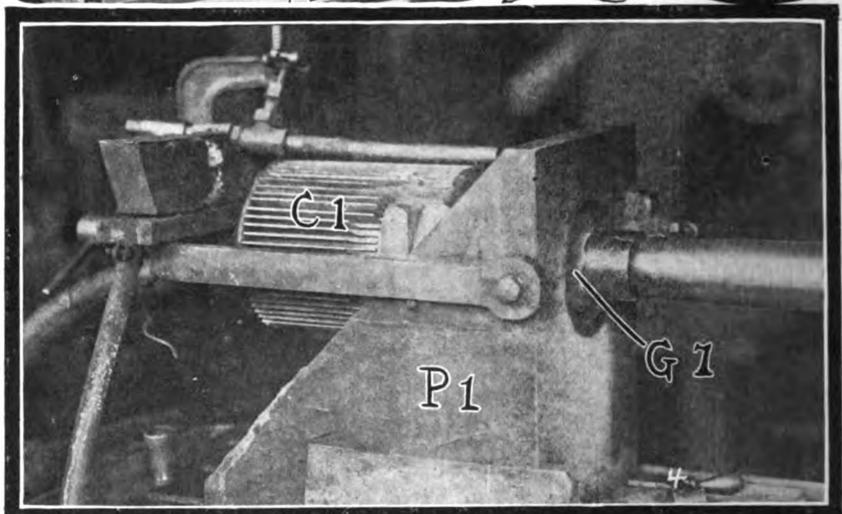

Fig. 4—In the Franklin Plant, showing the air-cooled cylinder C1 bolted to an angle plate P1 being finished by grinding G1, using a Heald type of grinder.

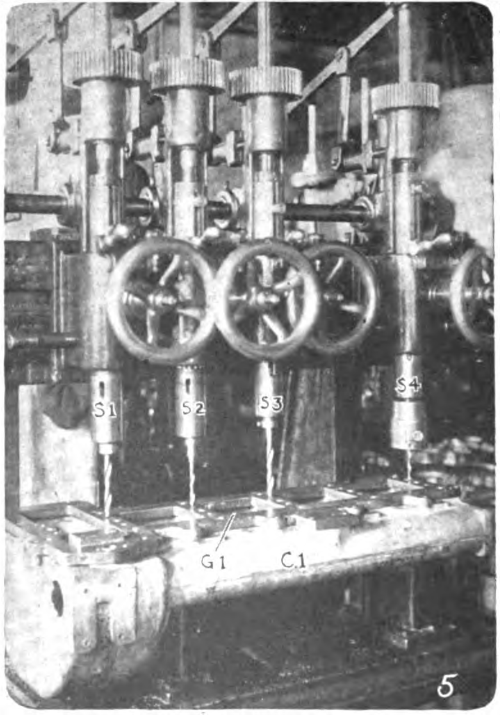

Fig. 5—In the Elmore Plant, showing a jig G1 on the crankcase C1, with spindles S1, S2, S3 and S4, of a multiple spindle drill so contrived as to reach all the holes as indicated in the platen.

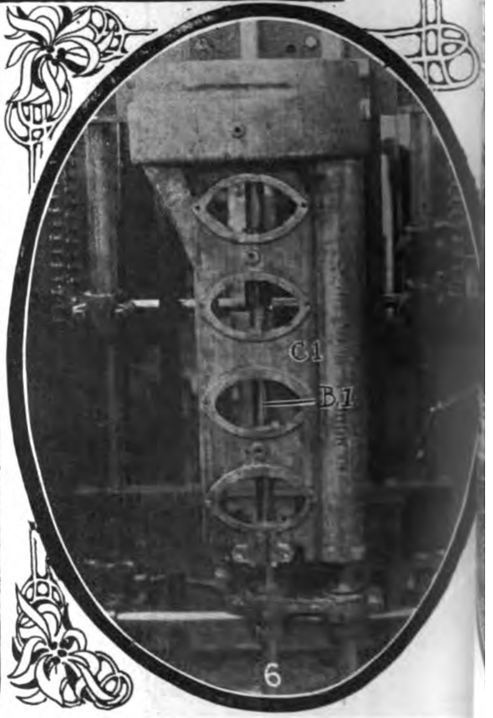

Fig. 6—In the Franklin Plant, showing a Gleason Planer G1 with its progressive cutter C1 planing the teeth on the gear G2. This is one of a complete battery of modern gear fashioning equipment used in this plant for producing noiseless performing gears from special types of gear steel.

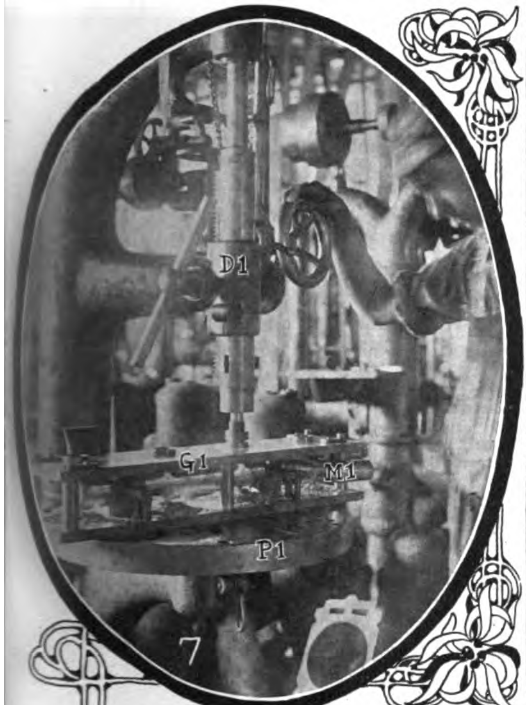
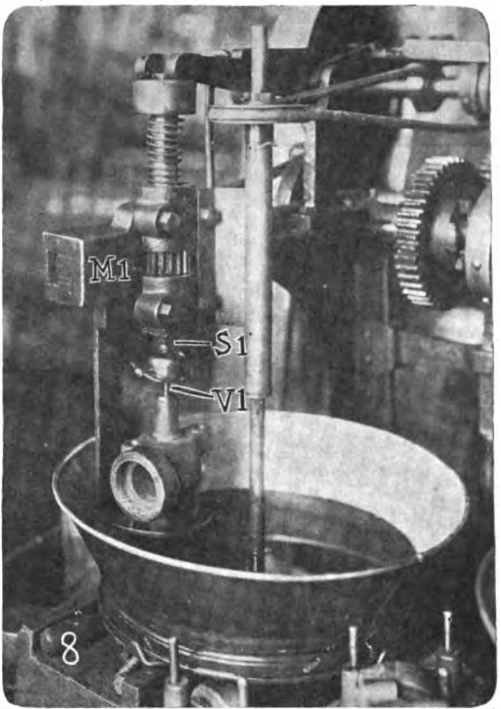
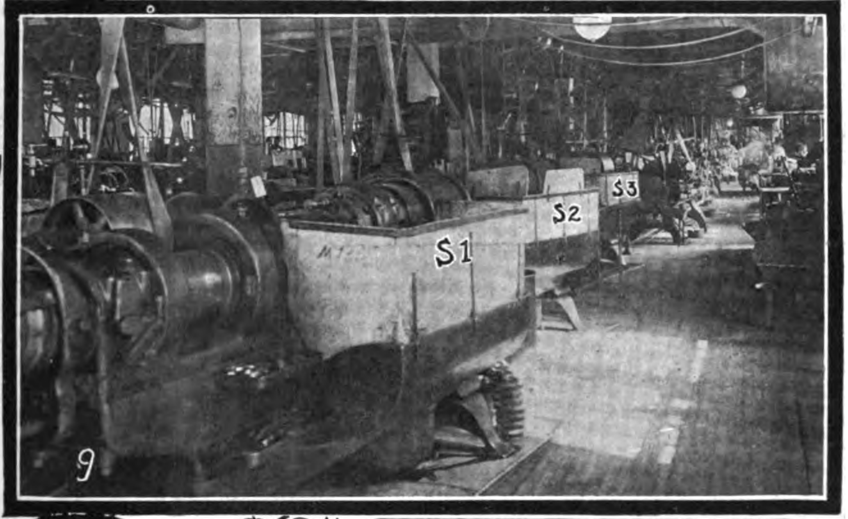
Fig. 7—In the Elmore Plant, presenting a drill press D1 using a fixture with a jig plate G1 on the platen P1 finishing a manifold M1 which under ordinary circumstances would be an extremely difficult piece to handle, but

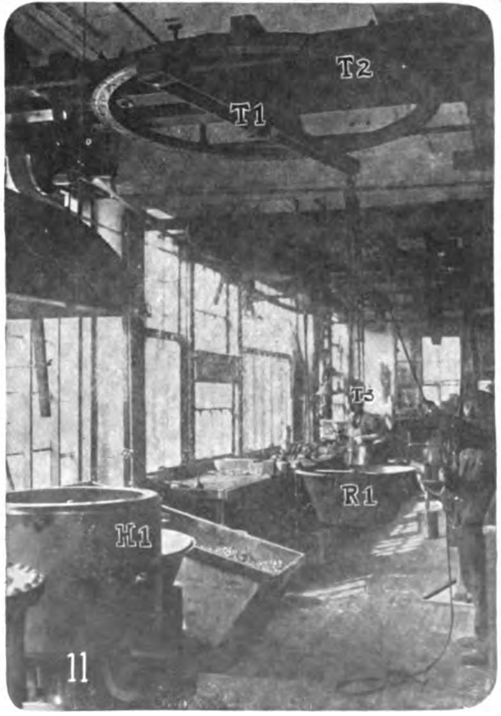
Thomas

Referring to Fig. 12 of the Model M 6-cylinder, water-cooled Thomas motor, the details of which are given in the accom-









panying tabulation, the carbureter C1 is supported by a separable neck N1 attached to the intake manifold M1, the latter having branches B1 and B2 in combination with the common feeder F1 resulting in the equal delivery of a fixed volume of well-proportioned mixture to the respective cylinders, this being one of the most important details in connection with six-cylinder work, and it has been found that this plan works out to the maximum of efficiency under practical conditions of service. The magneto M2 is located on a ledge L1 at the front end of the motor and is driven from a gear in the halftime housing H1 with a universal joint U1 intervening, so that the magneto, in addition to being flexibly mounted, may be removed at a moment's notice by undoing the wing nut N2, and in replacing the magneto there is no danger of throwing the same out of line or making a mistake. The general design of the motor is on a uniform basis with an eye to refinements of detail throughout, and in the installation in the chassis the same care is taken, including a well-contrived distributing box D1 for the high tension wires.

in this way the work is quickly and accurately done.

Fig. 8—In the Franklin Plant, showing one member of a special machine M1 fitted with a series of spindles S1 arranged for grinding in the valves V1 imparting precisely the same motion in the same way as when the valves are ground by an experienced man as a "bench" undertaking.

Fig. 9—In the Franklin Plant, showing shields S1, S2, S3, etc., fitted around all of the machine tools thus preventing oil and chips from strewing about the floor, and it is one of the features of this plant that the hardwood floor is scrubbed every night and is kept scrupulously clean, thus reducing the fire hazard enormously and adding to the efficiency of the workmen.

Fig. 10—In the Elmore Plant, showing a special vertical boring bar B1 in the crankcase C1, with an automatic feed boring all the main journal holes simultaneously.

Fig. 11—In the Franklin Plant, showing an overhead turntable T1 on a circular track T2, using a block and using a tackle T3 lifting the receptacle R1 which is full of oil-soaked chips in order to place it in the housing H1 of the centrifugal oil separator, showing how one laborer is enabled to separate the oil from all of the chips of the plant in a clean and efficacious way, thus indicating something of the plan for economy which has been worked out.

Referring to Fig. 23 of the universal joint used in the driving of the Thomas magneto, attention is called to the hardened and ground shaft S1 with the integral flange F1 and the mating flange M1 which, together with the accommodation piece P1, comprise the set. This arrangement affords an adequate degree of flexibility, renders the drive positive and secure, eliminating the ills that ordinarily come through the absence of flanging and the difficulty of keying in conjunction with relatively small shafts such as are in common use in magneto work.

Marathon

Referring to Fig. 13 of the Marathon motor, details of which are given in the accompanying tabulation, attention is called

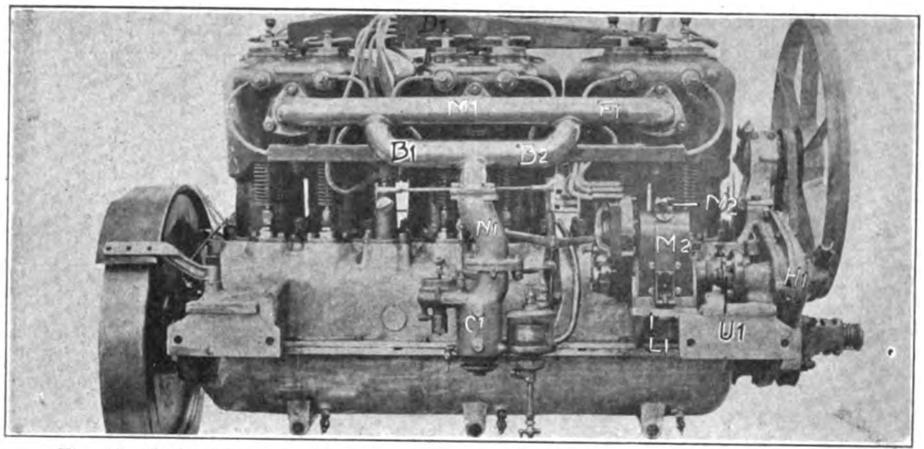


Fig. 12—Model M 6-cylinder Thomas motor showing the location of the magneto.

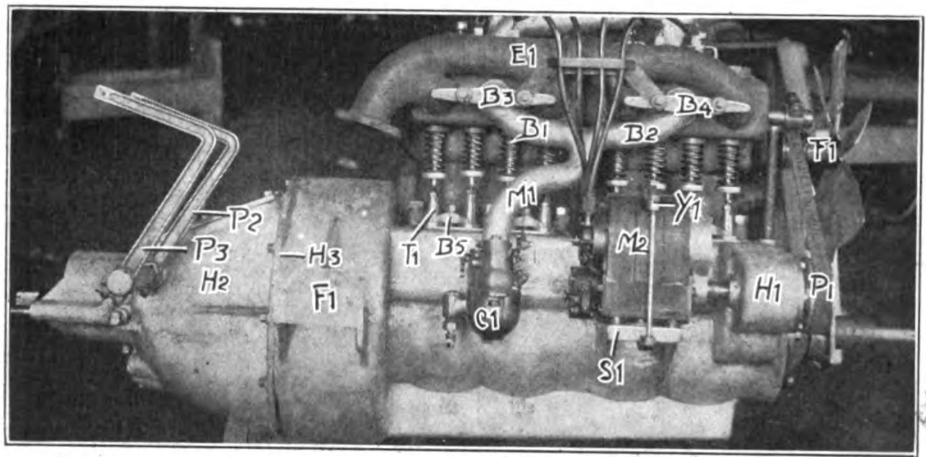

Fig. 13—Marathon motor showing a self-contained motor, magneto and carbureter

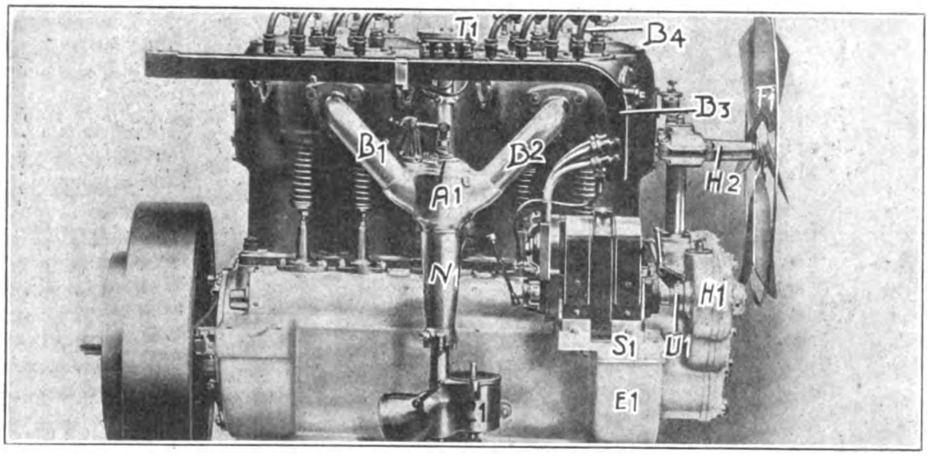

Fig. 14—Peerless motor construction, showing the location of the magneto

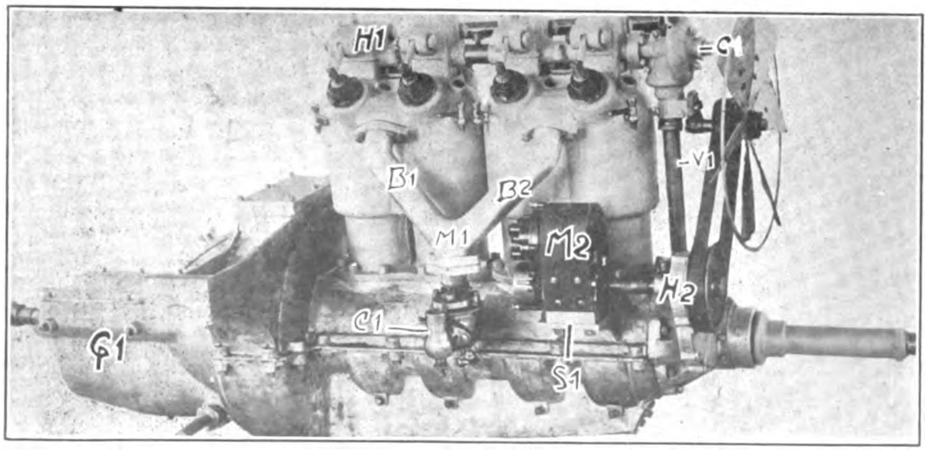

Fig. 15—Presenting the Jackson motor with overhead valve construction

to the carbureter C1 supported by an offset manifold M1, with branches B1 and B2, leading to the two pairs of cylinders and the exhaust manifold E1 which, in common with the intake manifold, are held in place by bridge pieces B3 and B4. The magneto M2 rests upon a shelf S1 and is held down by a yoke Y1, putting tension on a pair of bolts. The magneto is driven by a gear in the housing H1, and the same shaft extends through to the pulley belt P1, by means of which a fan F1 is driven. The motor is supported in front at a single point and is given rear support by the arm with its face F1 bolting to the chassis frame on each side.

The transmission gear is in the extension housing H2, the latter being flanged to the flywheel housing H3. The clutch is actuated by the pedal P2, and the service brake is actuated by the pedal P3. The cylinders of the T-type working 4-cycle water-cooled are substantially flanged to the crankcase, and the valve tappets T1 are held down by bridges B5.

Peerless

Referring to Fig. 14 of the Peerless 4-cylinder water-cooled motor, the details of which are given in the accompanying tabulation, the carbureter C1 of the Peerless make has a long neck N1 and a supplementary air valve A1, with branches B1 and B2 leading to the respective pairs of cylinders. The magneto M1 rests upon a shelf S1 and is driven by a shaft through a universal joint U1, taking power from a gear in the halftime housing H1. It is noteworthy that the magneto shaft is short and a quick detachable means of fastening is afforded. The timer T1 passes upon the left side of the motor to a point above the cylinders, so that it is in a get-at-able position, and the high tension leads from the magneto to the spark plug are distributed through a box B3; from this box branches B4 on the jackstrap plan make connection with the spark plugs. Among the other noteworthy features is the method of driving the fan F1 by a shaft in a housing H2, taking power by a system of gears, all of which are enclosed and dustproof. The oil pump is on the under side below the enlargement E1 in a position which is accessible for inspection or a more complete examination.

Jackson

Referring to Fig. 15 of the water-cooled Jackson motor, the details of which are more completely given in the accompanying tabulation, it will be observed that the carbureter C1 is supported by a manifold M1 with branches B1 and B2 connecting with the two pairs of cylinders, and attention is called to the fact that these branches extend almost down to the carbureter. Overhead valves are used in this motor with a camshaft C driven by a vertical shaft V1 and rockers in housings H1, of which there are four so arranged as to place the valves in an angular position with respect to the vertical, thus making the flow of gas into the combustion chamber as nearly direct as possible, and they are made of relatively large diameter, so that the depression losses are minimized. The magneto M2 is located on a shelf S1 and is driven by a shaft from a gear in the halftime housing H2, which shaft extends out to accommodate a shrouded pulley which serves as the driving member to actuate the flat-belted fan. The power plant is of the self-contained type, with a transmission gearcase G1 in integral relation with the housing for the flywheel.

Referring to Fig. 22 of the Jackson overhead camshaft construction, attention is called to the oil-tight housings H1 for the cam shaft C1, by means of which the overhead construction is rendered noiseless and satisfactory. The housing is split on the center line as shown at H2, and the various bearings are maintained in a state of profuse lubrication by a system of ducts and the methods contrived.

Moline

Referring to Fig. 16 of the Moline 4-cylinder water-cooled motor shown as it rests in the chassis, the carbureter is held in place by the manifold M1 with branches B1 and B2 passing up under the exhaust manifold E1, and the two manifolds are supported in place by bridge pieces B3 and B4. The magneto M1 is on the left side of the motor to the front and is driven by a shaft from a gear meshing with the halftime train in the oil-tight housing. The high tension timer T1 is on the left side front of the motor and the high tension wires are distributed to the respective spark plugs through a tube T2.

Haynes

Referring to Fig. 17 of the Haynes 4-cylinder water-cooled motor, the magneto M1 and the water-pump W1 are driven by a common shaft from a gear in the housing H1. The same shaft extends through to accommodate a shrouded pulley for the fan belt. The transmission on gearcase G1 is held in place by arms A1 on each side of the flywheel F1 integral with the crankcase C1.

Warren-Detroit

Referring to Fig. 18 of the Warren-Detroit 4-cylinder water-cooled motor of the block type, more complete details of which are given in the accompanying tabulation, it will be observed that the magneto M1 rests upon a finished face F1 of the rear motor support S1 and is driven by a shaft S2 in common with a water pump W1 through a universal joint U1 taking power through a gear in the oil-tight housing H1 of the halftime gears. The carbureter is located on the opposite side, and in this view the simplicity of the blocked casting is brought into prominence. The crankcase is split on the center line C1 and the

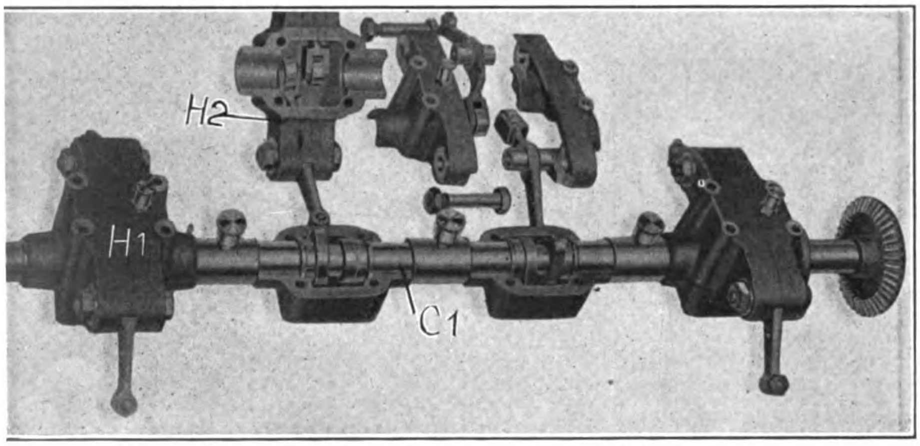

Fig. 22—Overhead camshaft construction of the Jackson motor

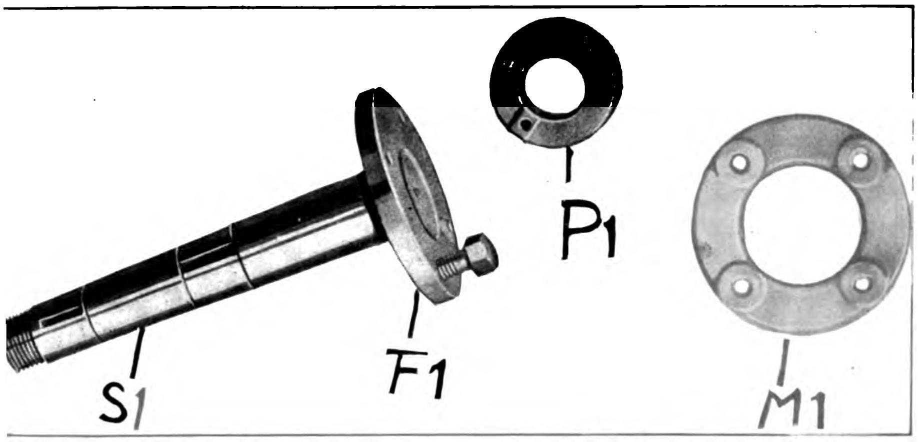

Fig. 23—A very nice detail of the universal magneto drive in the Model M Thomas motor

lower half is extended E1 for the accommodation of the lubricating oil. Other details of unusual interest will appear to the discriminating reader.

Westcott

Referring to Fig. 19 of the Westcott 4-cylinder water-cooled motor, details of which are extended in the accompanying tabulation, the magneto M1 is located on an extension E1 of the crankcase, forming a part of the motor support S1 and the magneto is driven by a shaft from a gear in the housing H1, and the timer T1 is also driven from a gear out of the same housing; the shape of the casting below is such as to accommodate the oil pump drive and the shrouded pulley P1 for the fan belt is pressed up on the end of the crankshaft. The carbureter is located on the opposite side, leaving ample room for the breather B1. The rear motor arm S2 comes out as close to the flywheel F1 as possible, so that the gyroscopic action of the flywheel member is taken care of without introducing crank arm moments. In many other respects the motor presents evidences of designing refinement.

Velie

Referring to Fig 20 of the 4-cylinder water-cooled Velie motor, more complete details of which are given in the accompanying tabulation, the magneto M1 rests on a finished face F1 on the rear motor arm A1 and in common with the water pump W1 is driven by the shaft S1, taking power through a gear in the halftime gear housing H1, and the timer T1 is also driven by a gear on the end of a vertical shaft in the housing H2. The carbureter is located on the opposite side of the motor and the cylinders in pairs P1 and P2 are of neat and symmetrical design, substantially flanged and bolted to finish faces on the crankcase. In other respects the design is conspicuous for clean and simple work.

E-M-F

Referring to Fig. 21 of the 4-cylinder water-cooled E-M-F (Flanders "20") motor, details of which are more completely stated in the accompanying tabulation, the block casting C1 is shown in part section presenting the piston P1 at the downward end of the stroke and the piston P2 at the upward end of the stroke, while at the other end the valve V1 is shown in the open position, and the valve V2 is presented in the closed position. The sections of the cylinders are of even thickness throughout, and the water space is uniform. The details of the valve lifts come out clearly in the illustration showing the cam, C2 integral with the camshaft S1, and at the end of the camshaft the halftime gear C1 is also shown in section. The crankshaft with its connecting rod and main bearings come into view and attention is called to the long main bearing M1 supporting the flywheel F1.

Operation and Care

FASTENING FLYWHEELS TO STAY; SYSTEMATIC LUBRICATION TABLE; CANTOR LECTURES; LETTERS; DON'TS; QUESTIONS; PRACTICAL REPAIRING; CARE AND REPAIR OF TIRES, ETC.

WHILE it is true that flywheels are put on to stay, the fact remains that a large amount of energy is stored up in a mass of this character when it is rotating at a speed of more than a mile in a minute. If the flywheel is fastened to the crankshaft by means of a flange and six holding bolts, there is no chance of it loosening up unless the nuts back off of the bolts, which is not likely to happen if the nuts in turn are locked by means of cotter pins. But these are all matters that the automobilist should look into; if cotter pins are used he should see that they are all in good condition. If locking is done by simply battering up the thread of the nut, the situation is not so healthy, and other means of locking should be taken advantage of.

When the flywheel is put on the end of the crankshaft rather than being bolted up on a flange, it remains to see if it is pressed up tight, but unless it is it will work loose. As the flywheel works off it will manifest its condition by a series of knocks; when a strange knock is heard it is a good idea to feel of the flywheel and note if it shakes. If the end of the crankshaft is ground down to a taper of 3-8 inch to the foot, or some other slow taper, the flywheel will press on tightly, and with close grinding to begin with together with a pressure of, perhaps, 15 tons it should stay on; it still remains for the automobilist to examine the flywheel occasionally and see if it is all right.

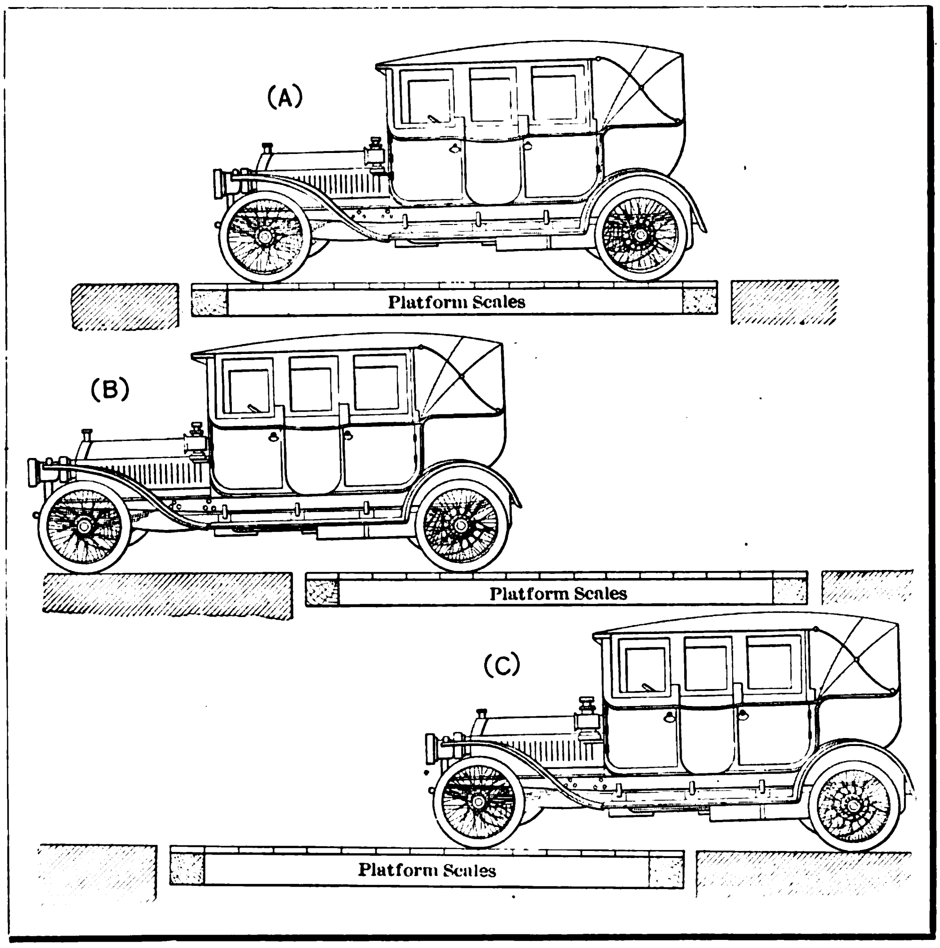
How to Weigh a Car

Important to Know in Selecting Proper Size Tires

THE best way to ascertain the weight of a car is to take it to the public weigh scales and, if possible, place it so that the four wheels rest on the scales as shown in Fig. A. Sometimes this is not possible owing to the great length of the wheelbase or the shortness of the scales. In any case, the car should be fully equipped with all accessories—spare tires, full tanks, water, oil and gasoline, and each seat that can be occupied filled with a passenger, for reasons that will be made clear. Of course if the car can be weighed on the scales with both front and rear wheels resting on the bridge, to obtain the total weight it is only necessary to add, say, 150 pounds average for the number of passengers the car will carry; but this does not give the weight per axle or per wheel—the important point in determining the proper size tires.

It can first of all be assumed that the combined weight obtained by weighing the car as shown in Fig. B and Fig. C should give the total weight obtained by the method used in Fig. A to within a few pounds; but the weight carried on each of the four wheels is by no means one-fourth of the combined weight. The reason of this is that different bodies are of different weights, and the position of the body and seating capacity has a bearing on the amount of weight thrown on the front and rear wheels. Take, for instance, seven-seated limousine and two-seated runabout bodies that are used on the same chassis. The tires that are just large enough for the latter will be quite inadequate for the former, but the cost of upkeep on the runabout will be decreased if it is fitted with tires that are large enough for the limousine, although if detachable rims are fitted a smaller section tire could be used if desired. However, the cost of the rims would not compensate for the difference in price of the two tires.

American Exporters Should Quote Prices in Money of Importing Country—The quotation of prices of American-made automobiles and accessories in the money of the country in which the manufacturer hopes to build up a trade is imperative if the house expects to win the confidence of the foreigner. Quoting prices in American money when advertising goods, even if it is in England, has recently proved to be a great error, attractively written though the advertisement was, in the publications in which it appeared. The effect upon the reader was to prejudice him against the goods by requiring him to calculate what the prices would be in English money.



Method of weighing a car, with special reference to the fitting of the proper size tires

Where Lies the Mystery?

Lack of Harmony of the Motor to the Gear Ratio More Likely Than Not

POOR performance of some automobiles is due to an overwrought ambition. When an automobilist whets his appetite up to the point where he wants to go at the rate of 60 miles per hour in an automobile that might reasonably be expected to make 40 miles in that time, it stands to reason that the poor automobile must be doctored in some way or other, and it is scarcely to be expected that it will be an all-around good performer. A low gear ratio will make the automobile go faster if the motor will continue at a given speed, but when a hill is approached, or the roadbed is soft, the motor will be at a great disadvantage. Under such conditions it will be necessary to fall back upon the sliding gears, and continual shifting of gears will fall to the lot of the automobilist.

It has been said that the sliding gear mechanism used in automobile work is a most clumsy innovation; so it is. Why, then, fix a set of conditions that will demand the use of this gear so much that it will be worked to death, so to say? Why acquire a taste for speeding on a level if it is to be accompanied by a lot of "sliding" when the roads are a little hummocky, or as the brow of a hill lifts its noble contour above the horizon? Who is to blame for this condition? If automobilists persist in demanding speed on a level, and they will have it, it is quite evident that makers will have to bow to the will of those who have the money to pay for what they want and insist upon having it.

It might be said: Why limit the power of the motor so that trouble of this sort will be experienced? Must it be told that considerations of economy demand that a motor be of the size that will give it a fair load when it is propelling the automobile? Mechanical efficiency and, let it be understood, thermal efficiency as well decrease as the load tapers down, falling to a low level if the loading is less than half of that which the motor is capable of. The proper course, under the circumstances, is to use a size of motor that will afford a good all-around efficiency, but, in order to do so, it is necessary to regulate the gear ratio so that the motor will be capable of pulling the automobile up the hills that beset its path without having to drop into low gear.

If the gear ratio is such that the motor will do the work of propelling the automobile up every 7 per cent. hill and through stretches of soft going without sliding the gears, it follows that it will not shine as a racing automobile on level hard roads. In a sense, when all the considerations are fittingly estimated, the automobile that will be most capable on a grade and reasonably alive on a level hard road is the one for the man who has to count the cost, either of operation from the fuel and tire point of view, or from the standpoint of depreciation as well.

The Slide versus the Poppet Valve

What Hamlet would have said about it

To slide or not to slide? That is the question.
Whether it is wiser in a valve to suffer
Th' external noise of the poppet system,
Or take to sleeves (not arms) against the trouble,
And by back-sliding end it? To slide—to pop
No more; and by a sleeve to say we end
The vices, and the thousand natural shocks
The poppet's heir to—'tis a consummation
Devoutly to be wished. To slip—to slide—
To slide—perchance to heat—ay, there's the rub.

—*Motor News* (Ireland).

Conserve the Automobile

BY THE SYSTEM OF LUBRICATION HERE SHOWN (IF CLOSELY ADHERED TO), IT IS BELIEVED THAT THE LIFE OF THE AUTOMOBILE CAN BE PROLONGED MARVELOUSLY

WHEN an automobilist goes in quest of a car and he is instructed how to care for and run it, one of the points that every maker will try to impress upon him is that the car must be well lubricated. Just what these instructions will mean to the purchaser will depend upon his previous training. If a machinist makes a purchase it is highly improbable that he will be impressed at all; he will know that the mere mention of such an important matter is scarcely sufficient.

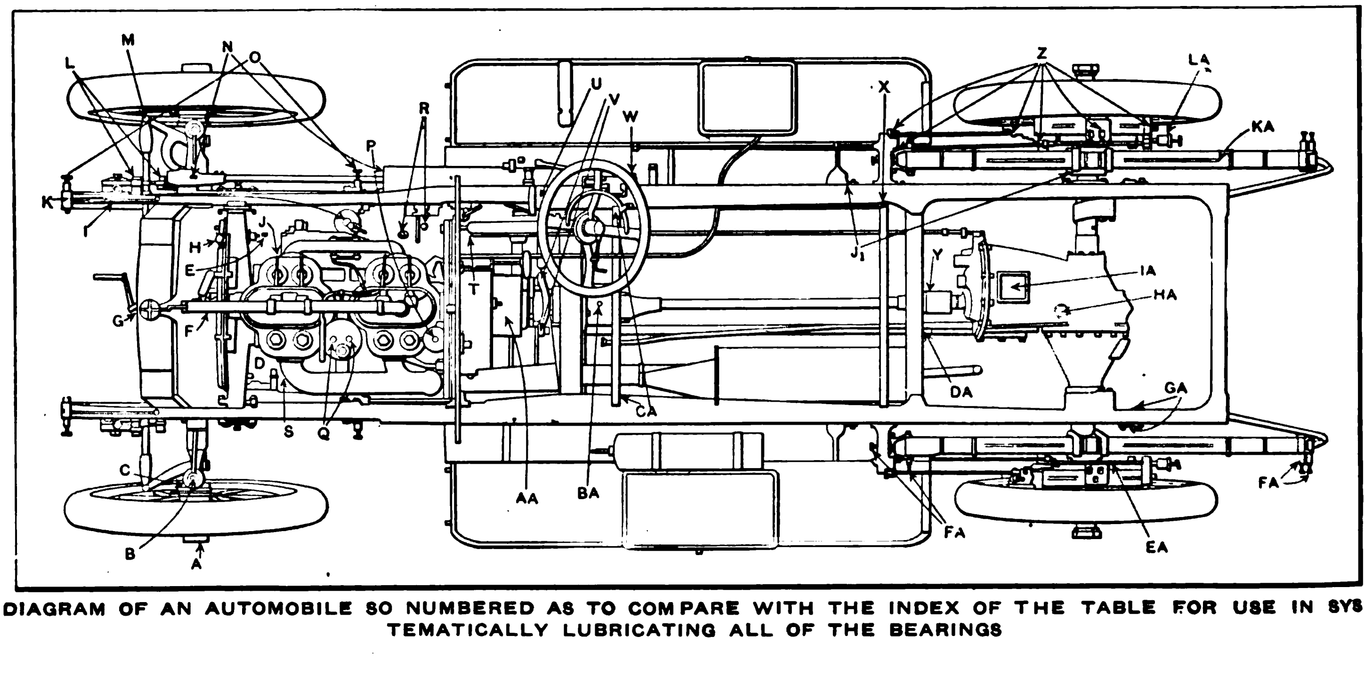


DIAGRAM OF AN AUTOMOBILE SO NUMBERED AS TO COMPARE WITH THE INDEX OF THE TABLE FOR USE IN SYSTEMATICALLY LUBRICATING ALL OF THE BEARINGS

But if the purchaser knows no more about machinery than he may have learned by trying to fix his wife's sewing machine, he will come away sufficiently impressed to make him believe that a squirt can should be emptied at frequent intervals, although it will be all the same to him whether the oil out of the can goes into the bearings or over the exterior surfaces, and he will wonder what all the little holes are for; the places that ought to be protected from the silt of the road by a suitable oiler. The grease cups will look so large to an automobilist of this character that he will wonder if they will ever be emptied.

The real situation is quite different; every place that has relative motion, as every joint, and bearing, even unto the plates of the springs, must be lubricated at frequent intervals or the automobile will soon fall into a state of disuse; at all events it will soon make so much noise that the owner will lose his taste for it. But all of the bearings do not have to be lubricated with the same frequency, and the quality of the lubricant does not have to be the same in each location. Of course, it will be a good idea to use a good grade of lubricating oil in any case, but it will not be necessary to use a high-priced cylinder oil in the little bearings around the chassis, as the brakeshaft journals, etc. In certain places it will be proper to employ a good grease; the consistency of the same to be varied to suit the time of the year and the place of use. Graphite may also have a use in this work, as for illustration, it is good to use with the grease in lubricating the side-chains and in like service. The tabulation, as here given, tells the days of the months, for a whole year, on which to lubricate the various bearings, and, while it is true that this diagram will not serve for all makes of automobiles, the fact remains that, with but slight departure, the automobilist may follow the outline suggested, and, if he will take the pains to employ the system here given, he may be sure that his automobile will run twice as long, at least, as it will if he merely does the work on a haphazard basis.

Reminder to the Automobilist When and Where to Lubricate

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.S.C., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE EIGHTH INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

TAKING the case where there is no compression, and taking the initial volume of the mixture as unity, and representing its state by the point, A, we suppose that by the burning of the petrol 1,150 foot-pounds of heat energy are communicated to the gas, the volume remaining constant, so that the condition of the contents of the cylinder at the end of combustion is represented by the point, E. Next, let the piston travel out, doing work, till the gases have expanded to twice their original volume, *i. e.*, till the point, F, is reached; the exhaust valve is then supposed to open, so that the pressure falls to atmospheric pressure, represented by the point, G, and the piston, on the return stroke, expels the gases, and thus we get back to the point, A. The work done during this cycle is represented by the area of the figure A E F G.

Next, starting with the same quantity of mixture at the same pressure, represented by the point, A, let it be compressed adiabatically, *i. e.*, without loss of heat, to the point, B. Then, the piston remaining stationary, let the mixture be fired, so that 1,150 foot-pounds of heat energy are again communicated to the gas. The pressure will rise to the point, C. Then, allowing the piston to move out, the gases will expand, doing work on the piston, till the original volume is reached, that is, till we come to the point, D. The exhaust valve is then opened, and the products of combustion are allowed to escape. The work done during the cycle is represented by the area of the figure, A B C D, and a mere glance is sufficient to show that the area of this figure is very much greater than the area of the figure, A E F G, or, in other words, the work done by the engine is greater, and, since the energy supplied in the form of fuel is the same in the two cases, it follows that the efficiency, in the case of the compression cycle, is considerably greater than in the case of the non-compression cycle. The actual value of the work done in the compression cycle is 410 foot-pounds, so that the efficiency is 410 ÷ 1150 or 0.36. In the case of the non-compression cycle, the work done is 205 foot-pounds, and the efficiency is 0.18.

It will be observed, further, that if the expansion in the case of the compression cycle were carried to twice the original volume, as was done in the case of the non-compression cycle, an additional amount of work, represented by the area, D H G A, would be obtained, and that this additional work would be about two-thirds of the whole work obtained in the non-compression cycle.

If we consider an ideal engine, working on the Otto cycle, in which there are no thermal losses due to conduction and radiation, and in which the gas in the cylinder, usually called the working fluid, has at all temperatures the same properties as has air at ordinary temperatures, then the efficiency of such an engine can be at once calculated if we know the amount of the compression. Thus, if r is the ratio of the original volume of the charge before compression to the volume after compression, that is, is the ratio of the stroke volume plus the volume of the combustion space to the volume of the combustion space, the efficiency is given by

$$y = 1 - \left(\frac{1}{r}\right)^{0.408}$$

The quantity, r, is called the compression ratio, and some values of the efficiency calculated by this formula are given in the following table:

AIR STANDARD EFFICIENCY

Value of r.	Efficiency
2	.25
3	.36
4	.43
5	.48
6	.52
10	.61
100	.85

In practice, the compression ratios of petrol engines lie between 3.5 and 5, generally about 4.

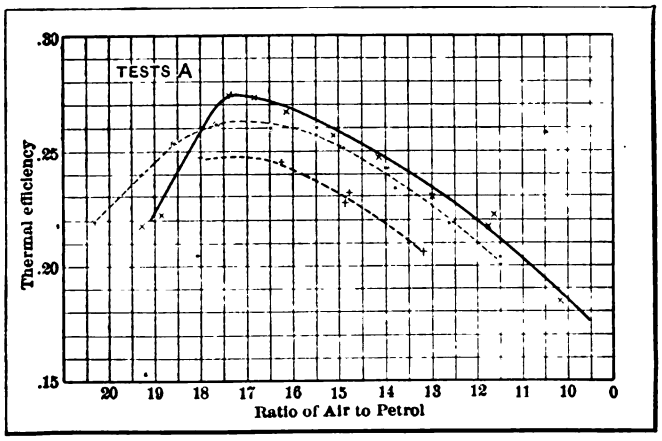

Fig. 30—Indicator diagram showing actual measurements of thermal efficiency obtained from a four-cylinder engine at varying speeds

Some actual measurements of efficiency are shown in Fig. 30, which were obtained from a four-cylinder engine having a bore of 85 millimeters and a stroke of 120 millimeters, the compression ratio being 4.71. The full line curve corresponds to a speed of about 1,300 revolutions per minute. The curve marked with small dots to a speed of 1,100, and the curve marked with dashes to a speed of 700 revolutions per minute.

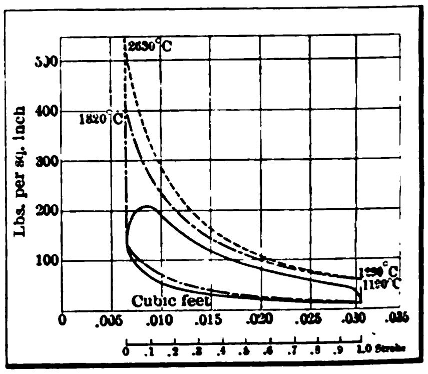

Fig. 31—Showing efficiency with heat supply per cycle of 962 foot pounds

It will be observed that, except with very weak mixtures, the efficiency increases with the speed. Considering the measurements made at the highest speed, and starting with the weakest mixture that will fire, which is about 19 of air to one of petrol, the efficiency is about 0.22. As the mixture gets richer, the efficiency rapidly increases, and reaches a maximum of 0.276 for 17 parts of air to 1 of petrol. After this the efficiency steadily decreases as the strength of the mixture increases. It is important to notice that the maximum efficiency is not obtained with the exact amount of air required to give complete combustion, that is with 14 of air to 1 of petrol; increased efficiency is obtained by working with weaker mixtures, that is with mixtures containing an excess of oxygen. For mixtures richer than 1 of petrol and 14 of air there is a certain amount of combustible gas (CO, H and CH_4) in the exhaust, and hence some of the energy of the fuel is wasted owing to incomplete combustion. This is a point to which I shall return later.

Since only about 27 per cent. of the heat energy supplied in the fuel is converted into work, it follows that the remaining 73 per cent. is wasted, and I now wish to consider what becomes of this wasted heat, and if it is practicable to avoid such loss to any great extent. The heat which is not converted into work is either communicated to the walls of the cylinder and hence to the jacket water, or escapes in the exhaust, the gases of which are at a very high temperature. We require to separate the losses of heat into two parts, namely, that communicated to the cylinder walls during the compression and working stroke, and the remainder, which represents the sensible heat of the exhaust gases at the end of the working stroke. The first of these (*a*), namely, the heat lost to the cylinder walls during the working stroke, is pure waste, and in every way it is advantageous to reduce it to a minimum. The second, (*b*) namely, the heat represented by the hot exhaust gases; although it represents a waste as far as the conversion of heat energy into work is concerned, is quite unpreventable so long as the engine works on the Otto cycle, in which the expansion stops when the volume is equal to the initial volume of the uncompressed charge. To what extent we may hope to reduce it by using a different cycle of operations will be discussed later on. Now it is quite impossible in a four-cycle engine to separate experimentally the heat losses into the two parts, *a* and *b*, for the reason that the jacket water receives quite a large proportion of the heat from the exhaust gases. This is due to the fact that the hot exhaust gases remain in contact with the cylinder walls throughout the exhaust stroke. Further, in order to prevent the burning of the exhaust valve and its seating, the part of the exhaust passage near the valve is always well waterjacketed. Thus, on both these accounts, much of the heat of the exhaust gases is communicated to the jacket water. We can, however, form some idea of the relative magnitudes of the losses, *a* and *b*, by studying the action of an ideal engine, in which the walls of the cylinder are supposed to be impervious to heat, and hence there is no loss of heat from the working fluid to the walls. In such an ideal engine we can calculate the heat contained in the exhaust, and then the difference between the total quantity of heat lost in the actual engine, and the quantity of heat lost in the exhaust of the ideal engine will give us some idea of the quantity of heat lost owing to conduction in the actual engine.

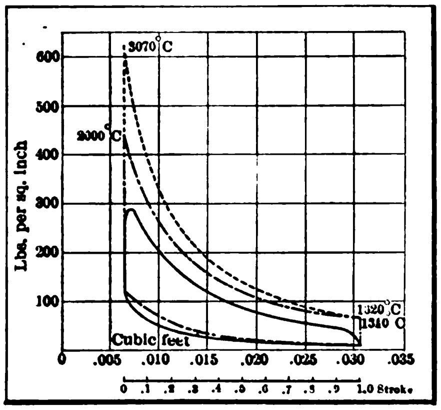

Fig. 32—Showing efficiency with heat supply per cycle of 1150 foot pounds

When considering the ideal engine we may either suppose that the working fluid has also the ideal property of having the same specific heat at all temperatures, when it is usual to refer to the engine as one working on the air cycle, or we may suppose that the properties of the working fluid are identical with those of the gases which are actually present in the cylinder of an engine. In this case it will be necessary to allow for the fact that the specific heat of such gases increases as the temperature rises.

In the air-cycle engine the efficiency will vary with the compression ratio, as already mentioned, but will not vary with the amount of heat supplied per stroke. In the case of the variable specific heat ideal engine, the efficiency will vary with the compression ratio to almost exactly (in reality a very little less) the same extent as in the case of the air cycle. Owing, however, to the increase in specific heat with temperature the efficiency will vary with the heat supply per cycle, for the temperature reached at the end of the combustion will depend on this quantity, *i. e.*, on the strength of mixture in the charge.

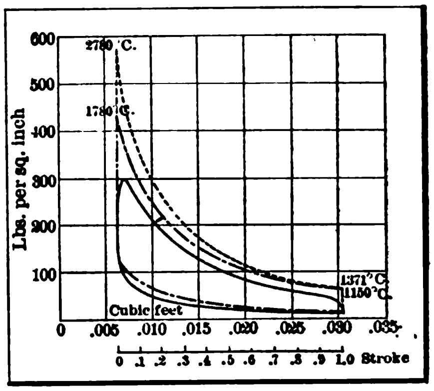

Fig. 33—Showing efficiency with heat supply per cycle of 1027 foot pounds

In Figs. 31, 32, 33 are shown for three different amounts of heat supply per cycle, the three indicator diagrams corresponding to—(1) an ideal engine working on the air-cycle; (2) an ideal engine working on the variable specific heat cycle, and (3) an indicator diagram taken from an actual engine, in each case the compression ratio being 4.7. In Fig. 31 the heat supply per cycle is 962 foot-pounds, which corresponds to the use of a mixture containing 17.4 parts of air to 1 of petrol. The following table gives the manner in which the heat supply is utilized in the three cycles:

	Efficiency	Mean effective pressure lbs. per sq. in.	Heat converted into work per cycle ft. lbs.	Heat rejected per cycle ft. lbs.
Ideal engine, air cycle......	.463	128	445	517
Ideal engine, variable specific heat cycle............	.367	102	352	610
Actual engine...............	.275	77	265	697

Thus it appears that while an ideal engine, in which there are no thermal losses due to loss of heat to the cylinder walls, would reject in the exhaust 610 foot-pounds the actual engine rejects 697 foot-pounds. Of this 697 foot-pounds, part is lost to the walls of the cylinder, and we see that such loss probably amounts to about 87 foot-pounds per cycle.

In Fig. 32 the heat supply per cycle is 1,150 foot-pounds, which corresponds to a mixture containing 14.1 of air to 1 of petrol, and the heat supply is accounted for as follows:

	Efficiency	Mean effective pressure lbs. per sq. in.	Heat converted into work per cycle ft. lbs.	Heat rejected per cycle ft. lbs.
Ideal engine, air cycle......	.463	153	530	620
Ideal engine, variable specific heat cycle...........	.856	118	410	740
Actual engine...............	.248	84	285	865

In this case the entire loss in the actual engine is 125 foot-pounds per cycle.

In Fig. 33 the heat supply per cycle is 1,027 foot-pounds. This corresponds to the heat actually developed in the cylinder when a mixture containing 10.1 parts of air to 1 of petrol is used. The calorific value of the fuel is much greater than 1,027 foot-pounds, but with this limited supply of air the petrol is only partly burnt, a large proportion of carbon monoxide, hydrogen and methane being present in the exhaust. The heat developed by the combustion that actually takes place is accounted for as follows:

	Efficiency	Mean effective pressure lbs per sq in.	Heat converted into work per cycle ft. lbs.	Heat rejected per cycle ft. lbs.
Ideal engine, air cycle......	.463	137	475	552
Ideal engine, variable specific heat cycle............	.381	113	390	637
Actual engine...............	.289	86	297	730

In this case the extra loss in the actual engine amounts to 93 foot-pounds per cycle.

In the latest type of Blériot aeroplane, as exhibited at the recent aviation show in Paris, the designer takes distance from the revolving type of motor, having equipped his machine with a four-cylinder Gregoire-Gyp motor, which is furthermore placed upside down so as to lower the center of gravity for the whole structure and incidentally gaining whatever improvement in balancing may result from having reciprocating parts work against gravity instead of with this force during the power stroke.—*Allgemeine Automobil-Zeitung.*

Wiring Diagram of Delco Distributor

Editor The Automobile:

[2,450]—Will you please publish a wiring diagram of the Delco ignition system? Subscriber.

Jersey City, N. J.

Using six cells of battery in the series, arranged for a four-cylinder motor, connected up to four spark plugs, the wiring diagram is as shown in Fig. 1.

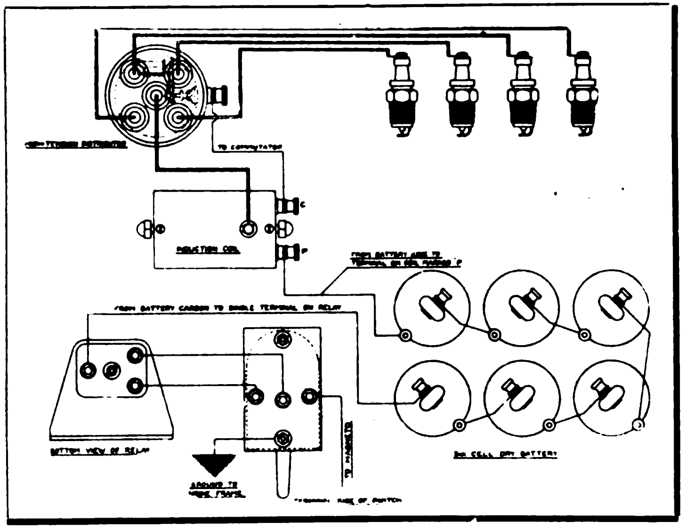

Fig. 1—Illustrating the method of wiring in a Delco Ignition system

Refinement in Design Readily Noted

Editor The Automobile:

[2,451]—I have had some experience as a designer, but I do not understand what is meant by ultra-refinement, or to what extent motors and other parts of automobiles can be made better than they are, taking them as they may be found in the many examples of the present day. Will you give a single example, illustrating the difference between a real refinement and a design that might be classed as indifferent? Kindly make the comparison as plain as possible, so that it will appeal at once to the reader. Predesinger.

Detroit, Mich.

Referring to Fig. 2 of a cylinder and to the metal around the seat of the valve, note that it is not of uniform thickness, being bunched at A and quite thin at B. Now examine another cylinder design as depicted in Fig. 3, observe that the metal of the cylinder around the valve is uniform in thickness and that the water J1 and J2 is in quantity, with free circulation all around. Also observe that the water connection at the top J3 is in good volume. A moment's observation, taking in the two designs, will suffice for your purpose.

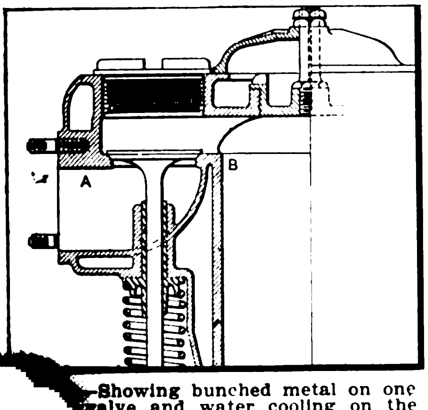
A Useful Tool for Magneto Work

Editor The Automobile:

[2,452]—I recently wanted to set the make and break of my magneto and tighten up some nut on it, but found the ordinary small adjustable wrench was useless for the purpose. Is there any spanner designed for this especial use? R. C. Jones.

Pittsburg, Pa.

A spanner is usually supplied by makers of magnetos, but if you wish to make one it is a very simple matter. Out of a piece of 3-16 inch steel as shown in Fig. 4 a spanner can be cut with a hacksaw and filed up to shape to the sizes indicated, which are the usual ones for nuts and bolts used for this work. It is a tool that can be carried about in the pocket without inconvenience, and one that will allow of getting at ordinarily inaccessible places without much trouble, incidentally avoiding the possibility of a set of badly barked knuckles and the consequent profanity.



—Showing bunched metal on one valve and water cooling on the

Alcohol Mixtures Kept at Proper Strength

Editor The Automobile:

[2,453]—When alcohol is used with water in the radiator of a motor and heating up is enough to boil the solution, the question is, does the alcohol boil off, and if so, how can one determine when to strengthen the solution in order to be sure that the same will not fall below the desired point?

Brooklyn, N. Y. C. F. G.

According to law, denatured alcohol is the "grain alcohol of commerce rendered unfit for beverages." The freezing point of this alcohol is about 160 degrees Fahrenheit. When added to water in various proportions it lowers the freezing point of the water. An approximation of the freezing points of various proportions of water and denatured alcohol is given below:

FREEZING POINT OF DILUTED DENATURED ALCOHOL

Proportion of water in gallons	Proportion of denatured alcohol in quarts	Freezing point in degrees Fahrenheit
1	1	10
1	1.5	5
1	2.5	—20
1	4	—35

NOTE.—The solution must be balanced from time to time, maintaining the same at the proper level. If it is safe to employ a mixture holding 2.5 quarts of denatured alcohol to the gallon of water it is necessary to maintain this level.

A very simple way of observing the relation of alcohol to water is to mix, say, 2 1-2 quarts of denatured alcohol with 1 gallon of water and then by means of a weighted float with a stem on it find out how low the float sinks in the solution and mark this point on the stem as shown in the illustration (Fig. 6). With a good-sized cork, a long, slender stick of wood and a couple of washers it would be possible to make a measuring instrument in five minutes that will serve every purpose. Calibrate the instrument by finding out how low it will sink in the solution and mark the place. After this all that has to be done is to draw off some of the solution from the radia-

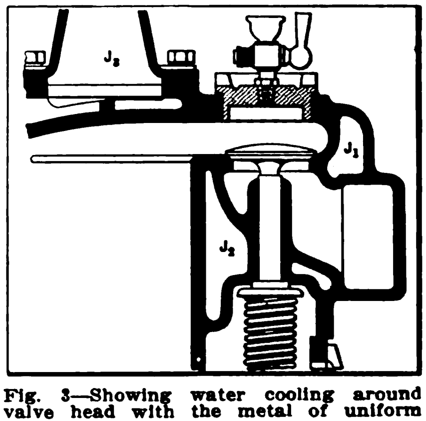


Fig. 3—Showing water cooling around valve head with the metal of uniform thickness

tor in a bucket and drop the instrument into the liquid, noting how low it will sink. If it does not sink down to the mark, add alcohol until it will; if it sinks below the mark, add water to float it up to the same.

Some Pointers as to Electrically Lighting a Car

Editor The Automobile:

[2,454]—I am desirous of equipping my car with electric light throughout, and would be obliged if you will answer the following queries in order that I may form an idea as to what the cost of operation will be:

1. How should the wiring be carried out for a complete equipment?
2. What capacity storage battery would give the best results?
3. What would be the consumption of current per lamp per ampere hour?
4. Is it a simple matter to fit a lighting dynamo?

New York. Limousine.

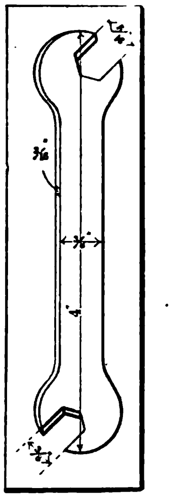

Fig. 4—Wrench for magneto

1. Fig. 5 shows how the wiring should be carried out, with a central switch L on the dash. The battery M can be carried in a box on the running board, but of course it can be placed anywhere, although the position will depend upon the length of wiring. The different fittings—A, headlights; B, side lamps; H, electric horn; J, pillar light for lubricators and speedometer; F, cigar lighter; D, interior light; C, tail lamp—can all be run together, the inside lights being controlled by the switch E and the horn by switch I.

2. The capacity of the storage battery depends upon the candlepower of the lamps. Six-volt lamps are the ones usually employed and are the easiest to replace if broken, as this size is usually carried in stock. The headlights could be fitted with 16-candlepower lamps, the side lamps with 4 candlepower, the tail lamp with 2 candlepower and the interior with 4 candlepower lamps.

3. The consumption of the above would be as follows if tungsten lamps were used: The 2-candlepower lamps consume 0.4 ampere per hour; the 4, 0.8 ampere per hour, and the 16-candlepower, 3.2 amperes per hour. It will be noticed that the amperage is just double the candlepower. The amount of current consumed by the horn and other fittings is but slight. Carbon lamps, although much cheaper than the metal filament type, burn about three times the amount of current that is consumed by the latter.

4. Yes, and in some makes it can be used to charge the storage battery while not being used for lighting purposes.

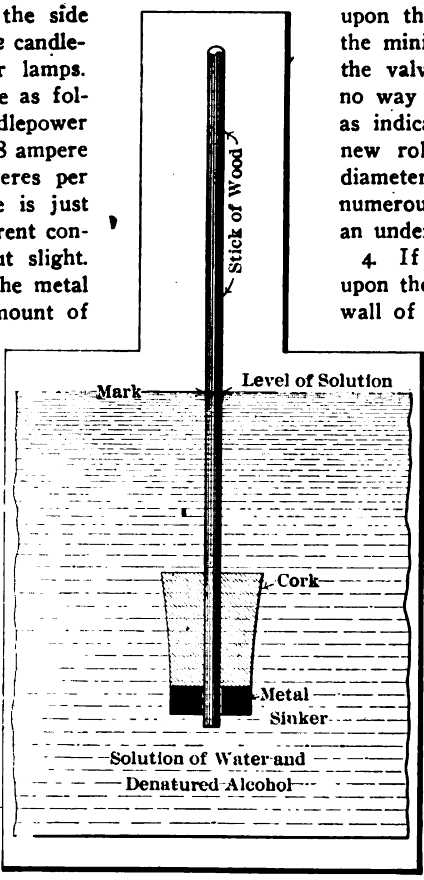

Fig. 6—Instrument to determine proper proportions of alcohol and water in anti-freezing mixture

A Baker's Dozen of Serious Motor Happenings

Editor The Automobile:

[2,455]—My motor is of the T-type. The timing gears are noisy, no doubt from wear. Would you advise getting new ones from the builders of motor, or having spiral gears made? If so, where could I have them made, and what should the price be? Also, what do you consider the best material for the gears? The timing of the valves is marked out on flywheel. I have the valves set so that when marks are at proper place there is no clearance between slider and valve stem, and valve is ready to open. This leaves quite a bit of clearance when valves are closed and makes noise. Is there any way this clearance can be taken up without changing timing? The valve sliders are square and oil works out, running down crankcase. Would grinding off corners of sliders allow oil to drain back, or would more be thrown out? Some makers are using telescoping sleeves to enclose valve springs, guides and sliders. Do you think they would help me? How are they made?

I have a Stromberg carbureter. Do you think a mechanical device used in intake manifold to break up mixture would increase power and smooth running, and decrease gasoline used?

Hammondsport, N. Y. I. J. Brundage.

1. A new set of gears might reduce the noise in the half-time system; they do not have to be spiral if they are well made. The cost will certainly be the lowest if the old gears are replaced from interchangeable stock which the maker should have.

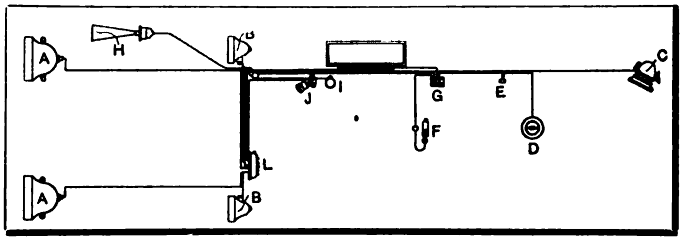

Fig. 5—Diagram showing method of wiring a car for electric lighting

2. Halftime gears are sometimes made of cast gray iron in order to keep the noise down. They may be of any good grade of gear steel, and to render them noiseless a ring of Babbit may be cast around inside of the flange, adhering to the inner surface of the teeth base. After this band is cast in, the gears may be set up in centers, and the Babbitt may then be turned down to any desired smooth contour.

3. There should be a little clearance between the lift of the valve and the stem in order to make sure that the valves will seat. The exact amount of this clearance will depend upon the diameter of the cam roller; reduce it to the minimum possible consistent with the seating of the valve. You will understand that there will be no way of reducing this clearance by a certain way as indicated by the diameter of the roller, unless a new roller is substituted, the latter of a reduced diameter, which is equal to redesigning the motor in numerous particulars, and this may be too much of an undertaking.

4. If oil sneaks up the valve lifts and crawls out upon the ledges above, cut a recess around the inner wall of the outer extremity of the guide and clap a washer down on top of it, making the same with a hole that will hug the lift. When the oil crawls up and touches the washer it will fall back into the cavity instead of crawling out upon the ledge.

5. Telescoping sleeves are advantageous, nor should they be hard to make. You might take two lengths of brass or copper tubing so sized as to telescope each other, and after inserting them into place, prevent them from dropping down by drilling a hole through and slipping a long cotter pin clear through, thereby clinching back the ends.

6. Adjust the Stromberg carbureter so that it will give you a mixture that will not heat your motor too much when it is running slow. You should have no trouble at all after you make the proper adjustments. The level of gasoline in the jet on this particular carbureter is very easily adjusted, and decreasing the level in the float chamber may have the desired effe-

Don'ts for the Autoist

THE BURDEN OF THIS PLAINT IS IN THE NATURE OF SOME INJUNCTIONS FOR THE GOOD OF THE SERVICE AND THE EDIFICATION OF USERS, OR THOSE WHO MAY JOIN THE RANKS

Don't set up a wail of woe if you run on a deflated tire for a few feet only and then have to visit the tire maker.

Don't try to achieve fame in an automobile at the rate of 60 miles per hour; you might have to wear splints.

Don't be seized with hysteria if the brasses of your motor melt out after they put up with the abuse which comes from a shortage of lubricating oil for three hours.

Don't shoot down your intelligence in cold blood; this is what you do when you abuse your chauffeur for keeping your automobile in good working order.

Don't exhibit grief if you purchase a second-hand automobile and, failing to examine it, discover that it is a white elephant instead.

Don't write an advertisement entitled "News for investors" if you wish to dispose of a second-hand automobile that is positively useless; just say "Bait for suckers" instead.

Don't be less than the shrewd investor who will first consult his needs and then select an automobile to fill them.

Don't spend money on the patching of bad roads; build good roads instead.

Don't forget that good road-building requires science, skill and money.

Don't live on a bad road; it is a sign that you will always remain poor.

Don't overlook the fact that automobilists are men of affairs.

Don't argue against the automobile; it runs out of doors; fresh air is also to be found in the very places that it will be found in.

Don't forget that man is not a fish; he needs air; water is only a solvent.

Don't hover around a drawing room absorbing silly conversation; go out in an automobile and absorb oxygen; it will do you infinitely more good.

Don't be a reservation Indian; the noble red man fell into droll ways directly when he dropped his practice of hunting around for enough to eat and fresh air.

Don't pay your tailor to make you look like a man; get an automobile and watch Nature re-shape you into one whom the tailor will not have to pad.

Don't under-estimate the value of the crisp set of brains that nestle under the hair of the man who rides daily in an automobile; you would not have the slightest show in a mental tussle with him.

Don't hang around a sanitarium to be weaned; if you have the drinking habit and you desire to stop fighting, get an autobile and have the cobwebs swept away.

Don't have melancholia if you are a banker and you want to unload mining stock, but cannot; fall into line; buy an automobile and forget it.

Don't be a chucklehead; supposing it is true that the pianos you make are going but slowly, do you blace 'em? You ride in a big locomotive yourself, and you enjoy it too.

Don't go to a drug store for beauty dope; it rubs off; ozone, as it greets you from the four winds, as you brace to the breeze in a tonneau, is indelible.

Don't get mixed up in the financial ditch with a lot of high-priced millinery and other trappings; an automobile is much less expensive and it has more class; moreover, it is of real value in a dozen ways that feathers are as strangers to.

Don't disregard the traditional aid to sobriety as the "gold cure"; apply it in the purchase of an automobile, backing sobriety of judgment; get a good automobile.

Don't be overwhelmed by the force of acccuracy as it is set forth by the salesman; let him out a link on the road to proof of the pudding.

Don't put a damper upon the salesman who has the courage of his convictions; let him show you what he can do.

Don't dissolve the parliament of the senses or be content with a half-repair job at double-cost; convene the parliament and pass an act of censure if necessary.

Don't take the wind out of the sails of a good chauffeur; if he wants a tire gauge for purposes of economy, get one for him.

Don't take to a "safety razor" to work an economy sufficient to perpetuate a fallacy; if the chauffeur fails to help you out, fire him.

Don't imitate a barber when a "prospective" accepts your suggestion to see what your car is like; he neither wants a close shave, nor does he desire to be talked to death—send a dumb demonstrator.

Don't snort with disgust at the service your tires are giving: inflate them and they will last three times as long.

Don't bind your thoughts to make them small like the Chinese ladies' feet.

Humors of Aviation

Parisians Have Devised an "Easy-Drop" Garment for Sky Sailors

RUDYARD KIPLING wants aviators to don pneumatic clothes. Henry Norman insists that they should be provided with a parachute device. Capping the climax, Paris combines the pneumatic clothes and the parachute in the wonderful garment for aviators shown in the accompanying illustration. The moment the aeroplane strikes the unfriendly earth with some force, the shock releases compressed air and inflates the vestment, or if the aviator choose to abandon his craft in midair, he jumps, spreading his arms, and there is the parachute, ready to transform itself into a ball of air and guaranteed to land the daring airman with the most durable portions of his anatomy underneath.

Front and side views of the latest Parisian style of aviation apparel—the parachute dress

It Stands to Reason

THAT THERE ARE QUITE A NUMBER OF THINGS THAT WILL BEAR MENTION WITHOUT PROOF WOULD SEEM TO BE TRUE—THESE ARE SOME OF THEM

That the delightful throbbing of a well-timed motor creates a sensation of restful comfort in the being of the fortunate owner of the automobile; this condition may be perpetuated through the proper use of lubricating oil.

That there is romance in everything; cut out the romance and you murder enthusiasm; slay enthusiasm and your automobile will sell for junk.

That there is an affinity between a mechanic and a mechanical masterpiece; sever the magic connection and the machine will fall into disuse.

That the man who cannot get up an admiration for the automobile that he owns had better dispose of it before the varnish looses its lustre; strange to relate, the varnish can tell if its master has lost his heart to another form of beauty.

That the locomotive engineer who talks lovingly to and pets the iron-horse that so willingly bends to his touch, is the best engineer in the employ every time; the reason lies in the fact that the engineer does not abuse the machine that he longs to caress.

That pleasant dreams depart on black plumed wings with the dawn of the day that sees the automobilist unmindful of his charge.

That discordant sounds come bellowing from the midst of unlubricated automobiles.

That the man who wants something for nothing is in the guise of longing coiled about despair.

That work, while it is death to lily-white hands, is the birthplace of happiness.

That the poet's dream and the craftsman's work are the equivalent of each other; the one delivers brain-food and the other produces bodily comforts that give the poet breath and being.

That the plundered soul of the abused machine leaves a wreck behind when it departs.

That ravages of time are as naught to the unmindful petty ways of unthinking man.

That delights elude the embrace of the bungler.

That the mind should not have such balloon power as to lift the feet up from the ground.

That water can be separated out of the gasoline if a chamois skin is first soaked in gasoline and then used as a filter.

That the wiring must be kept free from lubricating oil, otherwise the insulation will deteriorate.

That the high-tension cables must be protected in every way; the voltage is not far from 10,000, and it is prone to jump to adjacent metals through the insulation of the wire.

That much of the ignition trouble that is experienced is due to the presence of oil and dirt.

That some of the balance of the ignition trouble is due to bad joints.

That batteries must be kept charged if the ignition current from them is to be up to the fullest requirement.

That dry cells have to be replaced at sufficiently frequent intervals to assure the presence of a reliable source of electrical energy to deliver the required spark.

That slime in the gasoline piping is frequently at the bottom of an insufficiency of gasoline.

That a drop of solder in the piping is sometimes the mischief maker.

That a wad of waste, left in by the workman, is occasionally the cause of a shortage of gasoline.

That automobilists are sometimes absent-minded or languid.

That a misplaced float in the carbureter is the cause of the loss of much gasoline in many an automobile.

That it is easier to put a carbureter out of adjustment than it is to readjust it.

That a slipping clutch is a power consumer and a nuisance in other respects besides.

That a "fierce" clutch will wreck an automobile.

That the way to keep a clutch from acting "fierce" is to lubricate it.

Pointer on Chain Drive

Oilers in Convenient Places Insure Lubrication in Wet Weather

THE efficiency of chain transmission depends upon the amount of lubrication that the chain receives and the immunity from becoming clogged with dust and mud, provided the pitch of the teeth of the sprockets is correct and the alignment good. The first question is: What causes a chain to stretch, as it is made of metal, unlike a belt that can contract and expand? The answer is, wear; and the best way to avoid this is to have chain covers fitted so that all dirt is excluded and the chain can dip into oil and so be continually lubricated. Some cars do not adapt themselves very easily to chain covers, and it is also an expensive matter to fit these so that they do not rattle. Lubrication remains, therefore, to be properly attended to. Apart from fortnightly taking off and soaking in kerosene and graphite grease, small oilers that can be turned on and off at the driver's wish and without trouble, as here illustrated, would be found beneficial if the following method were adhered to: Copious oiling is not necessary, as it will bespatter the car with oil and make the paint soon look shabby. It is needless to tell an autoist what the effect of oil is on his tires. Of course, if he really wishes to know let him pour some on the floor where the car stands, so that the tire touches it. No, it won't explode; but with the tentacles of the octopus it will grip that tire, squeezing all the elasticity out of it, rendering it lifeless and asking every stone it meets to end its misery, as it is about to fall asunder. Returning to our muttons: The leads from the oilers should allow the lubricant to drop over the front sprocket so that the oil enters the rollers on the side of the chains nearest to the car — that is where the rollers touch the bridge pieces. Two to three drops per minute is sufficient for dry weather and four to five for wet. In wet weather the oil will prevent the chain receiving a coating of mud and so prevent wear. In Winter the oil should be very thin; otherwise it may freeze and clog in the pipes.

Drip feed lubricators below front seats for oiling chains

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FOREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[307]—Give the events that occur in a four-cycle gasoline engine in the order of their occurrence.

Any part of the cycle may be taken as the starting point. It is convenient to begin with the stroke that draws in the combustible mixture.

First stroke: Intake or admission stroke. The piston starts from its extreme position next the combustion chamber (from the highest position in a vertical cylinder engine) and the inlet valve is opened either by suction (automatic valve) or by the inlet cam (mechanical valve) at about the same time so as to allow the combustible mixture (charge) to be drawn in by suction until the end or about the end of the stroke. The inlet valve closes at (or about) the end of the intake stroke.

Second stroke: Compression stroke. Both valves are closed. The piston moving toward the closed end of the cylinder (combustion chamber) compresses the charge to a pressure of about 65 pounds per square inch, as shown by gauge reading if a gauge is attached to the combustion chamber for obtaining the pressure.

Third stroke: Impulse, working, expansion or driving stroke. Includes ignition, inflammation, combustion and expansion of charge. The electric spark or other ignition device ignites the charge about the time the piston has completed compression, and combustion (following inflammation) takes place more or less rapidly. The gas pressure is increased by the heat of combustion (to about 350 pounds per square inch or less) and drives the piston out from the closed end of the cylinder. The expansion and cooling of the products of combustion lower the pressure as the piston moves out. Shortly before the end of the impulse stroke the exhaust valve is opened by the exhaust cam (the exhaust valve is always opened by a cam or other device positive in its action) and the gases escape rapidly with a characteristic puff until the pressure falls to about that of the atmosphere (to nearly zero by gauge).

Fourth stroke: Exhaust stroke. The piston, moving toward the closed end of the cylinder, expels more of the remaining gases through the open exhaust port. The exhaust valve is held off its seat until (or after) the end of the stroke. This completes the cycle. It is begun again with the next stroke, and continues on indefinitely.

[308]—What speed of rotation must the camshaft have?

Half as fast as the main shaft of the engine if each cam has only one lobe (lug, protuberance) or depression. The camshaft must be positively driven, as by tooth gears, by the main shaft. The gear on the camshaft has twice as many teeth as the one on the crankshaft. This applies to the four-stroke cycle motor. In a two-stroke cycle motor the camshaft rotates at the same speed as the crankshaft when the cam has only one lug, provided there is a camshaft, which is not usually so for a two-cycle motor.

[309]—What are two-to-one gears?

The gears used to drive the camshaft of a four-cycle motor. The driving gear is on the crankshaft. The driven gear on the camshaft has twice as many teeth as the driving gear.

[310]—What is a muffler and why used?

It is an enlargement (or enlargements) of the exhaust pipe, or a corresponding device to deaden the noise of the exhaust.

[311]—Does the muffler reduce the effective power of the engine?

Yes, but only to a slight extent when properly designed and installed. A cut-out valve is often applied to allow the exhaust to escape without passing through the muffler.

[312]—Why are piston rings used?

In order to make an air-tight fit of the piston and rings combined in the bore of the cylinder. It is found impossible to make the solid piston fit tightly enough in engine practice. The rings, on account of their thinness and being cut open on one side, expand by their elasticity against the bore of the cylinder so as to make a tight-fitting joint and adjust themselves to variation in diameter of bore caused by heat and wear.

[313]—What is a "dead center"?

In reference to an engine it means the position of the crankshaft which brings the connecting rod and crank in line so that a force exerted upon the piston to move it along the bore of the cylinder has no rotative effect on the crank, and the engine remains dead. In the ordinary types of engine each crank has two dead centers, one-half revolution of the crank apart, one for each position of the piston at the end of a stroke. The dead centers are not one-half revolution apart in an engine whose cylinder is offset so as to be somewhat to one side of the crankshaft.

Peculiarities of Dry Batteries

Telling Why an Open Circuit Test Gives Little Real Information

DRY batteries are much in vogue as the auxiliary source of electrical energy when a magneto is relied upon under working conditions for ignition purposes. The improvements that have been made in dry cells in view of the promise of a large return since the coming of the automobile were very marked indeed. It is within the memory of the average automoblist when dry cells were absolutely limited to unimportant open circuit work, as for bell-ringing in private dwelling houses, and even then confined to the minor responsibilities.

The unknown quantity in a dry battery is the internal resistance. Let the voltage be what it may on open circuit, the fact remains that if the cell is poorly made, or "dried out," instantly the circuit is closed, and the current begins to flow, the voltage will drop responding to the conditions of Ohms' Law, which may be stated as follows:

"The electro-motive force in volts is equal to current in amperes divided by the resistance in ohms."

The understanding of this law will compel the conclusion that measuring the voltage of the cell affords no information other than that given by the measurement. It stands to reason that if the resistance (internal) is high, instantly the circuit is closed, the voltage will drop, and the energy available from the cell under such conditions will be reduced accordingly. The energy output of a battery may be known as follows:

"The instantaneous value of the energy in watts is equal to the electro-motive force (unclosed circuit) multiplied by the current in amperes."

An examination of this statement will suffice to indicate that if the internal resistance of the cell is high, since it is the constant in the formula, the voltage will drop as the current increases and the output in watts will be low and in a poor battery too low to properly serve the intended purpose. From what has been said, it remains to reach the conclusion that in testing dry cells to obtain stable information it is necessary to use an ampere meter to show the current flowing, and a volt meter (simultaneously) in order to observe the voltage.

Keep Out of the Poorhouse

Watch the Carbureter and Make Sure That It Is Properly Adjusted.

JUST making an automobile go is the least thing to do. Economy tests almost invariably show better results, by far, than are realized by automobilists in everyday work. Why is this? Why not? When a company enters one of its models in an economy run, one of its skilled artisans takes at least a few moments adjusting the carbureter and oiling up the various bearings. What is this for? Were the bearings to run so freely that there would be no friction at all, the automobile, once started, would run on forever unless it were to come to a hill. Of course, the road bearing is counted in the list that must perform without friction. Having eliminated all the friction that oil is capable of, it remains to put the motor in good order so that it will deliver the desired amount of power with the minimum use of gasoline.

Now, there is no good reason why any automobilist may not obtain exactly the same economy which the maker is credited with in a run. It is the same automobile; every function may be taken advantage of to the same extent, but it will surely be necessary for the automobilist to realize that it is the carbon, hydrogen and methane that are of value; to throw these fuel components away is like throwing the motor out of the car.

The way to coax economy into the motor is to keep at the carbureter; trying to reduce the size of the hole through which the gasoline runs out without shutting down the motor or reducing the power below the reasonable demand.

The gasoline taken into the combustion chamber from the tank through the carbureter will be spent to no avail unless a sufficient amount of air is also drawn in.

The air holds 82.7 per cent. of nitrogen by volume, and with it must come 22.0 volumes of oxygen. The nitrogen is valuable because it is inert; detonation being thus avoided. But the oxygen is what is wanted in order to burn the gasoline. When the gasoline is properly mixed with the air it is ready to be burned, forming carbonic acid and water. If there is not enough air present the mixture will not burn as stated, but a certain quantity of carbon monoxide, hydrogen, carbon and menthane will escape to the atmosphere.

Now, the value of the hydrogen, methane, etc., is so great that if a very small percentage of them escape the loss in fuel value, in other words, in distance that can be covered per gallon of gasoline, will be great. It has been estimated that over one-third of the gasoline is lost in the average motor, due to the fact that there is too much gasoline feeding to the motor. Cut down the gasoline as much as possible and feel around with the air valve lever to find the rate of air that will make a smaller quantity of gasoline do more work.

Hardening Permanent Magnets

Hardening All Over Is the Latest Practice

PERMEABILITY, while it is maximum in annealed iron, and desirable in magnets, is not the only requirement in permanent magnets, and it has been found in practice that the retentivity is better in the permanent form of magnet when it is hardened all over. In the Lindenberg Steel Mill, at Remscheid-Hasten, using the electric furnace steel, experiments with hardening resulted in the conclusion as follows: The permanence is the same when the magnets are either hardened at the ends or when they are hardened all over. It is stated by them that the average value of the magnetic flux in the long run it better when the magnets are hardened all over. In hardening plain water, acidulated water and brine were experimented with, and the best results were obtained when brine was used as the hardening solution.

Practical Repairing

DEFINING THE PROCESS OF REPAIRING CYLINDERS THAT HAVE BEEN CRACKED BY FROST OR OTHER CAUSES, USING THE LATEST AND MOST EFFECTIVE METHODS, WITH ILLUSTRATIONS OF WORK

PARTS of a car that have for some reason or other broken or been cracked, such as cylinders and the like, can with care be reinstated to their original condition by what is known as autogenous welding. This process consists, in a few words, of melting the adjoining pieces and running into them metal similar to that from which they are made. The source of heat is either a mixture of hydrogen and oxygen, known as the hydro-oxygen process, or acetylene gas mixed in correct proportions with oxygen, known as the acetylene process. The equipment illustrated in Fig. 3 is of the latter type and consists of the cylinder C1 containing, when full, oxygen compressed to 150 pounds per square inch, to which are attached two gauges G1, the amount of pressure being used and controlled by the valve V2. G2 is a gauge showing the total amount of pressure in the tank, with a stop-cock S1 to entirely turn off the pressure.

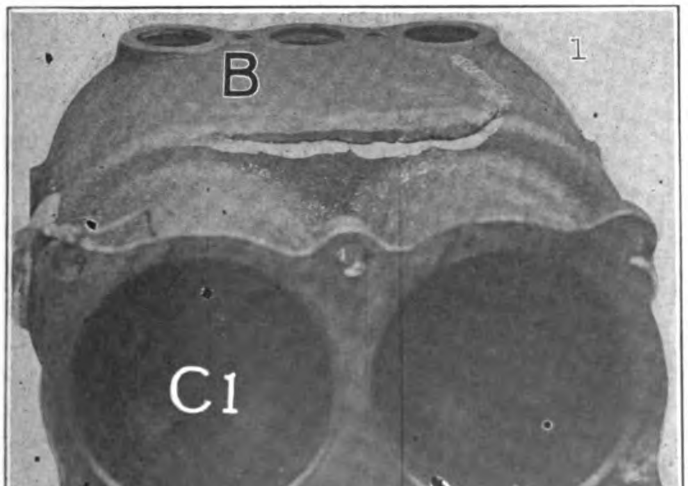

Fig. 1—Cylinders, cracked by frost, showing V-gap for welding

Cylinder A2 contains compressed acetylene gas, the flow of which is operated by the main tap T1 and the valve V1. The handling of acetylene is attended with risk if great care is not exercised, as should the flow exceed 20 pounds pressure per square inch the makers of the cylinders state that the gas becomes self-explosive. The interior of the cylinders is filled with asbestos discs which are steeped in acetone, which is capable of assimilating 25 times its own volume of acetylene, and in this manner the gas becomes transformed into a liquid. The air and gas pass from their respective cylinders through special rubber piping P1 and P2 to the burner B1. Rubber tubing is preferable to metal piping, for should the pressure become too strong the rubber will give and there the damage is ended; otherwise the burner might explode with disastrous result to the operator.

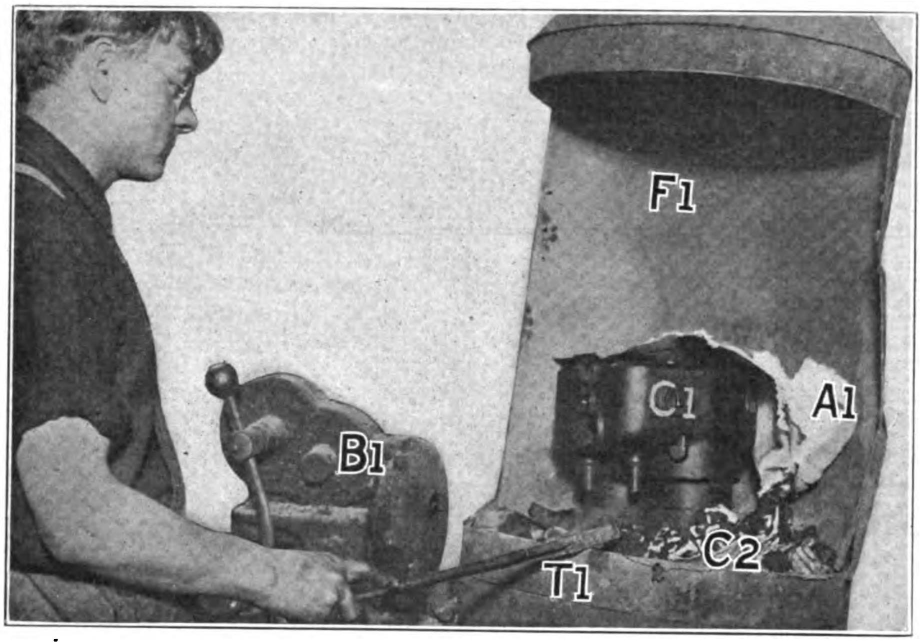

Fig. 2—Cylinders placed in blast forge and covered with asbestos, to be heated before welding

The illustration does not represent the relative size of flame used in welding by this process; the actual size is about one-half inch to one inch in length measured from the end of the nozzle of the burner. Different size burners are used, the size of the orifice depending upon the work to be carried out and whether the broken parts are large or small; they resemble the spray nozzle of a carbureter, being made of brass, and are known by the number size of the orifice. The light from the flame is so intense that it is necessary to wear blue glasses.

The burner B1 is held by the operator as shown in Fig. 1, and has two taps with which to regulate the flame. Parts that several years ago would have been thrown on the scrap heap can now by this process be repaired for a comparatively small sum, and made to answer the same purpose as new parts, with a great saving in the cost. Simple as the process may seem, the operator must thoroughly understand his work, as the metal can be overheated and cause a crack in another place. The heat of the flame from acetylene and oxygen can be raised as high as 6,500 degrees Fahrenheit, and when as an illustration of its power of dissolving metal, a steel railway rail was taken and cut through in a few minutes that in the ordinary way takes two men with a saw several hours to accomplish, some idea of its intensity can be realized.

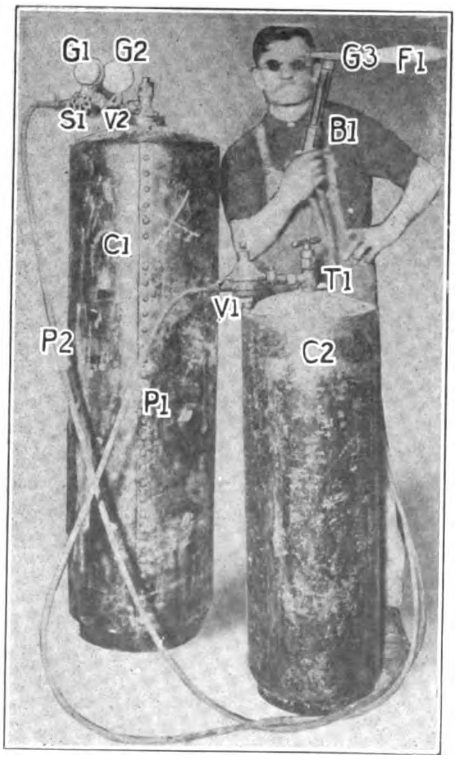

Fig. 3—Welding equipment, showing oxygen and acetylene tanks, gauges, valves, etc.

The pressures at which the gases leave their respective cylinders are 25 pounds per square inch for the oxygen and between 6 and 8 pounds for the acetylene, and as the valve V1 has only a very small opening the amount of flow can be regulated to a nicety.

Figs. 1 shows cylinders that have been damaged by over-cooling; in other words, by the freezing of the water in the jackets. It can be seen that the metal around the crack B1 has been cut away with a chisel in order to better get at the work and for a channel for the additional metal to flow into.

Fig. 4 represents the lug P1 of a cylinder C1 that has been broken off the base F1. The cause of this breakage is common where the thickness of the metal at the base is insufficient to withstand the force exerted inside the cylinders by the explosions, although if the cylinders are improperly bolted down or the nuts slacken off the result will be as here depicted.

It is proposed to deal with the method of welding the lug into place, and the same process applies to other work on cylinders. The first operation is to bolt the part in place as if it were on the base chamber; a piece of steel is drilled for the holes for bolts to pass through and with one of these the broken part is attached as shown in Fig. 6, the plate B2 extending the whole length of the base and secured by the bolts B1, B2. The part is then taken off and filed into a V-shaped gap to allow the metal to run in easily.

The cylinders C1 are now placed in a charcoal fire C2 as shown in Fig. 2, air blast being delivered by the blower B1. The top is provided with a cowl F1 to carry off the fumes, and strips of asbestos mill board are placed around the job to keep the heat in and give a uniform increase in heat. The object of this is to expand the metal uniformly, for when the extreme heat from the acetylene is applied at any particular spot, and the metal expands only at that spot, the other metal, if cold, is liable to crack or distort.

The heating has to be carried out slowly or the effects will be the same as if no heat were applied at all.

The burner is then taken in hand and, with the acetylene alone turned on, is lighted. The oxygen is now turned on in sufficient quantity to give a flame the required size and heat for the particular work and metal to be treated. and in the case of the cast gray iron from which cylinders are made the point of melting is about 2,220 degrees Fahr.

The flame is directed into the groove first, melting

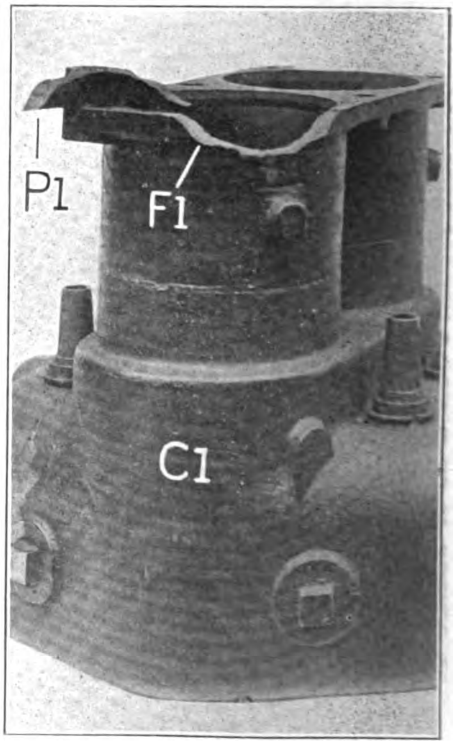

Fig. 4—Showing cylinder with bottom holding down lug broken off before repair

the thin bottoms, and at the same time a strip of metal in rod form 1-4 inch thick is held in the flame. This soon melts and runs into the parts to be joined, uniting them in such a way that when the superfluous metal has afterward been cleaned off it is impossible even to detect the joint. The process, therefore, consists in building up the gap by filling in new metal.

A white alkaline powder is used with cast iron only, other metal being treated with the flame alone. The powder is used to dissolve the globules of oxide that form in the heating process and acts as a flux in that it brings all impurities to the surface; it is known as a scaling or cleansing powder.

Fig. 5 shows the method of filling the crack inside the cylinder after the outside has been finished, as shown in Fig. 7. The operator is holding the metal rod M1 with the tongs T1 in his left hand and with the right directing the flame F1 onto the crack F2, the plate bolting the lug L1 in place having previously been removed.

During the operation of running the metal it is necessary to move the cylinders around so that the part on which the flame plays is vertical and the metal will run down into it. Particles of metal may run inside the cylinder, but there is no difficulty in dislodging them, as the moment the flame is withdrawn the fusion stops.

The final operation consists in cleaning up the outside and turning off and polishing the inside walls at the parts treated.

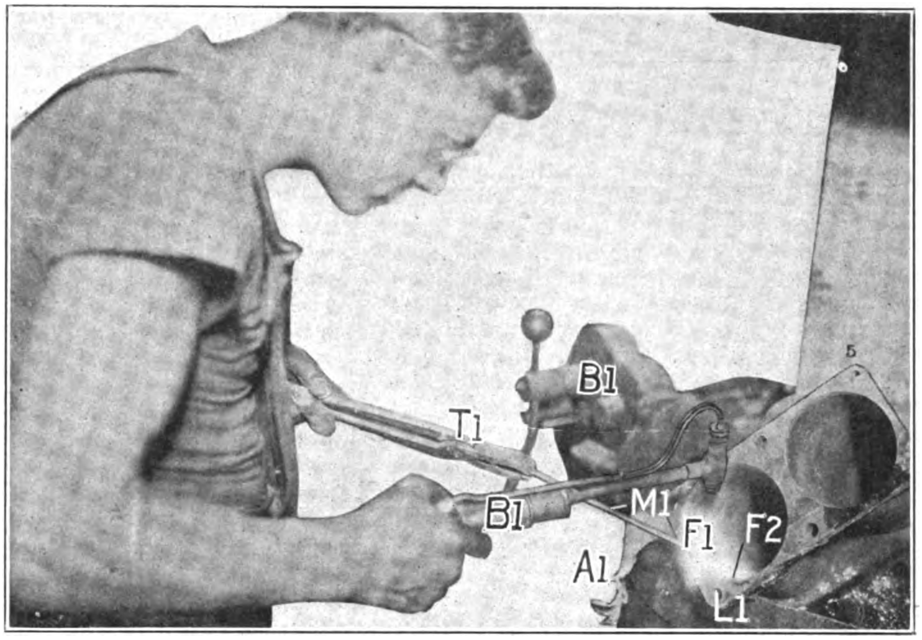

Fig. 5—Showing operator working at inside of cylinder to repair a crack

---

Magnesium as an Alloy—Magnesium has a specific gravity of 1.7, so that it is much lighter even than aluminum, whose specific gravity is 2.6, while that of iron is 7.8, so that magnesium is more than five times as light as iron and 50 per cent. lighter than aluminum. A recent French patent describes a process of manufacturing alloys of magnesium and zinc, containing as much as from 90 to 96 per cent. magnesium. The same inventor claims to have succeeded in making a practicable alloy of calcium, whose specific gravity is 1.58, with zinc, copper or aluminum, or a mixture of these three metals. It is proposed to produce a magnesium alloy suitable for aeroplanes, combining lightness with strength. Visitors to the Olympia Aviation Show of 1909 may recall an alloy answering in some respects to these characteristics. It was about 40 per cent. lighter than aluminum, *e.g.*, a triple stayed eight-gallon fuel tank of the bolster pattern weighed 43-4 lbs.—*The Trader.*

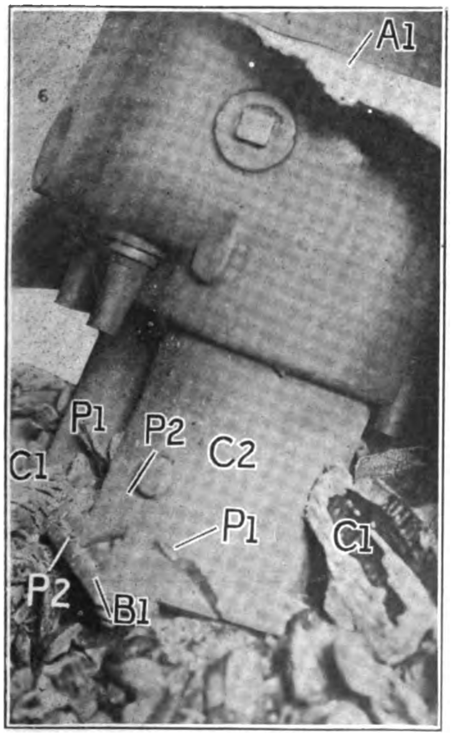

Fig. 6—Showing lug bolted to cylinders and V-shape groove cut; the charcoal fire around 'can be seen.

There Are Others

Chauffeurs Not the Only Delinquents As Regards Underinflation

SAYS THE AUTOMOBILE staff man: "During the past two weeks I have put the gauge on at least 60 tires, and there has been but one that showed a pressure approaching correctness, viz., a 36 x 4 1-2 showing 90 pounds. A few days ago I saw a large six-cylinder car with 37 x 5 1-2 tires that had just been put on by the tire makers and which the men tried to inflate till they were fatigued. They said the tires had 115 pounds pressure in them, but as a matter of fact when I put the gauge on them one showed 75 pounds and the other 45 pounds. If a man is supplied with some mechanical device with which to pump the tires there is no excuse for underinflation. At a garage where pressure is supplied free from a central compressor I pumped a tire so that it would stand no more, or, rather, the compressor would not give any more than was in the tank, which was 75 pounds. One would have thought that the tires would also have 75 pounds; but no, they registered only 45 pounds. The reason for this was that there was a leak in the connection in the piping from the tank to the main floor of the garage, which shows the necessity of testing with a gauge and not guessing."

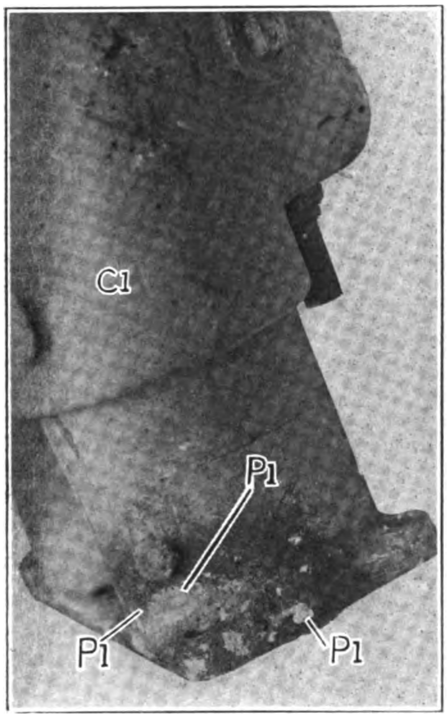

Fig. 7—Completed repair before filling up. After this has been done it is impossible to see the join.

Care and Repair of Tires

MANY TROUBLES AND A GREAT AMOUNT OF THE EXPENSE OF TIRES CAN BE TRACED TO THE CLINCHER RIM

THE average autoist when he buys his first car knows very little about such things as quick detachable and demountable rims except that he is aware that there are such things; and if they are not fitted to the car as a regular part of the equipment there may come some suggestion from the seller of the car that they should be fitted as an extra. This is just the point that a discerning buyer has to grapple with after the car proper has been decided on, viz.: How little can be spent on extras? The causes of tire trouble are twofold; abuse and the difficulty in putting tires on clincher rims without damaging the tires in the first place. Abuse of tires has been handled in these columns from different points of view, and the mere question of rims cannot alter matters if brakes are applied harshly or if the tires are run underinflated. It has been estimated by competent authorities that 18 per cent. of tube troubles can be laid at the door of the ordinary clincher rim; by this it is not meant that the rim proper is the culprit, but owing to the difficulty attending the putting of tires on this rim, and want of experience and practice of the owners of cars, the operation cannot be carried out without damaging the tire in some way or other. The greatest item in the upkeep of a car is the tire bill, and as makers do not build their cars to the tire but fit tires after the car is manufactured it is up to the autoist, so to speak, to insure himself against trouble. A fair mileage for the all-the-year-round driver would be, say, 25 miles per day for 300 days, which would show a mileage of 7,500 miles per annum. Supposing the life of the tires averages 2,000 miles per tire, 16 tires will be required for this mileage, and it would be safe to estimate two tubes per tire, not taking into consideration for the moment the cost of repairs to same from any cause whatsoever. What is the natural result? If an outlay of say $100 would show a return of 6 per cent. per annum in the ordinary course of events the investment would be considered a good one. This figure more than represents the cost of any device on the market to facilitate quickly detaching tires and assist the process of putting them on the wheel.

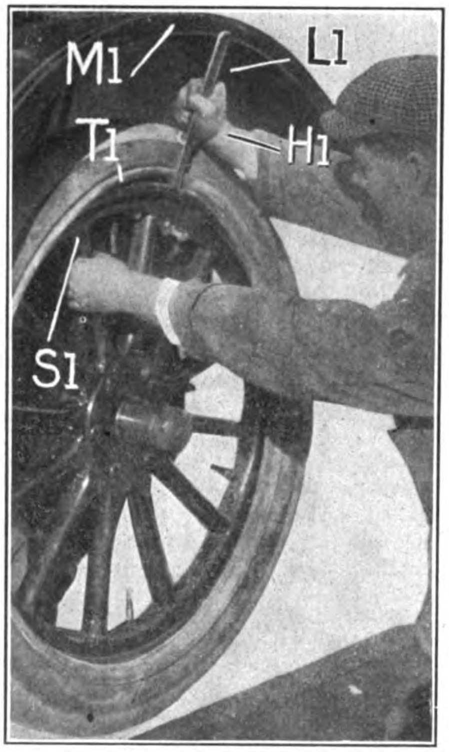

Fig. 1—Operator using short lever unable to get at tire owing to mudguard

The claims of the devices are various, but the gist is that tires can be put on and detached easily without the laboring and struggles attending the use of the clincher. It is no uncommon sight to see drivers using hammers or anything handy to knock, push or prod a refractory tire, and instead on saving the tire abuse in this manner their paramount idea is to get the tire on. If the work has to be accomplished on the road, the quicker it is done the better they like it.

Fig. 1 shows a man struggling with an ordinary clincher beaded tire with a short lever L1 barely a foot long. This amount of leverage is altogether inadequate to overcome the resistance of the tire. Further, the mud guard M1 gets in the way, preventing him from gripping the lever with his right hand in the position H1 so as to obtain all the leverage possible and at the same time giving the lever only a small amount of travel. The average amount of clearance allowed between the mud guard M1 and the tire T1 is five inches, but this is often decreased through structural causes, necessitating the operation being carried out as shown in Fig. 3. Here the man has the full travel of the lever, be it a straight lever L1, as in Fig. 1, or the forked lever L11, as in Fig. 3. The operator is here shown inserting a security bolt as it should be done, and the method depicted in Fig. 2 shows how it should not be done. In the latter case the bead B1 is distorted by the lever L1 and the point of the lever is straining on the canvas C1. The probability is that the canvas strands will be segregated at the point of contact of the lever and start the foundation of a blow-out. As long as the strands of canvas remain intact the strength of the fabric is sufficient in a well-made tire to withstand the strain imposed upon it, but the moment the strands are damaged in any way the chafing and rubbing and rolling of the tire will increase the size of the hole. There is a right and a wrong way of doing most things, and inserting inner tubes is no exception to the rule. One has only to catechise oneself and ask: "How many tubes that have been damaged on my car are the result of nipping?" Supposing the tubes to cost $5 apiece, the 18 per cent. amount of trouble due to nipping can be obviated by using some additional fixture, and on an outlay of $100 for tubes in the course of the year the saving, instead of the safe investment of 6 per cent., has risen to 18 per cent., without taking into consideration the additional life that would ensue if the outer casings were handled with more care and did not undergo the ill usage to which they are unavoidably subjected.

No one would think of going out without any oil in the engine, but how many times

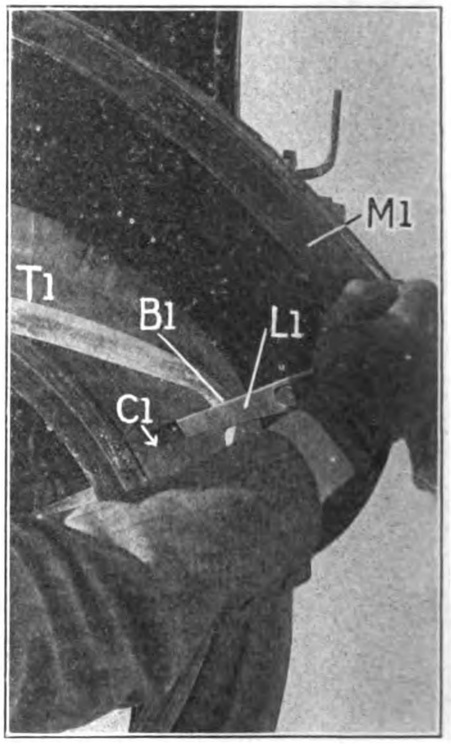

Fig. 2—Easiest way to cut the inside canvas, forming the nucleus of a blow-out

are tires put on the car without a particle of soapstone or French chalk to prevent heat and friction! Tires require in a certain sense as much lubrication as any other part that is subjected to friction. Fig. 4 shows what occurred to a tire that had been run 500 miles without soapstone. It will be seen that the tube T1 has a gash G1 about a foot long; this was not caused by heat alone, but was due to the tube sticking to the outer cover and the security bolt, so that when the tire was removed to repair a pinhole puncture, instead of coming out easily, as it should have done when pulled, it simply tore in the manner shown. The imprint I1 shows where the security bolt stuck to the bead, and the tube adhered so strongly to the inside of the casing that it took two men to tear it apart, one man pulling the tube while the other pulled the cover in the opposite direction. Flake graphite sprinkled in between the tire and shoe will prevent them from sticking together and is quite as efficient as talc. There need be no fear that graphite will in any way be detrimental to the rubber, because graphite is absolutely inert, not having any acid or alkaline properties. Large quantities of flake graphite are used by rubber packing manufacturers in order to get the necessary lubrication. When flake graphite is sprinkled into the vulcanizing mold a clean neat job is practically assured.

Fig. 4 serves as a good means of showing how an outer casing should be opened to thoroughly examine same for small holes and cuts in the fabric and gives an opportunity of patching them with canvas supplied by the tiremakers and in tool kits for the purpose. The size of the patch should be at least one and a half inches larger than the hole or cut so that the adhesion will be sufficient to counteract the outward expansion of the tire. Care should be taken to clean off all traces of soapstone on the lining of the casing so that the canvas patch will have a good foundation, for if it is only superficially attached the first wet day will allow sufficient moisture to get in to detach it, and it is principally against this enemy of tires that the patches are put on.

If the care of tires can be rendered less a matter of hard labor the autoist would try to pay more attention to the matter, but the average man would sooner leave well enough alone. If a tire is running satisfactorily at the moment it would seem unnecessary to disturb it. But if the tube could be taken out from time to time easily without fear of damage it would be greatly benefited with a rub over to remove the caked powder and fresh soapstone inserted. A tire that looks a little weak might with advantage be taken off the rear wheel and be placed on one of the front wheels with advantage and so prolong its life.

All this is possible with a good many of the devices on the market, but there is one point that must not be lost sight of when choosing such a fitting, and that is that besides possessing the virtue of quick detachability the rim must be fixed in such a manner that it is secure and has no wearing parts to lubricate or get out of order.

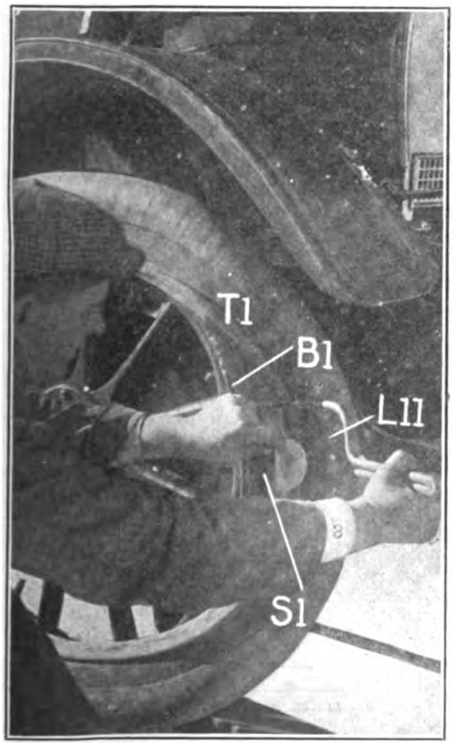

Fig. 2—Correct method of inserting security bolts and valves with a forked lever

The Village Blacksmith

"A Friend In Need Is a Friend Indeed" Is Applicable In This Case

FROM time to time it becomes necessary to have the car overhauled so that one can be sure not to be "hung up" on the road on a dark rainy night, this being the worst time to work on a car, although it is bad enough to have trouble at any time, especially with the engine. The point about the dark rainy night that particularly strikes the autoist is that in this particular vagary of the atmospheric conditions it is hardest to work and keep one's temper.

A joint comes loose perhaps and it is necessary to get the car somehow to the nearest forge to heat the job for brazing. The average village blacksmith is a good fellow, with brawny arms, but automobiles are not his pet weakness owing to the amount of trade he has been deprived of through the death knell of the horse having been sounded, as some will have it; every one will admit he has lost some trade. But he can be of great use to stranded autoists, as most automobilists can testify.

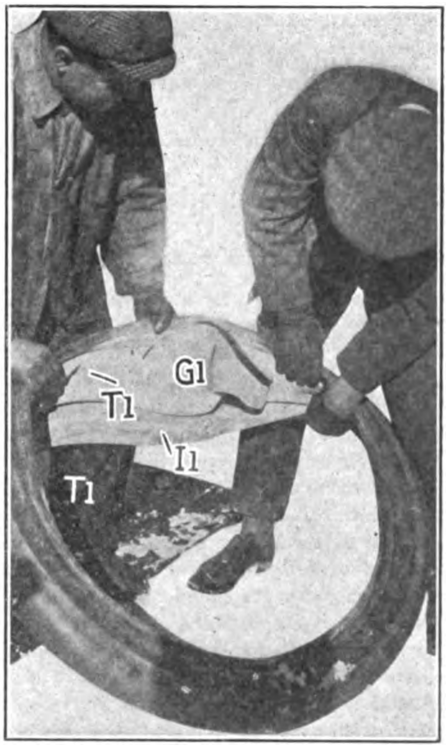

Fig. 4—Tube torn through sticking to the cover owing to want of soapstone

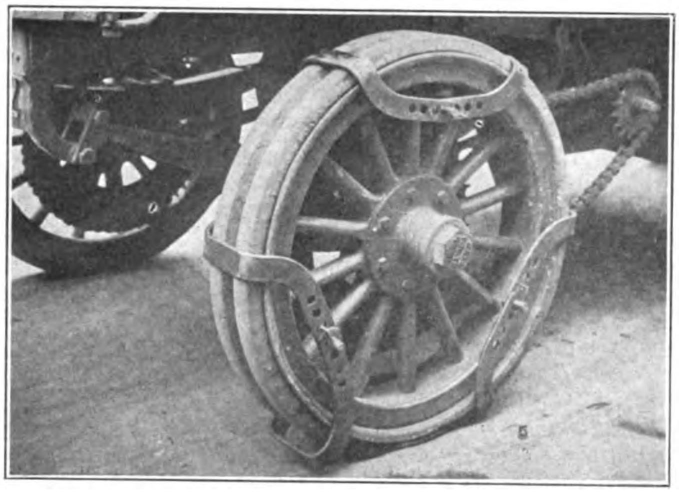
For example, the autoist is unfortunate enough to have a collision and bend his frame. The blacksmith can be of service in putting the frame back in such order that it is safe to drive; the first thing to do is to heat the frame to a good red heat, removing the body if necessary and inserting asbestos boards, or failing this, sheets of metal in order not to burn the paint on the springs; while hot with the use of bending irons the frame can be brought back to its original position. It is not often that the rear end of the car suffers in a collision, it usually being the front members of the frame that receive the blow. To effect repairs to the front of the car it is as well to remove the radiator and fit up some means of protecting the engine from heat that is applied to the frame. Heat applied at the point of bending and the use of a large wrench over which a tube has been fitted to increase the leverage should bring the form back with a little judicious hammering.

The ingredients a blacksmith does not always know are the fluxes for brazing and soldering, and these are as follows:

METAL	FLUXES
Cast iron, Malleable iron, Steel,	Borax, Sal ammoniac.
Copper, Brass, Gun-metal,	Sal ammoniac. Chloride of zinc. Rosin.
Tinned iron,	Chloride of zinc or rosin.
Zinc,	Chloride of zinc, commonly called "killed spirits."



Lyon non-skid for trucks consisting of metal bridges easily detached. Picked up by the "Staff Photographer" on the street in New York during the recent snow storm

Stops Thief and Joy Rider

Tricks of These Gentlemen Are Legion, but Axle Drawing Checkmates

SEVERAL suggestions have been given from time to time as to how the car can be left so that it cannot be used in the owner's absence, and among these are lock switches and lock taps for the gasoline; but to any one with the desire to do wrong, what are these trivialities? Of course they are good for street stoppages, but the garage fiend can easily overcome them. One method is to fit a strap over the hood with a lock. If any one wishes to take it off, the screws can be taken out; and if this is impossible, as the strap is sometimes riveted, a knife will soon overcome the leather bonds. Quite the latest method of effectively preventing the car being used while the owner is away for any length of time is to withdraw the axle shafts, if it is possible. The intention of the makers of cars so fitted was to facilitate the removal of such parts as the bevel gears without dismantling the whole axle, but the further use should not be forgotten. It stands to reason that if the magneto or a valve is removed, the car cannot be used; but less trouble is required in removing a shaft; besides, magnetos and valves are not uncommon things.

Dead Magnets Rejuvenated

When Permanent Magnets Weaken It Is Necessary to Remagnetize Them

ELECTROMAGNETS are made with a soft iron core and a coil of insulated wire is wound around them so that when the armature is rotated the current from the same passes through the wire of the magnets and they are saturated. By means of this magnetism the voltage of the armature "builds up" and the faster the armature is rotated the higher will be the voltage. But when the armature is stopped the current will fall to zero and then the soft magnets will be depleted of their magnetism excepting for a residual magnetic field that is always present, decreasing in value as the iron of the core is soft in variety and in the more perfectly annealed state.

Substituting high carbon steel for soft iron has a marked effect upon the behavior of the magnets. If the steel is hardened the magnetism will remain in once it is induced. The retentivity of the steel for magnetism will be great as the carbon content is increased, being a maximum at 90 points carbon, with the metal in the hardened state, as when it is heated at a high temperature and quenched in brine. If tungsten is added to the metal the carbon may then be reduced from 90 points to a lower level with a gain in the good working of the magnets. If the tungsten is 6.5 per cent. or nearly so, the carbon may then be held at about 60 points and for magneto work this metal will hold to a high state of magnetic saturation for a long time.

There are two reasons for desiring to reduce carbon and add tungsten. It is unfortunate, perhaps, that as carbon is increased the flux density decreases. This difficulty is overcome to some extent by reducing carbon and adding tungsten. It has also been found that the magnets will weaken faster if carbon is high, without tungsten, than with lower carbon and when tungsten is present.

Substituting high carbon tungsten steel for the soft iron core before mentioned would result in permanently magnetizing the cores, and thereafter the occasion for using a field winding is done away with. True, a soft core will build up a stronger field and if this is a necessity the soft core must be used; in lighting and power dynamos such is the necessity. For magnetos as used in ignition work permanent magnets provide a field that is amply strong and it is an advantage therefore to do away with the winding.

In the course of time the permanent magnets lose some of the magnetic flux and the voltage generated in the windings of the rotor is then reduced considering a given speed. Under such conditions it is either necessary to run the rotor at a higher speed, or have the permanent magnets remagnetized. It is not a large undertaking to do so. A very simple way is to purchase a length of No. 12 Brown & Sharp's gauge, double-cotton-insulated copper wire, sufficient to measure 0.3 ohm. Wind this wire into a coil with an opening in it so shaped as to permit the permanent magnets to enter it as shown in the illustration. When the wire is in place put the keeper in place and then connect the two terminals of the coil of wire to a 3-cell storage battery such as is used for ignition work. The flow of electrical current from the battery will be:

Let $I =$ current in amperes; $E =$ electromotive force in volts, and $R =$ resistance of the coil of wire in ohms.

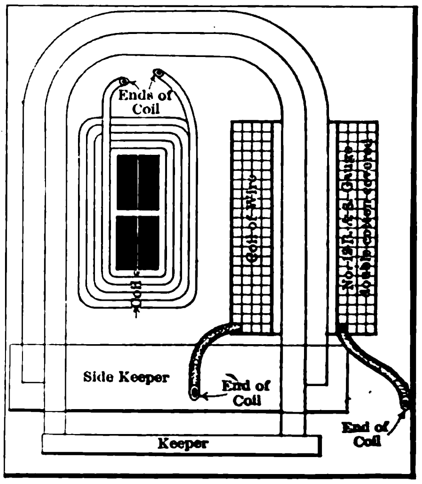
When,

$$I = \frac{E}{R} = \frac{6}{.3} = 20 \text{ amperes of current.}$$

This is on the assumption that the storage battery of three cells in series will deliver 20 amperes of current at 6 volts. The resistance is given as .3 ohm; it is measured cold, remembering that the current will not be passed through the coil long enough to raise the temperature so high as to interfere with the process.

Several applications of current are better than one, but the time required for each application will scarcely have to be more than a few moments. In parting the circuit when it is desired to interrupt the flow of current, it is right to pull the wire away slowly in order not to reverse the polarity of the permanent magnets. Drawing the arc is but a matter of parting the wires at a slow rate and this process has the same effect as putting a resistance in the circuit and increasing the same until the current recedes to zero.

The storage battery will not be damaged even if this work does require a discharge greater than the normal rating of the same.



Showing how the magnetizing coil is wound around the magnets to be rejuvenated

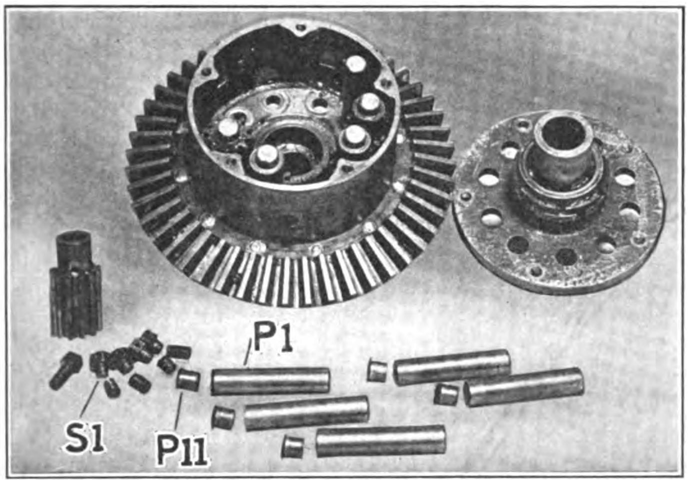


Fig. 1—Pins and bolts sheared in differential housing caused by going over a bad bump at high speed

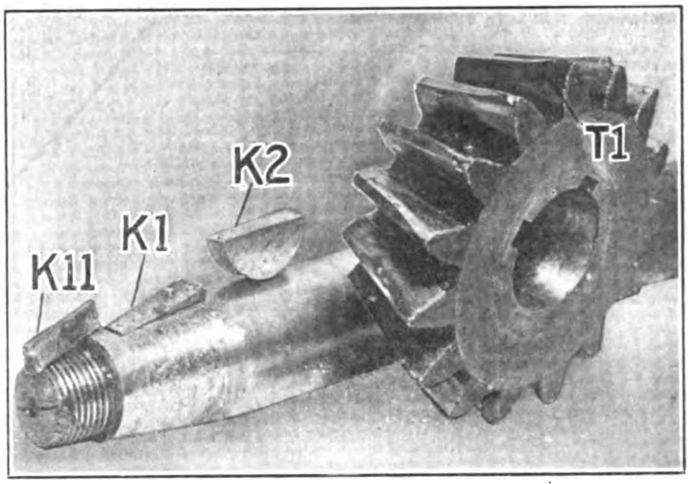

Fig. 2—Keys sheared and pinion deformed by the combination of bad road and high speed

Cause and Effect

Bumpy Boulevards Should Be Driven Over at Slow Speeds (Verb. Sap.)

THOSE familiar with the Hoffman Boulevard, Long Island, know it to be a bad road, and would never drive along it at a rate of over 20 miles per hour. But an automobile is a good-natured beast and stands for a lot of ill-usage, and the more it stands the more it is likely to be asked to stand. It cannot be wondered at, therefore, that sometimes it revolts; but the worst of it is that when it does kick in the traces it is not so quickly over with as when its equestrian rival shows its temper. The effect of striking a bad bump in the road at high speed can be seen by referring to the photographs of a differential recently put out of action on the above-mentioned Boulevard. Pause for one moment and think what happens to a car that leaves the road at speed, and what strain is thrown on every part of the car. Pinions are fixed on shafts either by keys, or the shafts are squared at the ends, or the shaft has a solid key milled out, and it depends upon the breaking strain of the metal as to when the shaft or key will give up work. The weakest part goes first, as is natural, and in this case the key K1, that holds the driving pinion T1 on the propeller shaft, succumbed. If only one key was fitted one can readily imagine that it would go; but there were two and they both sheared off as if they were made of lead. Laying on the shaft is a new key, K2, but before this can be fitted the shaft will have to be cleaned up, as it has been ploughed up by the particles of the old key after the shaft rotated inside the pinion. The broken part of the key K1 is shown near the key. This method of fixing cannot be recommended for this part of the car, a flat key of uniform thickness and having a bearing the entire length of the pinion being preferable. The differential proper has come off equally as bad, if not worse. Fig. 1 shows the differential housing with five pins in place; the pins that lay on the outside came apart in two pieces, P1 and P11. The part P11 fits in the housing and on this part all the stress is thrown. The screws S1 hold the outer cover of the casing to the main body and they sheared when the pins gave way as everything inside the housing was loose. The pinion took a decided twist in its teeth T1, as can be seen in Fig. 2, which all goes to show that it pays to drive slowly on bad roads. The damage is not always apparent at the time and may not show itself for a month or more; but when the last straw is imposed on the back of the long-suffering part it is bound to break and then people look around for the culprit. The usual answer to the problem is "faulty material."

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, ANNUAL MEETINGS AND OTHER FIXTURES

Dec. 31-Jan. 7, '11.	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 7-14.........	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12........	New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28........	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, First and Third Regiment Armories.
Jan. 16-21........	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A.L.A.M.
Jan. 16-21........	Detroit, Mich., Tenth Annual Show, Detroit Automobile Dealers' Association, Wayne Pavilion.
Jan. 28-Feb. 4....	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-11.........	Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 13-18........	St. Louis, Mo., Fifth Annual Show, Coliseum.
Feb. 18-25........	Minneapolis, Minn., Annual Show, Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25........	Brooklyn, N. Y., Annual Show, Brooklyn Motor Vehicle Dealers' Association, 23d Regt. Armory.
Feb. 18-25........	Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 18-25........	Newark, N. J., Fourth Annual Show, New Jersey Automobile Exhibition Co.
Feb. 24-27........	New Orleans, La., Annual Show, New Orleans Automobile Club.
Feb. 25-Mar. 4....	Toronto, Ont., Automobile Show, Ontario Motor League.
Feb. 27-Mar. 4....	Kansas City, Mo., Fifth Annual Show, Kansas City Automobile Dealers' Association, Convention Hall.
Mar. 4-11.........	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 14-18........	Syracuse, N. Y., Third Annual Show, Syracuse Automobile Dealers' Association, State Armory.
Mar. 14-18........	Denver, Col., Annual Automobile Show, Management Motor Field, Colorado Auditorium.
Mar. 18-25........	Pittsburg, Annual Show, Pittsburg Auto Show Association (Inc.), Exposition Hall.
Mar. 25-Apr. 1...	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mar. 25-Apr. 8...	Pittsburg, Fifth Annual Show, Duquesne Garden, First Week, Pleasure Cars; Second Week, Commercial Trucks. Automobile Dealers' Association of Pittsburg, Inc.
Apr. 1-8..........	Montreal, Can., Automobile and Motor Boat Show, Automobile and Aero Club of Canada.

Entered at New York, N. Y., as second-class matter.
The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

FINIS will be the proper word to apply to the automobile business from the standardization point of view whenever it will be possible to visit an automobile show and come away impressed by the fact that all the automobiles are precisely alike in every essential detail, and when that more or less indefinable and vague thing "art" is in the throes of ecstasy. This sad state has never fallen to the lot of any art; ambition has ever been master of the situation, and if standardization means anything in this material world it has to do with the gradual advancing along progressive yet stable lines of the work that men do. In presenting the details of the automobiles that will be offered to the clientèle of the industry in the early part of 1911, it is not with the idea that they will represent the last word; it is even impossible to predict the time when the last word will be spoken—let us hope, never.

* * *

GRANTING that the wear and tear on the pneumatic tires of an autombile will depend upon the square of the velocity of the car on the road as a prime consideration, and upon the weight that the tires must support as a secondary but important factor, it remains to keep the speed as low as consistent service will admit of; but the weight question is not to be dismissed by a mere injunction. Under the head of "How to weigh a car" a diagram is given showing an automobile in three positions on a platform scale, and the story has to do with the taking into account of the relative weight of the front, and the rear end of the car. It is not believed that the average automobilist seriously considers what it means to overload a car, especially if the particular tonneau is an especially made creation which he, for reasons of style, inflicts upon an innocent chassis. If the original idea of the designer had to do with a light body, and the rear wheels were designed accordingly, even a couple of extra passengers in the tonneau would have a marked bearing upon the tire life. But if the owner of the automobile decides to dispense with the light body, and substitute a château instead, the poor tires will have to labor under a bridge-breaking weight. Nor is this the end. The owner of the automobile, if he goes in for a castle on wheels, will feel obliged to invite his friends to ride in the new creation and he will be much gratified by the effusive way they will have of telling him how delightful it is; but the chauffeur will experience a revelation by way of language when the owner subsequently goes down in his pocket to pay for the tire bill.

* * *

CONSERVATION is the theme which has awakened interest in many quarters, but the best understanding of the term may be applied to the average automobile. Conserving the automobile is a paramount issue. If owners of cars would only understand that they might prolong the service per dollar expended in the ratio of 3 to 1 by the simple application of lubricating oil, the market on this slippery substance would go up. The reason why the average owner does not understand this situation may be traced to the simplicity of the remedy and the ease with which the work may be done by anyone. As a simile it will suffice to state that the main reason for the abnormal sale of patent medicine may be traced to the fact that the patient does not know what it contains. Were someone to tell him that copious applications internally of water out of a well coupled with a goodly sprinkling externally of water out of the ocean would cure, he would go to the nearest drug-store and invest in another bottle of patent medicine. It is the same story coupled with the automobile. Lubricating oil, and its cousin of greater consistency, grease, are shunned because of their undoubted efficacy and the perfectly simple process involved in their use. But for those who prefer a real remedy and desire earnestly to prolong life and abort noise, a plan is presented this week in THE AUTOMOBILE whereby the automobilist may spread out the process of efficient lubrication over a whole year, dates being given with proper intervals between so that some of the bearings may be cleaned and lubricated on each occasion, leaving the rest of them for other fixed dates, without risking the ills of neglect, since all are duly provided for under a plan which includes specific dates.

* * *

PRACTICAL repairing is a subject which is being handled in THE AUTOMOBILE in such a way as to illustrate the real work that is being carried on in the various repair shops, and cylinder repairing by means of the oxy-acetylene flame is the subject for this week, practical efforts being illustrated.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

Vice-President Brown, of the Willys-Overland Company, Says High Prices are Due to Bad Roads—A. L. A. M. Officials and News of the Garden Show—Completing Preparations for the Palace Exhibition—Making Ready for Displays at Brooklyn, Philadelphia, Cleveland, Cincinnati, Newark, St. Louis, Baltimore, Syracuse, Milwaukee and Hartford—New York to Have a Permanent Show—Advance News of the Paris Salon—Distant Lands as Seen Through Auto Goggles—First Race of the Year to Be On the Pacific Coast—News of Maker and Dealer in Many Fields—Short News from Every Section of the Country.

Brown Lays High Prices to Bad Roads

INDIANAPOLIS, Dec. 12—That efficiency in road construction advances with the development of civilization; that better roads would stop the migration of farmer boys to the cities, and that the high cost of living is attributable in a large measure to existing bad roads are beliefs of Will H. Brown, vice-president of the Willys-Overland Company, who was a prominent figure in the American Good Roads Congress, held December 6 to 9, under the auspices of the American Road Builders' Association.

Mr. Brown says the people of Indiana have lost enough in "invisible taxes" during the last ten years to have paved every mile of the 21,864 miles of gravel roads in Indiana. To support this statement Mr. Brown gives figures which he has compiled to show that bad roads increase the cost of farm products on the market.

Government estimates on the actual cost of transportation over Indiana roads indicate that for each ton hauled one mile the cost averages 25.5 cents; that is, the cost varies in different parts of the State from 16 cents to 35 cents a ton-mile. Tests over a bituminized road between Philadelphia and Atlantic City demonstrated that freight can be transported over country roads for less than 1 cent a mile.

It is estimated that over roads in Pennsylvania, New York and New Jersey freight can be hauled for less than 5 cents a mile, so that the cost of transportation over Indiana roads is unusually high.

Garage Men After Dead Beats

The Garage Owners' Association of New York is now on the trail of the motor dead beat or "Fly-by-Night," as that class of car owners is sometimes called. The association is endeavoring to have a law enacted making it a misdemeanor for a car owner to surreptitiously remove his automobile from a garage without paying the charges due thereon.

The lien given to the garage keeper by statute merely permits the garage owner to retain the car in his possession until the accrued charges have been paid. The lien is lost when the car leaves the garage and so is ineffective to check the practice of the "Dead Beat."

To Abolish Thompson Avenue Grade

Included in the budget of New York for next year will be an item covering the expenses of eliminating the grade crossing of the main line of the Long Island Railroad at Thompson avenue, if the borough presidents accept the urgent advice now being given them by the city streets committee of the Automobile Club of America.

The crossing in question is one of the most serious obstacles to traffic in the metropolis. It lies on the main route to Long Island and during such affairs as the Vanderbilt Cup race and the recent aviation meeting at Belmont Park it proved itself to be a nuisance of the first class.

Seldom could it be passed without delay at any hour, and during the press of traffic in morning and evening delays often of as much as half an hour occurred.

Black Crow Car to Be Sold by Makers

Announcement has been made to the trade by the Crow Motor Car Company of Elkhart, Ind., that it has dissolved relations with the Black Manufacturing Company of Chicago, which has handled the selling end of the Black Crow car.

The announcement is dated December 6, but it is only just being received through the East. The Crow Company has secured considerable additional capital and in future will handle the selling of the car direct.

Otto F. Rost, who has represented the Black Company in New York, will remain with the Crow Company as manager for the East, New England and export business.

It is announced by the Crow Company, that the additional capital secured is sufficient to purchase the building in which the car has been built and to finance the new selling plan. C. C. Darnell as general sales manager and a number of other representatives have been taken over by the Crow Company.

Pioneers at A. L. A. M. Banquet

When the Association of Licensed Automobile Manufacturers assembles for its annual banquet, which will be held January 12 at the Hotel Astor, during the first week of the Madison Square Garden Show, it is expected that the function will set a new mark in the progress of the association.

One of the features of the affair will be speeches by several of the pioneers of the industry. The set program of toasts will be limited to three or four speakers of national repute.

McMurtry Resigns as Technician

Alden L. McMurtry, one of the leading technicians of New York with regard to automobiles, has resigned as chairman of the Technical Committee of the Automobile Club of America. Mr. McMurtry is a member of the Technical Committee of the Contest Board of the A. A. A.

A. C. A. Gives Smoker

The Automobile Club of America gave a well-attended smoker at the clubhouse Tuesday evening. Vaudeville, entertainment and refreshments were enjoyed by those present.

A·L·A·M· OFFICIALS

Col. Charles Clifton
President

Alfred Reeves
General Manager

M. L. Downs
Sec. of Show Com.

Col. George Pope
Treasurer

L. H. Kittredge
Secretary

CULMINATING next month in a show that promises greater things than any so far staged on the American Continent, the history of the A. L. A. M. to this date has been a brilliant one. The life of the organization has been varied. It has not always floated along on the full tide of prosperity; it has had its ups and downs like everything else that bears the stamp of mortality.

From a small beginning it has grown into a vast, machinelike body, working—constantly working—for progress along lines of conservatism.

The history of the organization, like everything else connected with the rise of the automobile, is brief, measured in terms of years, but its work is colossal.

The association was formed in 1903 and its first roster included the comparatively few names of American motor car makers who were privileged to operate under the terms of the Selden patents which are now in a final stage of litigation in the United States courts.

Fred Smith of the Oldsmobile Company was chosen first president of the new-formed body, with George H. Day as general manager. Most of President Smith's term of office was spent in organizing and preparing for future activity and, at the end of the year for which he had been selected as standard bearer, he retired to give place to Col. Charles Clifton. Seven times in succession Col. Clifton has been invested with this leadership and he has seen not only the association grow out of its swaddling clothes, but he has also witnessed the automobile industry wax strong and lusty until to-day it stands out as the most remarkable development of this age, or, for that matter, of any other age.

While Col. Clifton has remained as president of the association, the executive officer—the general manager—has changed several times. In 1907 E. H. Cutler was chosen to fill that important post. Mr. Day, the original general manager, died about that time. Mr. Cutler served a year and was succeeded by M. J. Budlong, now president of the Licensed Dealers' Association of New York City. E. P. Chalfant was elected in 1909 and retained the office until the election of the incumbent, Alfred Reeves, who was recently re-elected.

One of the big things that has been accomplished by the A. L. A. M. was the work of its mechanical branch. When the association was formed the art of automobile construction was in its infancy. Everybody had widely differing views of many of the points of construction that are now considered well settled. In order to solve the maze of engineering problems that confronted the trade in those early days, the constituent companies delegated some of their best engineering talent to form a practical, professional body to straighten out the cumbersome puzzles. For several years the mechanical branch of the A. L. A. M. labored to eliminate some of the guess work from automobile building and the result of that work is acknowledged today wherever motor cars are made. The manufacturer who commences work to-day has the advantage of the titantic efforts and the gold and blood that was spent in perfecting the art to its present stage, by the mechanical branch. Coker F. Clarkson, who served long as assistant general manager of the organization, was working head of the mechanical branch, and due credit is given Mr. Clarkson by motordom for his earnest efforts along that line.

When the pioneers had demonstrated the necessity and advisability of holding annual shows, the idea was accepted by the A. L. A. M. without debate and, when the time was ripe, the association executed one of those simple, yet revolutionary coups that have marked the progress of motordom like milestones. The organization which had conducted a series of shows at Madison Square Garden since 1900 allowed its option on the exclusive right to exhibit automobiles in that building to lapse and the A. L. A. M. jumped at the chance like a hungry trout at a brown hackle fly in June.

Before anybody was the wiser, the exclusive right to show in the Garden had been tied up in a contract covering several years and the A. L. A. M. held the contract.

From the first show, held in 1906, the annual exhibition has been the event of the year, at least in Eastern automobile circles. Each successive show was larger, more scientific and more important than any of those that had gone before, and now, on the eve of the great show of 1911, the promise is for a display of vastly more brilliance and general interest than any of the others.

The accompanying picture gives some idea of how the great hall will appear when the time comes to swing wide the doors on January 7. An automobile is a bulky bit of mechanism at the best and would seem out of place in a drawing room, but artistic conditions and proportions have been studied out with so much care that the giant road locomotives seem to fit into the scene like a bunch of blush roses in the corsage of a bride. They are not jammed in any old way and while there will be literally hundreds of them in the Garden, their presence will not be unduly obtrusive.

For all practical purposes the vogue of the automobile began in 1903 when 2,037 cars were made in the United States. Of these about half were manufactured by the members of the association. The following year saw a great spurt in the industry, the production running up to nearly 9,000, including both licensed and unlicensed cars. The following year, 1905, saw the licensed cars swell to a volume of over 20,000. From that point to 1908 the increase was steady in spite of the most uncertain financial conditions. In fact, the upheaval of 1907 must have proved a financial rout and an industrial disaster but for the steady prosperity of the great and growing manufacture of automobiles.

The panic had its effect upon the industry to a certain degree, for the figures of production show that, with the first gleam of returning confidence, the motor industry blossomed out like a sunflower and the production of the A. L. A. M. reached the magnificent total of 95,000 cars. Last year was another season of gigantic production and the astonishing total of 163,000 was recorded for the various members of the association.

The variation in average selling prices obtained by dealers during the past eight years tells an interesting story. In 1903 the average price was $1,133. It increased steadily each year with the augmentation of size and luxury and also experimentation until it reached $2,137 for each machine. That was in 1907. Prices did not break abruptly as might have been expected, but each year since the panic the average selling price of automobiles in the United States has declined until last year it touched $1,545, about the same level as obtained two years prior to the top of the wave. The reason for this apparent decline lies in the fact that large numbers of moderate priced cars have been marketed. At the same time the highest grade cars also increased largely in volume and to some extent in price.

The scope of the motor industry in the United States to-day may be estimated from a few subjoined statistics. There are 11,165 companies engaged in making automobiles of all sorts and accessories and parts for them. There are 137 distinct companies manufacturing gasoline pleasure cars. When the truck makers and electric and steam automobiles are added to this total, the aggregate foots up to 205. Michigan leads in this respect with Ohio second, New York third and Indiana fourth. But in the grand aggregate of motordom, New York is far and away ahead of any other State in total number of concerns devoted to the manufacture of the various things that go to make up the sum total of the American industry. In the Empire State there are no less than 2,329 companies that draw their support from the automobile in the making. Massachusetts is second, Ohio third, and Illinois fourth on the list.

In making up this list, fifty-one different headings were used, ranging all the way from completed automobiles, embracing ten-ton trucks, costly touring cars and the dainty little runabouts and down to cotter pins, almost as fine as small needles.

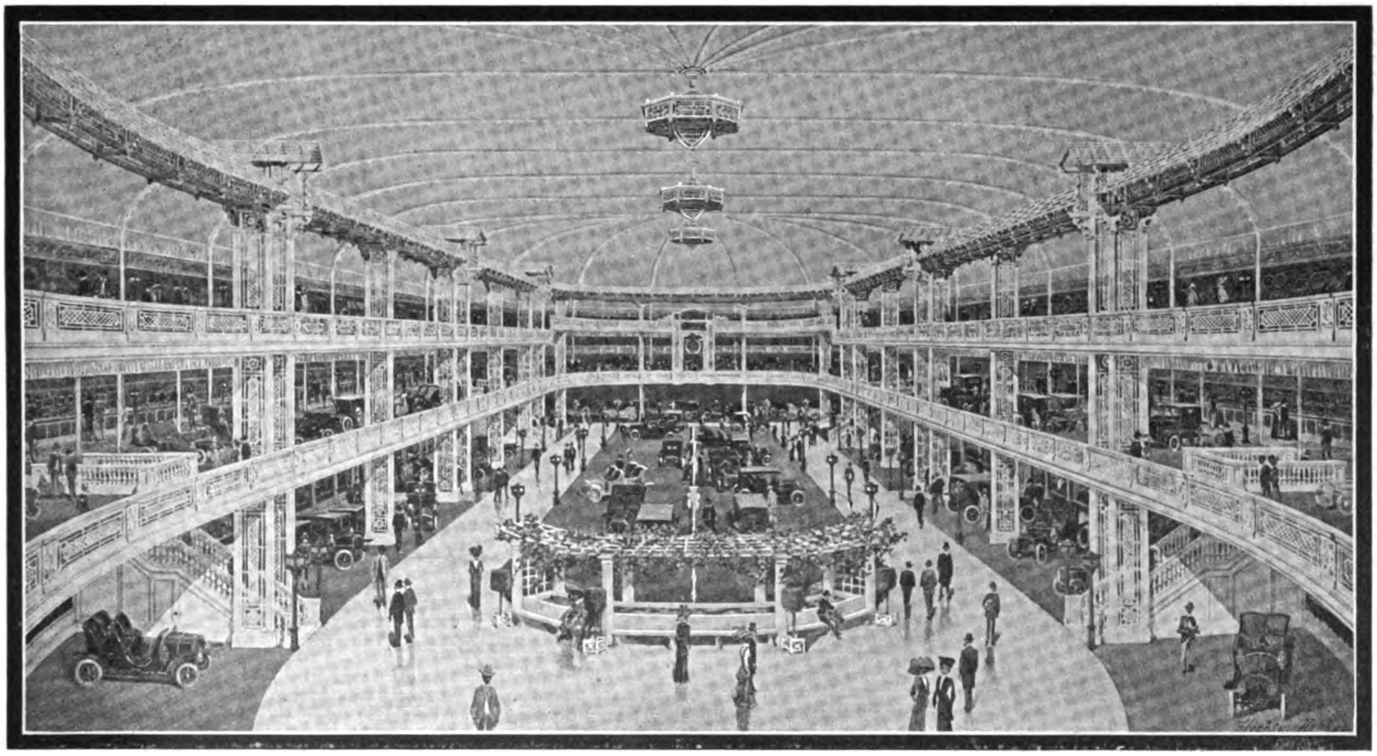
The automobile of 1910 is the most significant development of human ingenuity since the dawn of history. It represents a distinct advance step in transportation and, as the students of history declare, "a step toward perfecting transportation is a stride on the way toward perfect civilization."

No man who has due regard for facts can doubt that the annual display of automobiles in New York has had its part in this vast progressive movement. And there will be few to deny a share of credit for the development of the automobile to the Association of Licensed Automobile Manufacturers.

Gas Engine Trade Convenes

MILWAUKEE, Dec. 12—H. F. Apple, of the Apple Electric Company, Dayton, O., will be one of the principal speakers at the annual convention of the National Gas & Gasoline Engine Trades' Association, which meets at Racine, Wis., on Dec. 12, 13, 14 and 15. Mr. Apple's subject is, "The Installation of a Mechanical Ignition System Complete." H. I. Lee of Chicago, will speak on "Gas" and Joseph Tracy of New York on "Comparisons of Various Methods of Testing Engines." Charles F. Kratsch of Chicago has for his subject, "Does the Efficiency of a Gas Engine Depend on the Equipment?" Otto Heims of New York will analyze "Gas Engine Ignition."

A large exhibition of engines and accessories will be held in connection with the convention. The Mitchell-Lewis Motor Co. and Pierce Motor Co. will have a large share in the entertainment of the 400 delegates expected.



Interior of Madison Square Garden as it will appear when the doors of the Eleventh Annual A. L. A. M. Show are thrown open to the public

Palace Show Will Display Seventy Automobiles

According to official announcement, the automobile exhibits at the Grand Central Palace Show, which opens New Year's eve, will number over 70, including all kinds of types from the smallest runabouts to big racing machines and in the commercial line embracing trucks built to carry anything from a few parcels to ten tons of bulky freight.

The accompanying illustration shows how part of the big hall will look when the show opens. The color scheme is in cream and crimson with some contrasting green tints.

The recent snowfalls in New York have more than ever demonstrated the value of the motor trucks and business wagons. Horses were found wholly inadequate to their tasks in that merchandise was held up for hours and in some cases for days in transit about the city, as is the case in almost any period of heavy snowfall when the thermometer falls below the freezing point.

The motor truck walks away with the goods that must be delivered, the merchant is learning by experience. Business vehicles of all kinds are to be shown at the International Show, which, the makers assert, will cause the horse to become a rarity on the streets of New York within the next half decade.

The first big aviation show in the United States is to be held simultaneously with the Grand Central Palace Automobile Show, and it will give New Yorkers that have never seen aeroplanes at close range, an opportunity to inspect some of the world's most famous flying machines. All of the well-known makes of aeroplanes, such as the Wright Brothers, Curtiss, Lovelace-Thompson, Bleriot and other French types of biplanes and monoplanes are to be shown, in addition to many of the machines of the new manufacturers whose ideas are just coming into practical use.

Scores of model aeroplanes are to be shown and demonstrated to visitors at the shows, and the exhibits will prove a liberal education to laymen unfamiliar to the technical and scientific side of aviation.

Among the prominent aeroplanes to be shown are:

The Wright Brothers machine in which the late Ralph Johnstone made his world's altitude record of 9,714 feet shortly before his tragic death.

A second Wright machine, which has been built for Russell A. Alger, Jr., of Detroit.

The Bleriot biplane in which John B. Moisant flew from Paris to London, making his famous Channel flight carrying a passenger with him. This machine is now at the Lovelace-Thompson Aeroplane Works being repaired.

Another Moisant machine of all steel construction, which it is expected will successfully resist heavy strains in flying against sudden "pockets" of wind and shocks in alighting.

A third machine of Moisant's in which he made his famous flight across Brooklyn and around the Statue of Liberty.

The original Santos-Dumont "Demoiselle" aeroplane which has been brought over from France for the exhibition.

Two machines built by Burgess Company and Curtiss, one of which is a large passenger-carrying biplane, and the other being a smaller biplane.

A Lovelace-Thompson passenger-carrying aeroplane, and a racing machine built by the same company.

Glenn H. Curtiss's famous machine in which he made his remarkable flight from Albany to New York, winning the $10,000 prize given by the New York *World*.

A Bleriot type monoplane, built by the Scientific Aeroplane Company of New York, in which a gyroscope has been installed to demonstrate the balancing and stabilizing power of this invention as applied to aeronautics.

A Bleriot type of monoplane made by the Metz Company of Waltham, Mass.

A monoplane of original type manufactured by the Walden-Dyott Company of New York.

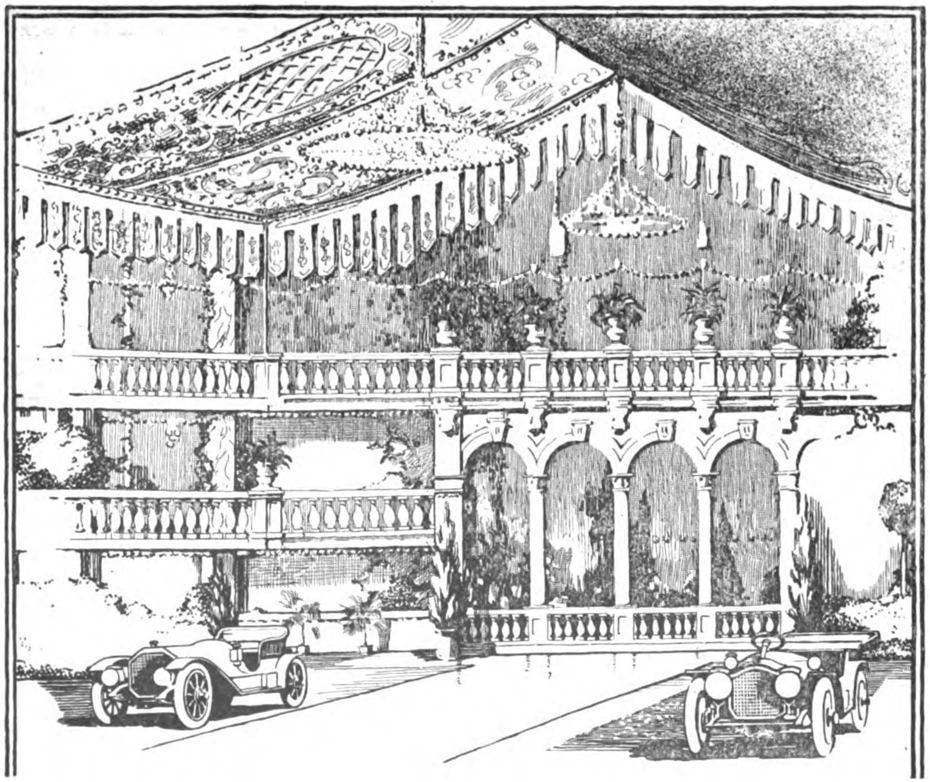
A biplane built by C. & A. Witteman of Staten Island.

A dozen other machines of types not so well known, several of them of odd and novel construction.

The Aeronautic Society of New York will display a score of models in a special exhibition booth, which is to be devoted to the interests of that organization. In another booth the Aeronautic Reserve will have an exhibit. The Reserve was organized to excite public interest in aeronautics and for the purpose of aiding the army and navy in time of need. Two tents, such as the one which was erected at the Belmont Park Meet, are to be set up in the exhibition space and numerous persons, prominent in aeronautics, are to attend.

The Junior Aero Club of America, under the direction of Edward Durant, is to be represented at the show.

Exhibitions of special attractiveness in the Aviation Division will be the showing of aeroplane accessories, consisting of engines, parts, ailerons and other sections of machines which may now be ordered and supplied upon a few hours' notice in case of accident.



Giving an idea of the scheme of decoration to be seen at the Palace Show

Stratton Resigns.

Philadelphia, Dec. 12—E. V. Stratton, manager of the Philadelphia Studebaker branch, has resigned, to take effect February 1. Mr. Stratton has been in charge of the Studebaker branch for the past two years.

Brooklyn's Show in White and Gold Glory

EVER since the formation of the Brooklyn Motor Vehicle Dealers' Association there has been a ground-swell of demand for an automobile show in Brooklyn. In response to this demand, the first annual motor vehicle show ever held in Brooklyn will be staged at the Twenty-third Regiment Armory, commencing February 18 and continuing to February 25.

The building is an immense affair containing more floor space than Madison Square Garden and is located on the chief Brooklyn motor artery, Bedford avenue. Bids for space are reported in considerable numbers, even so far in advance of the show, and the promoters are confident that a comprehensive exhibition will result.

The color scheme will be in white and gold and a special set of rules to gain uniformity in decorations has been enacted. Peculiarly liberal provision has been made for the members of the trade and affiliated organizations to attend the sessions. To the public, a charge of 25 cents will be made on all days except February 21, 22, when, on account of special features, the admission will be double.

Brooklyn boasts of owning more automobiles than any other city in the land except Manhattan and the vogue of the motor car has had a significant effect upon the whole of Long Island. For these two reasons the management is confident that the show will be well patronized.

The officers of the Brooklyn Motor Vehicle Dealers' Association are: W. H. Kouwenhoven, president; J. D. Rourk, first vice-president; C. F. Batt, second vice-president; C. M. Bishop, secretary; I. C. Kirkham, treasurer

Exhibition Committee: C. F. Batt, chairman; W. H. Kouwenhoven, H. L. Carpenter, E. T. Bloxham, Joseph D. Rourk, C. M. Bishop, I. C. Kirkham, W. H. A. Bruns, A. W. Blanchard, H. W. Palmer, M. J. Wolfe, Frank G. Dunham, Matchett & McFarlane, H. W. C. Hasbrouck, A. R. Townsend, Charles Carlson

Reception Committee: E. T. Bloxham, chairman; C. M. Bishop, H. L. Carpenter, W. H. A. Bruns, W. H. Kouwenhoven, J. D. Rourk, H. W. C. Hasbrouck, Chas. F. Batt, I. C. Kirkham, A. W. Blanchard.

Finance Committee: H. L. Carpenter, chairman; C. M. Bishop, E. T. Bloxham, C. F. Batt, W. H. Kouwenhoven.

Entertainment Committee: J. D. Rourk, chairman; Frank Dunham, H. W. C. Hasbrouck, H. L. Carpenter, C. F. Batt.

Press Committee: W. H. A. Bruns, chairman; Chas Carlson, A. R. Townsend, E. T. Bloxham, F. G. Dunham.

Transportation Committee: A. W. Blanchard, chairman; M. J. Wolfe, J. Matchett, H. W. Palmer, Chas. Carlson, A. R. Townsend.

Automobile show manager, Chas. H. Green.

Cleveland Shows Promising

CLEVELAND, Dec. 12—Arrangements for Cleveland's two automobile shows are progressing satisfactorily. The first show, held under the auspices of the Cleveland Automobile Show, will be given at Central armory the week of February 13. Frank Philips, Harry Moore, H. M. Adams and C. M. Brockaway are the committee in charge. George Collister has been appointed manager and has arranged for the opening to take place Saturday night, February 18.

The Manufacturers' and Dealers' show will open Saturday night, March 11, at Central armory. A committee composed of W. H. Barger, Ray Colwell, Harry G. Smith and H. J. Twelvetree has been appointed and 196 applications for space have already been received. The balcony and main floors will be used for automobiles and the banquet hall for accessories.

The committees of both shows are planning elaborate decorations and both shows will be the largest that the city has seen.

Queen City Show in Music Hall

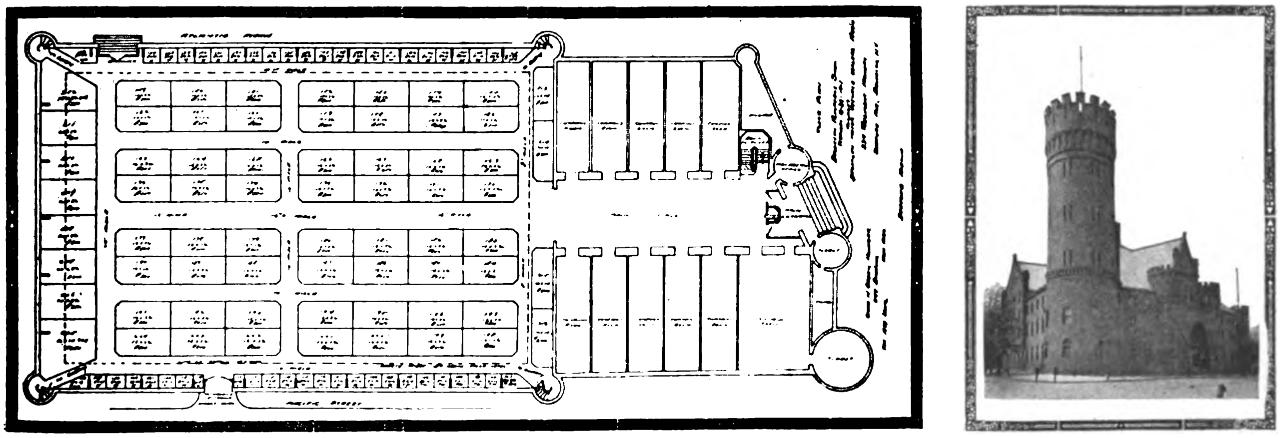
CINCINNATI, O., Dec. 12—Although the application blanks for space at the Cincinnati Automobile Show to be held at Music Hall from February 20 to 25 have been placed in the mail during the last few days, there is already a decided demand for space, indicating that the exhibition this year will be, in every way, more comprehensive than any enterprise of the kind heretofore arranged for Cincinnati.

The executive committee of the Cincinnati Automobile Dealers' Association will conduct the show this year. It has been decided that the entire first floor of the south wing of the Music Hall will be given over to automobiles exclusively. Accessories, motor boats, flying machines, and other special attractions, including the roof garden, will be located on the second floor.

Will Mail Newark Show Blanks

NEWARK, N. J., Dec. 12—Application blanks of the forthcoming Newark show, which takes place from February 18 to 25 in the First Regiment armory, are being mailed this week. A vast volume of inquiries has been directed at the promoters of the enterprise from prospective exhibitors and the indications are favorable for the disposal of all available space long before the show opens. Engineers have been busy measuring the armory and mapping out exhibition spaces.

The decorative scheme, while not yet fully worked out, will be elaborate. Offices of the show committee have been opened on the tenth floor of the Firemen's building.



Ground plan showing arrangement of the Brooklyn Show in 23rd Regiment Armory, and a view of the exterior of the building

Permanent Auto Show Is Being Planned

PREPARATIONS are being made with vigor to renovate the Brewster Building, Forty-eighth street and Broadway as the home of a permanent automobile exhibit in New York. The plan is being carried out by Frank E. Malone, 1670 Broadway, who handles the Mora and the Westcott cars. It is the intention of Mr. Malone to open the show December 26 and continue its first instalment until after the conclusion of the A. L. A. M. show at Madison Square Garden.

The idea, as advanced by Mr. Malone, is of considerably more breadth than a simple automobile show. In outlining his plan, Mr. Malone said: "I have secured the Brewster building on long lease and am busy now installing lighting, heating and communicating systems in anticipation of the opening of the show. There are five floors in the building, each with a floor space of about 7,000 square feet. On the main floor there is sufficient room for twenty-two car exhibits. On the second and third floors the accessories will be shown. On the fourth we will have a line of aeroplanes and on the top floor inventions and patented devices of a mechanical nature will be exhibited."

Caley Gets Club Job

CINCINNATI, O., Dec. 12—The announcement has been made by the directors of the Cincinnati Automobile Club of the appointment, effective January 15, 1911, of Frederick H. Caley, as general manager of the organization. The place, which was created especially for Mr. Caley, was offered him to-day at a meeting in the Gibson House club quarters, and Mr. Caley accepted it.

The new general manager is at present registrar of automobiles in the office of Secretary of State Carmi A. Thompson, in Columbus, O., is the author of much of the present legislation affecting the licensing, operation and regulation of motor vehicles, and is credited with many reforms in the relations between the State and automobile owners, which other States have been quick to seize upon and incorporate into their own laws.

St. Louis Space Snapped Up

ST. LOUIS, MO., Dec. 12—It is announced that about 90 per cent. of the space available in the Coliseum for the Fifth Annual Automobile Show, to be held February 13 to 18, has been taken. It is estimated that nearly 150 cars will be shown, many of which will be shipped to St. Louis from the National Show at Chicago, which closes the Saturday preceding the Coliseum exhibit.

Among the dealers who have taken space are the Beguelin-Buschart Motor Car Company, with the Selden car; the Case Threshing Machine Company, with Case cars; the Cook Motor Vehicle Company, with the Columbus Electric, Krit and Firestone-Columbus; Franklin Automobile Company, with the Franklin; Grand Motor Car Company, with the Regal; Gray Motor Car Company, with Kline cars; Hall Automobile Company, with the Jackson; Haynes Automobile Company, with the Haynes, Cole and Page; Kardell Motor Car Company, with the Reo, Fal, Michigan and Gramm truck; Kissel Kar agency, with the Kissel; Mound City Buggy Company, with the Halladay; Overland Motor Car Company, with the Overland; Pope-Hartford Motor Car Company, with the Pope-Hartford and Everitt; Southern Auto & Machine Company, with the Ohio gasoline car; Smith Auto & Battery Company, with the Ohio electric; St. Louis Stearns Auto Company, with the Stearns; Swartz Auto Company, with the Velie; Van Cleave Auto Company, with the Speedwell; White Garage Company, with the White; Whitman Motor Car Company, with the Mercer and the Grabowsky truck, and the Wilcox Trux Company, with Wilcox trucks and the Rayfield.

The German invasion brings along a Cyklonette type of vehicle for package and other forms of nimble delivery

Date for Baltimore Show

BALTIMORE, MD., Dec. 12—The annual show in this city will be held February 20. Whether it will be entirely under the auspices of the Maryland Club, as last year, or be given jointly by the club and dealers will be decided within the next few weeks.

The announcement that the show would be held on the date mentioned was made by Dr. H. M. Rowe, president of the Automobile Club of Maryland and the White Automobile Company, at a meeting of twenty representative dealers the past week who met to formulate the Baltimore Automobile Dealers' Association The first step in forming this organization of dealers was taken and further action will take place within the next week.

Syracuse Exhibition to Follow Boston Show

SYRACUSE, N. Y., Dec. 12—At a meeting of the Syracuse Automobile Dealers' Association, held at the Yates Hotel, at which President C. Arthur Benjamin, M. W. Kerr, George E. Messer, T. F. Willis and J. H. Valentine were present, it was definitely decided to hold the third annual show in the State Armory during the week of March 14. M. W. Kerr was again elected chairman of the show committee, the members of which will be selected later.

In selecting the date, the Association arranged, as usual, to follow the Boston show, which is dated from March 4 to March 11. It is understood that some of the Hub exhibits will be sent on. Negotiations for the use of the State Armory for the week of the exhibition have been completed.

What German Invasion Offers This Week

The Cyklonette, as the illustration shows, is a three-wheeler. It is made by the Cyklon Machinenfabrik G.m.b.H., Berlin, and it is handled in America by Richard B. Darré, who has one of the cars at the garage, 2 West Ninetieth street, New York City. The motor is placed on springs on the fork of the front wheel, which is also fitted out for steering, and the drive is by means of a sprocket set. The motor is of the air-cooled type and cooling is rendered more effective through the use of a vacuum system which works automatically. The machine is well made, is suited to running over ordinary pavement, and the tire equipment is 650 x 80 millimeters all around. The full set of brakes includes double bands for the rear wheels in addition to tire brakes. The length of the wheelbase is 100 inches, with a tread of 56 inches. The frame is of tubular steel, and the body is of stamped metal. The speed is about 30 miles per hour, and the motor is rated at 6 horsepower. The size of the cylinder of the motor is 72 x 90 millimeters, the stroke being relatively long.

Ready to Draw in Milwaukee

MILWAUKEE, Dec. 12—The first drawing for space for the first annual show of the Milwaukee Automobile Dealers' Association will be held in the Auditorium, Milwaukee, Wis., on Dec. 15. Applications for the first drawing must be in the hands of the show committee or Manager Bart J. Ruddle, on Dec. 14.

This show will be the third to be held in Milwaukee, the Milwaukee Automobile Club having held shows in 1909 and 1910. This year the dealers' association undertook the management with the co-operation of the club. The semi-annual meeting of the Wisconsin State Automobile Association will be held at the Auditorium during the show, which opens January 16 and closes January 21.

Figure on Two Halls at Hartford

HARTFORD, Dec. 12—From present indications the forthcoming show of the Automobile Dealers' Association, which is to be held in Hartford Foot Guard Armory the last week in February, or the first week in March, will be the biggest thing the show committee has ever attempted. A member of the committee states that two halls the size of the armory could easily be filled if all applications for space were considered.

It is not unlikely that another hall may be rented and two shows operated by the dealers' association, one admission covering both exhibitions.

To Build Road Across State

NASHVILLE, Dec. 12—Governor-elect Benj. W. Hooper, who will take his seat as chief executive of Tennessee in January, has inaugurated a project to build a State highway across the State the long way, from the extreme border in the mountains on the east to the Mississippi on the west, touching en route many of the leading cities and towns of the State and passing through the capitol city. The road will be about 600 miles in length.

The plan is to build the highway in two days, the work being done by thousands of volunteers and the material, wagons, tools and other things being donated.

Permanent Good Roads Body

INDIANAPOLIS, Dec. 12—Permanent organization was decided upon by the Indiana Good Roads Association before that body adjourned last week. A committee to accomplish this result was named as follows:

Indiana Engineering Society—C. C. Brown and Professor W. K. Hatt.

Indiana Bureau of Good Roads—J. C. Crabill and G. J. Pyle.

Indiana Manufacturers' Bureau—M. W. Mix and J. L. Ketcham.

Indiana Rural Letter Carriers' Association—W. J. Ward and J. O. Bonebrake.

Northern Indiana Good Roads Association—Lorenzo D. Hall and Cadmus E. Crabill.

Indiana State Trustees' Association—C. E. Pittinger.

Indianapolis Trade Association—C. G. Fisher and C. A. Bookwalter.

Indianapolis Commercial Club—William Fortune and Hugh Dougherty.

Indianapolis Board of Trade—Bert A. Boyd and William Scott.

Indianapolis Manufacturers' Association—H. H. Rice and S. C. Parry.

Indianapolis Automobile Trade Association—Fred I. Willis and F. O. Smith.

Indiana Conservation Society—William Holton Dye and Dr. H. O. Pantzer.

C. A. Kenyon will continue to act as chairman and Will J. Dobyns as secretary until the permanent organization is effected.

Aside from the matter of organization, this committee was empowered to appoint a sub-committee to draft a bill for presentation to the legislature, authorizing the formation of a State highway commission.

Dinner to David Bruce-Brown

David Bruce-Brown was tendered a testimonial dinner by the Benz Auto Import Company of America, in recognition of his services in winning the Grand Prize Race at Savannah, November 12, at the club house of The Automobile Club of America, Friday evening. The occasion brought together members of the Automobile Club, members of the Savannah Automobile Club, members of the Benz Auto Import Company, newspaper men and many personal friends of the winner of the Grand Prize.

The dinner was set in the grand salon.

Mr. Schwarzkopf, acting as toastmaster, introduced Robert Morrell, of the Motor Cups Holding Company, who made the presentation of the prize, calling attention to the spirit of the race. Mr. Bruce-Brown responded, paying a tribute to his competitor in the race, Ralph De Palma.

Mr. Neumier, selling agent of the Benz Auto Import Company in Germany, spoke and was followed by Thomas Moore, of New York; Charles Ellis, of Savannah; Major Humphrey, of the Post, and Ralph De Palma.

The dinner closed with a brief compliment by Mr. Froelich to the Savannah Automobile Club for the very efficient manner in which it conducted the race.

Long Stroke Motors

PARIS, Dec. 3—Two years ago the Automobile Club of France was at the head of the annual exhibitions held in the Grand Palais. Last year, under the influence of the slump and a theory that cars could be sold without a costly exhibition, no show was held in France. Later the leading manufacturers became convinced that they had been enriching a private club for ten years; they decided to break off all connections, to hold their own show, to give the Automobile Club of France an honorary position only, and to make the event a purely business exhibition. And it was this exhibition which was thrown open to the public this morning after a formal inauguration by President Fallières attended by practically all the members of the government.

Bloc casting of the cylinders has won its position. After seeing six cylinders as high as 3 1-2 inches bore cast in one bloc, it cannot be denied that this method has the approval of engineers The models are to be found on such important stands as Panhard, La Buire, Delage, etc. From 80 millimeters bore down it has now become the general rule to cast all four cylinders together.

With a view to keeping down length, a few firms have adopted V-casting for six-cylinder motors in preference to bloc casting in Indian file. The most notable example is a Delahaye, with a six-cylinder V-motor. Another example is the Aries Company with six-cylinder motors of 60 by 100 and 75 by 120 millimeters cast in one bloc with their cylinders inclined only 7 1-2 degrees from the vertical.

Although there are more six-cylinder motors than ever before and indeed very few firms that have not adopted a six, there is not a single instance of a four-cylinder model having been dropped to make room for a six, and not a single firm producing sixes exclusively.

Motor Truck Club to Hold Run

The Motor Truck Club, an organization famed for the purpose of conducting and administering reliability and economy tests of commercial trucks has elected the following officers: James Hemstreet, president; F. B. Porter, vice-president and E. A. Levy, secretary and treasurer.

The first contest to be staged by the club will be a run from New York to Boston and return, if the event obtains official sanction. It is planned to have the start during the second week in January and the finish is aimed to be simultaneous with the opening of the second week of the A. L. A. M. show.

The route proposed is about 500 miles long. Under the tentative rules submitted to the Contest Board the cars will carry the minimum catalogue load.

Tollgates Are Disappearing in Maryland

Tourists in Maryland will be more than delighted to know that the Baltimore and Frederick Turnpike has been purchased by the State Road Commission and that the tollgate from Baltimor to Boomsboro will be closed. The tollgates from Boomsboro to Hagerstown are already closed, owing to proceedings against the company for not keeping the road in repair.

It is common knowledge that the Pennsylvania and Maryland Turnpikes are often worse than dirt roads in other States, and the tourist wonders why he is compelled to dig down every few minutes for the privilege of destroying his tires. The spirit of progress has at last reached these benighted States and even in Pennsylvania some of the principal tollgates have been closed, the most notable instance being that at Trevose or La Trappe on the main Philadelphia Trenton Route, No. 221, as given in the Official Automobile Blue Book.

at the Paris Salon

The extension of thermo-syphon cooling is remarkable. Once adopted there is not a single firm having gone back to pump circulation, and the firms that have tried it on their smaller models have gradually extended it to the larger cars.

While abolishing the pump for the water circulation, most manufacturers have taken it up for lubrication.

Since the adoption of the Knight motor on this side, the demand has been for greater silence.

Worm drive and front wheel brakes, two strongly British features, have not met the approval of Continental manufacturers. Outside the English section there is not a worm drive at the show and there is an equal lack of front wheel brakes. Wire wheels are offered when specially requested, but they are not made a standard feature by any firm.

Continental manufacturers who clung to the chain for the highest powered cars have practically abandoned it in favor of shaft drive. There is no uniformity in rear axle construction and just as little in the matter of distance rods and torque stays.

Springs are lengthened, are generally of the three-quarter elliptic type, and in a few cases, as on the Rénault, have their seating under the axle, not above it. It it becoming common to shorten the upper portion of the three-quarter elliptic, in order to avoid side sway. Offsetting of the springs has also been adopted, especially for the platform type, this effectively preventing any tendency to roll when heavy bodies are carried. This method has also been adopted with the three-quarter elliptic type.

Probably 50 per cent. of European houses have adopted four-speed gear boxes in place of three speeds. On the Aries cars a chain-driven gear box has been adopted in place of spur gears. Sautter-Harle has produced a novelty in the form of a patented four-speed gear box with internally meshing teeth.

Will Attend the New York Shows

Detroit, Mich., Dec. 12—At least two large parties will go to New York from here to attend the metropolitan shows, the first leaving December 31 and the second on January 4. The Wolverine Automobile Club, which in the short space of five months has developed into a flourishing and influential organization, has made arrangements to have special cars attached to the regular Michigan Central train leaving here at 3:45 p. m. on those dates, and many of the club members are planning to take advantage of the accommodations.

Virginia Cars Must Be Retagged

Richmond, Va., Dec. 14—The licenses of all owners of automobiles in Virginia to operate their cars on the State roads or city streets, must be renewed on January 1, 1911, or they will be liable to prosecution. Under the recently enacted State law on the subject, these licenses must be renewed annually.

Grand Rapids Is Optimistic

Grand Rapids, Mich., Dec. 12—The second annual automobile show will be held here next February under the auspices of the Grand Rapids *Herald*. Local automobile men are looking for a larger exposition than last year.

The American Locomotive Company, makers of the Alco car will exhibit this year's Vanderbilt cup at the exposition. Last year's show was a remarkable success. It was largely attended, not only by people of this city, but by visitors from all over the country.

Peeps Through Auto Goggles at Distant Lands

AMERICAN makers and exporters of automobiles who wish to build up trade in Rio de Janeiro, South America, cannot hope to compete with European exporters unless they show their goods. This is one of the reasons why the United States has a very small automobile trade in the fine country of Brazil. The Americans do not display their wares in the right way. The majority of the large commercial houses are either German, English or French. Goods of all sorts are dear there. The agent of a foreign house who is a resident of Rio de Janeiro must needs sell his automobiles if he would live. Good American-made shoes, baking-powder and food are high. And so are automobiles. But not five per cent. of the machines owned and registered in Rio de Janeiro—and there are five hundred of them—were manufactured in the United States. One American who operates a machine in that city declares that the American manufacturers will not stand by their automobiles, and that he could not succeed in getting any guarantee from them. As the American cars seen there are not built on the metric system, it is impossible for the local machinists to supply duplicate parts. Americans will not guarantee to keep duplicate parts in Rio de Janeiro. The European manufacturers supply their South American agents with duplicate parts.

Upon his arrival in Germany, the foreign automobile tourist, if not provided with an International passport, is furnished with a special elliptical number-card. A fee of two marks (47 cents) is collected for one day's stay within the Kaiser's kingdom. Taxes on foreign-made automobiles are scheduled as follows: One day's stay, 71 cents; two to five days, $1.90; six to fifteen days, $3.57; sixteen to thirty days, $5.95; thirty-one to sixty days, $9.52; sixty-one to ninety days, $11.90. The days need not be consecutive. The days in which the automobile remains in the garage or in the repair shop or while it is absent from the country are deducted, provided that a card of admission, or a tax-card, has been stamped by the customs officer at the border, when departing from and returning to Germany.

American-made cars cut scarcely any figure in France. The policy of soliciting trade by means of catalogues and circulars does not avail there. The average Frenchman (especially the Parisian) is "from Missouri," and he demands to see the goods before investing his money in an automobile. Besides, the machine must be of the very latest type; and it should be exhibited in an important centre to attract attention. It is vitally essential that the salesman shall be able to describe the machine in the French tongue.

Johannesburg, South Africa, is open for a good, medium-priced type of motor-delivery wagon for city use. In order to enter the field for the sale of automobiles, it is necessary that the business should be carried on through local representatives, the ordinary South African invariably having his suspicion of the stranger.

The demand for automobiles in Great Britain is increasing, 203,227 machines being now registered in the United Kingdom.

A German has invented an armored automobile to fight airships. Technically it is known as an armor-clad automobile. It is fitted with a 60 horsepower gasoline engine. The machine is able to take steep grades. It is equipped with a two-inch rapid-fire gun as armament. The vehicle, including five men, the gun, ammunition and general outfit, weighs 7,350 pounds. One hundred shrapnels comprise the ammunition, each shrapnel containing 128 projectiles of hard lead, in addition to the explosive charge. The double shrapnels are wings of babbitt, in which teeth are cut which revolve outward, their purpose being to tear the canvas of the balloon when it is hit. A one-eighth inch thick nickel-steel armor covers the automobile. A maximum range of about four and three-quarter miles is attained.

The introduction of a new spring-wheel for motor vehicles is about to be introduced in England, it being the invention of a Britisher. Eighteen links comprise the periphery of the wheel. Triangular wooden block comprise the links; and while the bases comprise the periphery each of the pieces is hinged to a piece of metal which is firmly attached to a volute spring, ranging from four to five inches in length, according to the weight of the vehicle that has to be supported. The other ends of these volute springs, eighteen in number, disposed radially, are fixed to the hub, or, rather to a small inner wheel of the ordinary artillery pattern with twelve spokes. The springs are made of slightly tapered strips of special steel coiled spirally in such a way that the greater part of each turn is within the preceding one and that under sufficient compression the whole of the inner coils can be forced to within the outermost one. Blocks of a hard composition of fibre and gutta-percha compacted under pressure are cemented to the surface of the links which roll on the ground. These can be renewed when worn away at a cost of 97 cents to $1.22 for each wheel. The inventor has aimed to imitate the action of the pneumatic tire. An obstacle such as a stone does not cause the whole wheel to rise, as is the case with an ordinary iron-tired wheel, but it is, as it were, swallowed up, the link or links immediately effected yielding by virtue of the hinges and bringing into play the resiliency (re-bound) not merely of one or two of the springs, but of the whole of them round the entire circumference. The object of the invention is to apply the spring-wheel for use on heavy commercial vehicles and motor-buses, to give them the benefits of the pneumatic tire without the employment of a particle of rubber. It is claimed that with this spring-wheel it is impossible for a machine to side-slip, while the amount of dust sucked up is far less than is the case with the pneumatic tire. A pleasure car having these springs attached was run in London for experimental purposes and the wheels showed that they afford a remarkable degree of resiliency, even at high speed.

A very interesting species of sport which is gaining favor in Leicester, England, is tilting at the ring in a motor-car, society having taken to amusing itself by this means in a very lively fashion. The ring is suspended after the mode seen by the side of the merry-go-rounds, and the tilting is done while driving the automobile at good speed.

An automobile ambulance for use in the German army is one of the latest innovations. A frame is constructed, and in place of the covered wagon which prevails in cities there is no cover, the wounded or ill soldier being carried lying on the bunk, over which stand the guards and the surgeons.

Atlanta A. A. Elects Officers

ATLANTA, GA., Dec. 12—The Atlanta Automobile Association recently held its election of officers. The stockholders met first and elected the following directors: R. J. Guinn, L. J. Daniel, F. J. Paxon, Forrest Adair, V. H. Kriegshaber, F. J. Cooledge, J. D. Rhodes, C. E. Caverly, John S. Owens, E. P. Ansley, W. D. Owens, Mell R. Wilkinson, Asa G. Candler, S. P. Turman, Morton Smith, Asa G. Candler, Jr., B. M. Willingham, A. Montgomery, Brooks Morgan and John J. Woodside.

The directors then held an election and the following officers were chosen: F. J. Cooledge, president; John J. Woodside, vice-president; Asa G. Candler, Jr., secretary; W. D. Owens, treasurer.

It is uncertain what will be done with the Speedway. Owing to the fact that the A. A. A. has refused to give the local track the dates that it has wanted and because of the poor patronage on the unseasonable dates which were granted the Speedway, racing in Atlanta looks dubious.

Panama-Pacific Race to Be First of New Year

SAN FRANCISCO, Dec. 8—After months of negotiation and useless talk, it appears at last that San Francisco is to have a second Portola road race. It is to be known as the Panama-Pacific road race, because of the boom here for a Panama-Pacific Exposition in San Francisco, and the date set is January 2d. The course is the same one in Alameda county that was used last year, although it has been cut almost in half. Most of the crack cars that took part in the recent Santa Monica road race will be entered, and in addition there will be plenty of local entries, judging from the present prospects.

The Portola road race was originally scheduled for October, but in the absence of President M. H. de Young of the Automobile Club of California, it was allowed to lapse, after permits and all the general arrangements had been made. Several attempts were made by local dealers to fix up the contest, but without avail until Dick Ferris, of Los Angeles, took the matter in hand.

The Portola Racing Association was formed by the San Francisco dealers, and the Oakland Automobile Dealers' Association is also taking a prominent part, making all the arrangements for the course and raising the greater portion of the money that will be needed to pull off the race successfully.

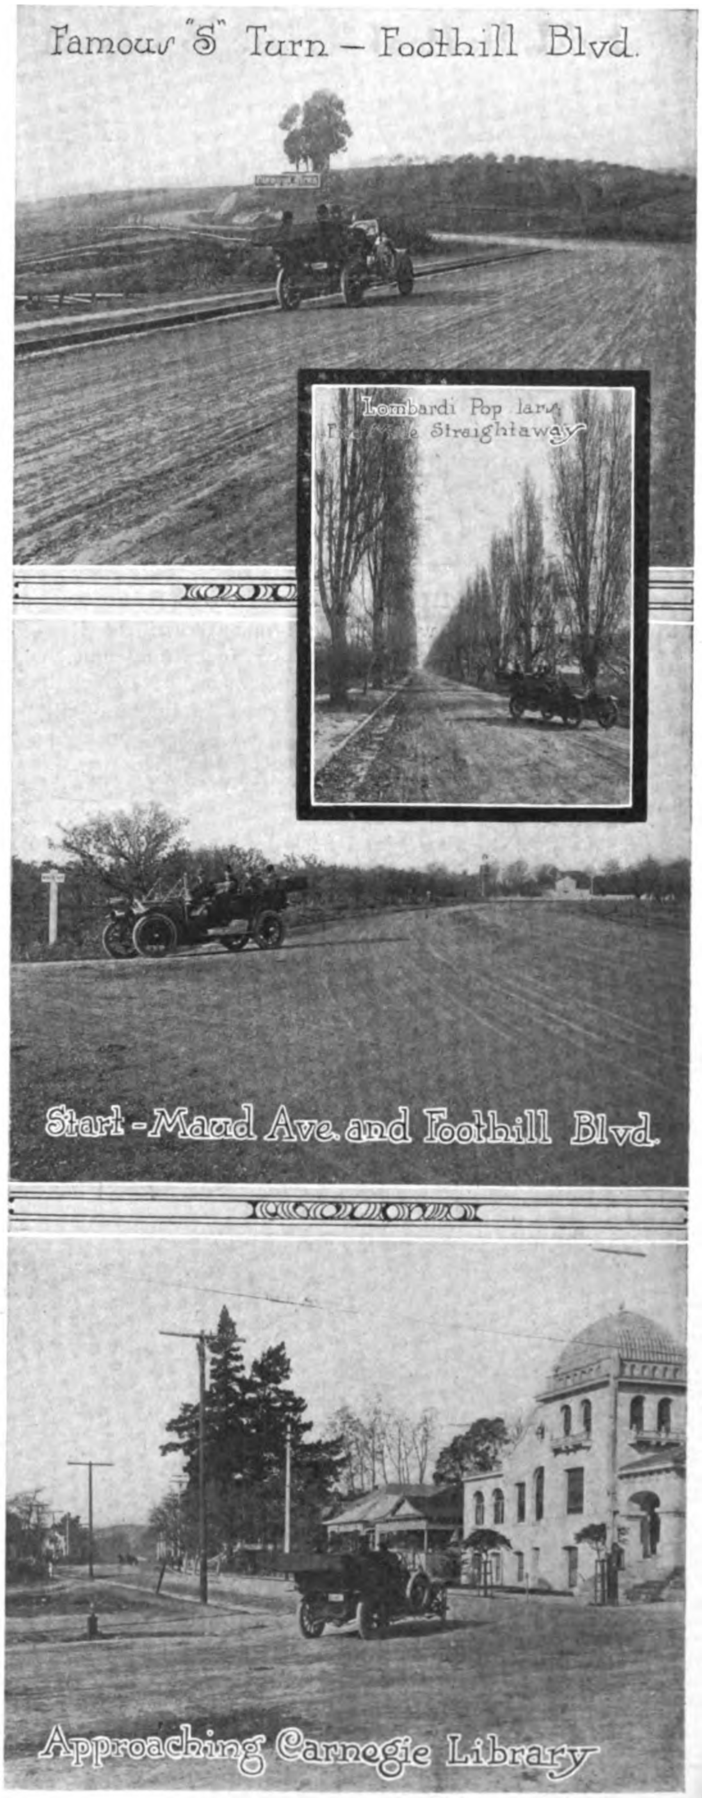
The course chosen is said by some automobile critics to be the finest in the United States. Almost one-half of its 10.923 miles is embraced in the famous Foothill Boulevard, a magnificently constructed piece of roadway that has been called the finest in California. It is as smooth as a billiard table for most of its length, and there is no limit to the speed that may be attained, beyond the capabilities of the cars and the attention that must be paid to the few turns along the course. These turns, however, are few, and are generally so broad and sweeping that they may be taken practically at top speed.

The course is oblong in shape, each of the long stretches being about five miles in length. The two connecting stretches at the ends are very short. One stretch, as described, traverses the Foothill Boulevard, while the second stretch of five miles is virtually a straight line between the towns of San Leandro and Haywards. A good part of this stretch is between two lines of magnificent poplars. The connecting links of the oblong are over well-paved streets in the two towns. There are three or four right-angle turns to be negotiated. It has been decided not to bank any of these, it being Western experience that more accidents are caused by the reckless taking of banked turns than by forcing a man to use his best judgment and slow down for level turns. In several cases turns will be modified along the course; in fact, everything possible will be done to secure the greatest possible speed, which is regarded by the automobile men as the greatest factor in the contest.

There are to be three classes in the race—light cars, heavy cars and free-for-all. The light car race is to be in two divisions, according to displacement. The length of the course for this race will be 98.3 miles. The heavy car race will be for machines from 300 cubic inch displacement up to 600 inches, without weight restrictions. The length of the race will be 152.9 miles.

The free-for-all will be without restrictions, and the distance will be approximately 250 miles. To the winner of the small car class will go 70 per cent. of the entry fees, to the second car 20 per cent. and to the third car 10 per cent. For the winner there will also be the $1,000 trophy donated by the Oakland *Tribune*.

In the big car event there will be the same division of the entry fees among the first three cars, while in addition the winner will receive the St. Francis Hotel trophy, valued at $2,500, one of the handsomest prizes of its kind ever given. The entry fee in the free-for-all will be $250, and this will be divided on the same basis between the first three cars.



News of Maker and Dealer in Many Fields

CONFIDENCE in the continued prosperity and growth of the automobile industry is evidenced in the announcement by The Thomas B. Jeffery Company of the completion of a new giant electrical power plant for the Rambler factory at Kenosha, Wis.

The new engine room covers 6,000 square feet, and the equipment has been so installed that its capacity may be doubled at any time. There are four power units, including a 1,200-horsepower Cross Compound non-condensing alternator, with three other units of 500, 125 and 100 horsepower each.

The boiler room covers an area of 8,000 square feet, and includes three boiler units of 500 horsepower each, with automatic stokers. A complete coal-handling equipment is now being added. Each of the boiler units is equipped with an individual steel stack, five feet in diameter and 126 feet high. The area of the boiler room permits of a future complement of 3,500 horsepower, or seven such units as are now installed.

The construction of the entire group forming the power plant is of concrete and steel trusses, with fireproof tiles for roofs. In addition, five new buildings have been added to the Rambler plant during the year.

Regal Abandons Retail Business

Edward H. Barnum, who has been manager of the Regal-Detroit Auto Company at 1720 Broadway for a long time, has announced that the Regal Motor Car Company of Detroit has decided to give up selling at retail in several of the large cities. In pursuance of this idea, the Regal-Detroit Auto Company has been abandoned and Mr. Barnum has been named District Manager of the parent company with offices in the Randall building.

The territory allotted to Mr. Barnum consists of New York, Connecticut and New Jersey and he is busy at present appointing agents to represent the Regal in various places. The New York agent for the car has not been selected as yet.

Mr. Barnum has secured adequate warehouse facilities to handle and store his line and expects the new plan to work out satisfactorily. The reason for the change is the apparent possibility of economies in the routine of sale.

Electrics Grow in Popularity

SYRACUSE, N. Y., Dec. 12—There are evidences that the electric vehicle trade is being pushed in Syracuse. S. S. Daub, Jr., representing The Broc Electric Vehicle Company of Cleveland, is in the city and intends to establish an agency here. T. E. Willis, the Syracuse agent for the Oldsmobile, has taken over the Baker Electric and it is reported that several other agents, who have not heretofore carried electrics, will take on leading makes in the near future.

Meanwhile, a display of leading electric propelled vehicles, given in the Peerless show room on Noxon street, is attracting considerable attention from the public.

Kelsey Company Widens Factory

HARTFORD, Dec. 12—The C. W. Kelsey Manufacturing Company, builders of the Motorette, have leased the entire north wing of the Cheney silk mills at Morgan and Market streets.

The Kelsey plant was first located on the second floor of the north wing; now the whole wing will be devoted to the usage of the Motorette builders. An inclined runway was recently built, this being of about 28 per cent., and it provides a simple climbing test for the cars. The Motorette is to be shown at Chicago, New York and Boston.

Gramm Factory Is Completed

TOLEDO, Dec. 12—The Gramm Motor Truck Co., has just completed its big $300,000 plant at Lima, O., and General Manager B. F. Gramm, has announced the removal of the business offices from Bowling Green to that city, the change to take place to-day. The plant will be in operation in January.

Tests of the machinery and electrical work are now being made. The capacity of the plant is expected to be one complete truck a day after the first six months.

Buffalo Trade Body Board

BUFFALO, N. Y., Dec. 12—The Automobile Trade Association of Buffalo held its annual meeting, election and banquet at the Hotel Iroquois last week. The following were elected to the directorate: Chas. F. Monroe, John J. Gibson, J. C. Cramer, Ralph E. Brown, A. W. Meyers, E. E. Denniston and George Ostendorf.

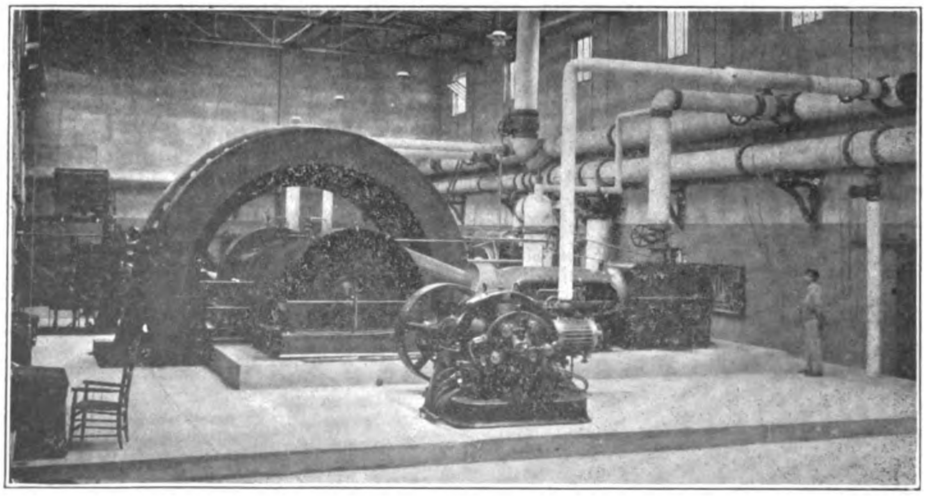
Four New Ohio Concerns

COLUMBUS, O., Dec. 12—The Vickers Motor Car Company of Coshocton, Ohio, was incorporated with an authorized capital of $25,000 to manufacture and sell all kinds of motor cars and accessories by Eugene H. McMasters, Carl B. Vickers, William C. Myers, Homer H. Kline and J. G. Kline.

The Imperial Motor Car Company, of Cincinnati, Ohio, was incorporated with an authorized capital of $150,000 to operate garages and sales agencies and handle accessories by Harry C. Strauss, Frank H. Lamb, Jacob Straus, B. Chatten and Joseph C. Kinze.

The Callen Co-operative Wheel Company, of Cleveland, Ohio, was incorporated with a capital of $50,000 to manufacture and sell vehicle wheels of all kinds and automobile accessories by Charles Callen, Clara L. Callen, Edwin A. Callen, George A. Callen and C. Cole.

The Western Compound Rubber Company, of Cincinnati, Ohio, was incorporated with a capital of $100,000 to manufacture and sell rubber articles by Henry W. Jones, John E. Pitts, J. Albert Mauss, Robert F. Jones and Harry F. Taylor.



New steam power plant at the Rambler factory at Kenosha, Wis.

News in Brief from the East, West and South

Hartford, Dec. 12—The Stearns, heretofore unrepresented in this section, has been taken on by Richard H. Skinner with office in the Connecticut Mutual building.

Hartford, Dec. 12—Harry E. Fields, vice-president of the Hartford Rubber Works Company, has resigned and on January 1 will become manager of the New York office of the Rambler.

New York, Dec. 12—Frederick R. Simms, president of the Simms Magneto Co., returned on the steamship *Campania* and is now actively engaged in the organization of the new works at Bloomfield, N. J.

Akron, O., Dec. 12—John W. Kelly has taken the position of general factory representative with the Swinehart Tire & Rubber Company, and will give his special attention to solid tires for truck and pleasure electrics.

New York, Dec. 12—A. H. Whiting, E. C. J. McShane and Gilbert Burdett have formed a combination to handle the Cunningham line in this city. All three were formerly identified with the Dayton Motor Company.

New York, Dec. 12—The New York home of the Hudson will be removed January 1 from its present location to Fifty-fourth street and Broadway. The A. Elliott Ranney Company, which has the agency, has been cramped for room for many months.

York, Pa., Dec. 12—Belmont S. Walters, who left the Pullman employ some time ago and signed with the Parry Automobile Company of Indianapolis, Ind., has returned to his former position, and will travel through the middle West and Southwest.

Toronto, Can., Dec. 12—The Goodyear Tire & Rubber Company, of Canada, recently acquired the plant of the Durham Rubber Co. of Bowmanville, Ontario, who manufactured an extensive line of mechanical goods, and enjoyed an enviable reputation.

New York, Dec. 12—The executive offices of the Licensed Automobile Dealers of the City of New York have been removed from the Thoroughfare Building to the eleventh floor of Motor Hall, 250 West Fifty-fourth street. Charles A. Stewart is the general manager.

New York, Dec. 12—Ralph DePalma, who has driven Fiat racing cars with much success, has been released from his contract with that company and will act as a free-lance during the coming season. He will drive a car of another make in the 24-hour race at Los Angeles on Christmas Day.

Baltimore, Md., Dec. 12—Among the recent members of the Automobile Club of Maryland are: Messrs. W. A. Fingles, Robert Crain, John Pleasants, George T. Phillips, G. E. Kraft, F. Baurenschmidt, J. Alexis Shriver, Dr. Lewellys Barker, Mrs. Charles M. Lanahan and Miss Dolly C. Fulton.

Seattle, Dec. 12—"Farthest North Evans," of Alberta, Canada, or rather Edmonton, Alberta, has recently completed a trip in a Cadillac car from the last Hudson Bay trading post north of Athabasca to Edmonton, a distance of 200 miles. Mr. Evans is the Coast representative of the Cadillac Company.

Chicago, Dec. 12—The annual century run of Ford cars will be held New Year's day as usual. The start will probably be from the headquarters of the Chicago Motor Club to Elgin and Lake Geneva. Last year 17 cars, not all of Ford make, took part in the run. Luminous confetti to mark the course was a feature of past runs.

Philadelphia, Dec. 12.—George W. Hipple, Philadelphia representative of Chalmers Motor Company, has been elected treasurer of the Automobile Trade Association of Philadelphia This association of motor car and accessory dealers now has a membership of 39 automobile dealers, 21 dealers in accessories and supplies and 90 contributing members.

Indianapolis, Dec. 12—J. P. Primrose has accepted the position of assistant sales manager of the Willys-Overland Company with offices at Indianapolis. This position was formerly held by William D. Myers, who is now assistant sales manager of the Marion Sales Company, also located at Indianapolis.

Los Angeles, Cal., Dec. 12—The world-touring Hupmobile party has arrived in Los Angeles, having made its trip from Detroit here in 36 days. The party was met by W. M. Mason, the local representative, and party in San Bernardino, the escort being augmented in Pasadena by many cars.

Toledo, O., Dec. 12—The Standard Automobile Company has opened a branch on Madison avenue, for the exclusive handling of Packard automobiles. William Love, who for three years prior to his connection with the present company was associated with Kirk Bros. Auto Company, is in charge of the new branch.

Altoona, Pa., Dec. 12—S. I. Fries of this city celebrated his 76th birthday last Wednesday by driving his car about thirty miles over the country roads. Mr. Fries lays claim to being the senior motorist of Pennsylvania. He has driven an early Franklin model for over five years. He and Mrs. Fries are planning to make quite a long tour next Summer.

Richmond, Va., Dec. 12—The Merchants' Motor Delivery Company Incorporated, is the latest automobile concern to secure a charter here. Its principal offices will be at Richmond. Capital stock: Maximum, $25,000; minimum, $5,000. Objects and purposes: to operate a motor transfer for the City of Richmond.

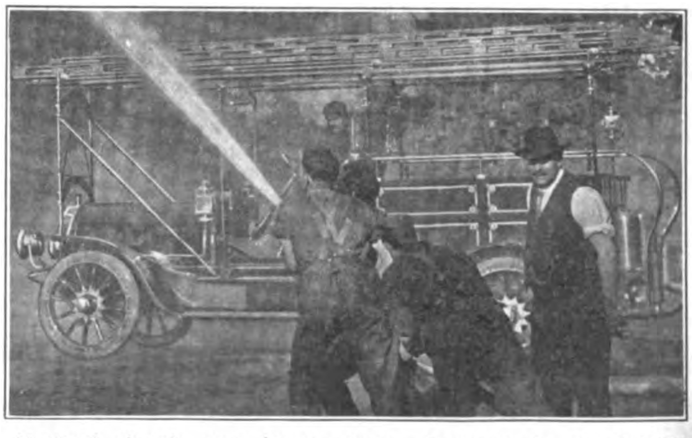
Omaha, Dec. 12—The Marion Automobile Company has started in business in Omaha, and has a garage on automobile row. C. W. McDonald, formerly western manager of the Sandwich Manufacturing Company, resigned his position to become manager of the automobile company. The firm will have the agency for Marion cars for all of Nebraska, Northwestern Missouri, and Western Iowa. It will also handle the Overland cars locally.

National Car Fitted for Fire Fighting

The accompanying illustration is of a National car as made by the National Motor Vehicle Company, of Indianapolis, Ind., showing the same as it is fitted out for fire fighting by the Howe Company and dedicated to service at Paterson, N. J., where it was put to the test, a report of which was made on November 1 last.

For four hours the motor-driven pumps forced 413 gallons of water each minute through the 1 1-4 inch smooth-bore nozzle of the "deluge" set and hurled the water 223 feet.

The wonderful possibilities of the automobile fire engine were recently demonstrated in the presence of Mayor McBride of Paterson, Fire and Police Commissioners Ryan, Hopson and Mallon, Board of Works Commissioner Milson, Chief John Stagg and several other interested officials at East Twenty-fourth street and Eighteenth avenue.



National chassis used by the Howe Company for fire-fighting purposes at Paterson, N. J.

Among the Accessory Makers

THE ROYAL DUPLEX BRAKE; BALZER AIR-ON-TAP; BULLDOG CARBON REMOVER; SELF-CLEANING SPARK-PLUG; THE CASGRAIN SPEEDOMETER

RELIABLE DISTANCE RECORDER

The principle upon which the Casgrain Speedometer (Fig. 5), which is being marketed by the Casgrain Speedometer Co., 53 State street, Boston, Mass., is built is well known in mechanics. It simply utilizes the power of a rapidly moving body of liquid, similar to the manner of the old waterwheel. The application of this liquid force in a speed indicator is original.

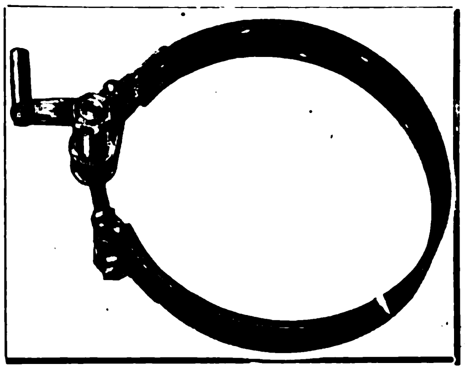


Fig. 1—An effective band brake

The outer casing is of heavy brass, cylindrical in shape. Inside this brass shell the dial, its operating mechanism and the liquid operating medium are all contained in a sealed glass cylinder.

Motion is conveyed to the liquid—a refined mineral oil—by means of four steel paddles which are rotated by the driving mechanism. The amount of liquid is a fixed quantity. The size of the confining cylinder is always the same. There is no possible chance for wear or alteration in the size of the rotated paddles. Therefore the result must always be the same.

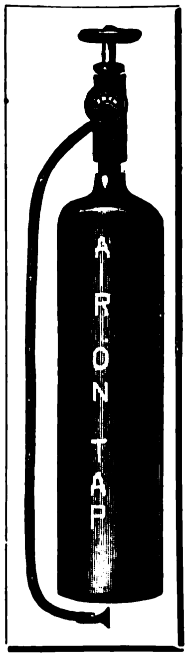

Fig. 2 — Saves time and energy

All road shocks or engine vibrations are absorbed by the liquid. No mechanical connection exists between the driving mechanism and the dial.

A flexible shaft connects the instrument with the front wheel. This shaft gives a positive drive.

It shows on its dial an individual, large black figure for every mile, plainly readable under all conditions.

HANDY CARBON REMOVER

The accessory depicted in Fig. 3 represents a useful and quick method of removing the carbonic deposit that forms on the top of the piston and in the head of the cylinder and is used in the following manner: The flexible coil chain, made from tough soft steel wire, is inserted in the spark plug hole after the latter has been removed and a small quantity of kerosene is then inserted to assist the scavenging. The plug is reinserted and the engine run for several minutes. The ignition in the cylinder in which the operation is being carried out must be cut off and after being run at a moderate speed the motor can be shut off and the wires removed with the hooked tool through the spark plug hole. The chains are made in two sizes and either one or the other of these will adapt itself to any motor with poppet valves. These chains are manufactured by E. S. Michener, Newcastle, Pa.

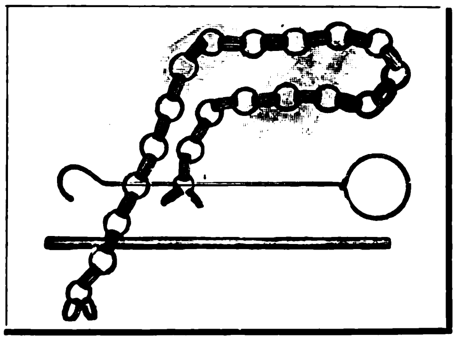

Fig. 3—"Bulldog" outfit for removing carbon

THE NEW DUPLEX BRAKE

The new brake shown in Fig. 1, designed for machinery and vehicles where the braking effect is relatively large compared with the operating force, is manufactured by the Royal Equipment Company, of Bridgeport, Conn. The retarding effect is equal in both directions of rotation of the drum. The well-known wrapping or winding effect of a flexible band surrounding and in contact with a rotating drum is made use of in this brake. One end of the flexible band is fixed, while the operating force is applied to the other end in the direction of the rotation of the drum.

AUTOMATIC CLEANING SPARK PLUG

The principle upon which this plug (Fig. 4) operates is compression of the gases in the brass bushing. A chamber of some depth is constructed, the outlet to which is six small holes at the bottom of the chamber, so drilled as to point toward the tapered mica tube insulation. When the compression takes place in the cylinder an equal amount of compression also takes place in this brass chamber. When the compression is released in the cylinder the gases rush out of the compression chamber of the plug with such force as to drive away all deposits on the tapered insulation. In actual practice these plugs have worked satisfactorily. The New York Mica & Manufacturing Co., Auburn, N. Y., are the makers of this plug.

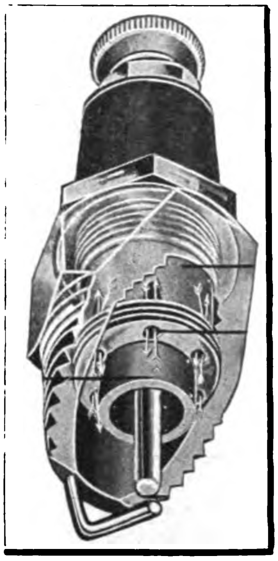

Fig. 4—A spark plug that cleans itself

LABOR-SAVING AIR PUMP

As the name "Air-on-Tap" indicates, the cylinder illustrated in Fig. 2 can be carried on the car to save the labor of pumping while on the road. The tank is tested to 4,000 pounds hydrostatic pressure to insure security. The makers, Gus Balzer Co., 1777 Broadway, N. Y., have a charging plant which should be useful to local autoists.

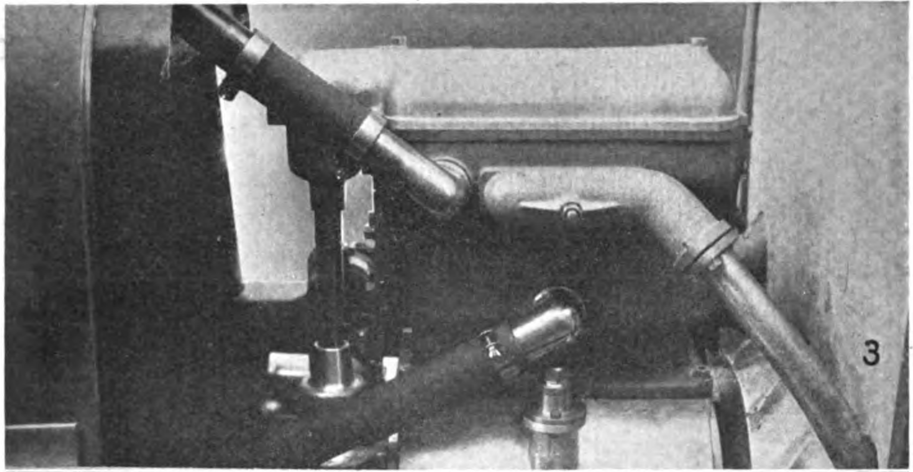
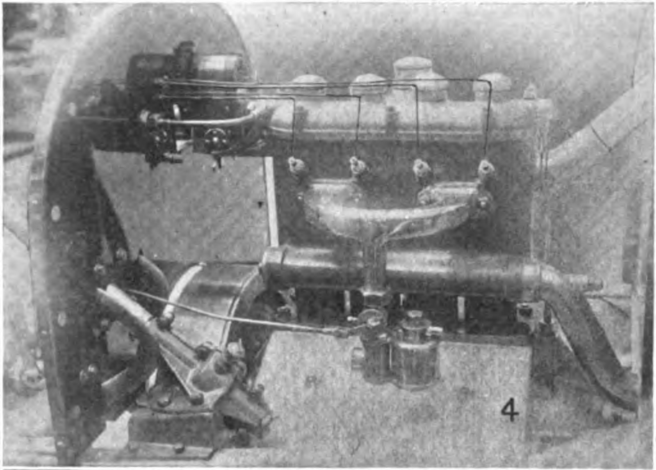
Vol. XXIII New York—Thursday, December 22, 1910—Chicago No. 25

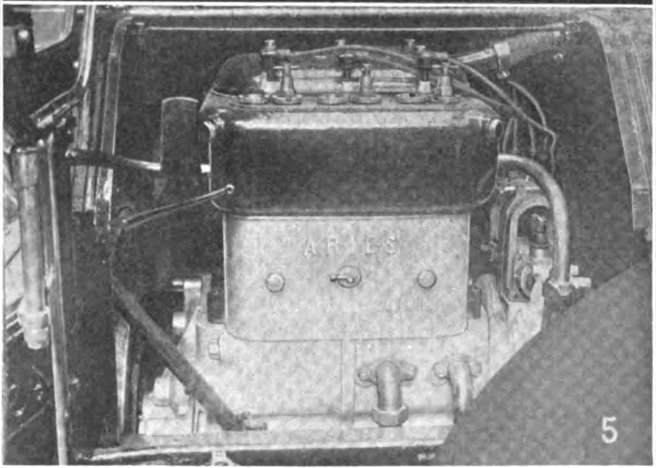
THE AUTOMOBILE

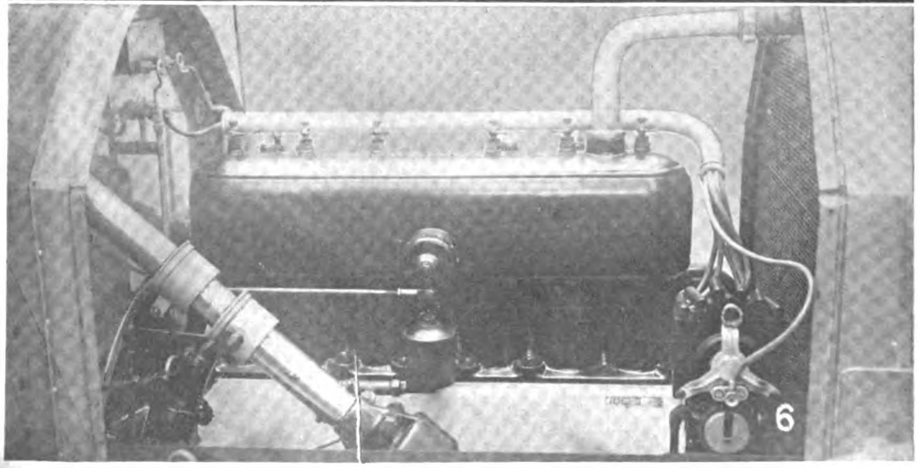
PARIS SALON

PARIS, Dec. 12—The motor at the Paris Salon having the highest ratio of stroke to bore is the new four-cylinder Sizaire-Naudin, the dimensions of which are 2 7-10 by 6 3-5 inches bore and stroke. This gives a ratio of 2.42 to 1. But the long stroke is not the only interesting feature of this motor. The cylinders are a single casting, with valves on op-









posite sides, stems enclosed, and presenting a square box appearance. On the former model, of 2 7-10 by 4 7-10 inches, the valves were superimposed, with a single camshaft. The change to two camshafts has allowed a better position of the sparking plug and an increase of the valve diameter, the area now being 2 1-5 inches. This is probably the largest area of any standard motor on the European market.

It is significant to note that the ball bearings formerly employed on this firm's four-cylinder motors have been dropped for the plain type. The crankshaft is of original design, having only two throws; thus pistons Nos. 1 and 2 are connected up to one crankpin, and are at 180 degrees to pistons 3 and 4. Counterweights are carried on the crankshaft. Tubular connecting rods are employed, and light pressed steel pistons are used. The lower half of the connecting rod bushing is common to two connecting rods. A silent chain is now used for driving the two camshafts. The housing at the forward end of the motor carries two chains, one being on the crankshaft pinion and the two camshaft pinions, and the other taking the drive from the mainshaft to the magneto shaft.

To facilitate timing of the motor, a hole is bored through each pinion and a corresponding hole in the wall of the crank chamber. When the pinions have been locked by a fine bolt passed through these holes, it is only necessary to put on the chain to have the correct timing. Cooling of the motor is by thermo-syphon, but instead of five rows of copper tubes the radiator is now composed of a single row of narrow tubes the full depth of the radiator. Each tube is about 2 1-2 inches in depth, from front to rear. The belt-driven fan is a one-piece aluminum die casting. In place of simple splash lubrication with dippers on the connecting rod ends, as used on the ball-bearing motor, forced feed lubrication is now employed. The pump is driven off the main shaft, drawing its supply of oil from the base chamber and delivering it by internal leads to the two main bearings and through the hollow shaft to the connecting rod ends. The oil filler is on the left-hand or exhaust side of the motor. Attached to the cap is a broad fiber gauge descending into the base, and giving the oil level on being withdrawn. The space between the crank chamber and the side frame is enclosed, and in order to reduce all visible piping to a minimum the intake water

3—Bozier 4-cylinder Monobloc exhaust side

4—Cottereau valveless motor, carbureter side

5—Aries 6-cylinder V-motor in one casting

6—Fiat 6-cylinder motor in one casting. Note entire absence of intake pipe from the radiator is carried under this plate until it reaches the center of the cylinder bloc; thus there is only a 2-inch length of piping visible.

Although rated at 14 horsepower only, the motor is declared to have given 34 horsepower on bench tests.

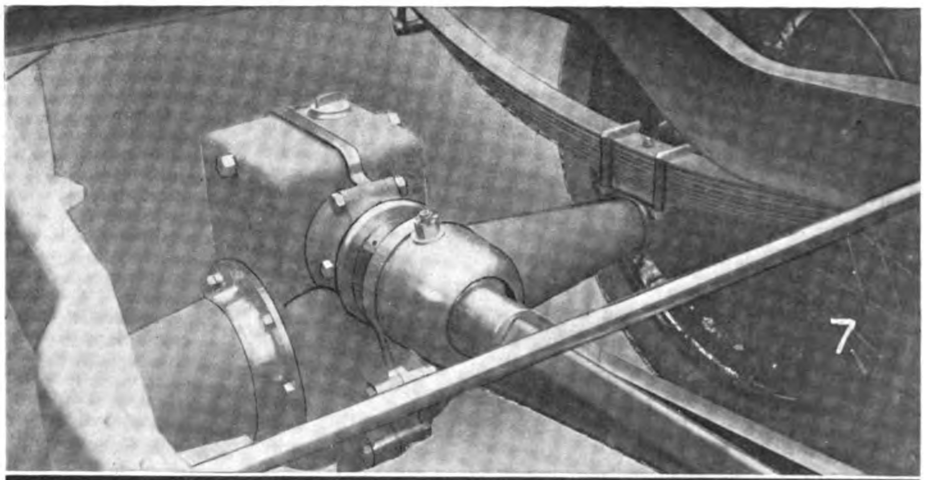
After the Sizaire-Naudin the longest stroke is to be found on the Hispano-Suiza, a motor of 80 by 170 millimeters (3.1 by 6.6 inches bore and stroke) or a ratio of 2.12 to 1. Then follow at least half a dozen makers with a ratio of 2 to 1, prominent among them being Gregoire with 80 by 160 and the Peugeot and Sautter-Harlé with 75 by 150 millimeters. The rest average 1.6 to 1. This is sufficient to prove that the long-stroke motor is accepted unhesitatingly by Continental manufacturers.

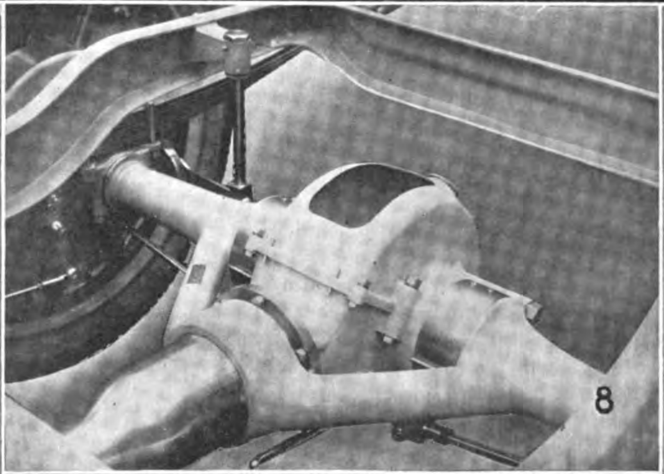
An important feature of the show is the en bloc casting of motors with all water piping and intake and exhaust manifolds. Two years ago the bloc casting was confined to four-cylinder motors of not more than 3 1-4 inches bore.

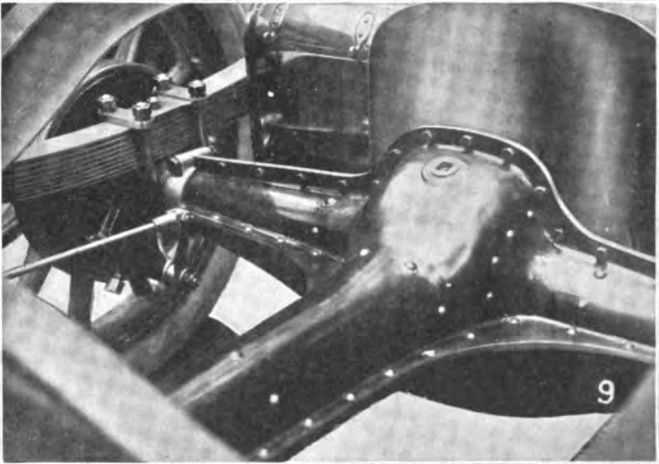
Almost without exception this type of motor is now a single casting, generally with the intake manifold as an integral part, but very frequently with a separate exhaust manifold. But an extension has been made so that this year it is common to find six-cylinders in one casting, some of them having a bore as high as 3 1-2 inches. Examples are to be found on the new Panhard of 80 by 120, the new Fiat of 80 by 130, a Delage of 65 by 125, a new La Buire of 90 by 130 and a Rochet-Schneider of 95 by 130 millimeters bore and stroke. This motor is the largest six-cylinder in one casting to be found in the show.

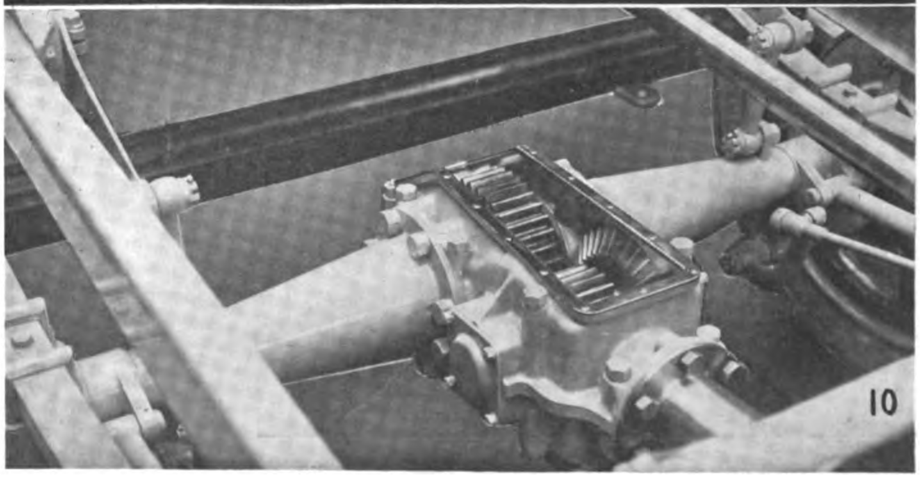
Generally, a single length of piping connects the carbureter with the water-jacketed gas passage cast with the cylinders, and it is a very common practice to place the carbureter on the side opposite to the valves. This is found on the new Rochet-Schneider, the La Buire and on the Fiat. But the Fiat people have gone further than any other maker by abolishing all intake piping.

A remarkably united movement is shown towards carrying the magneto and water pump across the front of the motor, the two being worked off one shaft. This is the system adopted on the six-cylinder Fiat, on the Berliet models, on the Rochet-Schneider, Lorraine-Dietrich, Mors, Sautter Harlé and others. The change appears to have been made with the object of giving greater accessibility to the valves and carbureter.









7—Darracq worm-drive rear construction

8—Rear axle on the Peugeot car

9—Rear axle on Isotta Fraschini car, rear housing and torque rod in two stampings

10—Double reduction rear axle on Lion Peugeot light car

On the smaller models produced by Charron a couple of years ago thermo-syphon circulation was employed with a belt-driven fan in the radiator. This has been abolished for all models. Another firm having made the same change is Bayard-Clement, all the touring cars now having thermo-syphon, no fan, and Renault type of bonnet. Another notable example of the abandonment of the pump is to be found on the new six-cylinder Leon-Bollee. Here the radiator remains the same, and a belt-driven fan is employed to assist the cooling. Although there are plenty of firms having followed the Renault lead in the matter of cooling, very few have made the additional change of placing the radiator back of the motor.

Evidence is not difficult to find of the growing popularity of forced feed lubrication. There are two main systems, one in which the oil is pumped from the crankcase sump to a sight feed or feeds, and then allowed to drip to the main bearings and the connecting rod ends, as on the Charron and the long-stroke Gregoire, or the increasingly popular method of delivering it to all parts under pressure. It is this latter method that has just been adopted by Renault for all 1911 models. The crankshaft is bored to allow the oil to be carried to the connecting rod ends. When this method is adopted all external oil pipes are abolished, examples being the new Sizaire and the latest type of Renault, the oil pump in each case being within the crank-chamber and the oil leads internal. Renault has even abolished the lead to the pressure indicator on the dash by placing a sight tube on the front of the motor. Easy dismounting of the pump has frequently been taken into consideration, as is shown by the removal of this organ from the rear to the front of the camshaft on the Charron models. Although within the crank chamber, provision has generally been made for dismounting the oil pump from the base by a trap in the undershield, as on the Gregoire and the F. L. In a few cases, however, the pump is external, and yet at the base of the crank chamber, as on the Sautter-Harlé six-cylinder model and the Chenard-Walcker new four. The claim made is that in such a position the pump has oil to draw upon until the last drop has been consumed, and that it is more readily examined and dismounted than when within the chamber. There appears to be a tendency, too, to supply oil under pressure to the gearbox and rear axle. This is done on the Hispana-Suiza cars and on the Charron. In this latter case the oil is delivered under pressure to the sight feed, then allowed to drip to the gearbox, from which there is a direct connection through and a constant level maintained with the rear axle. Renault, on the other hand, has preferred to provide for separate lubricating of the gearbox and rear axle by placing large and easily opened fillers on each of these organs. The gearbox filler on the side of the frame member, with a suitable lead, has been abandoned, and the same system has been taken up by Berliet, who has an oil box on the frame with leads to the universal joint, gearbox and rear axle and instructions to fill every day.

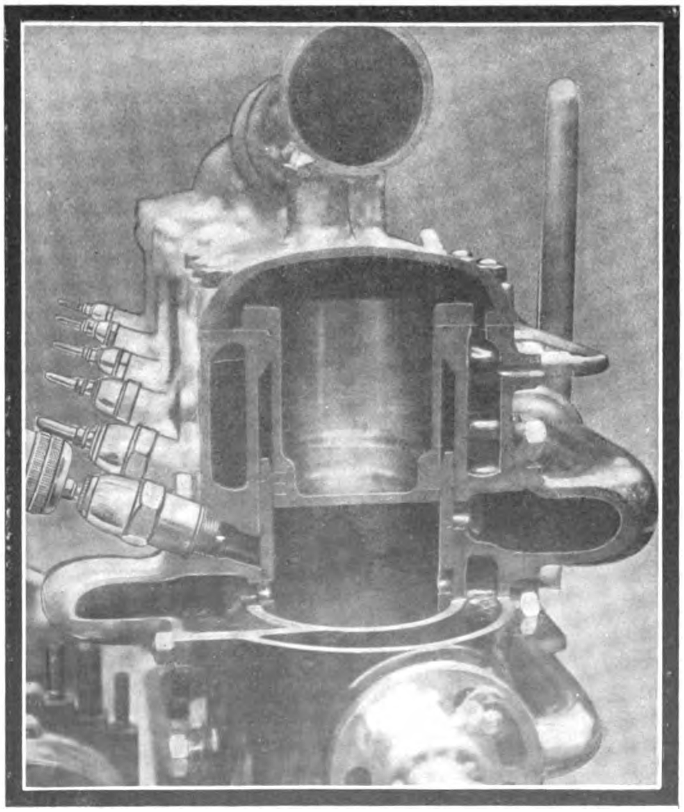


Fig. 11—Section of the Rolland Pilain sleeve-valve motor

Makers are moving rather cautiously toward the adoption of ball-bearing crankshafts. Where they have been taken up it has generally been for small motors, and with the object of gaining space. Thus, Delage has fitted a central ball bearing on his compact six-cylinder because he has not sufficient space for a plain bearing. Darracq has adopted ball bearings for the popular 80 by 120 millimeters model; Sautter-Harlé, a firm producing a small number of very high-grade cars, employs two-ball bearings and a central plain bearing for a six-cylinder motor of 75 by 150 millimeters.

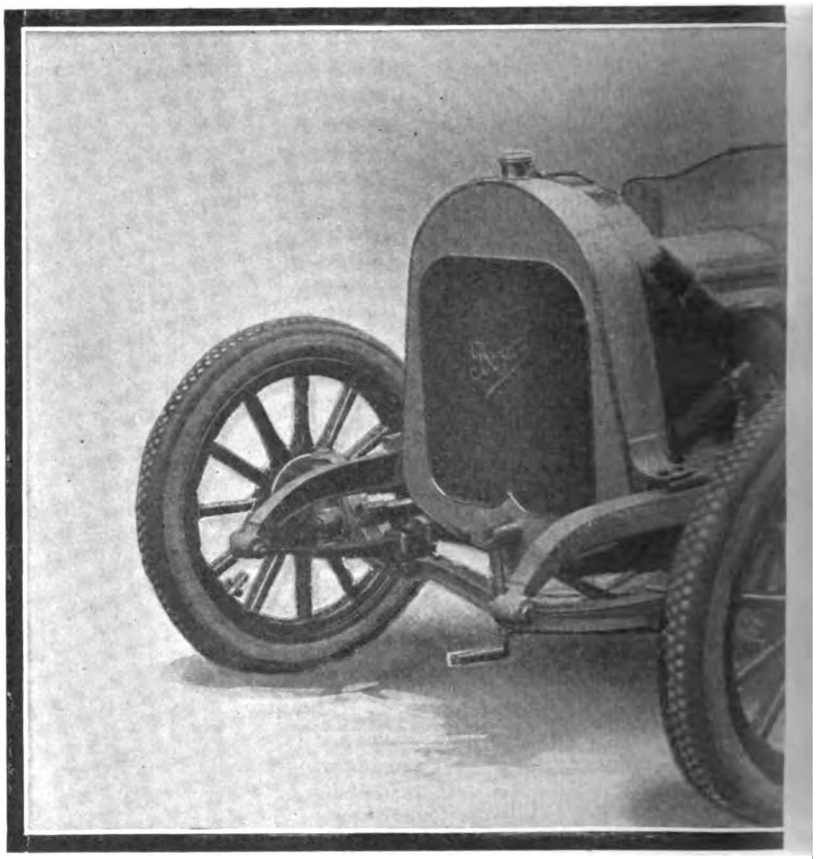

Fig. 12—Bozier four-cylinder light chassis.

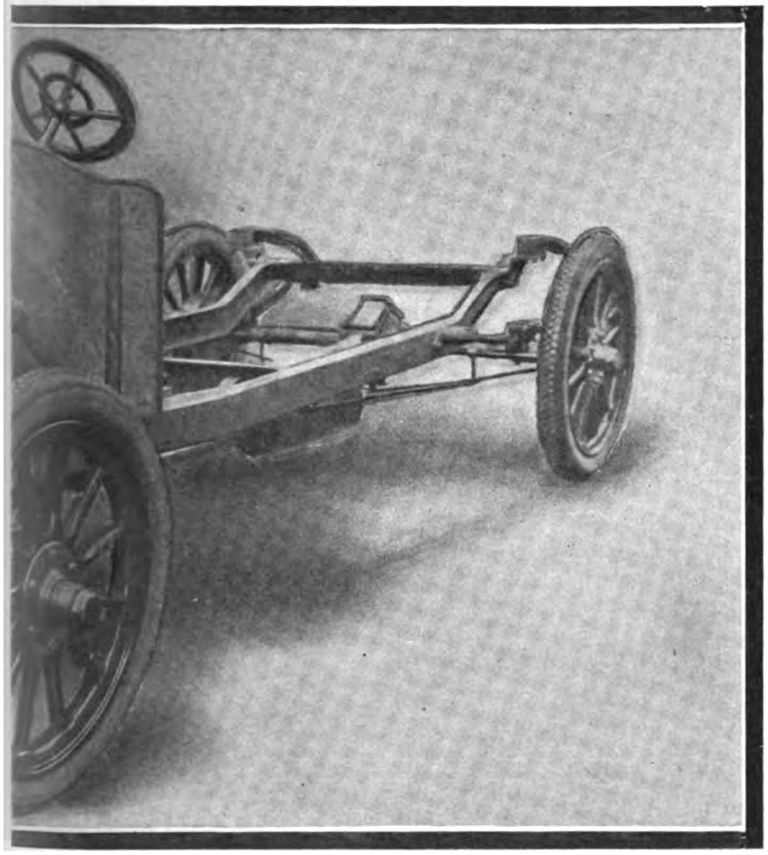
Berliet has made an attempt to get away from the poppet-valve motor by adopting piston valves, there being two for each cylinder, one serving for the intake of the charge and the other for the exhaust. The model shown is a four-cylinder in one casting of 3.9 by 5.5 inches bore and stroke. The eight piston valves are connected up to a secondary crankshaft driven by spur gearing off the mainshaft. Everything is enclosed; intake and exhaust manifolds being cast with the cylinders and all water pipes being integral.

A motor on somewhat similar lines has been brought forward by Sautter-Harlé. It is a four-cylinder, two-cycle, with the lower portion of each piston acting as aspirator and compressor. For this purpose it is of greater diameter than the upper portion. The motor carries eight piston valves, connected up to an auxiliary crankshaft. The charge is aspired through an intake piston valve and on the compression stroke passes through a second piston valve into a compression chamber from which the cylinders are fed. During this stroke the intake valve has, of course, been closed to prevent the charge being driven back into the carbureter. A patented feature of this motor is that the piston valves only operate at half engine speed, whereas poppet valves when employed for two-cycle motors generally work at engine speed.

Considerable interest was shown in a slide valve motor shown by the Rolland-Pilain Company. Within the cylinder is a single sleeve fitted with three deep compression rings, and having two ports, one for the intake and the other for the exhaust. In addition to the two openings in the cylinder wall communicating with the intake and exhaust, there is a third one entering into a pocket carrying the sparking plug. The cylinder head differs considerably from that employed on the Knight motor. It is really a cylindrical shaped head descending into the body of the cylinder and of slightly less diameter than this latter.



ith encased valves and upswept frame

On the Mustad motor, instead of the concentric sleeves of the Knight, there are two semicircular sleeves, serving respectively for the intake and the exhaust, and operated independently.

The Henriot is a rotary-valve motor, an example of which is shown in a small four-cylinder monobloc.

In the Cottereau is to be found a slide valve similar in its underlying principle to the Reno.

The Knight motor was represented by Panhard, Daimler, Minerva and Mercedes, the holders of this license in France, England, Belgium and Germany. At the Panhard stand was a large scale working model with a bore of not less than 34 inches, and which never failed to attract the attention of the visitors.

The present show marks the end of the chain drive. In the treatment of rear axles there is probably more variety than in any other part of the car.

Generally on the French cars the casing of the propeller shaft fulfills the function of torque tube, and this appears to be a solution that is gaining ground. Delahaye has slightly modified his design by using two radius rods from a hanger under the frame member to the axle housing, and a torque rod from the top of the differential housing to a cross member of the frame. The pivoting joints on the rods are enclosed in a leather boot.

Outside the English section of the show, there is only one worm drive shown—it is on the Darracq six-cylinder chassis.

There is a new mechanism giving four direct drives in the Miolans. On the crown wheel are screwed three sets of spur pinions, and on the opposite face a single set of teeth. The driving pinion has a sliding movement on the extremity of its shaft, allowing it to come into engagement with any of the three sets of gears.

German Auto Trade

Teuton Is Clannish, but American Maker Has a Field There

GERMANY'S demand for self-propelled vehicles is almost entirely supplied by the home manufacturers. It is worth recording that the Germans have within the last decade wrested the home trade from the French manufacturers. There are some facts which the American who has an eye on the German territory may profit by if they are brought to his notice, facts which are at the present time to his disadvantage. At least twenty German firms producing machines which seem to satisfy the Teuton already have the trade well in hand, inasmuch as they turn out automobiles at prices that suit the people. These firms advertise liberally; and in the event of their having a large output, their selling agents carry a generous stock of accessories. There are hundreds of miles of splendid roads in the Kaiser's dominions, and particularly in the vicinity of Thuringia, where the scenery is of a character to cheer the automobilist's spirits. In spite of this, the question worth while for the American manufacturer to consider is whether the extent and trade of this section of Continental Europe is not such as to warrant him in going to the expense of introducing his machine.

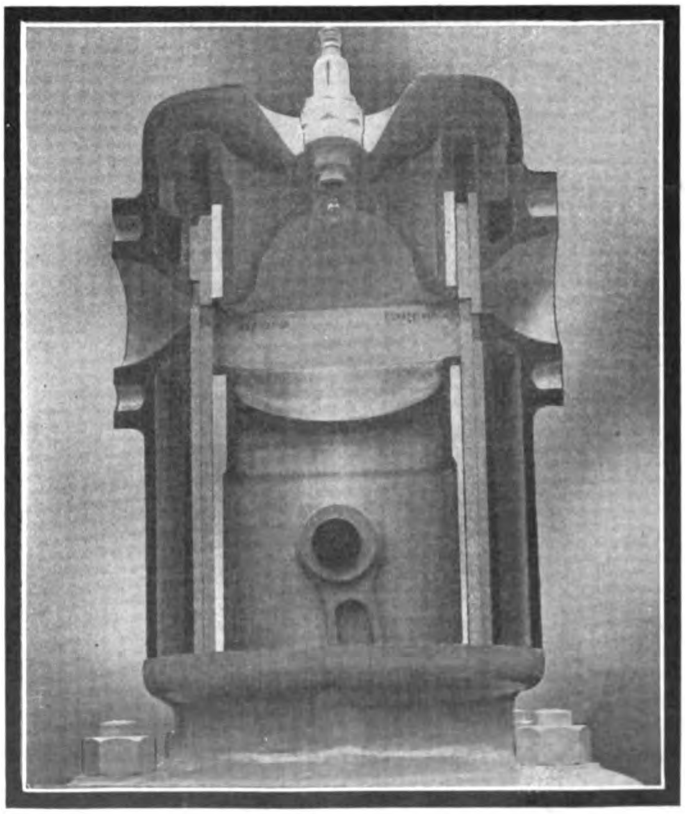


Fig. 13—Working model of the Knight-Panhard motor

Motoring in Winter

THE AUTOIST WHO CONTEMPLATES PACKING HIS CAR AWAY IN COTTON WOOL JUST NOW IS GIVEN SOME COGENT REASONS WHY HE SHOULD NOT DO SO

STIMULATED so that his blood races, skin tingles and appetite is whetted like that of a boy who has enjoyed a daybreak plunge in the ocean, the owner of an automobile who uses it 12 months in the year, particularly in the winter months, has all the advantage in the world over those who lay-up their cars at the first snow flurry.

Winter propounds no problem that cannot be answered by modern automobile construction. There is no intrinsic reason why the autoist may not ride in January as well as in June. In fact, January has a lot of favorable elements that do not exist when the beautiful greenery of the fields and woods seem to be in specially inviting mood. In the first place, a good road is no worse in winter than in summer. If it is good at all it will prove passable in the dead of winter, and very frequently the freezing of a bad road makes it much better for traffic of all kinds, particularly the travel of automobiles.

Given a clear, bracing day, with temperature well below the freezing point, a stout car and a route that passes through a picturesque country, such as the Connecticut hills, the valleys of Jersey or nearly any other favorite summer touring ground, and the result of a day's excursion will not prove disappointing.

Of course, exposure to the elements must be guarded against. No man would think of appearing on Broadway in duck trousers and a Panama in Winter time, and neither would he consider motoring dressed in the same clothes worn in summer. Let him don clothes of sufficient warmth and thickness, paying special attention to feet and legs, and hands and wrists. It is surprising how little extra clothing will be found necessary if the extremities are adequately protected.

During the ride there are a number of simple little expedients, advantage of which may be taken to promote comfort. In the first place, a sensible windshield is a requisite. The motorist who rides behind a good windshield need wear no goggles, because dust is not one of the difficulties that will be encountered in winter. If the day be snowy goggles would prove a distinct disadvantage to the man who drives. The windshield has the further advantage of breaking the force of biting breezes to passengers as well as driver.

A person who lacks actual experience on the roads in mid-Winter might make the mistake of thinking that an undue amount of tire trouble occurs, but such is not the case. In fact, the records tend to show that if anything the percentage of such mishaps is less, if due care is used to keep sufficient pressure within the tubes.

Those who ride in the tonneau will find that if the upper layer of boarding is removed from the flooring over the exhaust pipes the misery of cold feet will be obviated, and when the feet are comfortably warm the whole body is warm.

In dry, cold weather, where the roads are clear, a January ride in a good car is something to dream about. The music of the motor, the tonic of the pure, cold air, the exhilaration of motor motion are all accentuated by the season. To the office man returning to his home in the suburbs such a ride is better than anything ever devised by the learned physicians to bring a healthy appetite. To the invalid such an experience will excel in its effects the action of all the drugs in the Pharmacopeia. To the average owner of an automobile it is simply one more delightful attribute of the car. All told, those who have tried it, and their number is growing by leaps and bounds, unite in paraphrasing Sancho Panza by saying, "God bless the man who invented January—and the automobile."

Brooklands as a Testing Ground—Besides the regular meetings that take place about every two months at Brooklands Autodrome the track can be used for speed tests for manufacturers and those members of the Brooklands Automobile Club who are desirous of indulging in bursts of speed that are impossible on the road for obvious reasons.

The Cost of a Tour

BEING THE FINAL INSTALLMENT OF THE LOG OF A LEISURELY SUMMER AUTOMOBILE TRIP FROM THE JERSEYS TO THE FAR WEST AND RETURN

THE completion of the initial installment of this log of a long and leisurely automobile journey across country from New Jersey to Montana left the travelers in Chicago, where they arrived on July 1, after having been on the road for nine days. They had covered 1,122 miles, having used 154 gallons of gasoline—7 1-4 miles to the gallon. The log continues:

July 2. Scoured Chicago for information about the Western roads and for maps of the States through which we intended to travel. These helped us in the general direction but not with the roads. Left Chicago late in the afternoon. We followed a beautiful road through Elgin to Rockford, Ill. Ran into a thunderstorm later in the evening. Had more trouble with the chains. 95 miles.

July 3. Discovered that a number of the balls and part of the inside ring of the thrust bearing in one of the front hubs were smashed. Telephoned immediately to the Fiat Repair Company in Chicago, who sent a messenger to Rockford that afternoon with a new part.

July 4. Went on over a very sandy and hilly road to Clinton, Iowa. Stopped at Sterling for a little while to have lunch. Crossed the Mississippi at Lyons, going South a short way to Clinton. Some of us had never seen this river before and admired it very much. The scenery for the whole day had been very beautiful. 87 miles.

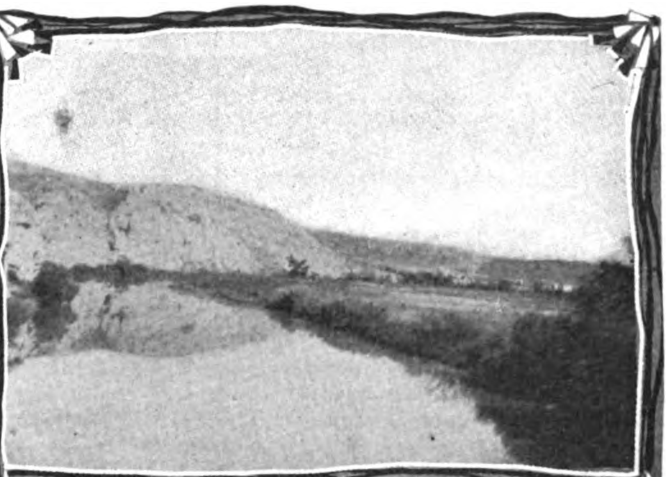
July 5 and 6. Delayed in Clinton by rain.

July 7. Finding it all but impossible to drive an automobile through the Iowa mud, we ran the machine on a freight car and went across the State by rail to Sioux City on the Missouri river, which is at that point the boundary between Iowa and South Dakota.

July 8 to 11. Remained in Sioux City on account of rains and floods. This town is built on the side of a rather steep hill, and by climbing this one can obtain a beautiful view of the whole place with the river in the distance.

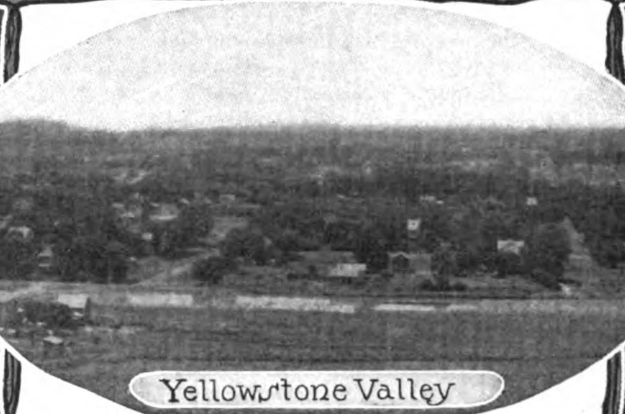
July 12. Made a desperate attempt to get out of the flooded district. We ploughed through a continued mudhole for three or

In Camp near Yellowstone Park



Along Yellowstone River

A Great Elm on the Route



Yellowstone Valley

Rest After Lunch

Rosebud Creek

four miles, only to find all bridges and culverts washed away. It was all we could do to get back to the city and we were very much discouraged. Leaving the car and chauffeur in Sioux City, we boarded a Burlington train for Billings, Mont.

July 14. Arrived in Billings.

July 16. Two of us went back to Sioux City.

July 19. Provided ourselves with a block and tackle, 100 feet of rope, a shovel and an axe and left Sioux City in the machine. Excepting for occasional mudholes, the roads were not as bad as we expected. Time and again we would make a vain attempt to dash through a mudhole, but would get hopelessly fast in the center of it. It usually took about two hours to get out. We would jack up the rear wheels as best we could and put planks under them. Sometimes the car could get out without the help of the block and tackle, but we usually had to drive a stake in the center of the road and fasten the tackle to it. Went through Akron and Sioux Centre to Rock Rapid, Iowa, where we spent the night. Two punctures. 80 miles.

July 20. Went on through Sioux Falls to Farmers, S. D. The roads were the sauce. Were fast in the mud four times. This day we carried two-inch planks along with us to avoid hunting around for some. Once the car slipped entirely off the road into deep mud. 100 miles.

July 21. The roads were better than the last few days. Found very little mud. The only difficulty we had was in crossing a graded railroad track. Went through Mitchell and Redfield to Aberdeen, S. D., which is quite a large town. 140 miles.

July 22. The roads continued good except for an occasional mudhole. In the midst of one of these we found a small car unable to move. We helped it out, and, as we did not know the way, followed it to Mowbridge, S. D. The roads were now changing from roads to trails which were good but did not permit of fast time. In many places the grass on each side was as tall as the car. Went by way of Ipswich and Jacksonville. 105 miles.

July 23. Before leaving Mowbridge we employed the services of a native to guide us across the Cheyenne Indian Reservation which we were about to cross. Drove the car on a little boat which ferried us over the Missouri River. This day was the hardest one we had so far. There were frequent mudholes to bother us. I thought one of them would be the end of everything. It was impossible to raise the rear wheels by jacks, but we finally thought of placing a log behind the wheels and using a strong piece of wood as a lever. We went down into a brook, but the bank was so steep that the car could not ascend it by its own power. Crossed prairie and bad lands all day and were very fortunate to have the services of a guide. It was getting dark when we came to the cabin of a rancher who very kindly kept us overnight. Only a trail all the way. 92 miles.

July 24. Went on to Lemmon, S. D., for dinner and in the afternoon to a little place in North Dakota called Scranton. Had fair roads all the way except for the proverbial mudholes. These we could not escape. They delayed us for hours. The country was much the same, just prairie. One puncture. 125 miles.

July 25. Went on through Bowman, where we had breakfast. almost to Marmouth, N. D. Here a thrust bearing in the transmission was broken. So we walked into Marmouth and sent a couple of teams out after the machine. Immediately telegraphed to Chicago for a new part, which was not in stock and had to come from New York. The roads were very hilly and rough through the same kind of country. 60 miles.

July 26 to August 1. In Marmouth, N. D. New bearing arrived August 1.

August 2. Went on through Baker and Ismee to the Powder River. We followed trails wherever possible, but they were so rough and hilly that we were forced very often to abandon them and cross country. A rock sticking up in the road took the petcock off the gasoline tank, but we fortunately had a cock to hold in the gasoline. As it was dark when we came to the Powder River and we could not see to cross it, we built a fire and slept in the car. 100 miles.

August 3. Arrived safely in Miles City, Mont., where we had breakfast and fixed the gasoline tank. Went on to Forsythe, Mont. The roads were bad beyond description. They were hilly and rough and full of mudholes caused by flooded irrigating ditches. Went very slowly all the way. 80 miles.

August 4. Went on to Huntley, Mont. The country and roads were the same. One hill was so rough and steep that it was out of the question to climb it. We therefore tried to go around it. In attempting this we encountered a graded railroad track. We got on top of this but were stuck there, for the rear wheels kicked out the cinders so as to let the flywheel down on one of the rails. We were now in a bad way as a train might happen along any minute. We jacked up the wheels, putting rocks and planks and anything we could find under them, until the whole car was raised up sufficiently to clear the rail. Then the chauffeur managed to run the car off and down the other side. There were difficulties in store for us every foot of the way. 125 miles.

August 5. Made short run from Huntley to Billings, Mont. The roads were very good and the country beautiful. No trouble of any kind. 15 miles.

Freehold, N. J., to Billings, Mont., by the route we took is approximately 2,176 miles. We covered it in 20 running days; average, 108.8 miles per day.

August 6 to 22. Remained in and about Billings, taking many beautiful drives through the country. One trip took almost to Yellowstone Park. We followed the Yellowstone River through Park City to Columbus, where we had lunch. Here the river was crossed and the Stillwater River followed through Absorikee, over the most beautiful country imaginable, with snow-capped mountains on three sides. On August 19 we freighted the machine over the bad lands to Jamestown, N. D., going by train ourselves.

August 24. Left Jamestown in the rain and went over a fine road through Valley City, where we had lunch, to Fargo, N. D. During the whole day we crossed one continuous wheat field and passed many lakes. Both fields and lakes were covered with thousands of snipe and duck. Every few miles was a tremendous grain elevator. Near Fargo the road was very muddy and for 15 miles we ploughed through it on low gear. 125 miles.

August 25. Left Fargo at noon and followed a fine road through Barnesville to Fergus Falls, Minn. This whole country is a mass of small lakes. The road winds between them, giving beautiful views. One puncture. 150 miles.

August 26. Beautiful run over fine roads through Alexandria to St. Cloud, Minn. The country was much the same as on the day before. 160 miles.

August 27. Good road to Minneapolis, where we arrived in time for dinner.

August 28 and 29. In Minneapolis. Beautiful drives around lakes to St. Paul.

August 30. This part of the country is made like a checker-board by the roads which are about three miles apart. We lost our way often but could keep the general direction. Crossed the Mississippi and followed it some distance through Faribault, where we had lunch. Went on through beautiful country to Cresco, Iowa. 170 miles.

August 31. The roads were slippery on account of rain, but we went without accident through Independence and Delwein to Dubuque, Iowa. 150 miles.

September 1. Proceeded through Freeport to Rockford, Ill. The roads were very poor, full of rocks and steep hills, some of which it was all the car could do to climb on low gear. 100 miles.

September 2. Beautiful macadam road through Elgin to Chicago, where we arrived in time for lunch. One puncture. 95 miles.

September 3. Across the Kankakee swamps to Lafayette, Ind. The roads were wonderful except in this swamp. Here they were so slippery that we covered the whole distance at about five miles an hour. Blew out a tire that lasted from New York. 125 miles.

September 4. To Indianapolis in time for dinner. The road all the way was a regular race course. 75 miles.

September 5. Went on through Richmond and Dayton to Columbus, Ohio. We followed the National Road and had no trouble. 176 miles.

September 6. Still on National Road through Zanesville to Wheeling, W. Va. Road still good, but the last few miles brought up to the edge of the Allegheny Mountains. 120 miles.

September 7. Arrived in Pittsburgh in time for lunch. The roads were very hilly and covered with high water bars. On account of the small clearance of the car these gave a lot of trouble. 75 miles.

September 8. Leaving Pittsburgh in the afternoon we made a short run to Johnstown. I will not attempt to describe the hills in Pennsylvania. 79 miles.

September 9. Went on through Bedford Springs to Chambersburg. Roads same as on preceding day. 96 miles.

September 10. Through Gettysburg, where we spent an hour on the battlefield, and York to Lancaster. Roads good. 78 miles.

September 11. By way of Philadelphia and Camden to Freehold, N. J., the place of starting. 135 miles.

Jamestown, N. D., to Freehold, N. J., by our route is 1,980 miles, which distance we covered in 17 working days. Average. 116 miles per day. During the entire trip we covered 4,309 miles in 39 traveling days. Average, 110 miles per day. This mileage does not include numerous short rides taken in the West, nor the 900 miles over which the car was freighted. These would bring the total mileage up to some 5,700 miles. This, of course, is approximate.

Altogether we had about 10 punctures and blowouts. Found the pneumatic tires very satisfactory. Much of the success of the tour was due to the untiring efforts and care of the chauffeur, Louis Colauer.

In the Building of Balloons

PROFESSOR WILLIAM B. ENNIS PRESENTS TECHNICAL INFORMATION UPON AERIAL SUBJECTS FOR THE PURPOSE OF CLEARING UP SOME OF THE PROBLEMS THAT DEFY SOLUTION BY A CUT-AND-TRY METHOD—FIRST INSTALLMENT

WHILE one group of men traveled from Paris to London faster than the trip had ever before been made, and that through the air, six other men started on the world's record flight of 1,000 miles in three days over the Atlantic Ocean. These reached no destination and for the most part held to no course. Yet no one would now venture to say that within a year or two, with more adequate preparation and sounder planning, some more successful explorer—or even these same men—may not accomplish what has this time failed of success: in spite of the assertion, made not many months back, that before men would travel through the air at pleasure there must first be discovered either some new metal or some new force.

Aerial Statics

A cubical block of wood measuring 12 inches on a side floats on water because it is lighter than water; it weighs (yellow pine) 38 pounds, while the same volume of water weighs 62.4 pounds. Any substance weighing more than 62.4 pounds per cubic foot would sink in water. If our block of wood be drilled (Fig. 1) and *lead* poured in, the total size of wood and lead block being kept constantly at 1 cubic foot, the block will sink as soon as its total weight exceeds 62.4 pounds. Ignoring the wood removed by boring (as compared with the lead which replaces it, an insignificant amount), the weight of lead plugged in may reach 62.4 — 38 = 24.4 pounds before the block will sink. This figure, 24.4 pounds, then represents the *maximum buoyant power* of a cubic foot of *wood in water*. If any weight *less* than this is added to that of the wood, the block will float, projecting above the water surface more or less, according to the amount of weight buoyed up (Fig. 2). It will not rise entirely from the water because to do this it would need to be *lighter*, not only than water, but *than air*.

Buoyancy in Air.—There are *gases* lighter than air, among the best known being coal gas and hydrogen. A bubble of any of these gases if isolated from surrounding air cannot sink, but must rise. At equal pressure and temperature hydrogen is fourteen and one-half times lighter than air. If a bubble of hydrogen be liberated in the atmosphere it must continually rise just as wood immersed in water would rise when set free. But the wood will stop when it reaches the surface of the water, while there is no sufficient reason to suppose that the gas bubble will stop. The hydrogen bubble can be made to remain stationary in equilibrium if it be weighted down with something of thirteen and one-half times its own weight (Fig. 3). (Strictly speaking, it will still rise slowly because that additional something would itself displace some additional air; but if the added weight is a solid body its own buoyancy in air is practically negligible.) We then have our first principle: At the same pressure and temperature, a confined volume of hydrogen has a maximum lifting power in air of thirteen and one-half times its own weight, the substance considered to be lifted including the containing vessel for the hydrogen itself.

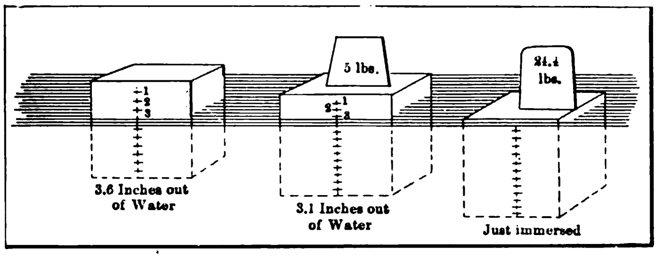

Fig. 2—Illustrating the relating buoyancy of bodies

Variations in Buoyancy.—The two fundamental equations

$$P_hV_h = R_hT_h;\quad P_aV_a = R_aT_a;$$

in which P = pressure in pounds per square inch, measured above a perfect vacuum.

V = volume of one pound of gas in cubic feet,

T = Fahrenheit temperature + 460,

R = a constant, having the value 5.347 for hydrogen and 0.3706 for air, and the subscripts *h* and *a* refer respectively to hydrogen and air; enable us to determine the relative densities (weights per cubic foot $= \frac{1}{V}$), and consequently the buoyant power, of the hydrogen when it and the air are at different pressures and temperatures; for we have, D standing for the weight of a cubic foot in pounds,

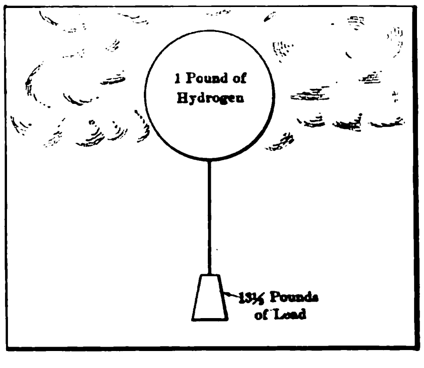

Fig. 3—Indicating the lifting power of hydrogen in air

$$D_h = \frac{P_h}{5.347\ T_h} \text{ and } D_a = \frac{P_a}{0.3706\ T_a} \qquad \text{(Equations A)},$$

$$\text{and} \quad P_h = 5.347\ T_hD_h,\quad P_a = 0.3706\ T_aD_a \qquad \text{(Equations B)}.$$

Thus, let a gas bag or envelope, at sea level, where the atmospheric pressure is 14.7 pounds per square inch and the air temperature at the moment is 32° F., be filled with hydrogen at a gauge pressure of 2 pounds per square inch and a temperature of 60° F. Then,

$$P_h = 14.7 + 2.0 = 16.7 \qquad T_h = 60 + 460 = 520$$
$$P_a = 14.7 \qquad T_a = 32 + 460 = 492,$$

and

$$D_h = 16.7 \div (5.347 \times 520) = 0.00604,$$
$$D_a = 14.7 \div (0.3706 \times 492) = 0.0806;$$

So that the lifting power of each cubic foot of hydrogen under these conditions is

$$0.0806 - 0.00604 = 0.07456 \text{ pounds.}$$

If the gas bag, car, etc., weigh 2,000 pounds, we must have

$$2{,}000 \div 0.07456 = \text{about } 26{,}820 \text{ cubic feet of hydrogen.}$$

Altitude, Pressure and Temperature.—The pressure of gas in the balloon is usually kept down (especially at starting) to a very small fraction of a pound. Its temperature may be about the same as that of the air. The balloon is always provided with excess of lifting power above its load when completely manned. This excess buoyant power must be counteracted while the bag is in the hangar by the use of extra ballast or holding-down ropes (Fig. 4). When liberated from these the great gas bag at once flies aloft. To bring it to equilibrium on an even keel somewhere in the air there must be a readjustment of pressures and temperatures. The normal pressure of the atmosphere *decreases about 1 pound, for each 2,000 feet of ascent**; its weight per cubic foot, assuming the temperature to remain constant, is accordingly decreased about $\frac{1}{14.7} = \frac{2}{29}$ for this amount of ascent; but this decrease is somewhat offset because of the fact that the temperature of the air decreases as we ascend. For moderate elevations, however, the temperature does not change greatly. This decreased density of the air with elevation attained tends, of course, to decrease the buoyant power of the balloon.

Meanwhile, the reduced external pressure has permitted the gas bag to expand somewhat, as a result of which the pressure of the hydrogen falls, its weight per cubic foot of space occupied slightly decreases and (which is most important) the strain on the gas bag, on account of the now greater difference between internal and external pressure, has decidedly increased. Further, the sun shining on the heat-absorbent material of the gas bag may increase the temperature of its contents above that of the surrounding non-absorbent atmosphere, again increasing the gas pressure, while possibly decreasing the weight per cubic foot of space occupied and thus tending to increase the buoyant power. Will this tendency suffice to offset the change in density of the air? Here, in a word, is the whole problem of what may be called BALLOON REGULATION. Air has no *surface*, like water, limiting the upward rise of the gas bubble. We must find a means of controlling our vertical position irrespective of pressure and temperature conditions.

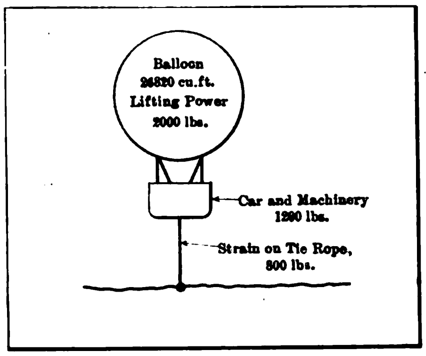

Fig. 4—Depicting the strain on tie rope under given conditions

Illustration.—Suppose under the pressure and temperature conditions previously considered a margin of lifting power for ascent is obtained by keeping the total load on our 26,820-cubic foot balloon down to 1,900 pounds instead of the 2,000 pounds which it is just able to support, and suppose it to be desired that we maintain an elevation of 1,000 feet with air at 20° F., gas at 70° F. At the required elevation,

$$P_a = 14.7 - 0.5 = 14.2,\quad T_a = 20 + 460 = 480,$$
$$T_h = 70 + 460 = 530.$$

Let us assume in advance that the decreased external pressure, coupled with any change which may take place in internal pressure, will expand the gas bag and its contents by 1 per cent., so that

$$D_h = 0.00604 \div 1.01 = 0.00598,$$

while from Equation A

$$D_a = 0.3706 \times 480 \times 14.2 = 0.0798.$$

The buoyant power per cubic foot of gas is now

$$0.0798 - 0.00598 = 0.07382 \text{ pound;}$$

or for the whole balloon,

$$26{,}820 \times 1.01 \times 0.07382 = 1{,}990 \text{ pounds.}$$

Since the load is only 1,900 pounds, we still have a surplus of lifting power, and the balloon will continue to ascend. It will rise until the buoyant power per cubic foot of gas becomes (assuming no further stretching of the bag to take place)

$$1{,}900 \div (26{,}820 \times 1.01) = 0.0701 \text{ pounds;}$$

And if we assume (merely for the purpose in hand and not in accordance with the necessary facts) bag expansion and atmospheric temperature to be the same for all altitudes, the rising will continue until the weight of a cubic foot of air becomes

$$0.0701 + 0.00598 = 0.07608 \text{ pound}$$

at a pressure of (Equation B)

$$0.07608 \times 0.3706 \times 480 = 13.6 \text{ pounds per square inch,}$$

when the altitude is

$$2{,}000\ (14.7 - 13.6) = 2{,}200 \text{ feet.}$$

The pressure in the gas bag is now, from Equation B,

$$5.347 \times 530 \times 0.00598 = 16.9 \text{ pounds per square inch.}$$

The net bursting pressure (difference between internal and external pressures) is 16.9 — 13.6 = 3.3 pounds, whereas at starting it was only 2 pounds. The *stress on a linear inch of fabric* (in a cylindrical balloon) is obtained by *multiplying this net pressure by half the diameter in inches*. Suppose the balloon to be 20 feet in diameter. The stress on each inch of fabric, tending to split it longitudinally, is $2 \times \frac{240}{2} = 240$ pounds at sea level and $3.3 \times \frac{240}{2} = 396$ pounds at our 2,200-foot elevation. No such stresses are actually attained in fabricated envelopes, as the pressures are kept low; but the variations in stress with altitude are serious, and with such fabrics as are now available a stress even as low as 40 pounds per linear inch (with the diameter in our illustration, equivalent to a pressure of $40 \div \frac{240}{2} = \frac{1}{3}$ pound per square inch) would leave little margin of safety.

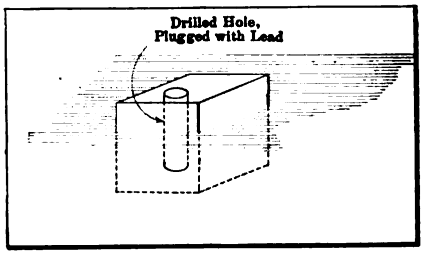

Fig. 1—Presenting a problem in buoyancy, indicating effect of loading a buoyant body

Methods for Altitude Control

First Method: By Venting Gas.—Our balloon is now in equilibrium at an altitude of 2,200 feet, although in order that we may encounter more favorable wind conditions we prefer a 1,000-foot elevation. In addition, it is dangerously stressed. In some way we must quickly bring about a new equilibrium condition. The only way at once apparent is to allow some of the gas to escape. We wish the buoyant power to be exactly 1,900 pounds at a 1,000-foot elevation. To compute the amount of gas to be allowed to escape in order to accomplish our pur-

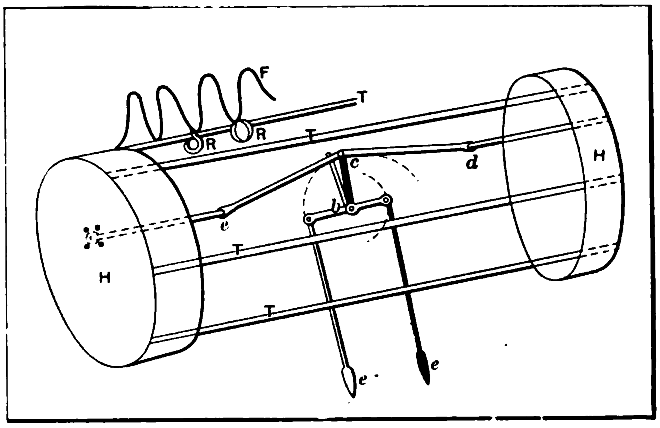

Fig. 5—Scheme for varying the density of the gas bag by changing the volume within

---

*This rough figure has been used for simplicity in the balance of the calculations. More accurately, the relation of altitude to pressure is about as follows:

Altitude in miles	Atmospheric pressure pounds per square inch
0	14.7
¼	14.02
½	13.33
¾	12.66
1	12.02
1¼	11.42
1½	10.88
2	9.80

pose involves some difficulties, but that the operation is practicable may readily be shown. The weight of gas in the bag, based on our sea-level density and volume, is

$$26{,}820 \times 0.00604 = 162 \text{ pounds.}$$

Let the escape valve be opened, while at an altitude of 2,200 feet, so that 5 pounds of gas may escape, the gas bag partially collapsing in consequence. Suppose the elasticity of the bag to be such that the gas pressure now becomes 16.7 pounds per square inch. Equation A gives

$$D_h = P_h \div 5.347\ T_h = 16.7 \div (5.347 \times 530) = 0.00589,$$

and the volume of the partially collapsed bag is now

$$157 \div 0.00589 = 26{,}740 \text{ cubic feet.}$$

The necessary buoyant power being $1{,}900 \div 26{,}740 = 0.07105$ pounds per cubic foot, the external air must weigh $0.07105 + 0.00589 = 0.07694$ pounds per cubic foot, and Equation B gives

$$P_a = 0.3706 \times 0.07694 \times 480 = 13.64 \text{ pounds per square inch,}$$

corresponding to an altitude of

$$2{,}000\ (14.7 - 13.64) = 2{,}120 \text{ feet.}$$

We have descended 80 feet and have reduced the net pressure on the bag to 3.06 pounds per square inch, but at the cost of 3 per cent. of our gas. By letting out more gas we may descend further. The method seems adequate; but what are we to do if we should wish to rise again? We are wastefully throwing away the life blood of the balloon, its gas; and this in spite of the fact that there is a constant dangerous leakage through the fabric itself which is alone sufficient to bring about disaster and which we should counteract rather than encourage.

Three Chimerical Methods.—A writer of romance has equipped his aeronautic heroes with a complete gas generating plant so that all losses might be made up. This plan need scarcely be considered here; the supplementary device of heating the contents of the bag in order to dilate the latter and consequently decrease the value of D_h is more interesting, and would be practicable if a sufficiently elastic bag of proper strength could be obtained. At present the fabrics necessarily employed to secure strength are not very elastic, in spite of their lightness, so that this method of varying the density of the gas seems impracticable. Another method which has been contemplated is shown crudely in Fig. 5. The stiff dished heads H, H, say of aluminum, are connected by a fabric shown in part at F, which is attached to rings R, R, free to slide on telescopic rods T, T, T, T. The fabric then corresponds with the expansible part of a bellows. By means of the leverage a b c d e, actuated from outside the car, the ends may be caused to approach or recede, the fabric folds being correspondingly flattened up or straightened out, and the volume of gas decreasing or increasing, so that if its weight be kept constant, the density will vary inversely, and the altitude directly, as the distance between the two movable heads. The objections to the plan are obvious.

Don'ts for the Autoist

GENERAL INJUNCTIONS TO THE WISE—AND THE OTHERWISE —NOT ALONE AMONG THE AUTOMOBILE FOLK, BUT IN OTHER WALKS OF LIFE AS WELL

Don't forget that the foundation of success is deep down in the strata of concentration.

Don't trade off the power to fix the mind upon some one thing for a mess of pottage in the form of scattered thoughts.

Don't fight with your neighbors when the pugnacious desire comes on; go after yourself; ply the gloves valiantly; let yourself know that you will stand very little nonsense.

Don't allow your vividity of mind to settle upon your stomach and prey upon your telegraph system; place all excesses of vividity in cold-storage, lock the door and throw the key away.

Don't risk having the truth come to you in a violent form, as it will if you do not study moderation of thought.

Don't achieve blasé notoriety, nor allow the mind to petrify.

Don't drift along or float; flap your fins; churn up the seas of activity, have a wake, but trace it over a straight course in deep water.

Don't go on fudging up your future; have a real object in life; be prudent, but be active.

Don't be a drifting derelict; swim!

Don't allow the world to write your epitaph in lying charity; compel the general tongue to articulate.

Don't ever get the idea that you must have a flying start to get anywhere; the greatest enemy to sound progress lies in a friendly push; he who pushes must have pay.

Don't court the clock, caress the thermometer, or allow visions of beauty to lull you to sleep; sting the mind if it refuses to obey the dictates of industrious concentration—make it unconscious of the buzz of the house-fly, not by sleep, but by a determined effort along fixed lines.

Don't dream beautiful sonatas; they are heavier-than-air bodies, and, unfortunately, they lack motive power sufficient to get you anywhere.

Don't let time get away from you, nor forget that it goes on ceaselessly; if you desire to keep up, imitate time.

Don't forget that he who makes the giants, strangles them.

Don't awaken from a period of inactivity and omit to say, "I have been ill—I am better now!" and straightaway engage the mind in serious wrestle with some likely problem.

Don't forget that the ordinary pretext of those who make most of the misery of others is that they wish them good.

Don't forget that rogues are communicative; their thoughts are of no use to themselves; the chance of gain lies in having someone add the pollen.

Don't plunge back into the crowd once the feet have disentangled you from the maze of the commonplace.

Don't, oh modest hypocrite, peddle wares in the market-place of stalking intelligence.

Don't be the soundless tenor in the choir of real voices.

Don't dart forward when some wag calls out for a fool.

Don't tackle a job unless fraught with determination.

Don't be a pointless commonplace; better be a bland surprise.

Don't forget that they who lag late on the road may want money for supper.

Don't be an ill omen; color the worst thought; make it vie with the spectre of the brightest rainbow.

Don't console yourself with the thought that a live dog is better than a dead lion; it is the lion who lives on forever.

Don't overlook the fact that the devil himself would not support an attorney with a bad brief.

Don't write "private" and "confidential" across the paper that discloses a secret; burn it.

Don't forget that the tool is broken after it serves in a poor cause; dodge the part of tool; let a fool play it.

Don't be mild, indolent, irresolute; some calling such crimes by the kindly appellation, "meditation."

Don't forget to baffle the ingenious swindler; all that he wants is your money—lock it up.

Don't gather the notion that you are a slave because you are made to work; why do you wait for someone to tie a stick of dynamite to your tail?

Don't obey the impulse: rather keep company with reflection.

Operation and Care

HANDY TRAVELING HOIST; QUESTIONS THAT ARISE; PRACTICAL REPAIRING; LINING UP WHEELS; LETTERS; CANTOR LECTURES; DON'TS; LUBRICATION PROBLEMS

THIS is the season of the year when the average automobilist considers the laying up of his car, due, perhaps, to his lack of appreciation of the fact that the automobile does not labor under any of the disadvantages of the horse. True, the automobile has its own peculiar failings, but they, such as they are, will bend to intelligent treatment, and it should be the business of the user to find out what they are and apply the right treatment in every instance. Take, for illustration, the question of the freezing of the cooling water. There is no occasion for risking it; water will freeze at 32 degrees Fahrenheit; do not use this cooling solution. The best plan is to mix with the water such a quantity of denatured alcohol, or other efficacious compounds, as will prevent the solidifying of the solution, but care must be exercised not to use substances that are not suitable in view of the several conditions. It was only the other day that an automobilist of much discrimination put corn-meal into the radiator, and he is now trying to discover some way of getting corn bread out of the cooling system. THE AUTOMOBILE, however, much as it has tried to help automobilists along the pathway of roses and pleasant dreams, 'fesses that it labored under the impression that everyone knows how to make bread; but this particular automobilist, even in a dire extremity, might have consulted his wife about this particular matter.

The great question is to remember that an automobile will run in cold weather even better than it will go during Summer's heat, and it is during the inclemency of Winter-time that the greatest good should be experienced. There is nothing to fear from the cooling question; just use a suitable mixture; the ingredients have been exploited repeatedly in THE AUTOMOBILE, but if there are some of the readers who may have failed to grasp the situation, it will be easy for them to purchase a quantity of denatured alcohol, and to each gallon of water used in the system add three pints of the alcohol—the freezing temperature will then be about five degrees Fahrenheit above zero.

Perhaps there is another angle to this question; most automobilists seem to labor under the impression that "technical" literature, so-called, is not for them. It would come as a great surprise were they to be told that there is no literature that is worth reading if it is so mysterious that it fails to convey the intended impression, and the class of technical literature, so-called, that cannot be even looked at is like the *news* in the paper which, not so long ago, made the editorial announcement that it was a newspaper; the editor of this *novelty* was the only person who was conscious of the news value referred to.

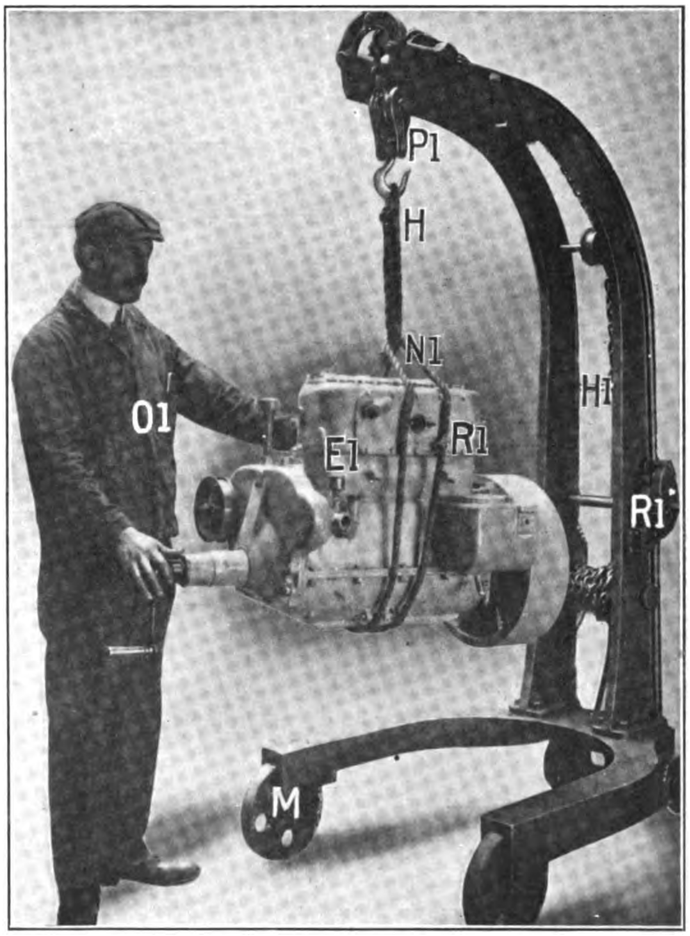
Traveling Hoist

Showing a White Motor Ready to be Fitted in Chassis After Overhauling

NO garage or repair shop can claim to be completely equipped unless it possesses a traveling hoist. It is surprising the multifarious duties such a shop adjunct can be made to perform, from lifting out a motor to raising the chassis to insert grease or oil between the leaves of the springs. With this convenience installed, there is no necessity to call several men off their jobs to come over and lend a hand at this or that, and it is not an unknown occurrence that a part has been damaged through an unlucky fall or a man has had his fingers badly pinched and been compelled to remain in that position till more men could be summoned to release him. The part to be lifted is bound around with the rope R1, forming a loop knot N1 just above and suspended from the hook H1. A crank is attached to the ratchet R1 and wound up or down as may be required. In this case a motor in the White Company's New York garage had undergone a complete overhauling in the repair shop and was carried thence to the chassis in the main assembly room in such a state that it only required bolting *in situ*. This saves a lot of valuable space in any repair shop, doing away with the congestion that occurs through lack of the means of transporting heavy parts.

Pressure-fed Gasoline.—In order to obviate the ridiculous operation of pumping up pressure for several minutes before starting by sending air into the gasoline tank, in the case of cars thus fitted, this pumping can be avoided and the following may be of service to those autoists who have pressure feed supply:

Start the car with the gasoline contained in the float chamber; there is usually enough to give a few explosions. Then run to the back of the car and block up with the sole of the shoe the exhaust pipe outlet, and the pressure having only one outlet left, viz., through the relief valve in the pressure circuit, the pressure in the gasoline tank will rise quickly. It will not be necessary to stop up the hole long and there is no likelihood of burning the shoes. This method of obtaining pressure can be resorted to in case the pressure pump gets out of order.



A most useful tool for garage work generally. It can be used in multifarious ways

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FORREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[314]—What precautions should be used in charging the acetylene gas generator?

It should not be filled more than two-thirds full. When lump carbide is used it expands as the chemical change produced by dropping water on it takes place.

[315]—How can the burner tips of an acetylene gas burner be cleaned sometimes?

By picking the carbon deposit out of the orifices with a small pointed instrument such as a sewing needle. If the deposit is too hard to be picked out in this manner a small drill can be used. The tips should not be treated roughly since they are brittle and weak.

[316]—Give the events that occur in a two-stroke cycle (usually called two-cycle) engine in the order of their occurrence.

As a convenient method for a beginning, it will be assumed that there is a compressed charge in the combustion chamber, and the piston in its position nearest the combustion chamber. When a charge is fired the piston is driven out on the impulse stroke by the pressure caused by the combustion until the stroke has been nearly completed. A number of small port holes arranged circumferentially around the cylinder walls and previously covered by the piston are then uncovered by its motion. The gases in the cylinder still being under considerable pressure rush out through these openings which form the exhaust port. Still further motion of the piston on the impulse stroke uncovers another row of port holes circumferentially arranged, which connect with the crank chamber. When the piston starts on the impulse stroke the crank chamber is filled with a combustible mixture at about atmospheric pressure. The impulse stroke compresses this mixture so that when the inlet ports—just referred to as being uncovered by the piston—are open a charge passes from the crank chamber to the cylinder and combustion chamber. The next stroke (up-stroke in a vertical engine, in-stroke in a horizontal engine) of the piston closes first the inlet port, then the exhaust port, and finally compresses the charge in the cylinder. On the compression stroke, mixture is drawn into the crank chamber. This completes all the operations related to the cycle. As the name indicates, the complete cycle occurs in the two strokes of piston corresponding to one revolution of the crankshaft.

[317]—Does the gasoline engine main shaft reverse its direction of rotation when the car changes from forward to backward motion?

No. The change-speed and reverse gears provide for this.

[318]—Will a four-stroke cycle engine run its main shaft in either direction?

No. Except in very unusual designs.

[319]—Can a two-cycle engine be run in either direction?

Yes. By moving the timer to ignite properly, it will run equally well in either direction of rotation—clockwise or counter clockwise. This applies especially to one which has no mechanically operated valve, such as the valve in the crankcase.

[320]—How are the cylinders placed in a two-cylinder opposed engine?

On opposite sides of the crankshaft.

[321]—How do the pistons move in a two-cylinder opposed (horizontal) engine?

They move toward each other during one-half revolution of the crank and both recede during the remaining half-revolution.

[322]—How is compression produced in the crank chamber of a two-cylinder opposed engine?

By the motion of the pistons toward each other.

[323]—How do the pistons move in relation to each other in a four-cylinder vertical engine of the four-stroke cycle type?

The front and rear pistons move upward together at the same time that the intermediate ones move down together. This is the usual construction.

[324]—In what order are the successive charges exploded in a four-cylinder four-stroke vertical engine whose pistons move as just described?

Starting with the front cylinder they come in the following order: (1) Front cylinder; (2) one of the intermediate cylinders; (3) rear cylinder; (4) remaining intermediate cylinder.

[325]—Where is the gasoline tank placed in relation to the carbureter?

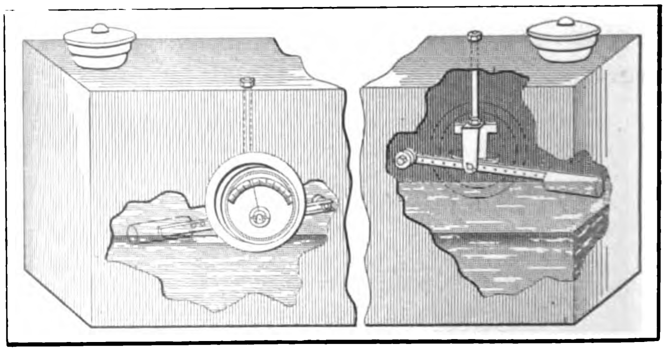
Either high enough above it for the gasoline to flow by gravity into the carbureter, or it is placed below the level of the carbureter.

[326]—What precaution should be taken for allowing free flow of gasoline from the tank in the gravity system?

There should be a small opening (vent) in the top of the tank. It is usually in the plug; 1-32 inch diameter is sufficient. It is advisable to have the metal raised in a hump or knob where the vent hole is made. This will prevent stoppage by collected dirt.

French Gasoline Gauge for Fuel Tanks

A gasoline gauge has been devised by the use of which perforation of the side wall of the gasoline reservoir is entirely avoided, thereby eliminating the possibility of leakage and forestalling accidental fire losses. From the top of the tank and contiguously to one of its walls there is suspended a magnet bar, to one end of which a float is attached. The magnet turns around its central point of suspension as the float goes up or down with the level of the gasoline. A cup-shaped dial is soldered to the outside of the same wall of the tank and a thin bar of steel—also magnetized, says the account—is mounted under it so as to turn freely around a point exactly corresponding to the pivot of the interior magnet, whose movements it will closely follow, and a band attached to the exterior magnet points at an index scale, telling the exact quantity of fuel in the tank. Automobilists who pass in and out of Paris are required to have their supply of gasoline measured at the excise district boundary—the *banlieue*—and the gauge facilitates the work of the excise officers, particularly as the moving parts may be readily sealed and prevented from acting.—*La Pratique.*



Gauge devised to enable French excise officers to quickly ascertain quantity of gasoline in an automobile tank

Communication in Relation to Formula

In relation to the A. L. A. M. formula for estimating the horsepower of a 4-cycle internal combustion motor, as discussed on page 879 of The Automobile, November 24, it would seem that for reasons that should be well understood this formula fails of its purpose, as it is hopelessly inaccurate in comparing motors whose strokes differ widely. The reason for this failure lies in the fact that the A. L. A. M. rating is based upon a piston speed of 1,000 feet per minute and therefore upon the fallacy that the number of revolutions per minute varies in the inverse ratio to the stroke.

In Europe almost all the 1911 models have ratios of stroke to bore varying from 1 1-2 to 1 up to 2 to 1.

Argyll	90	by	140	or	3.54	by	5.51

This list is sufficiently comprehensive to indicate the tendency to long-stroke motors. That long-stroke motors can be built to turn fast is clearly demonstrated by the results of the Coupe des Voiturettes. It is calculated that many of the motors in that event had a piston speed of 3,000 feet per minute.

An examination of the table will be sufficient to convince anyone of the prominence that is being given long-stroke motors, and taking as a typical example the Gregoire with a bore and stroke of 80 x 160 millimeters (3.14 x 6.28 in.), by the use of large valves, light reciprocating parts, etc., these motors give from 50 to 100 per cent. more power than the A. L. A. M. formula would denote.

In my opinion a formula that is infinitely more accurate than the A. L. A. M. rating is $\frac{D^2SN}{12}$, in which D = bore, S = stroke, N = number of cylinders, 12 = a constant arrived at by considering 1,000 as the number of revolutions per minute. If the dimensions are in millimeters the formula reads, $\frac{D^2SN}{200{,}000}$.

According to this formula the horsepower of the Gregoire motor above mentioned would be 20 1-2 at 1,000 r.p.m. or 30 3-4 at 1,500 r.p.m., while according to the A. L. A. M. rating the horsepower would be somewhat less than 16.

For four-cylinder motors my formula is simply $\frac{D^2S}{3}$, and for six cylinders $\frac{D^2S}{2}$, while the A. L. A. M. rating is $\frac{D^2}{.625}$ and $\frac{D^2}{.4166+}$. As whole numbers are more easily dealt with by the average man than fractions I think that my formula also scores on the count of simplicity.

A Reader.

Graphite Paint.—Graphite mixed with pure, boiled linseed oil in which a small percentage of litharge, redlead, manganese or other metallic salt has been added at the time of boiling to aid in the oxidation of the oil, forms a most effective paint for metallic surfaces as well as for wood.

Practical Repairing

DEFINING THE PROCESS OF REPAIRING ALUMINUM CASTINGS BY THE OXY-ACETYLENE FLAME, ILLUSTRATING THE STAGES OF THE WORK STEP BY STEP

The principle of the working of the oxy-acetylene flame was dealt with in last week's issue in so far as the equipment itself goes and its adaptation to cast-iron welding, and it may be stated that there is a great similitude between the processes as applied to all metals, the main difference being the handling of the metal by the operator. Until quite recently aluminum defied the repairman, and, although some solders were claimed to join aluminum parts that had been broken, yet its utility rested in filling cracks and holes on which there was no strain and where there was no attempt to approximate the strength of the metal. The difficulty to be overcome with soldering aluminum is the electrolytic action set up by the small amount of oxide which it contains and the attending difficulty in coating the surfaces without having an intervening layer.

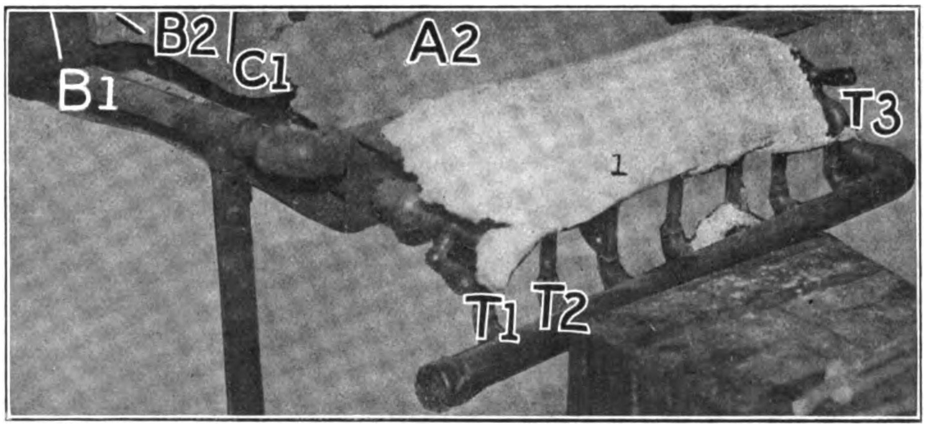

Fig. 1—View of gas burner heater over which the job is placed

This difficulty can be overcome with the acetylene flame, as when the surface of the aluminum is reduced to a molten state the fusion that takes place has a coating of oxide, and this can be broken up by puddling with a steel tool, allowing the metal to run together, thus producing a weld that is to all intents and purposes a recasting. In the process here described there is no flux of any description used.

Fig. 2 represents the part over the fire with the charcoal F1 and the steel bar S1 in place. The cracks C1 and C2 are easily noticeable, also the parts that have already been repaired, R1 and R2.

The first operation (see Fig. 3) after the parts have been heated in the manner above described is to cut a V-shape slot W1 with a chisel C1 so as to allow the operator better access to the crack and start the melting from the base upward and so build in a new part on clean material. The heat from the flame is diverted from the operator by means of asbestos strips A1. For reasons above stated, to counteract the sudden contraction of the metal after the intense flame is withdrawn, a second operator O2, as shown in Fig. 4, heats the opposite side of the job with an ordinary gas blower B1, directing the flame F2 on the work C1. The operator O1 will be seen using a steel rod P1 to puddle the metal into shape while melting the part to be repaired with the acetylene flame F1. After a good foundation is thus made a stick of aluminum is held in the flame F1 and the molten metal allowed to run in the V-shape slot to a little above the height of the casting itself, and, as will be seen in Fig. 5, this is molded with a flat-ended tool T1 in the manner shown. This particular part of the casting is very thin and practically has to be rebuilt with new metal, for as soon as the flame touches it, it crumbles away.

During the whole operation the heating is continued underneath, and for this purpose the asbestos boards are placed over the fire to protect the operator. It will be seen that he is wearing two pairs of glasses G1 and G2; G1 he happens to wear in the ordinary way, but the second pair have dark-blue lenses to protect the eyes from the intense light given off by the flame despite the fact it is not above one-half to three-quarters of an inch in length.

Though aluminum fuses at a comparatively low temperature (1,200 deg. Fahr.) its high conductivity for heat, which has a ratio of 31.3 as compared with 11.9 for iron, makes it a necessity to use more heat in welding than is required by metals having a much higher melting point. The heat is conducted away from the weld into the surrounding metal to such an extent that when the surface to be welded becomes molten the metal for a considerable distance around is close to the point of fusion and liable to collapse if great care is not exercised.

It can be readily seen that one of the principal features of carrying out this work is the amount of time taken, as the longer the flame takes to fuse the metal the greater the amount of heat that is conducted into the surrounding parts; therefore, the hotter the flame the less the time and the conduction of heat. This is the reason why it is necessary to use a flame of such a high temperature (6,300 deg. Fahr.) as that produced by burning acetylene with oxygen to obtain satisfactory results on a metal of such a low point of fusion as aluminum. The amount of contraction of aluminum from the point of fusion to atmospheric temperature is three-sixteenths of an inch per foot, and from this it can readily be understood that unless great care is exercised there is a chance of the part cracking, due to the metal shrinking in cooling.

To overcome this the part is placed as shown in Figs. 1 and 2 over a gas fire with a charcoal base, and the part is heated uniformly, the amount of heat being regulated by the amount of gas by the taps T1, T2 and T3, in Fig. 1. To keep the heat in, a strip of asbestos A2 is placed over the entire job, and in this particular case of a half of a base chamber C1 that had several cracks, a bar of steel B1, the same size as the bearing B2, is placed under these to prevent warping. Fig. 6 shows the half of the crankcase that has been repaired at the points R1, R2, R3, R4, R5 before being cleaned up. This is part of a crankcase of a four-cylinder motor, and is virtually as good now as when originally turned out from the factory. The repairer is sometimes confronted with the problem that in some accidents parts

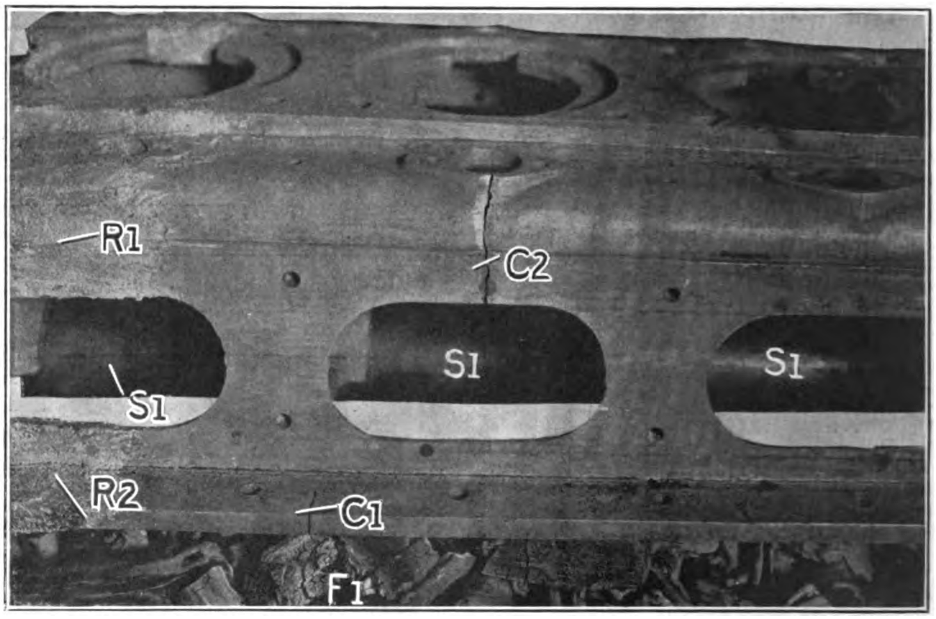

Fig. 2—Top half of aluminum base chamber, showing cracks and charcoal fire

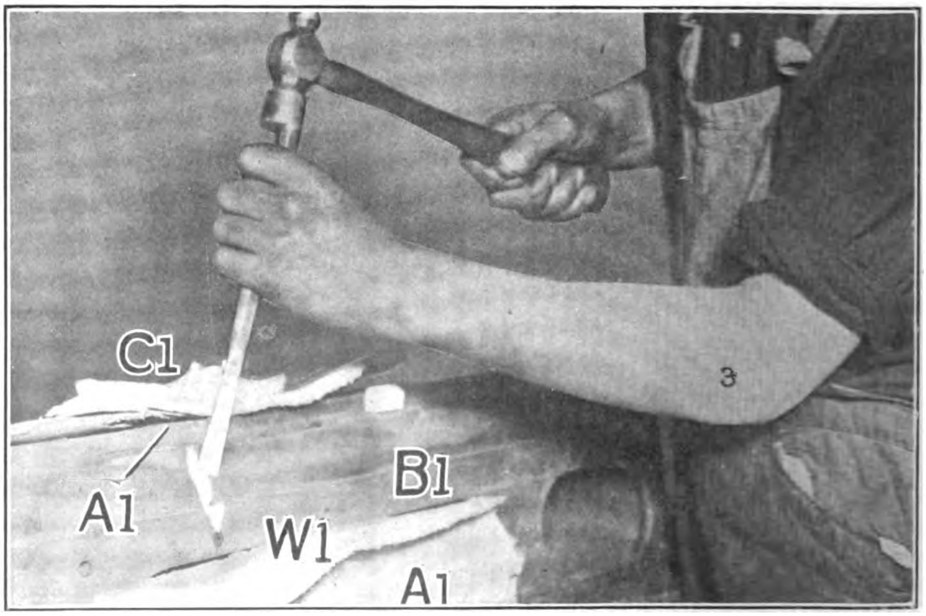

Fig. 3—Slotting crack with chisel so as to allow the new metal to run in freely

are lost or so damaged that they no longer resemble the original; but this is not really a drawback, as the broken parts that remain are pieced together and the missing parts are remade by filling the blank spaces with new metal by a building-up process, which consists of adding layer after layer till the gap is filled, and with the aid of a file afterward any unevenness is smoothed off level.

If a crankcase ruptures in service and it is due to an accident of some kind, the chances are that the quality of the aluminum found in the crankcase will be above suspicion, but if the rupture cannot be traced to some violent physical exertion, it will be futile to undertake a repair without first ascertaining whether or not the material in the crankcase is sufficiently good to warrant considering its further use. The mere fact that a crank case does rupture in service in the absence of violence will suffice to indicate that the material of which it is made is below a substantial standard. If this is true, the autogenous welding process, if it is invoked, will be for the purpose of joining the disrupted members of such inferior material that it would be inviting further trouble, but under more accentuated conditions.

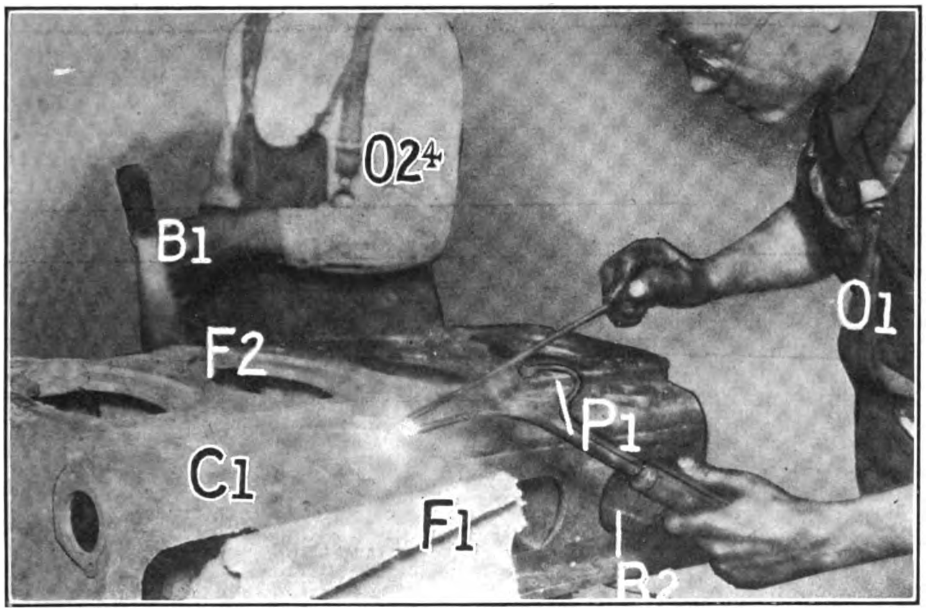

Fig. 4—Running in new metal to fill crack while the second operator heats the opposite side

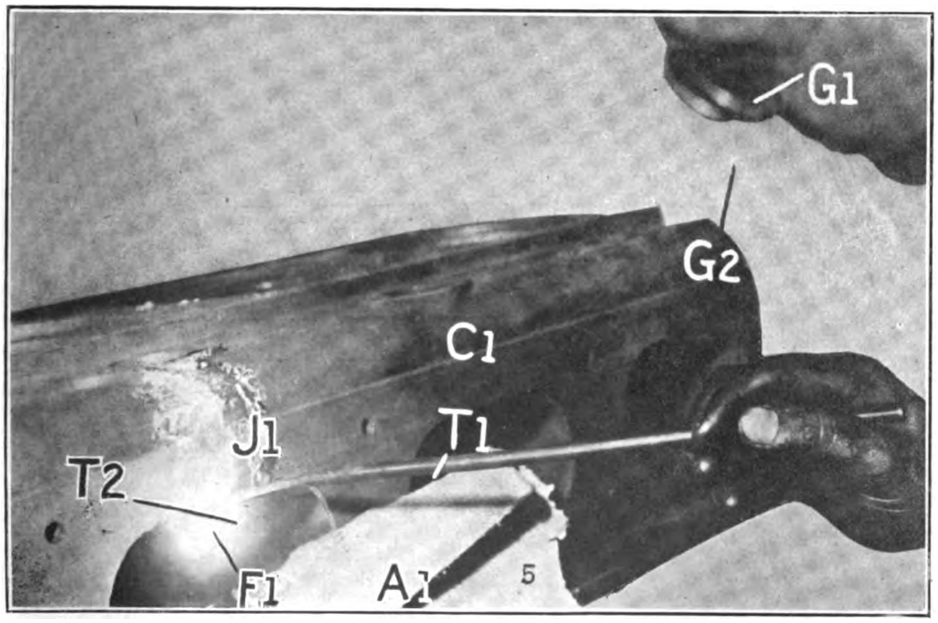

Fig. 5—The metal at this point is very thin and will melt at the slightest touch of the flame

The owner of an automobile, if he is confronted by the necessity of having the crankcase or the transmission gear case repaired or replaced by a new one, should find it to his advantage to be able to decide for himself, unaided by the repairman, which course to pursue. If the material in the broken member is so poor that it will not sustain under the work, it will not require the deliberations of an expert in the reaching of the conclusion that the re-joined parts by a welding process will not even be as strong as the original inferior member. If the owner of the car will take an ordinary machinist's hammer and strike the crankcase at a point near the fracture, if the material is inferior, provided it is of aluminum, the sharp blow will probably have the effect of breaking off one or more additional pieces, and a little more investigation along this line will soon prove to the unfortunate owner than an autogenous repair will be of no service to him. Should the broken case behave well under the rain of sharp blows, thus proving that it is not "cold-short," it will be time enough to call upon the repairman and ask him to join the broken parts.

The reason why it might be better for the owner of the car to conduct the primary investigation with a view to purchasing a new case rather than the making of a repair if necessary, is because the repairman would probably be able to autogenously weld the inferior material quite as efficaciously as if it were good, and he would consider no doubt that his responsibility is limited to the mere joining of the broken members, nor could he be expected to assume responsibility for the quality of the metal.

It is not to be expected that builders of automobiles will sanction the use of certain grades of aluminum castings for motorcases and transmission gear housings. Take for illustration the aluminum alloy known as No. 3; it is used in good automobiles for running boards and trim work; the composition of this alloy is substantially:

Approximate Chemical Composition of No. 3 Aluminum Alloy

Aluminum	65.0 per cent.
Zinc	35.0 per cent.

The impurities in this product would probably be very high. Silicon, which is fatal to good work, might readily reach over 1 per cent., and iron would probably go above ¾ of 1 per cent., but the worst crime of all would lie in the use of scrap, much of which would be devoid of a history.

A better aluminum alloy is that known as No. 2, with an approximate chemical composition:

Approximate Chemical Composition of No. 2 Aluminum Alloy

Aluminum	84.0 per cent.
Zinc	14.0 per cent.
Copper	2.0 per cent.

In this product, the aluminum should not be less than that as above given, and the copper should range between 2 and 3 per cent. Of the impurities, as silicon and iron, it is scarcely to be expected that the sum of these elements present will be below 1.25 per cent, and it is highly improbable that this alloy would be worth considering in exacting service, particularly if "scrap" is put

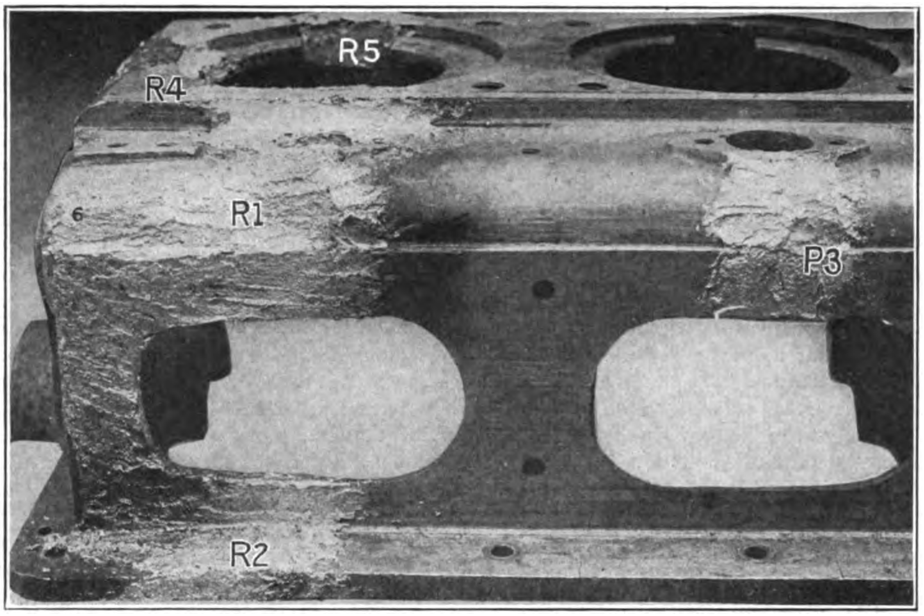

Fig. 6—Completed repair before filing and cleaning off

into the charge. An ordinary machinist's hammer in the hands of a man of no great strength will disclose the presence of excess of silicon and iron or the use of "scrap" in the charge, if the part is given a sharp blow—the pieces will fly with almost explosive force, this being a sign that the material of the case is so bad that a repair is not worth while.

Relatively good transmission gear and crankcases are composed of aluminum having properties—

Approximate Chemical Composition of No. 1 Aluminum Alloy

Aluminum	91.5 per cent.
Copper	8.5 per cent.

In this product, both aluminum and copper contents vary a little, and impurities are mainly copper and silicon, the sum of the two not exceeding 1.25 per cent. This alloy is supposed to be from heats using new metal only, and while the silicon and iron content is a little too high for the very best result, the castings resulting are nevertheless good, but even castings from such good alloy may fall short of the requirement, due to overheating and other foundry miscalculations. To some extent the responsibility for bad work is to be charged to inferior designing methods.

While the subject is up, considering the importance of fine castings in motor work, it is not too much to say that the best possible results obtain when the foundry uses virgin metal, limiting iron to less than 0.40 per cent. and maintaining the silicon content within 0.50 per cent.

The photographs illustrating this article, as well as that referring to cylinder repair in last week's paper, were taken at the plant of W. R. Smith & Co., 304 and 306 West 52d Street.

Lining Up Wheels

ALTHOUGH TIRES ARE CARED FOR AS INDIVIDUAL UNITS, YET A SMALL INACCURACY IN ALIGNMENT WILL IN ALL CASES CAUSE UNDUE WEAR

THERE are times when one has to utilize what one has on hand to carry out a repair, and a stray piece of metal or string is often very welcome. But when it comes to tires only the best is good enough. Makeshift methods of lining up the wheels should be given a back seat and the autoist will do well, if he has not the necessary appliances, to consult some competent repairer if he finds his tires do not give the service the makers guarantee. Unless the road wheels of a car are perfectly in line with the chassis—and themselves, which must follow if the former is the case—there is added to the rolling and driving strains a side dragging or uneven wear on the part of the tire not intended to come in contact with the road. To better illustrate this, if reference is made to Fig. 1 it will be seen that the wheels W1 and W2 have a decided inward inclination—what is known as toeing inward. This is not such a frequent occurrence as when the wheels have an opposite inclination; that is, the front of the rim is farther from the chassis than the rear part. The consequence is that the dragging will take place at A and B, and instead of wearing even the tires will be treated in a similar manner as when they are put on a buffing machine to take off superfluous rubber before repairing, the only difference being that in this case the road acts as the buffer and remains stationary while the tire takes the place of the buffer and rotates. The effect, however, is the same on the tire, which is the point at issue.

While on this subject of toeing it would be as well to relate the experience of the driver of a truck who had the misfortune to strike a slippery incline in New York and found it impossible to avoid sliding to the curb off the crown of the road

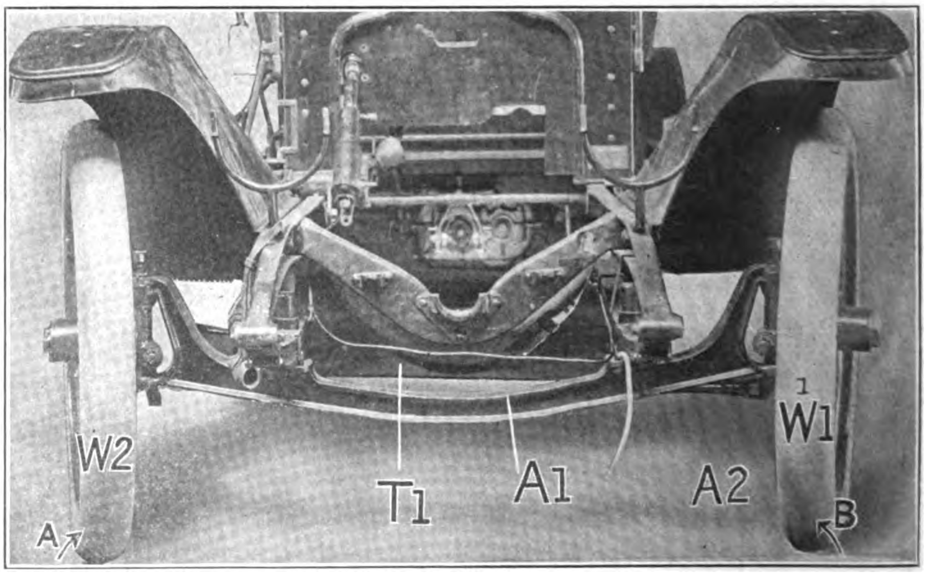

Fig. 1—Showing front wheels toeing in too much, inducing extra tire depreciation

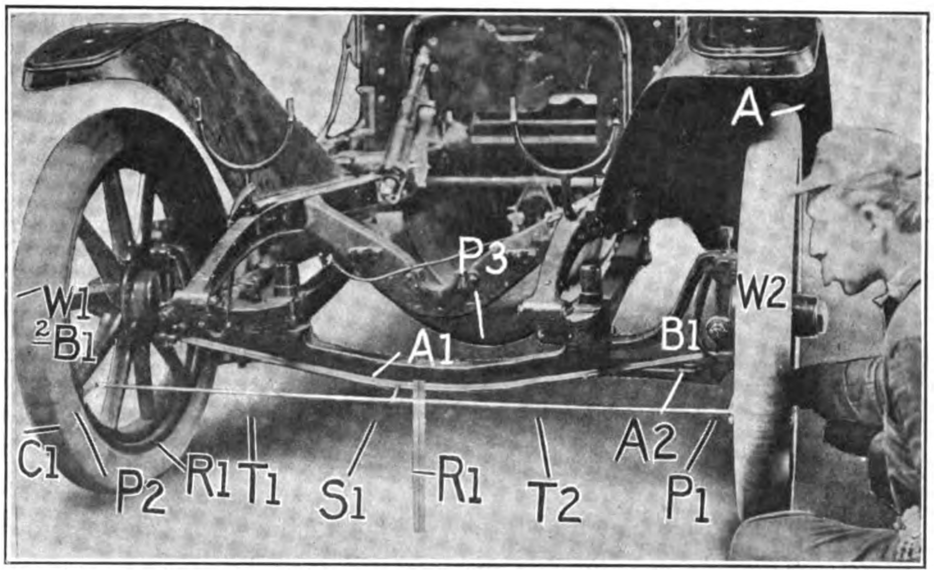

Fig. 2—Showing method of aligning the wheels, using rule and telescopic pointing tool

when the brakes were applied at a cross-road half-way down the incline. The man was a good driver and had been in the employ of the company for some time. When asked to explain the reason and cause of the accident he said that it was impossible with that particular car to keep it on the road at that particular spot if the brakes had to be applied and the roads were at all skiddy. And he went on to say further that if he had to negotiate it again under similar conditions the result would be the same; but if he might fix the car up as he wanted to he thought it was possible to eliminate 50 per cent. of the skidding. In order to test the first half of his statement, that it was impossible to avoid the skid, another driver was told to take the car out and disprove what seemed to be bad driving, and the principal awaited the result. It was not long in coming and was in the nature of a telephone call to send a new wheel out, as the car had skidded badly and struck the curb and could not proceed without the new part. The first man was then allowed to do what he wanted, and it was to toe the front wheels inward at the front a matter of one-fifth of 1 degree, which on a 36 x 5 wheel would be equal to 3-16 inch; but should the tires be smaller the amount of toeing might be increased to, say, one-fourth of 1 degree for 34 x 4-inch tires.

This represents a fraction over the point where lost motion starts through non-parallelism of the wheels, and consequently places a resistance on the forward motion not sufficient to appreciably stop the momentum. Besides this he contended that it was necessary to allow a small amount of power to remain on while braking, so that the rear wheels had a better purchase on the ground. This solution solved the difficulty and the car was driven over the same road again without the semblance of a skid.

The accompanying illustrations were taken at the White Company's New York garage and clearly show the practical way of realigning the wheels should they become out of line through accident, wear of bearings or spreading of the axle, which in most cases can be put down to overloading.

There are three ways a wheel can be out of line—firstly, in the manner indicated in Fig. 1, known as toeing, which, as previously stated, may be an inclination to the front or rear; secondly, undue splaying, when the top of the wheel is farther out of a perpendicular line drawn through the axle pivot than 5 per cent., unless, of course, the makers originally make this setting more; 6 per cent, is an outside limit. Unless the rear axle is specially constructed so as to allow for splaying, the wheel should be a true perpendicular to the road, the above percentage of splay being applicable to the front wheels only.

The third way is that the parallelism of the two axles is upset and causes the wheels, although parallel to the chassis when facing forward, to take a wrong angle when turning a corner, causing a drag and consequent undue amount of wear on the tires. The usual causes of this are either a bent axle or the spring center pin breaking and allowing the spring to slide on the axle plates. One cause, which cannot be remedied by the following methods of alignment, is when the frame becomes twisted.

The method of finding out whether the wheels toe can be seen by referring to Figs. 2 and 3. The operator is compelled in this case to take a point on the rim C1 10 inches above the floor (which must be level), the reason for this being that the pan P3 prevents him taking the measurements at the point where the difference is likely to be greatest, viz., a point midway between the floor and the top of the wheel B1. The calculations, however, will be just as accurate, for if the differences at this point C1 are more than they should be (as stated above), the difference at the point B1 will be increased.

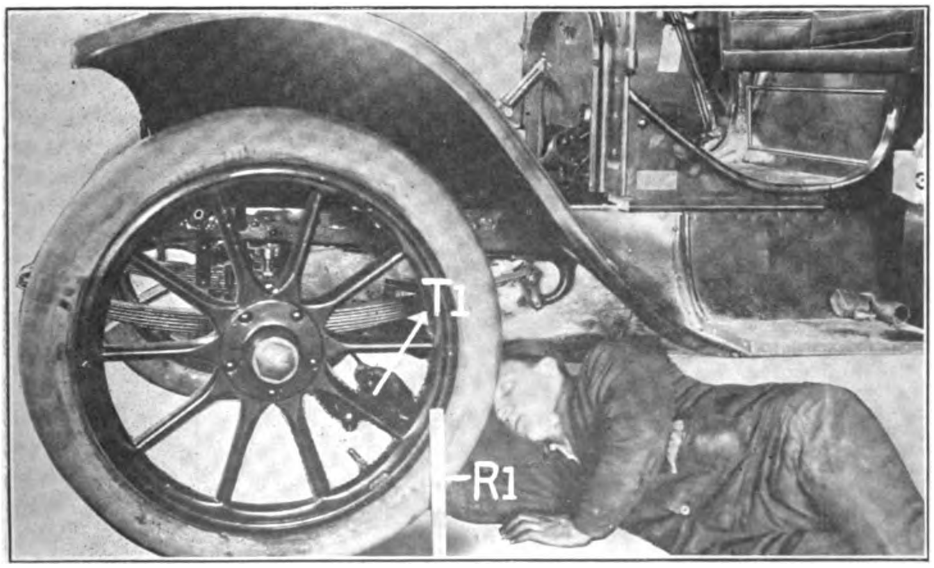

Fig. 3—With the same tools the rear of the wheel is trued and adjusted on the connecting bar

The instrument used in this case is a telescopic tool T1 and T2, with a set-screw S1 to lock the parts in a fixed position. The part T1 slides inside T2 and the ends P1 and P2 are turned over and pointed to form a scribing tool. The rule R1 is marked with chalk to permit easy reading of the measurement. The rims R1 are also marked off at the same height C1. The tool is then extended to touch the rim R1 at the point C1 on the wheel W1 and a point at the same height on the wheel W2 and the set-screw S1 locked. The instrument is then taken in the manner shown in Fig. 3, and after the height markings have been made, as in Fig. 2, it can be determined how much the wheels toe, if at all.

Most cars have the tie bar T1, in Fig. 1, fitted with adjustable ends, and it only remains to tighten or loosen the adjustment A2 in order to set the wheels.

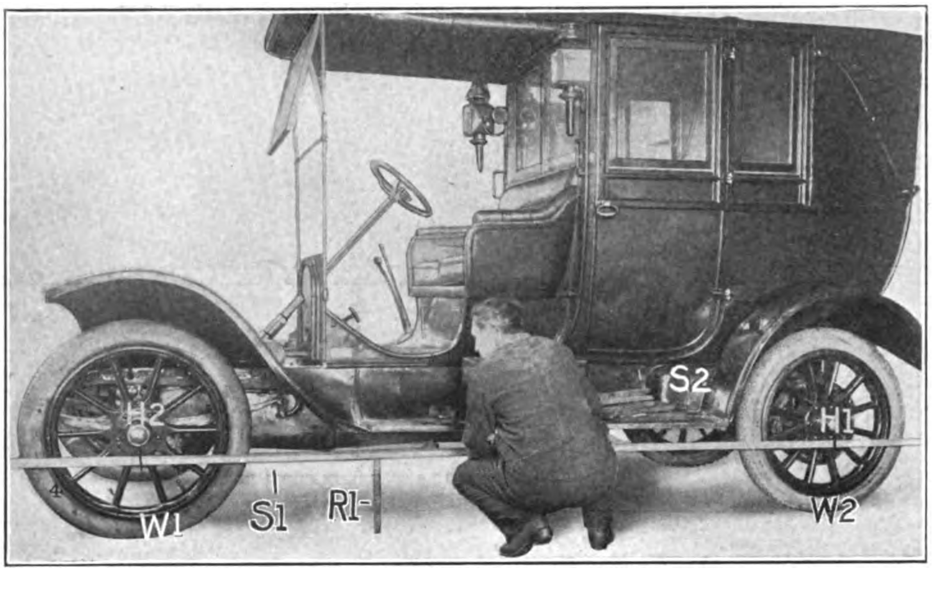

Fig. 4—Using a long square edge and a rule the alignment of all four wheels can be verified in the manner shown

Splaying of wheels can be treated in a similar manner, only in this case the measurements are taken at the top and bottom. It must be remembered that measurements must be made at the rims and not at the tires.

In order to keep the axles of the car at right angles to the chassis the springs have a center pin through them which is fixed in a recess on the axle boss, and provided the spring clips do not work loose this angularity should be retained. There is a possibility of this pin, however, being broken. Should this happen the springs have nothing to hold them in place, and the axle is free to move backward or forward. This will be noticed by the altered position of the spring clips on the springs, and the remedy is to fit new pins. A bad jar on the axle may twist it slightly—an amount hardly perceptible to the eye, but sufficient to put the wheel out of line. Fig. 4 shows the means of finding this out without taking them off.

In Fig. 4 the operator will be seen holding a straight edge S1 resting on a Rule R1 (it requires two men to effectively manipulate the long tool). The center of the hubs are marked off; or, better still, remove the hub caps H1 and H2, and as the axle ends are usually centered, the centers can easily be found. The opposite side wheels should have the same distance measurements as those first measured if the car is fitted with a live-axle type transmission. With a chain-driven car the procedure is different, as the tension rods to tighten the chains are seldom equal in length. The sprocket case S2, in Fig. 4, must be removed, and the distance taken from the center of the front axle to the center of the jackshaft axle will give the alignment of the front wheels. With the tool used in Fig. 2 it is possible to find out which tension rod is the longer, caused by the stretch of the chains.

To find out if the chassis has taken a twist it is necessary to remove the body and measure up for height and parallelism with a straight edge. This is not an undertaking that the average automobilist should consider too difficult to undertake, but some care should be exercised in the process.

Letters from Subscribers

THIS DEPARTMENT IS DEVOTED TO THE ANSWERING OF LETTERS FROM SUBSCRIBERS ON ANY SUBJECT RELATED TO THE RUNNING OF AUTOMOBILES

Floating Piston Pins Do Much Damage

Editor The Automobile:

[2,456]—A few days ago my motor suddenly shut down, and when it was taken apart in the repair shop the repairman discovered that one of the piston pins went adrift, and I am now awaiting a new cylinder from the maker of the car, but the problem which confronts me is: How will I prevent the recurrence of this type of trouble?

Camden, N. J. Subscriber.

Referring to Fig. 1, four methods of holding piston pins in place are given, and of the four it is possible that (A) is the least desirable; (B) represents a very good plan in which one

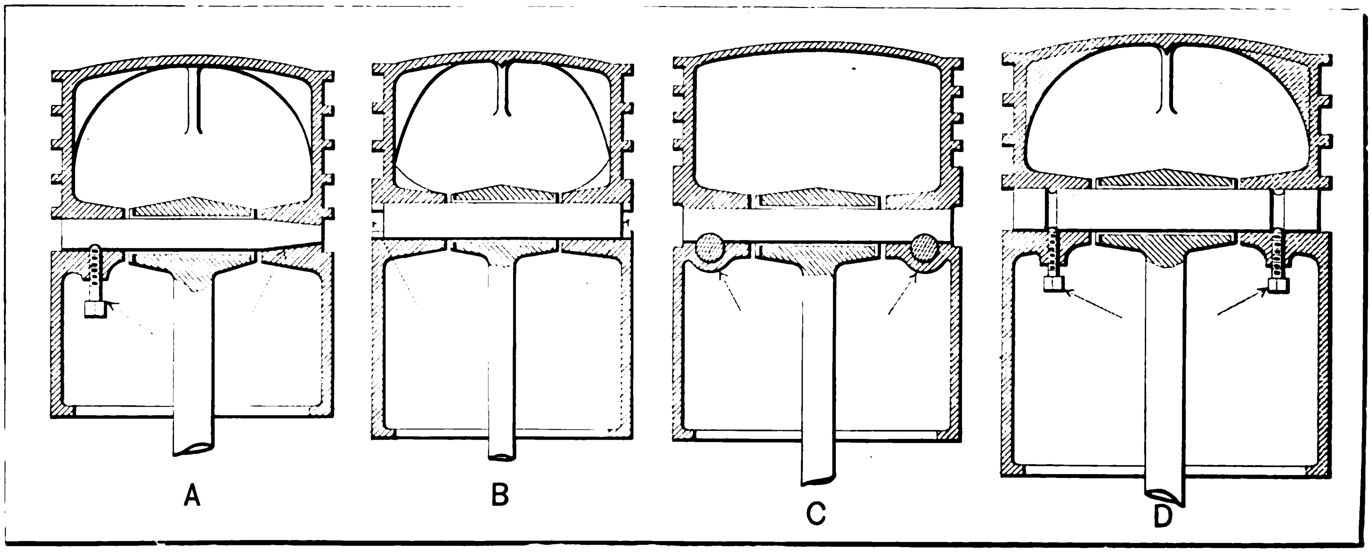

Fig. 1—Sections of pistons, showing four ways of so fixing the piston pins that they will not float out

of the piston rings is put on in a groove in a plane of the piston pin after the pin is inserted into place, so that the section of the ring would have to be parted before the pin would be free to float out. (C) shows a very good way, utilizing two bolts, cutting through the diameter of the pin at two points, so that it is prevented from floating out through the interference of the bolts. (D) shows a very common method of holding the pins, utilizing studs with a fine taper-thread with grooves cut in the pin so that when the studs are fetched up tight the ends thereof register in the grooves.

Wants to Increase the Cooling Effect

Editor The Automobile:

[2,457]—I am a great believer in air-cooled motors, and I have in mind the idea of experimenting upon a type of air-cooled motor with a view to increasing the cooling efficiency without adding to the complication. The enclosed sketch will give you a rough idea of the method I propose to employ, and I would like to have your criticism of it. Reader.

St. Louis, Mo.

Your sketch (Fig. 2) is very interesting, but it is not believed that there is anything very practical about the plan. In the first place, when the car is standing still and the motor is running it will heat up unduly, and much smoke will be generated, due to the burning of lubricating oil, and this smoke instead of passing out of the exhaust orifice to the rear will be distributed so that some of it will pass out through the front and envelop the car to the annoyance of the more æsthetic of its occupants. You also propose to have the cylinders with a smooth exterior and the probabilities are that the radiating surface will be insufficient. It takes 40 square inches of water-brushed surface to handle 1 square inch of flame-swept surface for proper cooling of an automobile motor, and this fact is sufficient to indicate that your problem will be a difficult one to handle, especially since you make no provision for the enforced delivery of air on an equality basis to the respective cylinders.

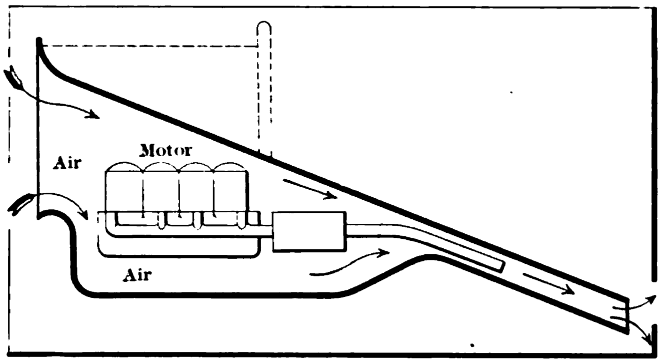

Fig. 2—Showing a plan of ventilation and cooling of an air-cooled motor that looks too attractive to be good

Pressure of Clutch Springs

Editor The Automobile:

[2,458]—I have had trouble with my clutch for some time past and have thought of fitting a new spring to overcome the slipping that I cannot cure, although I have had a new leather. I have dressed it well with castor oil, and while it was slightly rough from the turning it held, but now it has become smooth the slipping has started again. I should be obliged if you will tell me how I can calculate the strength of spring required and what the angle of the cone should be.

Montpelier, Vt. Leather Clutch.

The angle of the cone of the clutch should be about 12 to 14 deg. The formula to find the strength of spring is as follows:

Let T_w = the pull in pounds exerted at a mean radius to transmit the required power,

N = the number of revolutions per minute.

r = mean radius of the clutch in feet.

H. P. = the power to be transmitted at the required revolution,

then

$$T_w = \frac{H.P. \times 33{,}000}{2\pi \times r \times N}$$

Draw a sketch of your clutch after finding the exact dimensions in the manner indicated in Fig. 4 and let AD be a center line coinciding with the axis of the driving shaft. From a point A on the line AD draw AC normal to the face of the clutch, and from C draw CB at right angles to AD. Then if AB to scale represents W, the force pushing the inner part into the outer part of the clutch AC to the same scale equals R, the pressure exerted between the faces of the clutch.

Produce CD to cut the center line AD at point A and let a = angle ADC.

Then

$$\frac{AB}{AC} = \frac{AC}{AD} = \frac{W}{R} = \sin a$$

$$\therefore W = R \sin a$$

and

$$R = \frac{W}{\sin a}$$

If μ = the coefficient of friction of the rubbing surface, then to transmit the horsepower required $R\mu$ should be equal to T_w. Hence

$$W = \frac{H.P. \times 33{,}000}{2\pi r N \mu} \sin a$$

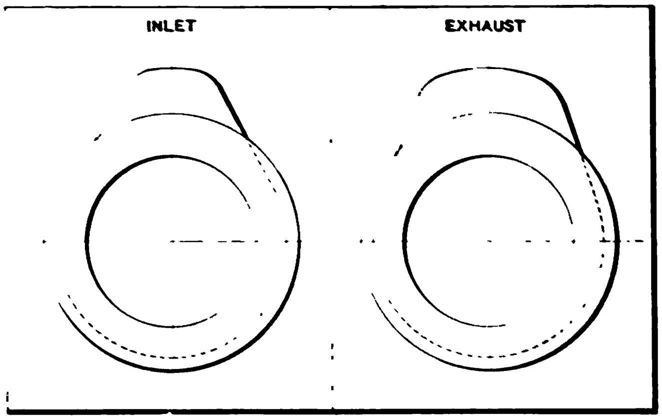

Fig. 3—Inlet and exhaust cams, showing that they are not of the same contour

Inlet and Exhaust Cams Not of Same Shape

Editor The Automobile:

[2,459]—In examining my motor I find that the inlet and exhaust cams are not of the same shape, and my lack of familiarity with the subject makes it impossible for me to know whether or not the builder made a mistake. Will you put me right?

Memphis, Tenn. A. L. M.

An examination of the inlet and exhaust cams, as shown in Fig. 3, will suffice to indicate to you that the respective cams are definitely shaped to different angles, although in this case the lift is the same for both. The reason why the two cams do not shape to the same combined angle is because the inlet and the exhaust valves are not held in the open position during the same number of degrees of rotation of the camshaft or of the crankshaft.

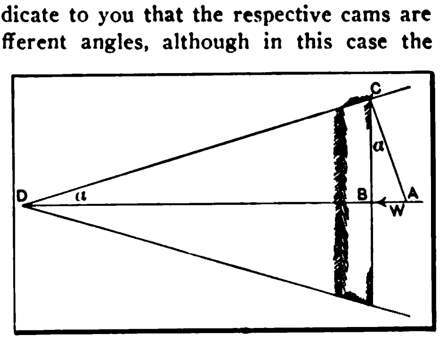

Fig. 4—Diagram of a cone clutch used to show what the spring pressure must be under "holding" conditions

Cantor Lectures on Motors

PROFESSOR W. WATSON, D.S.C., F.R.S., DELIVERED A SERIES OF LECTURES ON THE GASOLINE MOTOR, OF WHICH THIS IS THE FINAL INSTALLMENT—BY PERMISSION OF THE ROYAL SOCIETY OF ARTS

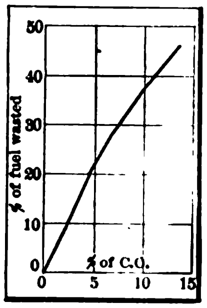

Fig. 34—Showing heat wasted for different percentages of carbon monoxide in exhaust

FROM the numbers which have been given it will be evident that the loss of efficiency due to heat losses in the cylinder is not very great, the reason that the efficiency falls so much below unity being that, owing to the cycle of operations in which the engine works, only a fraction of the heat supply can possibly be converted into work. In order to see how nearly the actual engine approaches the performance of the ideal engine, we may calculate what is called the relative efficiency, that is, the ratio of the efficiency of the actual engine to the efficiency of the ideal engine having the same compression ratio, the working substance being supposed to have the same properties as in the actual engine, that is, the specific heat being taken as variable. Such a comparison for three values of the compression ratio is here shown:

Compression ratio	Compression pressure in lbs. per sq. in. above atmospheric pressure at a speed of 1,000 revolutions per minute	Actual efficiency (maximum at speed of 1,300 revs).	Ideal efficiency	Relative efficiency
4.71	86	.275	.367	.749
4.35	77	.272	.354	.769
3.92	68	.263	.337	.780

It is evident from this table that as long as we confine ourselves to the Otto cycle, however much we reduce the thermal losses in the engine, we cannot improve the efficiency more than about 20 per cent.

I now return to the discussion of the manner in which the efficiency of an actual engine changes with the strength of the mixture. Starting with a mixture containing 14 parts of air to 1 of petrol, and decreasing the strength of the mixture, we see that the efficiency increases; that is, for a given heat supply per cycle the losses are reduced. The reason for this is that as the strength of mixture is reduced the temperature reached after combustion is also reduced. This has a beneficial effect in two ways. In the first place, the lower the temperature of the gases during the working stroke the less is the loss of heat to the walls of the cylinder. In addition, since the temperature is lower and the specific heat of the gases increases with temperature, the mean specific heat of the gases for the range covered by the rise of temperature during combustion will be decreased. Now, the lower the mean specific heat of the gases, the greater the rise of pressure produced by the communication of a given quantity of heat. Since it is the increase in pressure which forces the piston down, and hence does work, it is obvious that the greater the increase in pressure produced by a given heat supply the greater the work done during the cycle, and hence the greater the efficiency. The efficiency does not, however, increase indefinitely as the mixture gets weaker, but, instead, decreases somewhat rapidly for mixtures weaker than about 17 parts of air to 1 of petrol. The reason for this decrease is the very slow burning of such weak mixtures, so that even by advancing the spark more than usual we are unable to arrange that the whole charge shall have burnt before the piston has appreciably moved down on the working stroke. The greater the speed of the engine the further will the piston have moved before the combustion is complete, so that we should expect the efficiency curve to drop more rapidly at high speeds than at low. This effect is, in fact, quite evident from the result of the experiment shown in Fig. 30.

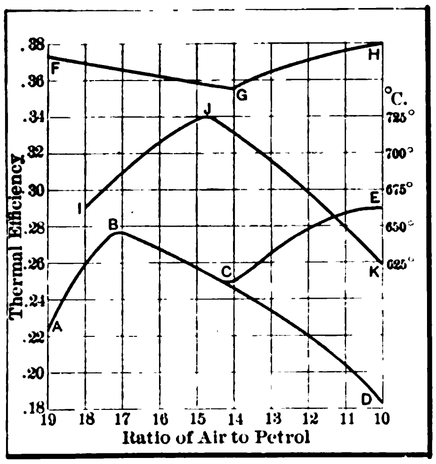

Fig. 35—Diagram showing thermal efficiency with varying percentages of gasoline and air

In the case of mixtures richer than 1 of petrol to 14 of air the combustion is not complete, some of the heat of the fuel not being liberated. By considering the quantity of heat which could be obtained by burning the carbon monoxide, hydrogen and methane found in the exhaust, and deducting this from the calorific value of the fuel supplied, we can calculate the heat actually liberated in the cylinder and then, using this value, obtain the efficiency of the engine after allowing for the effect of incomplete combustion. The amount of heat wasted for different percentages of carbon monoxide in the exhaust is shown in Fig. 34. It will be observed that when there is 10 per cent. of CO in the exhaust, 37 per cent. of the heat in the fuel is wasted on account of incomplete combustion.

On working out the efficiency, allowing for the heat not liberated, the efficiency curve for mixtures richer than 14 of air to 1 of petrol has the form shown at C E, Fig. 35. The rise from C to E is due to two effects. In the first place, as the petrol becomes more and more in excess the temperature falls, and thus the losses due to conduction to the cylinder walls decrease. In the second place, as is shown in Fig. 25, there is a rapid rise in the increase in volume on combustion for mixtures richer than 1 of petrol to 14 of air. Now this increase in volume produces an increase in pressure in the cylinder, without any corresponding increase in temperature with its accompanying losses, and, therefore, has a marked effect on the efficiency. If the efficiency for an ideal engine (variable specific heat) is worked out for different strengths of mixture, *i. e.*, heat supply per cycle, and the results plotted, we obtain the curve F G H (Fig. 35). The rise from G to F is due to decreased maximum temperature, while the rise from G to H is partly due to decreased maximum temperature and partly due to increasing expansion on combustion.

Although there is very little doubt that the temperature reached will be higher for a mixture of 1 of petrol to 14 of air than for both weaker and stronger mixtures, it would be a good thing if direct experimental proof were obtained. Now, owing to the very high temperatures reached during the explosion, temperatures sufficient to melt a platinum wire, the direct measurement of such temperatures is impossible. Owing to the expansion which takes place during the working stroke, as well as to loss to the cylinder walls, the temperature at the end of the working stroke is so much reduced as to be measurable. Hence we can measure the temperature of the exhaust gases directly after they leave the cylinder, and the values obtained by means of a platinum resistance thermometer, with different strengths of mixture, are shown in the curve, I J K, Fig. 35. It will be noticed that the temperature rises to a maximum for a mixture of 1 of petrol to 14.7 of air. Now, if the exhaust temperature is a maximum for this strength of mixture we may infer that the temperature throughout the stroke is also a maximum, and hence the explanation of the shape of the efficiency curve given above is supported.

Since it has been shown that if we restrict ourselves to the Otto cycle it is not possible to obtain any very striking increase in efficiency, it is interesting to see whether it seems likely that greatly improved efficiency could be obtained by employing a different cycle.

A study of the numbers already given shows that more than half the energy supplied in the form of fuel is discharged in the hot gases of the exhaust. One way of decreasing the loss on this account would be to carry the expansion on the working stroke further than is done in the Otto cycle. We are limited, of course, as to the amount of expansion possible since the pressure must not be allowed to drop below atmospheric pressure. If we continue the expansion till the pressure in the cylinder falls to atmospheric pressure, then the indicator diagrams obtained on an ideal air-cycle engine, an ideal variable specific heat engine and in an actual engine would have the form shown in Fig. 36.

The efficiency obtained and the heat distribution in such a case are shown in the following table:

	Final volume	Mean effective pressure lbs. per sq. in.	Efficiency	Work per cycle ft. lbs.	Work per cycle, Otto ft. lbs.	Difference ft. lbs.
Ideal engine, variable specific heat.	3.5	38	.47	538	410	128
Actual engine......	2.7	30	.30	344	285	59

Expansion carried to atmospheric pressure.
Compression ratio = 4.7.
Heat supply per cycle = 1,150 ft. lbs.
Initial volume of charge taken as unity.

It will be seen that carrying the expansion to 2.7 times the original volume only gives an additional 59 foot-pounds of work. Hence it is quite certain that, allowing for the increased friction, such an engine would not give as high a brake-horsepower as it would if the expansion had been stopped at the original volume. A further practical objection is that an engine having such a large expansion would be very heavy for the power developed, the mean effective pressure only being 30 pounds per square inch as against 84 pounds per square inch on the Otto cycle. It is conceivable that some way of obtaining increased expansion other than by means of a piston, say in a turbine, may be developed in time, but even then, as the above calculations show, the gain cannot be very great.

One method of obtaining increased efficiency is to employ higher compression; but, as has already been mentioned, it is impossible to compress a mixture of air and petrol above a certain amount without producing pre-ignition. Hence if we wish to use higher compressions it will be necessary to compress the air alone and then add the petrol at the top of the stroke, just as is done in the Diesel engine. It is very doubtful, however, if any very material increase of efficiency would be obtained in this way, and the complication introduced into the engine, as well as the increased weight, would preclude its adoption either in a motor car or aeroplane. It would thus appear that such modifications of the Otto cycle as I have considered do not promise to afford much improvement, and, as we have seen, the present-day engines working in the Otto cycle do give about 75 per cent. of their maximum efficiency, so that at most an improvement of 25 per cent. is possible. It must in this connection, however, be remembered that it is only when an engine is well designed and run with a correctly proportioned mixture of air and petrol and with a properly timed spark that such relative efficiencies as 75 per cent. are attainable. There is no doubt that, in the case of the majority of petrol engines which are in general use, these conditions are by no means fulfilled and hence the efficiencies obtained are much lower.

I have, in these lectures, given a somewhat rapid account of the methods by which we can obtain some insight into what goes on inside the cylinder of a petrol engine, and have given some of the results obtained so far. Much remains to be done before our knowledge is at all complete, but the subject is one attracting much attention, and many workers, both engineers and physicists, are attacking the problems, so that before long I have no doubt much that is now doubtful will be cleared up.

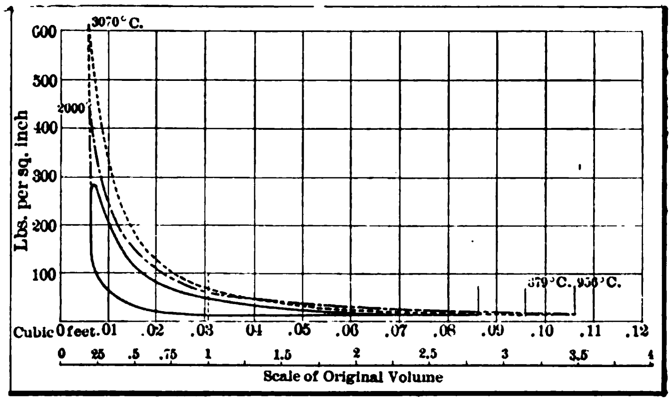

Fig. 36—Resultant pressures due to compression, explosion, and expansion for given volumes as shown, with equivalent volumetric measurements in cubic feet.

Radiator Trouble

Determining the Size of the Radiator Based Upon the Horsepower Rating of the Motor Is Futile

EARLY practice, guided by synthetic formulæ and a surfeit of inexperience, led to the use of radiators on many automobiles, which in after service proved to be a decided misfit. The conditions that must govern the wise engineer when he fixes upon the size of a radiator for a given motor may be set down briefly as follows:

(a) The thermal efficiency of the motor must be known.

(b) The amount of fuel that can be burned to carbonic acid and water is a factor.

(c) The stray heat units must be traced to their destination.

Since the value of the fuel is measured in heat units and all of the energy so measured, if it is not turned into mechanical work, must be disposed of in such a way as not to cause trouble, it remains to find out how much of this energy falls to the lot of the radiator to handle and the difference in sensible temperature under which the heat must be disposed of. For every 100,000 heat units furnished by the fuel and burned to finality it is a good motor that will turn 16,000 of them into mechanical work. It is not a bad motor that sends 50,000 of these heat units into the cooling water, in which event the radiator must unload 50,000 heat units to the willing air as it glides over the surfaces in the interstices of the radiator. The early mistakes in cooler practice followed the assumption that the thermal efficiency of all motors is substantially the same. After events proved that there was a wide divergence; moreover, there is considerable opportunity for serious trouble, even if the thermal efficiency is, say, 16 per cent., which means that 84,000 mischief-making heat units must be watched and guarded against.

These very possibilities show ample reason for wanting to know more about it. If a radiator is designed for a motor that only delivers 30,000 out of each 100,000 heat units to the cooling system and this radiator is transferred to a motor that permits 60,000 out of each 100 000 heat units to go to the water, the figures show that the radiator will be just half big enough.

The reason why some motors deliver more of the stray heat to the water jacket than is transferred in other examples is due to the difference in flame-swept surface influenced by other thermic relations. Restricting the internal surface of the combustion chamber of the motor reduces the path of transfer of heat units to the water jacket and vice versa.

Lubrication Problems

THE CAMEL MAY GO EIGHT DAYS WITHOUT LUBRICANT, BUT THE AUTOMOBILE IS CONSTRUCTED ON SOMEWHAT DIFFERENT LINES

THERE is nothing so disconcerting to the autoist as to hear a persistent squeak, and one that cannot be located, coming from beneath the hood of the car. Of course, it may not come from the hood at all, and nothing less than the stethoscope would seem to be able to discover the fault. No doubt if this instrument were placed on every square inch of metal of the car the cause might be located. But there is no necessity for this on a well-built car provided the lubrication is properly carried out. The body and its fittings are often the cause of these mysterious squeaks: for instance, the mud guards may rub against the frame, or the top sockets, having become rusty with exposure, may give out sounds as the bumps of the road move the upright arms in them. Such trivialities are easily remedied and once put right will not occur again.

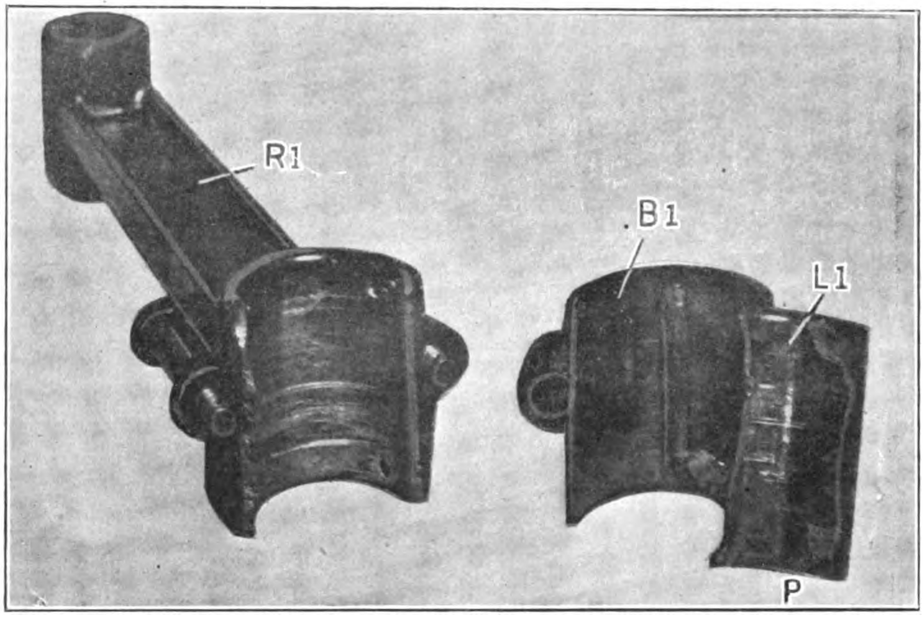

Fig. 1—Showing burnt-out bearings due to insufficient lubrication

A squeak is an ominous sign and should never be disregarded; it is like some great event casting a shadow before it. Should it emanate from some such cause as above instanced it is no reason why it should be disregarded the next time it occurs. The rule the autoist should lay down for himself is that it emanates from want of lubrication. Such noises do seem to have the knack of putting themselves in evidence at inopportune times—perhaps just a few miles from home and when one is least inclined to get down to attend to it. Procrastination is going to be a thief if the Good Samaritan neglects his duty. As plainly as any dumb animal can ask, the car is craving for oil. And why deny it? If a car that starts out lively in the morning shows signs later in the day of sluggish digestion there is one patent remedy known to all, and that is oil. One has but to drop into the first repair shop to discover that the majority of repairs can be traced to one cause—want of oil. There is no excuse for the novice if he has trouble through underlubrication, and the first thing that the maker of a car will ask if a part is broken is: "Did you lubricate it properly?" In the majority of cases this is the root of the evil. It is not sufficient to oil up a car regularly on the off chance that the oil "gets there": it is necessary that the channel should be free and the oil of the right consistency for the size of the pipe. A pipe that may be large enough to convey gasoline to the carbureter would be altogether too small if heavy oil were used for engine lubrication; and, again, should the vent to allow the gases that find their way to the crank chamber become partially stopped up, some of this back-pressure may find its way up the oil pipes and stop the flow of oil down them.

The majority of engines of the present day have some anti-friction metal liners in the main bearings, and these serve two purposes—the first being to reduce friction; the second, that should the friction become too great through the heat generated by want of oil, this lining metal, having a low melting point, will run and incidentally cause such a knocking that it will be impossible to drive unless one is deaf. If it were possible to drive with the eyes shut, there is no finer way to tell how a car is pulling; and it is really a pleasure, after the rudiments of driving have been mastered, to listen to the rhythmic beat of the motor. Then you begin to think of the car as a friend of man and fondly pet the part that makes the wheels go round rather than pat it externally and groom its glossy coat and count the number of scratches on the varnished panels. There is a saying that the way to a man's heart is through his stomach, and to get the best out of the car, "feed the brute" with oil. The gasoline motor has different ways of showing its displeasure, and two of these may be seen in the accompanying illustrations. Fig. 1 represents a connecting rod R1 and the lower half B1, and half the liner L1, or rather all that is left of it. The remains of the bearing were found in the lower half of the base chamber without a drop of oil in it. Here the metal had melted from the white metal linings and run almost in a stream, as the particles were found in a lump A, besides several small particles B, Fig. 2.

This is a mild form of trouble comparatively speaking. For instance, Fig. 3 represents the same trouble in a different light. In this case there must have been a sudden seizure of the bearing on the shaft which burst the bolt B1 and lower half of the bearing B11, and as something had to go, the weakest part gave way. In this case the manufacturer could not be held responsible for the omission of the driver. Had he had oil in his engine there would have been no seizure and consequently no hole in the base chamber. This was caused by the connecting rod C1 being freed from the crankshaft and being hit by same on the next revolution, the force being such as to drive it through the base E1, and a very lucky break, too. The connecting rod has been bent out of the perpendicular to the amount shown, allowing for the small amount of side-swing.

While it is the aim of every designer of an automobile to so contrive that the lubricating problem will be minimized, the fact remains that no method has as yet been discovered by means of which it will be possible to turn a car over to a user and say to him, "Forget all about the oiling question." It was hoped at one time that annular type ball bearings would thrive in the absence of lubricant, and so they will, to a greater or lesser extent, but they will last very much longer if they are lubricated than they will if they are permitted to run dry. It was found in the course of events that plain bearings will sustain under pressures as high as 1,500 pounds per square inch if the service is intermittent, as it is in the motor, due to reciprocation of the members rather than to continuous rotation. Even the camshaft belongs in the class involving intermittent pressures, because the load comes on intermittently. Persistent experimenting seems to have evolved a substantial array of data that proves quite conclusively that the real problem of lubrication has to do with an unbroken oil film rather than with pressure.

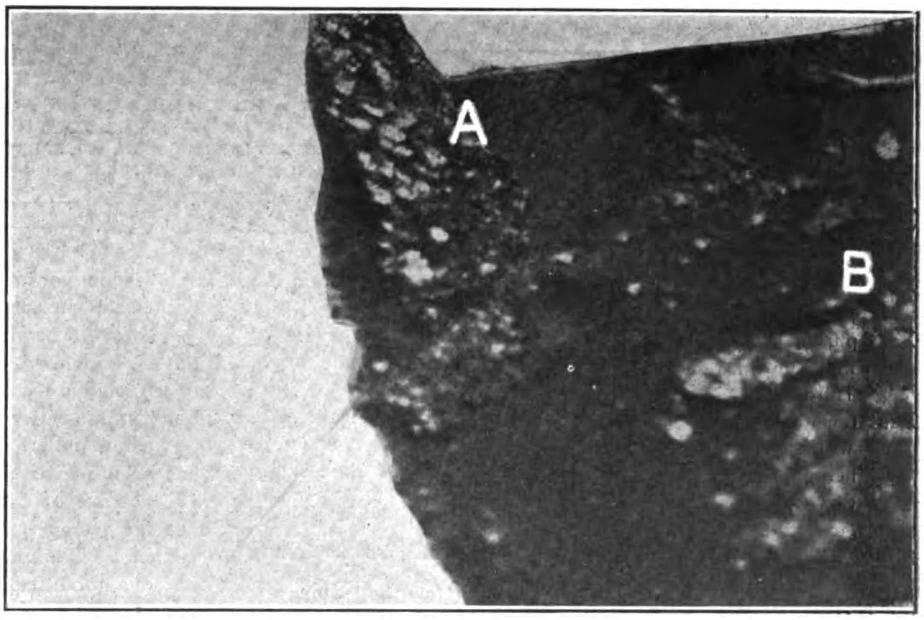

Fig 4—Showing the metal run out of the bearing into the base chamber, whence it was recovered

It is the duty of the automobilist to supply a sufficient quantity of good lubricating oil to assure that the film will not be broken. It is also necessary to appreciate the fact that even with good lubricating oil the film will be broken if a little water squeezes in. Following along this line of reasoning for a moment, it leads rather forcibly to the conclusion that the practice of cleaning out cylinders, using kerosene oil, or other liquids that are not good lubricants, leads to the contamination of the lubricating medium and to the very difficulty which it is necessary to avoid if the motor's bearings are to be kept free from harm. But a very few drops of kerosene oil will be required to so reduce the value of the lubricant that the oil film will be ruptured and the spindles will be let down on the journal brasses, which they will seize.

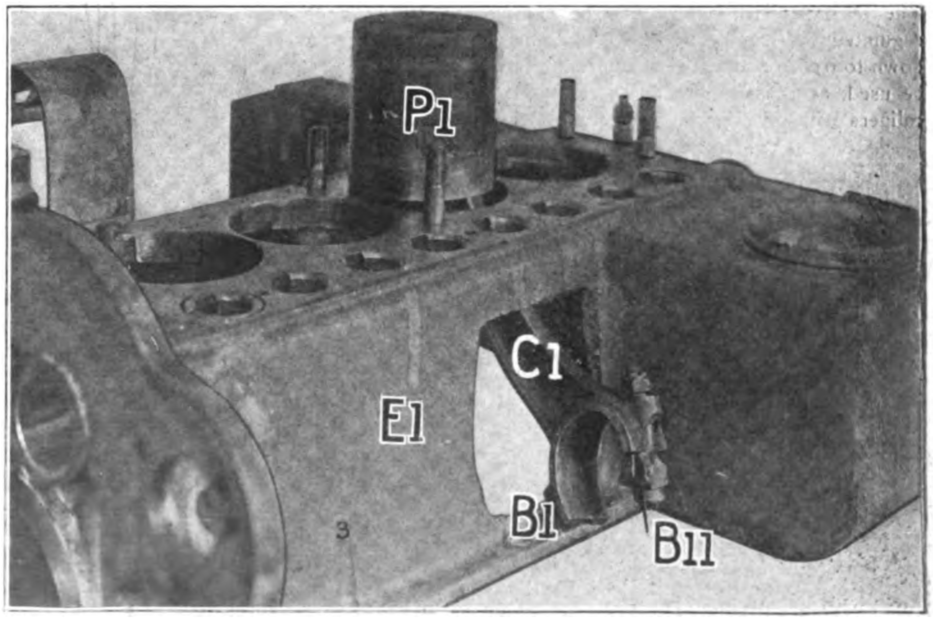
Stray Thoughts

On "the Ambitions of the Automobile Industry" or What They Ought To Be

SOME very fine problems are involved in making 10,000 automobiles with a capital of $10,000 and making them all alike and selling them at a profit at $1,000 for each and having each of them better than anything that could be bought for four times more money four years ago, and all those things. But there has to be division of interests in this world, just as there has to be division of labor, unless one is willing to split oneself up into atoms. An individual's interests cease distinctly when nearly all the things that are done are aimed at money-making for the other fellow and every improvement is pushed aside because it interferes with the regular routine of manufacture. The other fellow is vitally concerned, of course, as are all those who are to share in the profits. A little glow of satisfaction can even be derived from reflecting that the time is drawing nearer when every farmer and every expressman will be able to buy a car to help him out in his business, and any one can appreciate that every now and then this automobile production under high pressure uncovers some new way of mixing or of working steel which eventually may be of benefit to the engineer, who is doubtless willing to pick up and utilize these incidental gains as soon as they are ripe.

Meanwhile it would doubtless interest the public—the motoring portion, at least—much more to learn that, for example, a plan had been devised for doing away with the gasoline tank. Some one might get up a standard size of gasoline can—to hold three gallons, say—and have that sold all over like sugar, only sealed; and provide a couple of cradles with clamps for holding these cans in each car and an attachment with a nut and a pipe or anything to enable one to draw direct from either can. When one can was empty one could start drawing from the other and at the next stopping place simply exchange the empty can for a full one.

There would be decidedly less bother pouring gasoline or getting it dirty or full of water, and there would always be some on tap. The cans could be removed at home and the owner could store his car where he pleased without getting into trouble with the insurance people.



Disastrous effects may be caused by the bearing seizing and breaking a bolt, with results similar to those here depicted

It Stands to Reason

THAT A PURCHASER OF AN AUTOMOBILE IS IN THE GRAVEST DANGER OF TAKING TITLE TO WHAT HE CANNOT GENERATE A PERMANENT LIKING FOR WHEN HIS MIND BECOMES WRAPPED UP IN A SINGLE THOUGHT

That a tomato-can may be a satisfactory carbureter, but that the price to be paid should be on a tomato-can basis.

That purchasing an automobile is like venturing on the sea of matrimony; the sterner side is hidden; the smile might rub off.

That the idea of the mother-in-law being an index of the wife works out in automobiles; look at the service which is being rendered to ascertain the character of the service that you will experience.

That wisdom goes on a vacation while a man of little sense purchases an automobile based upon the envy that his neighbors will be able to support.

That the neighbors get the laugh on the man who wants them to coddle the envy that he pays so much to deliver.

That it is far better to purchase a modest automobile and reserve a few dollars for purposes of maintenance.

That a high-powered motor, so-called, is a mess of junk in the absence of a good carbureter.

That the average purchaser is over-awed by size; why not invest in a mountain; it comes by the acre.

That one good magneto is worth a bushel of poor ones.

That there are hundreds of automobiles delivering poor service for want of a good spark-plug.

That automobilists fail to appreciate what it means to keep a high voltage from jumping out of bounds; keep the spark-plugs clean; keep oil away from the wiring.

That excesses of lubricating oil are at the bottom of a large number of motor troubles.

That even the muffler will foul up in time if too much lubricating oil is used.

That it is a shame to pay so much for lubricating oil and then waste nearly all of it.

That profuse lubrication, while it sounds good as a phrase, is likely to end in a spree.

That it is not good for bearings to go on a spree.

That the excesses of lubricating oil dissolve the tires, accumulate dirt, and invite the owner of the automobile to keep from soiling his garments.

That simplicity does not consist in leaving some of the parts off an automobile and then going around bragging about the good qualities that it has a monopoly of; the best of the good qualities might reside in the parts that are left off.

That the "extras," so-called, may be necessities, in which event they are only to be classed as extras when the purchase is being made.

That things thrown in for good measure might just as well be left out as far as good value in them is concerned.

That it is better as a rule to buy what is needed; the quality will then be what is wanted, and the price, all points considered, will be the lowest.

That it is proper to include everything for comfort and convenience; when a trip is to be made in an automobile, it is just as desirable to be comfortable as when a journey is to be endured in a house-boat.

That it is a simple matter to dismiss the purchase of necessities until a later date; but it might be too long deferred and the cost of neglect would then have to be faced.

That proper lighting facilities must be procured whether they come extra or regular; get the best; make the purchase while the subject is up; why make two bites of a cherry?

That a lighting dynamo is a very desirable adjunct to a good automobile; it is a constant and reliable source of an adequate supply of electrical energy.

That acetylene lighting is admirably accomplished when a gas-tank is used; the cost is low enough; facilities for exchanging filled for emptied gas-containers must, of course, be near at hand.

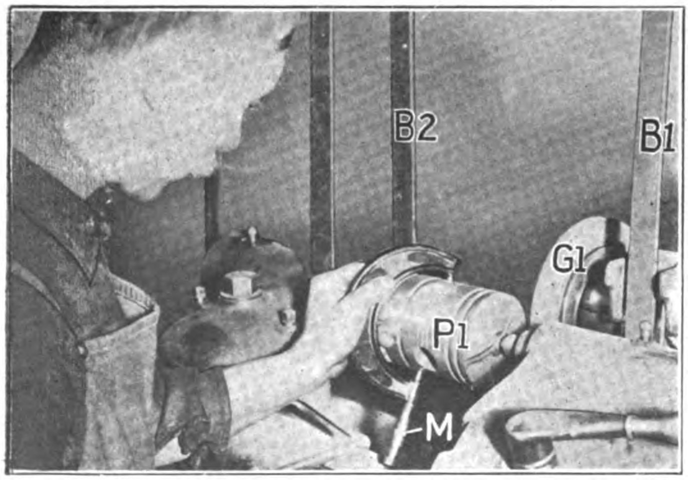
That acetylene generators are so much refined that any automobilist of ordinary intelligence will be able to make them work satisfactorily—get a good generator.

Fitting New Pistons

Explaining How the Pistons Are Treated from the Blank to the Finished Article

IT avails about as much to run an engine with the pistons a bad fit in the cylinders as to attempt to play "Hamlet" with the principal character left out. The life and soul of the motor lie in proper compression, which can only be attained if the pistons are a snug fit. Opinions differ as to the exact amount of clearance between the cylinder and piston required to arrive at this, but if the clearance is more than the outside estimate nothing will rejuvenate the motor unless new pistons are fitted.

As a temporary remedy new rings are often tried, but it is so much money thrown away to thus fuss around. Go to the root of the trouble, and if the car is to be used at all get new blanks from the makers, if possible 1-4 inch more in diameter than the old ones. Presuming the cylinders have been lapped—that is to say, evened up to a uniform diameter—this measurement should be carefully taken and the piston fitted up for grinding in the manner shown in the illustration. The polish given by the grinding method does away with the long process of running in the part if ordinary turning is resorted to. The grinding wheel G1 rotates clockwise, driven by the belt B1, while the piston P1 turns in the opposite direction, driven by the belt B2. The travel of the wheel can be set automatically or can be regulated by hand. For this class of work, where precision down to 0.001 of an inch is required, micrometer calipers M1 must be used, as it is impossible to ascertain with the ordinary bow calipers with any degree of exactness the thickness of the work.



Showing method of grinding pistons for cylinders that have been lapped out

Paint and Varnish Refinements

M. C. Hillick Discusses the Problems of Finishing for 1911

PUBLICATIONS devoted to the interests of automobile manufacturing and marketing have during the past few weeks been busy imparting information to their readers concerning changes in body construction, suspension, type, motors, propulsion and so on of the 1911 car. And while all these changes have been arranged for, the painters and finishers, whose work is, more than anything else, the visible thing which helps sell the car, have not been idle. As a matter of fact, when Milady and her escort visit the Madison Square Garden Automobile Show in January she will find original and unlooked-for color creations, striping effects to move her into an ecstasy of delight, and a finish sure to evoke her unstinted admiration.

For, verily, all these art matters have been provided for by the master of the paint shop and the varnish room.

In the matter of colors it is true that the great range of pigments—sufficient, indeed, to confuse the mind of the layman—all, or chiefly, radiate from a comparatively few members, such as, for example, green, blue, red, yellow, brown and gray. The shades and tints, and the modifications, made up from using the above as basic colors, are, fairly, as the sands of the sea. Every season brings its new crop of colors and the season of 1911, as the coming automobile exhibitions will show, is to be no exception to the rule.

For example, among many new colors to bid for popular approval will be found Detroit and Hudson gray, auto maroon, Niagara and Roman green, Detroit blue, Indian and fire blue. But it will not matter so greatly precisely what the colors are called so long as they have the tone, the brilliancy of effect, the capacity to elicit admiration. This last, in fact, is the real test of color value as it is tried out on the showroom floor and in the salesroom. It may possess other rare good qualities, but, failing in this, prove a loser.

The prospective buyer at the coming shows and elsewhere may expect, and look for, and even demand, some effects in colors which he has not hitherto enjoyed, namely, the proper display of colors with reference to one another. This matter has not heretofore been worked out on the automobile surface to the extent the painters have been capable of, and as a result we have had examples on the heavier type of car, notably the limousine, of colors jumbled together in such a way and in such direct violation of good taste and the law of artistic color effects that the entire color scheme has gone by the boards as crude and amateurish, as it deserved to. As, perhaps, nowhere else, the law of harmony, of seemly contrasts, must be lived up to the very letter on the rich and ample automobile surface. Otherwise the effect will be about as ludicrous as anything the imagination can conjure up.

The automobile surface showing the minimum number of colors, and those colors chosen for their capacity, above everything else, to display and accentuate the charms of each, will prove—indeed is proving—other things being equal, the one most eagerly sought for by buyers.

The great touring cars showing, as a case in point, two colors simply and elegantly displayed, each pigment adding to the attractiveness of the other, are commanding, and are destined to command, an amount of attention from the people whose attention is valuable, which more colors, or the same number of colors unfortunately displayed, can in nowise be expected to command.

The striping of the automobile is a part of the painter's work which may make or mar the appearance of the car. Too much striping is even worse than none at all. As in the employment of the minimum number of colors for the surface, so in the employment of the single, or, at most, the double lines of striping, lies the development of the most fetching effects. Strictly speaking, striping is intended to "set-out," to heighten the effect of the body color.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, ANNUAL MEETINGS AND OTHER FIXTURES

Dec. 31-Jan. 7, '11	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 2-7	New York City, Hotel Astor, Annual Importers' Salon.
Jan. 7-14	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12	New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, First and Third Regiment Armories.
Jan. 16-21	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A.L.A.M.
Jan. 16-21	Detroit, Mich., Tenth Annual Show, Detroit Automobile Dealers' Association, Wayne Pavilion.
Jan. 16-21	Milwaukee, Wis., Annual Show, Milwaukee Automobile Dealers' Association, Auditorium.
Jan. 28-Feb. 4	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-11	Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 6-12	Buffalo, N. Y., Ninth Annual Show, Automobile Trade Association of Buffalo, Broadway Arsenal.
Feb. 13-18	Washington, D. C., Annual Show, Convention Hall.
Feb. 13-18	St. Louis, Mo., Fifth Annual Show, Coliseum.
Feb. 14-19	Kansas City, Mo., Annual Show, Motor Car Trade Association.
Feb. 15-18	Grand Rapids, Mich., Annual Show.
Feb. 18-25	Minneapolis, Minn., Annual Show, Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25	Brooklyn, N. Y., Annual Show, Brooklyn Motor Vehicle Dealers' Association, 23d Regt. Armory.
Feb. 18-25	Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 18-25	Newark, N. J., Fourth Annual Show, New Jersey Automobile Exhibition Co.
Feb. 20-25	Cincinnati, O., Annual Show, Cincinnati Automobile Dealers' Association.
Feb. 20-26	Omaha, Neb., Annual Show, Omaha Automobile Association.
Feb. 21-25	Baltimore, Md., Annual Show, Automobile Club of Maryland, Fifth Regiment Armory.
Feb. 24-27	New Orleans, La., Annual Show, New Orleans Automobile Club.
Feb. 25-Mar. 4	Toronto, Ont., Automobile Show, Ontario Motor League.
Feb. 27-Mar. 4	Kansas City, Mo., Fifth Annual Show, Kansas City Automobile Dealers' Association, Convention Hall.
Mar. 4-11	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 14-18	Syracuse, N. Y., Third Annual Show, Syracuse Automobile Dealers' Association, State Armory.
Mar. 14-18	Denver, Col., Annual Automobile Show, Management Motor Field, Colorado Auditorium.
Mar. 15-18	Louisville, Ky., Annual Show, Louisville Automobile Dealers' Association, First Regiment Armory.
Mar. 18-25	Pittsburg, Annual Show, Pittsburg Auto Show Association (Inc.), Exposition Hall.
Mar. 25-Apr. 1	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mar. 25-Apr. 8	Pittsburg, Fifth Annual Show, Duquesne Garden, First Week, Pleasure Cars; Second Week, Commercial Trucks. Automobile Dealers' Association of Pittsburg, Inc.
Apr. 1-8	Montreal, Can., Automobile and Motor Boat Show, Automobile and Aero Club of Canada.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

STANDING on any corner of a business thoroughfare watching automobiles go by affords food for serious reflection to the man who studies the economic problem, and among the things which come to the surface mention may be made of spreading wheels and the poor alignment of the front with the rear wheels. When the snow is on the ground and the average automobilist finds by inspection that the front and rear wheels do not track with each other he may take it as a sign that the alignment is poor. Considerations of economy are founded on the proper alignment of the front with the rear wheels, although it is considered good practice to have the front wheels toe in slightly. In dealing with the lining up of wheels in THE AUTOMOBILE of this week the methods in vogue in some of the garage repair shops are illustrated, and since the process involved is relatively simple, one would fail to understand why any automobilist should throw away 25 per cent. of the value of his tires rather than to align the wheels.

* * *

ALUMINUM, as it is used for crankcases and transmission gear boxes, is supposed to be of the first quality, but if an automobilist has the misfortune to become "shipmate" with a broken crankcase he will at once take a keen interest in the problem involved and he will have to determine for himself whether or not he will call upon a repairman or procure a new case from the maker. Under the head of "Practical Repairing" this problem is discussed at some length in THE AUTOMOBILE this week, and quite a little space is devoted to that part of the subject which will help the automobilist to understand whether or not the quality of the material present in the event of a broken crankcase will be such as to encourage the making of a repair. If the material in any given case passes a critical inspection as to its physical characteristics it will then be time enough to utilize the oxy-acetylene flame and such other facilities as may be had with a view to welding the broken parts.

* * *

COMMUNICATIONS continue to come to the Editor bearing upon the subject of the mathematical determination of the horsepower output of internal combustion motors as they are used in automobile work. It is almost strange that anyone would regard an empirical formula as having any great virtue, particularly in view of the fact that a plurality of companies are paying real money to engineers of considerable reputation for no better purpose than to design motors so that they will deliver power on a satisfactory basis. If the whole subject is encompassed in an empirical formula that in itself is so simple that an office boy might commit it to memory in twenty minutes, it is past understanding why a pay-roll should be considerably bulged for the purpose of recompensing men of accentuated skill. As a matter of cold hard fact the formula tells nothing.

* * *

WHETHER or not an automobile motor will be highly efficient in the delivery of mechanical power or most efficacious as a stove or heater depends entirely upon the thermic balance, and judging from the character of discussion which emanates from even high sources it is not believed that the thermic relations are given the serious consideration to which they are entitled. But there is no reason why even an automobilist might not make himself quite familiar with the reasons why a motor will either deliver power or act like a stove, for instance; in other words, an ordinary kitchen range is looked upon as being a faithful servant if it furnishes heat. The stove differs from the motor when the latter is working properly, in that mechanical power is the product, but when a motor is in poor health it is mostly noted for its ability to imitate the kitchen range. All these thermic relations are being clearly expounded in THE AUTOMOBILE under the head of "Cantor Lectures," and the automobilist who wishes to know the difference between the motor in his automobile and the stove in his kitchen is in a position to acquire the information.

* * *

RECOUNTING the cost of a tour in THE AUTOMOBILE this week, involving a distance of 4,309 miles, taking thirty-nine traveling days, brings to light several important details, as, for illustration, the average traveling was on a basis of 110 miles per day. The trip was made over a great variety of roads between Freehold, N. J., and Billings, Mont. The total of the expenses of the trip was $3,507.55. A casual examination of the items of expense would lead one to the conclusion that the hotel bills were rather frequent and too large to suit the pocketbook of a man of ordinary means. The tire bills are also something to notice, and gasoline at 20 cents per gallon seems too high. It would seem possible for a man who first makes suitable preparation and thereafter drives his own automobile to conclude a tour of this magnitude well within the cost in this particular case.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

S. A. E. Program to be Interesting—News of the Shows Throughout the Country—New Jersey Automobile and Motor Club Quits A. A. A.; Louisville Club Will Follow Suit; Belated Action of A. A. A. on Disqualifications—Refinements to be Seen at the Paris Salon—News of Maker and Dealer in Many Fields—Peeps Through Auto Goggles at Foreign Lands—Short Personal Items of Interest to the Trade, Etc.

S. A. E. Program to Be Interesting

ASSEMBLING in New York when the metropolis is seething with automobile interest, the Society of Automobile Engineers will hold its annual meeting January 11-12, 1911. The sessions will be held in the quarters of the Automobile Club of America.

The opening session will probably be along the usual lines, including an opening address by President H. E. Coffin, followed by election of members and reports of the treasurer and council. Reports on the election of officers and a discussion of proposed amendments to the constitution of the society will probably conclude the session.

The first professional session is scheduled for the afternoon. According to reports, it will include papers on "Electro Steel," by Joseph Schaeffers; "Physical Facts Relating to Metallurgy," by Radclyffe Furness; reports of the Committee on Standards, including those of divisions on the various metals, parts and generally on standardization. A. L. McMurtry, who has been particularly active in contest work from the technical viewpoint, will deliver an address on "Contest Rules that Affect the Engineer." The matter of contests will be treated in two or more additional papers, one of which will be by Chester S. Ricker, who will discuss timing and coaching.

Wednesday evening will be devoted to a reception at which the retiring president and the president-elect will speak. This will be followed by the annual dinner and entertainment.

The last day of the meeting will be very busy. A professional session will convene at 9 o'clock, at which a number of important subjects will be covered. Logan Waller Page, of the Department of Agriculture, will treat of the construction of highways for motor traffic. "Leaf Springs," E. K. Rowland; "Valve Systems," E. P. Batzell; "Hot-Roller Gears," H. N. Anderson, and "Commercial Gasoline," by F. H. Floyd, are among the subjects that are reported to have place on the program of the session.

Thursday afternoon's professional session will be occupied by half a dozen addresses, including the following: "Bearing Metal Tests," S. P. Wetherell, Jr.; "Test of Franklin '20' Air-cooled Car," L. R. Evans; "Development of Grinding Wheel," G. N. Jeppson; "Methods of Grinding," John C. Spence; "Frictionless Friction Drive," C. E. Duryea; "Fire Protection," N. B. Pope; "Multi-point Ignition," Otto Hains.

"Commercial Vehicles" will be the subject of the evening session. "Standardization" will be treated by W. P. Kennedy; "Vertical Motors under Foot Boards," by B. D. Gay; "Proper Speed," by P. H. Breed; "Chain Drive for Trucks," by the same speaker; "Gasoline-Electric Transmission," Alex. Churchward; "Foolproofing the Commercial Car," A. J. Slade; "Co-operation between the Electric Vehicle Maker and Central Station," Robert McA. Lloyd; "Multiple Uses of Municipal Service Machines," John M. Mack; "City Merchandise Transportation," Hayden Eames; "Production of Commercial Vehicles," Charles E. Hadley; "The Ampere-hour Meter," C. A. Lamphier, and several other interesting papers will be presented by eminent engineers.

It is understood that many other subjects may be introduced.

Stoltz Reorganizes Croxton-Keeton Co.

J. P. Stoltz, of New York, and H. D. Michaels have effected a reorganization of the Croxton-Keeton Motor Company, of Massillon, Ohio, which has been in the hands of the courts since last Summer. The name of the company has been changed to the Croxton Motor Company, capitalized at $250,000, of which $150,000 will be common and $100,00 7 per cent, preferred stock.

The transaction was completed last Saturday, and the new management took hold immediately.

Production had not been stopped completely during the receivership, and all the new concern had to do was to put on more men. After his return to New York Mr. Stoltz informed THE AUTOMOBILE that he expected to have about 100 men working by the first of the year and that a still larger force might be put on in the near future.

H. A. Croxton, founder of the company, will remain as president and general manager. Mr. Croxton is favorably known to the trade. Mr. Stoltz is vice-president and will have charge of the Eastern distribution, with headquarters at New York. Mr. Michaels is secretary and treasurer of the reorganized company.

The amount of cash involved in the transaction was $75,000, and a settlement with the creditors had been previously effected on a basis of 25 per cent.

The holders of the preferred issue of the Croxton-Keeton company will receive an equal number of similar shares in the new concern. The company has filed articles of incorporation at the Ohio capital. The incorporators, besides the three officers heretofore named, are: W. E. N. Hemperley and Charles P. L. McLain.

In commenting upon the situation, Mr. Stoltz said: "Conservatism will be the keynote of our activities. For the present practically the same line will be manufactured, but a number of improvements are being considered. The record of the car speaks for itself."

All idea of moving the factory from Massillon to some other location in Ohio has been abandoned.

Storage Battery Displaces Horse

Gould storage battery cars have been installed on the Twenty-eighth and Twenty-ninth street cross-town line in New York. The new cars take the place of the antiquated, ark-like, horse-drawn cars that have proved such a joke to rural visitors in New York for ten years.

The new cars so far have proved satisfactory and a vast improvement over their ancient predecessors.

News Notes of the Coming Automobile Shows

AFTER the gasoline pleasure vehicle section of the A. L. A. M. show closes at Madison Square Garden, the commercial or freight vehicles will have their innings. The truck section will exhibit in practically the same decorative surroundings as were used by the pleasure cars and the appended list of exhibitors indicates that this section will prove the greatest of its class ever attempted.

Special program features are being arranged for the week which will attract a big attendance, in the opinion of those who have charge of the show. A complete and official list of those who will show trucks, electrics and accessories is as follows:

MAIN FLOOR

1a F. B. Stearns Co.
2a R. L. Morgan Company.
3a Pierce-Arrow Motor Car Co.
4a The Waverly Co.
5a Knox Automobile Co.
6a Hupp-Yeats Electric Car Co.
7a Peerless Motor Car Co.
8a Metzger Motor Car Co.
9a The Autocar Company.
10a Reliance Motor Truck Co.
11a Rapid Motor Vehicle Co.
12a Alden Sampson Mfg. Co.
13a Grabowsky Power Wagon Co.
14a The Lansden Company.
15a Studebaker Automobile Co.
16a The White Company.
17a Packard Motor Car Co.
18a Mack Bros. Motor Car Co.
19a American Locomotive Co.
20a General Vehicle Co.
21a Anderson Carriage Co.

ELEVATED PLATFORM

101a Buick Motor Co.
102a Cartercar Company.
103a Pope Mfg. Co.
104a Daimler Import Co.
105a H. H. Franklin Mfg. Co.
106a Reo Motor Car Co.
107a Willys-Overland Co.
113a Brush Runabout Co.
114a Atlas Motor Car Co.
115a Randolph Motor Car Co.
116a W. H. McIntyre Co.
117a The Garford Co.
118a Ward Motor Vehicle Co.
119a The Kissel Motor Car Co.
122 The Goodyear Tire & Rubber Co.
123 The Whitney Mfg. Co.
124 The Veeder Mfg. Co.
125 The Hartford Rubber Wks. Co.
126 The Badger Brass Mfg. Co.
127 The B. F. Goodrich Co.
128 The Diamond Rubber Co.
129 C. F. Splitdorf.
130 Gray & Davis.
131 G & J Tire Co.
132 Morgan & Wright.
133 National Carbon Co.
134 Light Mfg. & Fdy. Co.
135 Baldwin Chain & Mfg. Co.
136 Phineas Jones & Co.
137 A. O. Smith Co.
138 National Tube Co.
139 Diamond Chain & Mfg. Co.
140 The Jones Speedometer Co.
141 N. Y. & N. J. Lubricant Co.
142 C. A. Mezger, Inc.
143 Weed Chain Tire Co.
144 Continental Rubber Works.
145 Wheeler & Schebler.
146 Pennsylvania Rubber Co.
147 Remy Electric Co.
148 Consolidated Rub. Tire Co.
149 The Randall-Faichney Co.
150 The United States Light & Heating Co.
151 Republic Rubber Co.

622 Alfred C. Stewart Machine Works.

Palace Show Cars Now Arriving

There is a gathering of the automobile clans apparent everywhere in metropolitan motor circles, and along with the men who make and represent cars, the cars themselves are coming, too. Every section of the land is contributing by fast freight and express. On account of the fact that the Palace Show comes first on the list of events, the cars that are arriving first are mostly destined for exhibit in that show, which opens New Year's eve and continues in session until January 7.

The aeronautic section of the Palace Show has attracted much attention and the announcement has been made that the Army and Navy Club, the membership of which is 2300, will attend the opening session in large numbers. Weight carrying biplanes and multiplanes will be featured and military and naval officers have signified much interest in them as well as the swifter types, for which a speed of as much as 85 miles an hour has been claimed.

The details of installation of wireless telegraphy in the flyers will be shown in practical form and two machines will receive and transmit messages under conditions that approximate those of service as nearly as possible.

The truck displays will be specially emphasized, the line entered for the show including an interesting lot ranging all the way from the giant $6,000 car that carries ten tons, to the small parcel carriers that negotiate a couple of hundred pounds and cost only a small sum.

The scarcity and high price of horse feed and the inability of Dobbin to compete with the motor truck in good or bad weather or roads, has centered attention on this form of transportation and the management is confident that the truck section will prove popular.

Importers Allot Show Space

Space allotments for the Importers' Salon, which will be held at the Hotel Astor, January 2-7, have been made as follows:

In the section on the left side of the main aisle the C. G. V. Import Company drew the space nearest the door, where C. G. V. and Zedel cars will be shown. The Panhard & Levassor Automobile Company will display Panhard cars in the next space, and the De Dion-Bouton Selling Branch will have De Dion cars in the third space. The Renault Frères Selling Branch drew the first space in the section on the right side of the main aisle, where Renault cars will be shown. A. T. Demarest & Co. will have the next space to display Itala and English Daimler cars. The Benz Auto Import Company of America will show Benz cars in the third space.

Cesare Conti will have the first space under the balcony, at the right of the entrance, to show S. P. A. cars. Henry Ducasse & Co. drew the next space for the display of Darracq cars. The Peugeot Import Company will have the next space for Peugeot cars. Of the spaces at the left side of the room. Burr & Co. drew the one nearest the Broadway side of the room, where they will show examples of fine coachwork. Next to them the S. P. O. Automobile Company will have the S. P. O. and Vinot cars. J. M. Quinby & Co. drew the third space for showing Isotta-Fraschini cars. Glentworth & Jackson will show Napier cars in the end space.

One Hundred Models at Milwaukee Show

Milwaukee, Dec. 19—The first drawing for space at the third annual Milwaukee motor show, to be held this year by the Milwaukee Automobile Dealers' Association, with the co-operation of the Milwaukee Automobile Club, indicates that the show will be far greater in scope and size than any previous exposition.

The drawing was held at the Auditorium on December 15, and representatives of nearly 100 cars, twelve commercial cars and a large number of accessory dealers were allotted space, demanding most of the 95,000 square feet offered by the main hall and corridors, as well as the smaller halls.

The commercial car exhibits will be confined to the basement directly under Main Hall. It is planned to provide 15,000 additional feet of space for accessories by erecting a temporary gallery over the permanent parquet seat section surrounding the arena of Main Hall. This gallery will be 24 feet wide and 600 feet long. The space assignments are as follows:

PLEASURE VEHICLES: Section A—Edward F. Leverenz, spaces No. 22 and 23; American Automobile Company. No. 12 and 13; Buick Motor Car Company. No. 21 and 20; Kopmeier Motor Car Company. No. 29 and 30; Schreiber Motor Car Company, No. 14 and 15; Franklin Automobile Company, No. 24 and 25; Johnson-Burnham Sales Company, No. 31 and 32; Mitchell Automobile Company, No. 27 and 28; Hickman-Lauson-Diener Company, No. 5 and 6; Bates-Odenbrett Auto Compony, No. 18 and 19; McDuffee Automobile Company, No. 16 and 17; Albert Smith, No. 33 and 34; Welch Brothers' Motor Car Company, No. 1 and 2; Studebaker Automobile Company, No. 3 and 4; Emil Estberg, No. 7 and 8; Edgar F. Sanger Company, No. 10 and 11; Johnson Service Company, No. 9; Orrin B. Hughes, Marshfield, Wis., No. 26.

Section C—Warren Motor Car Company, spaces No. 1 and 2; F. A. L. Motor Company, Chicago, Ill., No. 7; Winton Motor Car Company, No. 6; Hearne Motor Company, No. 3; Gove Auto Company, No. 5; Akin Motor Car Company, No. 9; J. I. Case T. M. Company, Madison, Wis., No. 4.

Section D—Curtis Automobile Company, spaces No. 3 and 4; Velie Motor Car Company, Chicago, Ill., No. 1 and 2.

Lobby—West Side Auto Garage, No. 1; Mau Automobile Company, No. 2.

COMMERCIAL VEHICLES: Section 1—Buick Motor Company. spaces No. 3 and 4; Motor Truck Sales Company, No. 5 and 6; Johnson Service Company, No. 16 and 17; Brodesser Motor Truck Company, No. 18; Emil Estberg, No. 2; KisselKar Company, No. 12; Abresch-Cramer Auto Truck Company, No. 7; Orrin B. Hughes, Marshfield, Wis., No. 22; Stephenson Motor Car Company, South Milwaukee, No. 20; Commercial Auto Company, No. 1; Crown Commercial Car Company. North Milwaukee, No. 21; Welch Brothers' Motor Car Company, No. 9; C. F. Megow Company.

ACCESSORIES: Section F—Leo Hofmeister Company, space No. 1; Milwaukee Bronze Casting Company, No. 5; Milwaukee Oil and Tank Company, No. 2; Western Fixture Company, No. 6; Bartles-McGuire Oil Company, No. 4; Wadhams Oil Company, No. 7; Kamblee Company, No. 3.

Section, G—S. F. Bowser & Co., Inc., spaces Nos. 5, 6 and 7; Goodyear Rubber Company, Nos. 1 and 2; Standard Oil Company, Nos. 3 and 4.

Section H—Gross Hardware Company, Nos. 7 and 8; Wallmann Manufacturing Company, Nos. 9 and 10; Auto Supply Company, Nos. 5 and 6; Julius Andrae & Sons Company, Nos. 12 and 13; King Leather Tire Company, Nos. 15 and 16; Milwaukee Auto Specialty Company, No. 11; O'Neil Oil and Paint Company, No. 4; Milwaukee Tire Repair Company, No. 14; Avery Portable Lighting Company, No. 3; Sidney-Hirsch Company, No. 2; Garage Equipmnet Company. No. 18; Racine Auto Tire Company, No. 1.

AUTO TOPS AND BODIES: Rehearsal Hall—Milwaukee Trimming Company, Cream City Trimming Company, A. J. Monday, Charles Abresch Company, Longden-Buyger & Co., Fond du Lac, Wis.

Spaces Allotted at Hartford

Hartford, Dec. 19—Spaces on the main floor of Foot Guard Armory for the forthcoming show of the Hartford Automobile Dealers' Association, which is to be held in February, date as yet undecided, were allotted at a meeting of the association held this week. There are ten spaces on the main floor and an elevated stage, which this season, as in past years, goes to the Ford. Spaces 1 and 2, allotted to Brown, Thomson & Co., will be devoted to the display of the Lozier, Cadillac and Stevens Duryea. Space 3 was drawn by the Capitol City Auto Company, agents for the Mitchell, and Space 4 went to S. A. Miner, distributer of the Pierce Arrow. Space 5, the last on the north side of the building, was allotted to the Reo Automobile Company. On the south side of the building, Spaces 6 and 7 were given to the Palace Automobile Station Company, which will show the Thomas Flyer, Waverley electric, E. M. F. and Flanders. R. D. & C. O. Britton have the next two adjoining spaces and will show the Columbia and Maxwell lines, while the last space on the south side of the main hall goes to S. A. Foster & Co., agents for the Rambler and Regal. Other spaces in the basement, galleries and two front rooms off the main floor have not as yet been given out. The show committee is authority for the statement that there are enough applications on hand to fill two large buildings. An overflow hall is under consideration.

Colonels' Show in Big Armory

Louisville, Dec. 19.—The Fourth Annual Exhibition of the Louisville Automobile Dealers' Association will be held in the First Regiment Armory, which covers more floor space than any other building south of the Ohio River, March 15, 16, 17 and 18. The exhibit will open the evening of March 15.

Several committees have been appointed to make preparation for the show, the most important one being the publicity committee, composed of Hubert Levy, of the Hubert Levy Auto Company, and W. F. Glenn, of the Olds Motor Works.

The dealers have decided to spend considerable more money this year on decorations and expect to do something elaborate in this line. There will be a special department for commercial cars, electrics, accessories and the various trade journals.

Two-Bit Rate Killed at Chicago

CHICAGO, Dec. 19—S. A. Miles on behalf of the National Association of Automobile Manufacturers has made announcement that no 25-cent admission to the coming Chicago show would be in force. In place of such tickets, the exhibitors will be furnished with as many invitations as are needed, for which a rate of 50 cents each must be paid by the exhibitor. After the show the invitations taken up at the gate will be charged against the concerns issuing them, and the balance, if there be any, will be returned.

Among the other rules announced is one prohibiting the showing of commercial cars in the pleasure car section up to February 4. No exhibitor may remove his display from its sectional location until after 10.40 o'clock on closing night. This rule was enacted because of the tendency on the part of exhibitors at former shows to start their cars for the aisles early in the evening of the final night, thus hindering free passage and endangering spectators.

Detroit Space at Premium

DETROIT, Dec. 19—How to apportion 30,000 square feet of floor space among exhibitors sufficient to fill three times that amount was the problem confronting Detroit Auto Dealers' Association officials when it came to allotting space for the annual show to be held in Wayne Gardens, January 16-21.

Manager W. R. Wilmot conducted the drawing for places, the 24 association members having first pick, after which others who desired to be represented were cared for so far as possible.

The complete list of exhibitors is: Buick Motor Co., Brush Detroit Motor Co., J. H. Brady Auto Co., Cadillac Motor Car Co., Cartercar Co., Cunningham Auto Co., Elmore Automobile Co., Ford Motor Co., Grant Bros. Auto. Co., Lozier Motor Car Co., Wm. F. V. Neumann Co., Olds Motor Car Co., Seidler-Miner Auto Co., Standard Auto Co., J. P. Schneider Co., United Motor Detroit Co., Winton Motor Car Co., Security Auto Co., Rapid Motor Vehicle Co., Gillespie Auto Sales Co., Warren Motor Car Co., C. F. Gilmour, Alpena Motor Car Co., Hupp-Yeats Detroit Co., Krit Motor Sales Co., Anderson Carriage Co., Federal Motor Truck Co., Detroit Hupmobile Co., Collins & Co., Charles Berdan, Overland Motor Sales Co., VanDyke Motor Car Co., Phipps-Grinnell Co., Lion Motor Sales Co., Imperial Auto Co., R. H. Evans Motor Car & Parts Manufacturing Co., Amnett Auto Garage Co., Nederlander Auto Sales Co. This gives a total of 40 exhibitors, several of whom will have two or more makes of cars in the gardens, making the show stronger numerically than ever before.

Baltimoreans Confer on Show

BALTIMORE, MD., Dec. 19—Joel G. Nassauer, Thomas S. Young, Joseph M. Zamoiski, H. M. Luzius and Dr. H. M. Rowe have been appointed by the Automobile Club of Maryland the committee to arrange for the annual automobile show to be given at the Fifth Regiment Armory from February 21 to 25, inclusive.

This committee will meet Messrs. Zell, Schaab, Callahan, Duck and one other to be appointed, of the Baltimore Dealers' Association, in an effort to enter into a mutual agreement in handling the show. At this meeting it will be decided whether the club will hold the show as formerly or whether it will be a co-operative affair.

Buffalo Show Promising Affair

BUFFALO, N. Y., Dec. 19—Preparations are in full blast for the ninth annual Buffalo Automobile Show, which is to be held at the Broadway Arsenal during the week of February 6-12, by the Automobile Trade Association of Buffalo.

Although the hall is a capacious one, it appears from the present number of inquiries for exhibitors' space that it is going to be a difficult matter to take care of every one desiring to be represented.

Details Complete at Omaha

OMAHA, Dec. 19—The directors of the Omaha Automobile Show Association met last week and prepared a plat of the auditorium for the automobile show which opens Feb. 20.

Later all of the members of the association met and drew for spaces. There was a general protest for more space, so that it was decided to exhibit all of the trucks down in the basement. This will leave the whole floor of the large auditorium for the exhibition of pleasure vehicles. It was hoped to arrange it so that all of the cars should be exhibited on this floor, but there were too many pleasure cars to be shown.

The Johnson-Danforth Company, now dealing in the Avery truck, applied for membership and the privilege of exhibiting, and was admitted.

This makes a total of twenty-nine automobile dealers and five general accessories dealers who will exhibit. In addition, a dozen more dealers in tops, tires and other accessories have applied for space, and if possible will be accommodated.

Washington Dealers Draw

WASHINGTON, D. C., Dec. 19—With every inch of space allotted, the National Automobile Show, to be held in Convention Hall during the week of February 13, promises to be particularly successful.

The drawing for space took place last week and was attended by every dealer in the city. The hall will be divided into fifty-six spaces, which will be occupied by thirty dealers, representing fifty-four different makes of cars, and seven supply and accessory dealers. The show committee, of which W. C. Long is chairman, has the plans for the show well in hand.

Floor Space Taken at St. Louis

ST. LOUIS, MO., Dec. 19—The St. Louis Show committee reports that there is no more space to be had until the platting of the elevated aisle is completed. This will give 8,000 additional feet of space, and many applications have been received for reservations there, according to the committee. Rigid rules for conducting the exhibit have been adopted, and it also has been decided to advertise the show on an extensive scale within a radius of several hundred miles of St. Louis.

Pittsburgh Show in Exposition

PITTSBURGH, Dec. 19—Exposition Hall has been secured by the Pittsburgh Automobile Show Association for its display, March 18-25. The building is said to be the largest permanent exhibition building west of New York. So far space has been assigned to forty-two exhibitors. Among the recent accessions to the association are the Velie, Alco, Packers Truck, Penn Motor and Pittsburgh Motor companies. Thomas I. Cochran is manager.

Ford and Rambler at Brooklyn

While neither the Ford nor the Rambler will be exhibited at either of the New York automobile shows, both will be exhibited at the forthcoming Brooklyn show. Already definite preparations are being made to accommodate at least 150 displays. Members of the Brooklyn Motor Vehicle Dealers' Association are enthusiastic about the prospects for a successful result of the enterprise.

Will Make Valveless Engine

DETROIT, Dec. 19—The Evans Motor Car & Parts Co. is preparing to put on the market a car incorporating the two-cycle motor controlled by the English Valveless Engine Co. A large plant is all ready to be put into commission as soon as the final details have been arranged, and the manufacture of cars and motors will shortly be undertaken on an extensive scale.

N. J. A. and M. C. Trustees Quit A. A. A.

WAVING a stuffed club over the heads of the victorious forces of motordom in New Jersey, the specter of dissension threatens to nullify the effects of the winning fight made by Jersey automobilists at the late election, when, on the face of the returns, the noxious State law which forbids anyone who lives outside the classic precincts of Jersey from tooling his car within the aforesaid classic precincts unless the regular Jersey license fee had been paid as a condition precedent, was defeated.

The appearance of the specter was not exactly unheralded, for a whole series of mutterings had been audible ever since the club members of Jersey decided last Spring to upset the law.

The form it took was the adoption of a set of resolutions by the New Jersey Automobile and Motor Club trustees to withdraw from the Associated Clubs of New Jersey, and that also means that the second largest automobile club in the United States has withdrawn from the A. A. A.

As nearly as it may be outlined at this time the case is about as follows:

Away back last April, before the primary elections, the clubs decided that Jersey ought to have at least an amendment to the law covering the visits of non-residents en motor. Instead of jailing a few millionaires who had the money and were willing to spend it in Jersey, it was thought advisable to welcome them and their money. The hotel men were particularly enthusiastic about this phase of the matter.

Therefore, the clubs got together and held meetings and appointed committees and adopted resolutions, and readily got down to hard, practical politics. So efficient did this work prove to be that several aspirants for legislative jobs were shelved at the primaries simply because they were non-committal on the subject of the amendment.

The New Jersey Automobile and Motor Club, a giant organization, bore a certain part in the activities of politics. If one credits what its officers and members say, it was the "big noise" of the movement. If one takes the views of the other fellows there might be a question as to its real service.

Nevertheless, when the votes had been counted the night of November 8 it was found that the candidates who had pledged themselves to knock out the old law by passing the important amendment stood out like an army, while the opposition was represented only by a sung little bunch of hold-overs.

Thus far it looked like a perfect "skeeze" for the automobilists. Then appeared the little crack within the lute. It seems that the Newark Club was not exactly in accord with the rest of the organization about the methods that should be used to introduce the bill. Some thought Senator Walter Edge should be father of the bill, while others believed the measure should originate from a Democratic member of the lower house. At any rate a double set of legislation was prepared, and now there is a man-sized fear prevalent that the forces arrayed against the automobile will take heart at the split and oppose the passage of a measure so important to motordom.

Colonels Wish to Secede from A.A.A.

LOUISVILLE, Dec. 19—Considerable of a sensation was sprung in local auto circles at a special meeting of the Louisville Automobile Club, when action was taken which was equal to withdrawal from the American Automobile Association. The local organization held a well-attended meeting at its club rooms in the Commercial Building, and after discussing the question at length the members unanimously decided to call on the directors of the club to request the Kentucky Automobile Association, the State organization, to withdraw its membership in the national body. Louisville controls the vote of the State organization, and it is practically certain that this will be done.

The action of the Louisville Club is explained by one of its officers, as follows: "We have been paying out good money, for which we have received no return. The State Association pays to the A. A. A. $1 a year for every member of the State-wide organization, and we have, therefore, been paying out a big part of our funds for the support of the three A's. This money has been used principally in connection with work in the East and, as far as we are concerned, has resulted in no benefit. We have, therefore, decided it would be best for us to get out."

It is believed by those in touch with the situation that the action of the local club will be followed by that of other automobile organizations in this part of the country, and that later on a compact club association will be organized to promote motoring in the Middle West and South.

A specific request for the financial statement of the A. A. A. for last year, on behalf of THE AUTOMOBILE, was denied by that organization on the ground that a rule had been adopted to first publish the statement in the "house periodical." In commenting on the above article, Chairman S. M. Butler, of the Contest Board, said that if the Kentucky A. A. wished to withdraw, it had that privilege. He said that he had received no information about such contemplated action.

Belated Action of A.A.A. Disqualification

Notwithstanding the fact that the automobile racing season is over until next Spring and that its action will have little actual effect upon the earnings of racing drivers banned by its rule, at least until they have had more than plenty of time to make defence and, perchance, succeed in having their disqualification raised, the Contest Board has taken definite action against certain erring drivers in unsanctioned meetings during the past season.

Those disqualified until January 1, 1912, are the following: Barney Oldfield and his four racing cars; Leslie Henry and the Pacific Coast Motor Racing Association; J. Alex. Sloane, manager of Oldfield; Ascot Park Race Track; J. R. Kittle; Louis Arms, Williams, a Los Angeles agent; Henry Koch; William Carlson; W. H. Faust, Henry Butley and Condit, another agent, all of whom took part in the recent Ascot Park meet.

Charles F. Stamps, L. H. Mellus and W. Gray, who acted as officials at the meet, received a similar sentence, while E. Roger Stearns and Ben Kirscher were suspended for a year, and George H. Clark for two years, the latter because of his driving under an alias.

The cars entered and used by the various banned drivers are specifically barred until 1912.

As an additional penalty on Oldfield, the board has notified the Automobile Club of America of its action, for transmission to the international body at Paris, from which it will be sent to the various national automobile clubs of the world.

The board also paid its respects to the unsanctioned meet held October 1-3 at Norfolk, Va. J. E. Sheldon, Louis S. Hallowell, Coburn Motor Car Company; George Edwards and Edward Allen, who took part in the meeting, were disqualified for one year.

The Maytag-Mason Motor Company, which was disqualified for participating in an unsanctioned meet at Boone, Iowa, was reinstated.

Legagneux Breaks Flight Record

PARIS, Dec. 21—M. Legagneux, holder of the world's altitude record in heavier-than-air machines, established a new mark in distance flights for the Michelin cup to-day when he flew 320.43 miles in one uninterrupted flight.

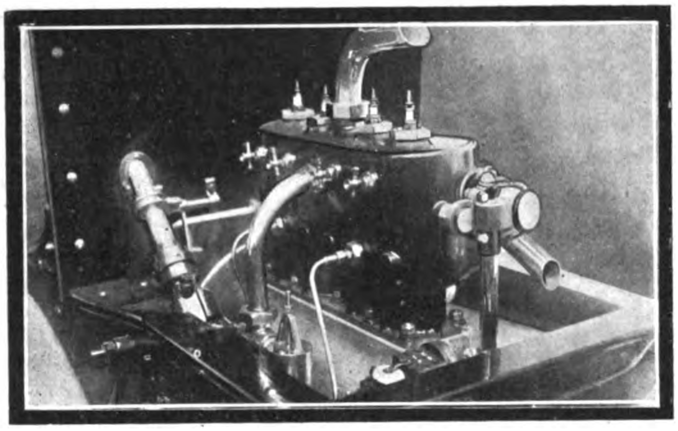
He started at 8:34 a. m. and finished his wonderful flight at 2:35 p. m.

French Refinements of Construction at Salon

PARIS, Dec. 13—Among the features of the Salon are the following:

On the Henriot system of rotary valve motor at the Paris Salon, a patent has been secured on the means for isolating the rotary valve from the combustion chamber at the moment of explosion. Near the head of the cylinder is a large port opening into a circular chamber within which is mounted a roller performing the functions of rotary valve. As can be seen from the illustration, there are two ports in this chamber, one opening into the induction pipe and the other communicating with the exhaust pipe. The rotary valve, which is hollow, has one portion of its face cut away to allow of communication between the combustion chamber and either the intake or the exhaust port.

The distinctive feature is that at the moment of explosion the piston has covered the port communicating with the rotary valve chamber, and only uncovers it after about one-sixth of the down stroke has been accomplished. The valve is thus isolated at the moment of greatest pressure, and it is this feature which, according to the inventor, has given success where other rotary valves have failed. The model shown is a four-cylinder motor in one casting, with the rotary valve carried in two ball bearings and driven off the mainshaft by means of bevel gearing and a vertical shaft.



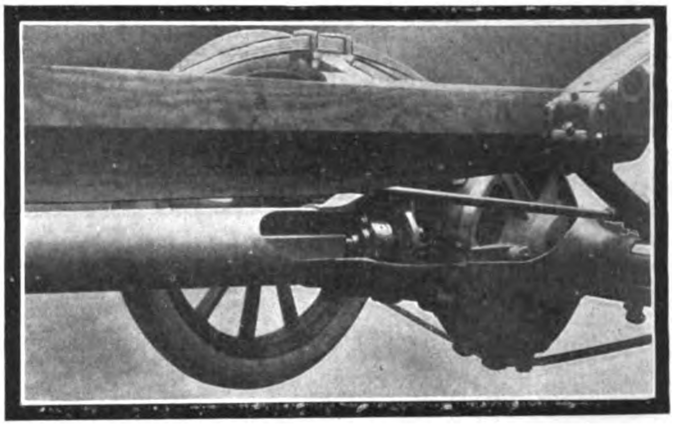
Henriot four-cylinder rotary-valve motor

It is claimed that by the use of a suitable type of cast-iron roller no leaks occur, and that the motor can be run satisfactorily as high as 4,000 revolutions a minute. The surface of the roller is lubricated under pressure by a lead from the crankcase base. One of these motors has been under test for a year on the road.

Berliet has produced a substitute for the poppet valve in the form of a piston valve motor, two pistons being employed for each cylinder, one for the intake and the other for the exhaust, and all connected to an auxiliary crankshaft driven off the mainshaft by spur gearing. The motor shown is a four-cylinder in one casting of 3.9 by 5.5 inches bore and stroke, with all working parts enclosed and the magneto carried across the front of the motor. This substitute for the poppet valve appears to be of such recent origin that the firm is not prepared to say whether it will be adopted in the future or not.

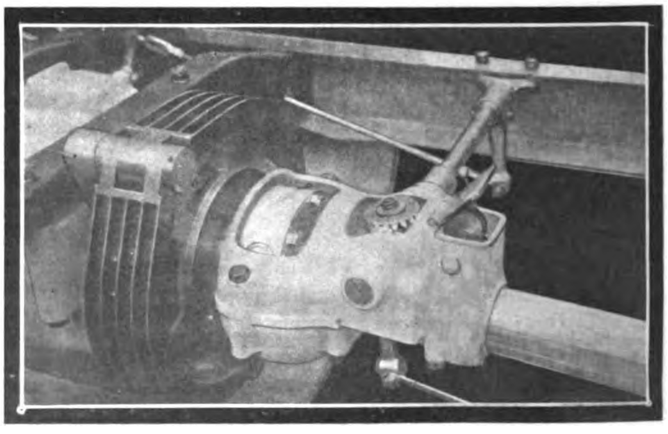
Ballot's attempt to provide a substitute for the poppet valve is in the form of a spherical sleeve in the head of the cylinder and having an oscillating motion by means of a suitably shaped cam on an overhead shaft operated from the mainshaft by a silent chain. As it oscillates the spherical sleeve successively uncovers the intake and exhaust ports carried in the head of the cylinder. The sleeve is kept in contact with the cylinder head by two coil springs.

Self-starters appear to have gone out of favor, for in no case were they to be seen on cars produced by big firms. A substitute for the starting crank was shown on the Mustad stand. The steering column had two wheels, the lower one being attached to an outer sleeve on the steering column and having at its base a bevel pinion engaging with a second pinion on the end of a horizontal shaft. The shaft passed through the dashboard, and at the opposite end, and under the footboards, was mounted a spur pinion. Keyed on the extremity of the motor shaft, just to the rear of the clutch, was another pinion, and between them an intermediate pinion normally kept out of engagement by means of a coil spring. A foot pedal allowed the intermediate pinion to be brought into engagement with the gear wheel on the driving shaft and on the motor shaft. Thus, by swinging round the lower of the two wheels on the steering column, the motor could be caused to turn. On releasing the pedal the intermediate pinion would slip out of engagement, thus releasing the wheel on the steering column.



Sizaire & Naudin rear axle, showing new torque tube. Direct drive on all three speeds

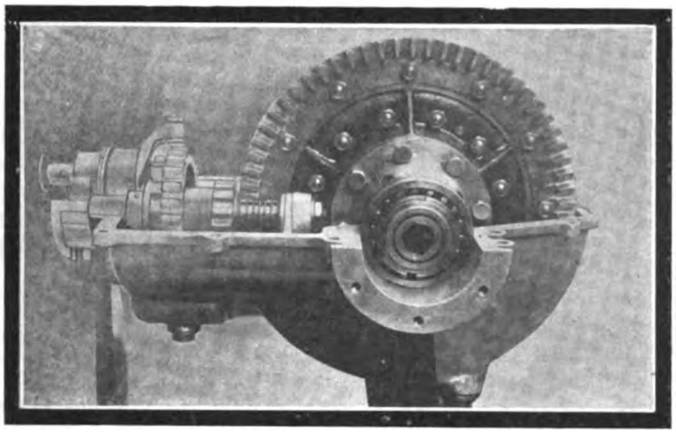
A neat and simple type of tire inflator was shown on both the Hispano-Suiza and the Piccard-Pictet cars, the two being built under the same license. On the gearbox cover was carried a small air-cooled cylinder, similar to a small motorcycle cylinder, with piston and connecting rod, this latter being connected up to a crankshaft having a squared end on which was mounted a spur pinion. By means of a cam and suitable lever projecting through the gearbox cover, the pinion could be moved on its shaft until it was brought into engagement with the 1st speed



Renault brake on transmission encased universal joint; differential gear for rear brakes and oil filler shown open pinion. The pump was sufficiently small and the gearbox carried sufficiently low for there to be no projection above the floor boards. The whole apparatus was most simple, and as the cylinder was only held in position by four bolts it could be readily dismounted.

How Michigan Law Works Out

LANSING, MICH., Dec. 19.—In an address before the American Road Builders' Association, which concluded a three-day session in Indianapolis recently, State Deputy Highway Commissioner Frank G. Rogers explained the highway system of Michigan, dwelling on the State Reward Law and the benefits that the State was deriving from the operation of the law.

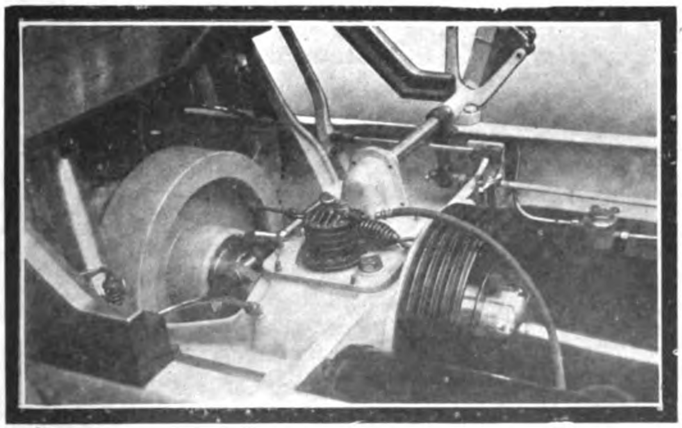


Miolans gear, giving 4 direct drives, right-hand side showing first and reverse speeds, shown at Paris Salon

Mr. Rogers stated that there were 70,000 miles of public highway in the State, and that 790 miles were either constructed or in course of construction under the provision of the law which provides a State reward of $250 to $1,000 per mile.

Maryland Law to Be Changed

BALTIMORE, MD., Dec. 19—Motor Vehicle Commissioner George wants an amendment made to the Maryland Automobile Law, whereby the registration year of licensed machines will begin May 1 and end April 30, instead of, as at present, from January 1 to December 31. He says that under the present arrangement the State loses thousands of dollars in revenue.



Tire pump on the Hispano-Suiza gear box. Behind the pump the external clutch spring will be noticed

By taking out licenses as they do in April or May, they get part-year licenses, obtaining a reduction in fee for each month of the elapsed time between January 1 and the time the license is applied for.

Good Roads for Franklin County

MALONE, N. Y., Dec. 19—Franklin County is to have 152 miles of first-class highways inside of two years as the result of the recent adoption of a bond issue of $500,000 by unanimous vote of the supervisors.

It is planned to expend $3,000 a mile on construction work, and the first section to receive attention will be through the Adirondacks from Saranac Lake to Malone, passing through Paul Smith's, Meacham Lake and Cheem Falls. This will connect with the State road leading from Malone to the Canadian border.

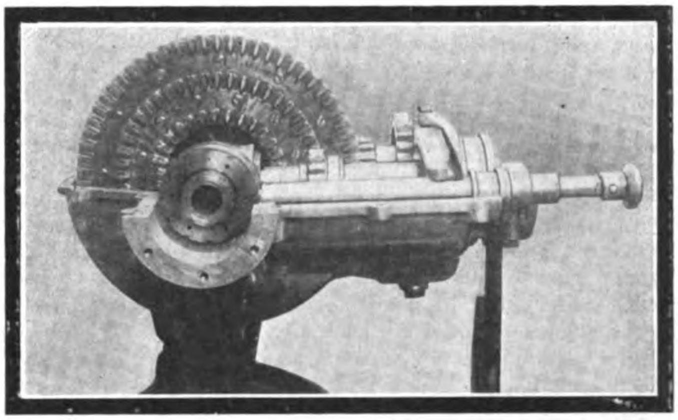
In connection with this project, the Canadian government has agreed to build a macadam boulevard from the international line into Montreal, following the St. Lawrence.

Work will commence in the Spring, and it is said that it will be completed, so far as the first section is concerned, in time for the 1911 touring season.

The project, which was suggested in practical shape by County Superintendent of Highways S. M. Howard, has received the support of farmers and merchants as well as hotel men.

Portola Race Again Postponed

SAN FRANCISCO, Dec. 19—Once again the Portola Road Race has been postponed. According to the latest plans the event is to be held over the San Leandro course on Washington's birthday, and is to be known as the Oakland-Panama Pacific Road Race.



Miolans gear with 4 direct drives, showing 2nd, 3rd and 4th speeds

The events are to be the same as scheduled for January 2. Manager Ferris announces that Los Angeles dealers will enter the following cars: Fiat, Isotta, Apperson, Simplex, Pope-Hartford, Only, Mercer, Maxwell and Staver-Chicago.

Ferris has the sanction and support of the Oakland and San Francisco dealers. He has been required to put up a $12,000 bond.

Insurance Companies Raise Ban

Insurance companies have withdrawn the restrictions whereby gasoline trucks were denied admittance to steamship piers in New York City.

Some time ago the insurance companies established a rule requiring occupants of piers, railroads and steamship companies to sign a warranty to the effect that such trucks could not be admitted upon their piers, and unless such warranty was signed an extra premium of 50 per cent would be charged. As a result of this dealers have found that a great many merchants have refused to supplant their horse-drawn delivery systems by motor trucks, owing to the necessity of whatever trucks they used frequently visiting the docks and piers to deliver or receive freight. The railroad and steamship lines have pointed to the attitude of the insurance companies as their reason for refusing admittance to the trucks.

News of Maker and Dealer in Many Fields

CLEVELAND, O., Dec. 19—A. C. Leonard, driver for W. T. Boutell, of Minneapolis, has been awarded $1,000 as first prize in the Winton Six upkeep contest for 1910. Between April 1 and November 30 Leonard drove Mr. Boutell's Winton Six a distance of 21,127 miles at a total repair expense of $1.40.

Second money, $500, was awarded to G. W. Butler, driver for J. E. Clenny, of Chicago. Butler drove 19,015 miles on a total repair expense of 30 cents.

Other prizes were awarded as follows

Third, $250, won by P. W. Mulford, driver for W. J. Friedlander, of Cincinnati; 18,809 miles; repair expense, 30 cents.

Fourth, $150, won by Wm. E. Ochsie, driver for Martin Daab, Hoboken, N. J.; 17,130.9 miles; repair expense, none.

Fifth, $100, won by John J. Boyce, driver for Isaac Bacharach, of Atlantic City; 17,390 miles, repair expense, $3.46.

Sixth, $100, won by Chas. A. Rice, chauffeur for L. T. Peterson, of Youngstown, O.; 15,790 miles; repair expense, none.

Seventh, $100, won by John T. Wilson, driver for W. B. Martin, of Cleveland; 14,847 miles; repair expense, none.

Eighth, $100, won by Michael Stone, driver for H. M. Cheney, of Toledo; 14,059 miles; repair expense, none.

Ninth, $100, won by Wm. G. Hyatt, driver for S. S. Boothe, of Los Angeles; 13,526 miles; repair expense, none.

Tenth, $100, won by Guy C. Davis, driver for Horace J. Phipps, of Boston; 14,208 miles; repair expense, $1.50.

The total distance driven by these ten men was 165,901.9 miles. and the total repair expense was $6.96.

G. J. G. Company to Build Runabout

WHITE PLAINS, N. Y., Dec. 19.—The G. J. G. Motor Car Company has made announcement that it would turn out a new type of runabout, beginning Feb. 15. The motor has four cylinders, 3 5-8 by 4 1-4 inches, cast of gray iron. The crank and cam shafts are drop forged, supported on Parsons' white metal bearings. The ignition system is by magneto, and the circulation is provided for with a centrifugal pump and Mercedes radiator. Cone clutch, splash lubrication, semi-floating rear axle and other standard features are included in its specifications.

Dealers Display New Cars

SPRINGFIELD, MASS., Dec. 19—The local dealers and representatives have now on display most of their 1911 models and automobile accessories in spacious and attractively decorated quarters, noteworthy among them being the Norcross-Cameron Company and William H. Dexter. The Norcross-Cameron Company have an up-to-date garage and salesrooms neatly decorated, along with an excellent display of 1911 models of the Peerless, Chalmers, Hudson, Buick and Waverly cars, for which they are the Springfield representatives.

William H. Dexter, in addition to a line of Cole cars, has added a display of the models of the Paige-Detroit cars, ranging in prices from $875 to $1,250.

Most of the automobile dealers and agents throughout the city report many new orders for 1911 cars, and it is the opinion that this will be the best season so far.

Maytag Company Reorganized

WATERLOO, IA., Dec. 19—The Maytag-Mason Motor Company recently has been reorganized, with capitalization of $1,000,000, and plans are being made to increase the yearly output from 1,000 cars to 2,500. The 1911 line includes seven models of pleasure cars on three different sizes of chassis, 26, 35 and 40 horsepower, respectively.

The company has made and marketed a two-cylinder motor, with which a favorable impression has been made in competition, both for speed and economy. The company plans to go into contest work on a larger scale next year.

In addition to the line of pleasure cars, the company manufactures a number of small trucks ranging in capacity from 900 to 1,800 pounds.

U. S. Motor Co. Annual Meeting

Reporting that business from August to November, 1910, exceeded that of the corresponding period of last year by 51 per cent., the United States Motor Company assembled in annual meeting Tuesday at Jersey City. The chief business on the calendar was the election of a board of directors and the entire incumbency was re-elected as follows: Benjamin Briscoe, J. C. Brady, J. D. Maxwell, C. G. Stoddard, K. B. Schley, Frank Briscoe, Horace de Lisser, J. H. Edwards, R. Irvin, H. Lloyd, O. J. Mulford, H. W. Nuckols, R. A. Robinson, J. W. Wellington and C. Tucker.

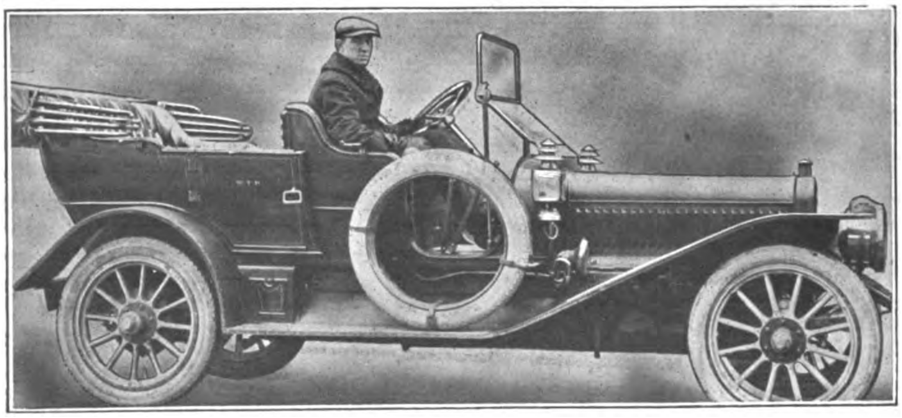
The directors are scheduled to meet again in the near future to elect officers.

Low Rates Please Moline Makers

MOLINE, ILL., Dec. 19—Announcement that the Trunk Line Association has granted reduced rates to the Madison Square Garden show in New York was hailed with delight by automobile manufacturers, dealers and owners in this vicinity. The Middle Western representatives promise to be present in force for the annual event. Local factories will be represented. C. H. Van Dervoort, sales manager, and Frank Salisbury will attend from the Moline Automobile Co. and will be in charge of an exhibit.

Workmen in the factory of the Mid land Motor Co. are busy preparing special exhibition chassis and motor for the Madison Square event. The Midland people are just getting out their 1911 models and, though late, these machines have more than the usual number of new features.

The Midland Motor Co. is planning to enter a 6-cylinder racer in the 500-mile race on the Indianapolis motor speedway May 27 of next year and expresses high hopes for the car.



Driver Leonard, winner of Winton upkeep prize

Peeps Through Auto Goggles at Distant Lands

MADRID, Spain, is waking. For the accommodation of automobile tourists a new hotel has just been opened. It is an up-to-date house, containing 185 fine bedrooms and 75 bathrooms. The proprietors aim to provide their guests "with all the comforts of home," together with a generous measure of cheer which will prompt the guests to declare that "they will always come back." In addition to being conducted on modern lines, this house, like some of the other modern hotels in Europe, has established a special passenger and luggage automobile service, five touring cars meeting all trains.

The splendid condition of the roads of Spain makes automobiling a source of delight in that country, and it is expected that as soon as the Winter wears away the custom of touring, as established by the jolly young King Alfonso, will be resumed with vigor and continue to grow in popularity as favorable conditions in the land of the Dons become known to automobilists, and especially to those from foreign nations who cross the border seeking new highways and byways to conquer.

In England a new spring-wheel for use on motor vehicles is about to be introduced. The periphery of the wheel is composed of eighteen links, each hinged to its neighbor on either side. The links in question consist of triangular blocks of wood, and while the bases make up the periphery, each apex is hinged to a piece of metal which is firmly attached to a volute spring, which is from four inches to five inches in length, according to the weight of the vehicle that has to be supported. The other ends of the volute springs, of which there are eighteen, disposed radially, are affixed to the hub, or rather to a small inner wheel of the ordinary artillery pattern, with 12 spokes. The springs are made of slightly tapered strips of special steel coiled spirally in such a way that the greater part of each turn is within the preceding one, and that under sufficient compression the whole of the inner coils can be forced within the outermost one. Blocks of hard fiber and gutta-percha are cemented to the surface of the links which roll on the ground.

The inventor intends the wheel for heavy commercial vehicles and motor omnibuses, the purpose being to give them the benefits of the pneumatic tire without using a particle of rubber in the construction of the wheel. The spring-wheel was put to the test in London the other day, a pleasure car equipped with the invention having been driven through the thick of traffic.

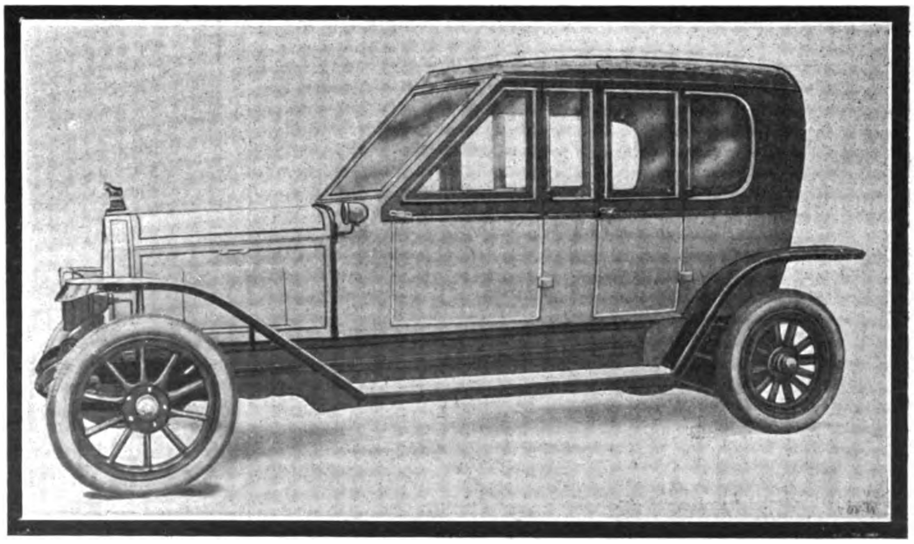
Two railless, overhead-trolley systems of tram cars have just been put into service in Bremen, Germany, connecting the outlying districts with the tram car lines running to the center of the city. The cars are of the ordinary automobile omnibus dimensions, but the electrical equipment being lighter, the weight of the cars is less than the conventional automobile omnibus. As it is necessary for the car while running to give way and move at times from 15 to 30 feet from one side of the street to the other, the difficulty was in constructing a trolley to this end. A Bremen engineer devised a way, and he has had his invention patented. The upper as well as the lower contact is increased by means of springs. Two wires reach into the car from rollers and hoops which are well insulated from each other. The car, while under way, passes other vehicles by reason of the extension of the wires, which uncoil from the drum inside of the car, and the drum automatically winds the wires up again at the least slackening. There are no switches attached to the wires; therefore, the trolleys of cars as they meet may simply be exchanged, allowing each car to renew its journey, the delay incidental to "waiting at the switch" being avoided. The wheels run on ball bearings and have solid rubber tires. The steering apparatus is similar to that used on pleasure automobiles.

Tsingtau, China, has about sixty miles of splendid roads running along the ocean front and into the mountains near by, affording one of the finest spots in the world for automobiling. In spite of this fact, there are but six automobiles in Tsingtau, and none of these is of American manufacture. Shanghai is the nearest convenient trading point from which machines might be shipped, and the freight charges, under the conditions, are not unreasonable.

Guadalajara, Mexico, harbors about 120 automobiles, of which 75 are in constant use, including one traffic car. The others are either in the hospital or their owners are not in the city. Cars thus out of commission cease paying the tax while idle, the amount of the levy being $4.98 per month. There are few asphalt-paved streets in the city, the country roads are bad, the hotels are not inviting and there is no local agent actively representing any manufacturer. Outside of the tax the cost of operating a car is not great. Good gasoline is 27 cents per gallon, and a chauffeur may be employed at $14.94 to $19.92 per month. A mechanic of good ability receives $62.50 per month. There are three garages in Guadalajara. About 60 of the machines are American-made, 30 are French, the remainder are English, Italian and German.

Chile holds out little encouragement for the introduction of the automobile for the reason that the number of desirable roads is limited. Valparaiso and the adjacent towns possess 30 cars of all sorts, and the chances for an increase in the number are not bright. Santiago has from 75 to 100 machines, with about the same country road conditions as are found in Valparaiso, although Santiago's streets are better paved. European-made machines are mainly seen in Chile, although the few American cars found here are splendidly adapted to the country owing to its hilly roads, and good climbers being necessary. There is no competition for this trade amongst automobile manufacturers.

New South Wales shows enterprise in the introduction of automobiles, the number being 1,095, exclusive of motor buggies and certain makes of which there are only one or two running. America is represented by 119; England, 519; miscellaneous foreign, 467. Altogether, 142 makes are found in the Commonwealth.



Inside drive body on a Pipe chassis, shown at Paris Salon

Cameron Sees Big Gun Cast by Krupp

Toledo, O., Dec. 19—W. H. Cameron, chief engineer of the Willys-Overland Company, has returned from his European trip with Mrs. Cameron, arriving in New York via the steamer "President Grant." During his visit in Germany he was granted the unusual privilege of inspecting the works of the great Krupp company. Mr. Cameron says that the German manufacturers are centering a vast amount of attention upon the chrome-nickel alloys and that they are not doing much with vanadium and other varieties of steel alloys for automobile work.

He says that his statements about the use of vanadium and its advantages proved surprising to the Teutons. He witnessed the casting of a huge gun at the Krupp plant. He states that the material from which the gun was made was treated in seventeen large furnaces, each containing 100 crucibles, and requiring the services of 500 men to cast.

French Factory for Goodrich

Paris, Dec. 14—The Goodrich Tire Company has decided to manufacture in France. For this purpose the European company has just secured possession of a large factory at Colombes, near Paris, recently vacated by the now defunct Krieger Gasoline-Electric Company. With a total area of 30,000 square yards, the space available is sufficient for a very large production.

It is expected that the new factory will be in working condition early in the spring and will be controlled by engineers and foremen from the Akron establishment. When in full working order it will supply the whole of the European market, comprising France, Italy, England, Germany and other outlying countries.

Not only will freight charges be avoided, but the high duty at present paid to bring American tires into most European countries will be removed. The company has had a selling branch in London for several years, and about three years ago opened a selling branch in Paris, primarily for the convenience of American tourists who were unable to use French sizes on their American rims. Since then the business has grown to such an extent that the supplying of tourists is a mere side issue. In France the Goodrich company has had considerable success with the taxicab companies.

Plans of Parry Auto Co.

Indianapolis, Dec. 19—Creditors of the Parry Automobile Company have practically agreed to ask the Superior Court to authorize the operation of the plant by the Union Trust Company, receiver, and to authorize a limited issue of receiver's certificates for the purpose.

After this is done it is probable the receivers will organize a holding company to take over and operate the plant until the indebtedness has been removed. During the last week the creditors have held a number of meetings here.

Panhard Valveless Motor

SHOWING ABSENCE OF VALVE POCKETS, CLEANLINESS OF DESIGN AND ACCESSIBILITY OF ALL PARTS, ROCKING MAGNETO ADVANCE

ANOTHER prominent maker to adopt the Knight engine system is Panhard et Levassor and their product will be known as Valveless-Panhard. The general principle is identical to that used on the Knight-Daimler, but the engine differs in several details.

The intake side of the motor, which has a bore of 100 millimeters (3.93") and a stroke of 140 millimeters (5.51"), is particularly free and accessible. The pump P is of the centrifugal type and is driven by a cross shaft that also serves to drive the magneto. The shaft is actuated by worm gear from the eccentric shaft, which in its turn is driven from the crankshaft by a silent chain through a sprocket attached thereto, the covering for which is marked T, Fig. 1.

The water is taken from the radiator through the pipe D and circulated by the pump P through D1 and returned to the radiator through D2. The intake manifold is made from copper with the lugs sweated on, carrying the carbureter so that it is easily removed. The float chamber is fitted with a removable cap F for flooding purposes and the usual Krebs air adjustment is located in B. Hot air is supplied to the carbureter through A2, while the sleeve A3 is fitted to give the requisite amount of cold air in hot weather. The control is by wires actuated from the center of the steering wheel passing over the roller H, which is fitted with a spring to carry the wire with it as it is played out and causes the throttle to rotate. The spark plugs are situated at S1, S2, S3, S4 directly over the center of the piston. A pump for the gasoline pressure is fitted and marked R and is driven by a small cam. In Fig. 1 the closeness of the joints at the

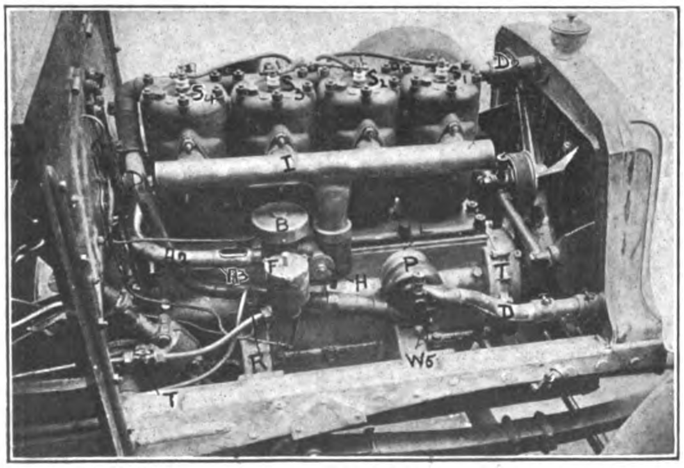


Fig. 1—Intake side of Panhard-Knight motor, showing carbureter water pump

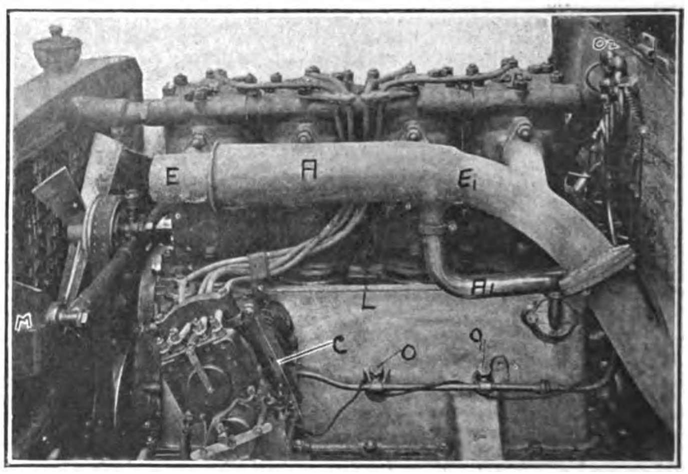

Fig. 2—Exhaust side of Panhard-Knight motor, showing rocking magneto retarded

cylinder bases is clearly shown and one bolt L serves to hold a pair of cylinders to the crankcase.

The feet are particularly large and the water-cooling area has been carried very low, as, besides the pistons, the sleeves require cooling as well. The same cleanliness wil be noticed on the exhaust side, the method of driving the magneto being clearly seen. The magneto employed is the Nilmelior and instead of the usual advance in this case the whole magneto is rocked from side to side; in Fig. 2 it is toward the radiator and in Fig. 3 it is inclined to the dashboard. The control is by wire C and is held forward when the wire is slack by the spring S. The exhaust manifold E carries on it a sleeve A welded to it at E1 preventing the air that enters from escaping except through A1, which leads to the carbureter. V and V1 are air vents for the crank chamber, W4 is a plug to drain all the water from the cylinders; other drain plugs are situated beneath the pump marked W5, Fig. 1, as well as in front of the radiator. The neat water joints W, W1, W2, W3 conduct the water from cylinder to cylinder. The heads are cast separately from the bases of the cylinders and it is almost impossible to see the joint, but this is located at the line J on the front cylinder; they are held by six nuts.

Reference to Fig. 4 shows the eccentric shaft L and the connecting rods M and M¹ which operate the sleeves N¹ and N driven by the chain from sprocket J to sprocket K. The shape of the piston H and compression chamber leave no room for pocketing of the gases and the lubrication of the piston sleeves and cylinder walls is by splash, the oil passing through the cross-drilled holes in the different parts. The lubrication system for the rest of the motor is effected by the pump U in Fig. 5; oil is taken from a reservoir under the floor boards and passes through the lubricator glasses on the dashboard, thence to the pump, which sends it to the main crankshaft bearings, it eventually finding its way to the crankcase to act for the splash, no used oil passing back to the pump.

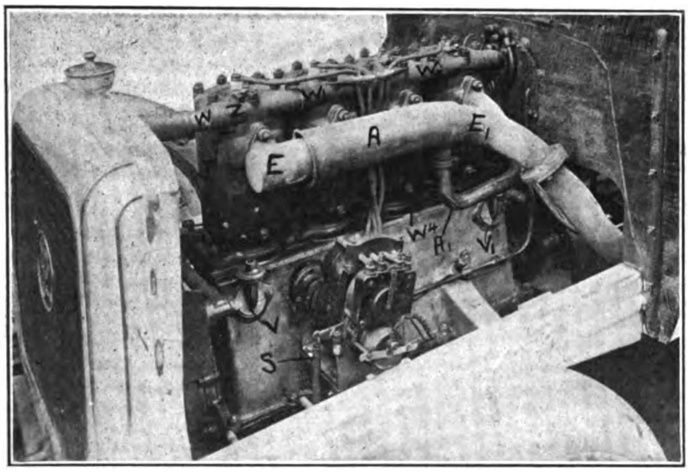

Fig. 3—Exhaust side of Panhard Knight motor, showing magneto advanced and hot air intake

The ports n1 open at the proper time for the suction and the ports n2 open for the exhaust. The magneto and pump drive O is carried on ball bearings and is driven by a worm at 90 degrees.

"The American Invasion"

Take this matter of the alleged invasion of our market by American motor cars. I am not for the moment referring to those cars of American origin which have already been upon our market for some time, but to the newcomers, whose arrival in bulk is anticipated. Our attitude is splendidly indifferent. "Nothing doing," we say. "Do you remember what happened to the American bicycle?" we say. "History just repeating itself," we say. "American cars not suited to our conditions; will never find a market here," we say. And so on. Our trade is very nice and healthy just now, do you see. We are plump and warm, and our outlook is rose-colored. "Let us eat, drink and be merry to-day—why not?" we say.

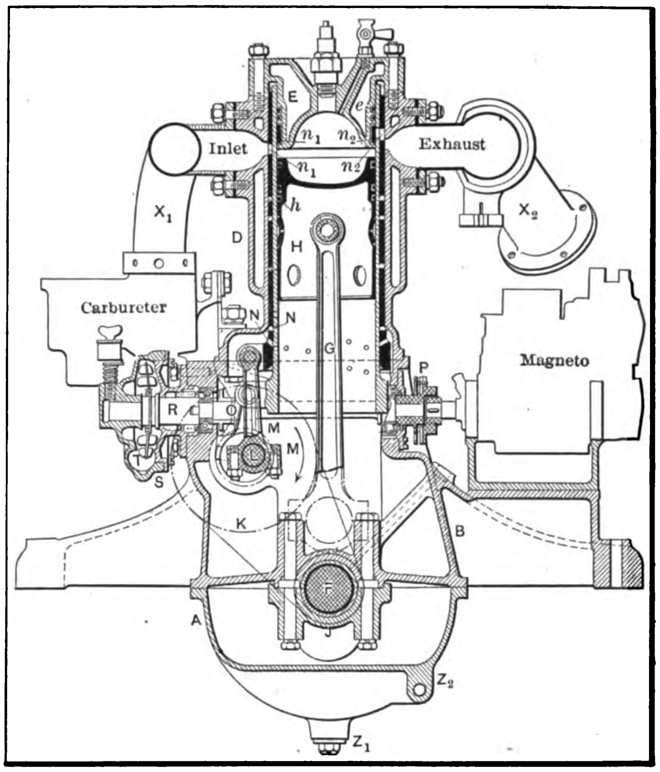

Fig. 4—Transverse section of the Panhard Knight motor, showing disposition of magneto and water pump and the chain-driven half-time shaft. It will be noticed that the actuating arm for the sleeves is in the shape of an ordinary connecting rod

Why not? The story of the prodigal son makes answer. The whole of our experience makes answer. If there were no to-morrow we might live out to-day to the uttermost. But as there *is* a to-morrow, it would not be bad policy to waste less in riotous living now. Do not let us make the gorgeous mistake of supposing that we have nothing to learn from America. Do not let us imagine for a moment that the American car cannot function as well (or better) on our roads as on the roads for which they were first of all made. And do not forever be dragging in the tale of the American bicycle. It has nothing to do with the case, except to indicate the only manner in which we may deal with the American car.—*Motor World,* London.

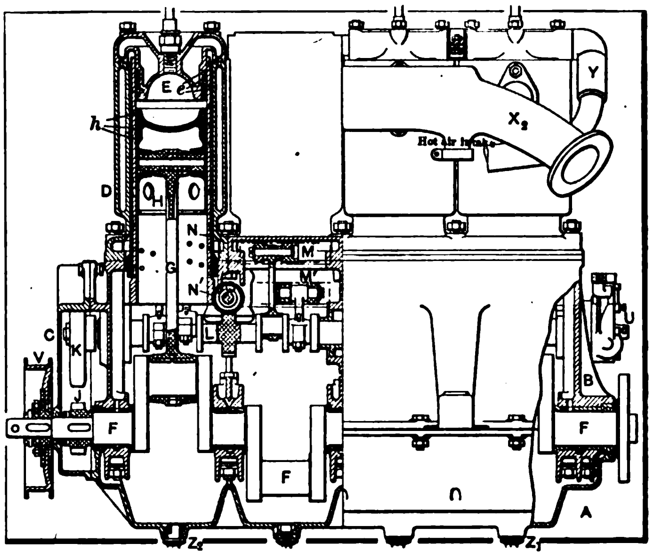

Fig. 5—Longitudinal section of the Panhard Knight motor, showing spherical pistons, crankshaft, and half-time shaft and the oil pump U

News in Brief from the East, West and South

Boston, Dec. 19—A meeting of the reorganization committee of the Bay State A. A. was held recently at which it was decided to have the annual meeting on December 28.

Cleveland, Dec. 19—William Orden has been appointed agent for Northern Ohio for the Auburn line of motor cars. His headquarters will be at the Lorain Clark garage.

Texarkana, Tex., Dec. 19—The Ohio car now making a transcontinental tour from New York to San Francisco has passed this point on its way westward.

Norwich, Conn., Dec. 19—F. W. Browning, president of the Uncas Specialty Company has taken active charge of the affairs of the company. Robert R. Keith is general manager. B. F. Leavitt has resigned.

New York, Dec. 19—The Carhartt Company has increased the price of its 30-35 model to $2,500. At this price the equipment consists of windshield, remountable rims, top, speedometer and license plate holders.

Detroit, Dec. 19.—The Ackerson Engineering Company has made announcement of its succession to the business of the Merle MacFarland Company. The company makes axles, power plants, motors, jack-shafts, etc.

New York, Dec. 19—Henry Knott, who for the past three years has been associated with the Frank Seaman Agency, has been appointed advertising manager of the E. M. F. Company, with his headquarters at Detroit.

Des Moines, Ia. 19—A room has been set aside at the Coliseum, at which the Second Annual Automobile Show will be held, for the exclusive use of the various trade papers during the show. The show dates are March 7 to 11.

Cleveland, Dec. 19—The factory of the Gabriel Horn Co., 1407 E. Fortieth street, was completely destroyed by fire Saturday, December 10. The loss is estimated at from $50,000 to $75,000 a great part of which was in valuable stock.

Pittsburg, Dec. 19—From January 16 to 21 an auction sale of automobiles will be held in the Exposition Hall. The sale is announced to be open to anyone who wishes to buy or sell a car and is being fostered by leading members of the trade.

Ft. Worth, Tex., Dec. 19—The Southern Motor Works has opened a distributing branch at 707 Commerce street, this city, which has been placed in charge of H. H. Brooks. A complete stock of Marathon cars, as well as parts, will be carried.

New York, Dec. 19—Considerable talk has been indulged in about the building of a municipal garage to care for the 130 automobiles owned by the City of New York. The number of machines has been increased by 11 during the current year.

San Francisco, Cal., Dec. 19—The San Francisco branch of the Firestone Tire & Rubber Co. has just moved into its handsome new building at Van Ness avenue and Fulton street. It is a three-story structure, built exclusively for the company.

Philadelphia, Dec. 19—The meeting of the Executive and Good Roads Committee of the Pennsylvania Motor Federation, which was scheduled for last week, has been postponed until January. Lack of sufficient notice is given as the reason for the postponement.

Columbus, O., Dec. 19.—On and after ten days it will be unlawful to have an automobile horn here which does not give off efficient warning signals. Mayor Marshall signed the ordinance passed recently by Council, and after ten days it will be in full force and effect.

Boston, Dec. 19—The Automatic Appliance Company announces that it has taken over the Couch & Seeley Co. and the Transfer Issuing Machine Company. The new concern is occupying the offices and factory formerly used by the Couch & Seeley Co., 162-172 Columbus avenue.

Cincinnati, Dec. 19—The Schacht Motor Car Company is now comfortably installed in its new plant and is turning out four-cylinder cars at the rate of ten a day. The present factory is three times as lorge as the old plant, with acreage for increasing to four times its present capacity.

New York, Dec. 21—The regular monthly meeting of the Electric Vehicle Association of America was held last night at the Engineering Societies Building. "The Alkaline Battery," by W. H. Holland and "The Mercury Arc Rectifier for Charging Electric Vehicles," by R. E. Russell were the two set papers read.

New York, Dec. 19—A midnight class of the Automobile School conducted by the West Side Young Men's Christian Association, 318 West Fifty-seventh street, has been opened to meet the demand of night workers who, because of their hours of employment, are unable to attend the regular day and evening classes.

Indianapolis, Dec. 19.—Harry C. Stutz has joined the forces of the Empire Motor Car Company, of Indianapolis. Mr. Stutz has been associated with the Marion, American and Overland automobile companies, also with the Schebler carburetor concern as engineer, and is now head of the Stutz Auto Parts Company, of Indianapolis.

Racine, Dec. 19.—C. O. Hamilton, of Sayrick, O., was elected president of the National Gas & Gasoline Engine Trades Association last week. The other officers elected are: Vice-president, A. C. Parker, Racine; secretary, Adolph Strictmatter, Cincinnati, O.; treasurer, O. M. Knobloch, South Bend, Ind. The semi-annual session will be held in Detroit next June.

Baltimore, Md., Dec. 19—Several changes have been made in connection with the local agency of the Ford Auto Company. Robert F. Kaehler, formerly of the Baltimore office, has gone to Richmond, Va., to take charge of that branch, while J. K. Harper, formerly of the Richmond, Va., branch, will be identified with the Baltimore branch after January 1. A. M. Eastwick will be in charge of the Baltimore branch.

Moline, Ill., Dec. 19—C. H. Van Dervoort, sales manager of the Moline Automobile Company, East Moline, Ill., and F. G. Salisbury are on a trip through the South, during which they will visit agents and establish several new agencies. Previous to the time of their departure a touring car, 1911 model, was shipped to Memphis, Tenn., and Van Dervoort and Salisbury will use the machine out of that city.

New York, Dec. 19—Automobile manufacturers and dealers of New York city and vicinity, are demanding of the Secretary of State, better facilities for obtaining license numbers for motor vehicles. They have been put to a great deal of inconvenience and trouble, on account of being compelled to loan purchasers license numbers, while the purchaser is awaiting the receipt of numbers for his machine, from Albany, which usually takes about ten days.

New Orleans, Dec. 19—Entry blanks are out for the New Orleans Mardi Gras Speed Carnival, the third running of which will take place February 25, 26 and 27, 1911. A big list of events has been arranged by Secretary-Manager Homer C. George, of the New Orleans Automobile Club, and every indication is said to point to a record-breaking number of cars. The prize list amounts to $3,500, with the various events ranging from five to fifty miles each, in addition to two one-hour races.

New York, Dec. 19—The Joscelyn Stable Co., 112-126 West Fifty-second street, has issued a booklet describing the immense garage conducted by the company. The building is four stories, 200 by 100 feet, and is reckoned to be as nearly fireproof as any in its line. The garage is equipped with cement floors, metal ceilings, steel lockers, three large elevators, telephone on each floor, compressed air service, buffing machines and vacuum cleaners. A full line of accessories is carried. Special regard for the comfort of chauffeurs has been provided.

Proper Garage Fittings

In the Handling of Gasoline and Lubricating Oil in the Average Garage the Entire Cost of a Decent Set of Fittings Is Dissipated at Least Once a Month

DISREGARD of considerations for economy in the maintenance of the garage have such far-fetched consequences in several directions that it may not be considered out of place if a few of the points are afforded discussion and suggestions of a remedial nature are offered. Before talking about the details and the methods by which economies may be perfected it will be to the purpose to point out that lubricating oil, even though it does cost far too much money to permit it to run on the floor, should be kept in the oil tank where it belongs on account of the savage manner in which it attacks the rubber of the tires, thus making heavy inroads upon the factors for general economy. In the same way, while it is true that gasoline is too high-priced to consider permitting it to run into the sewer pipe, it has that element of risk involving the fire hazard and possible explosions which is a sufficient reason for wishing to keep it in a storage tank rather than to permit it to escape onto the garage floor.

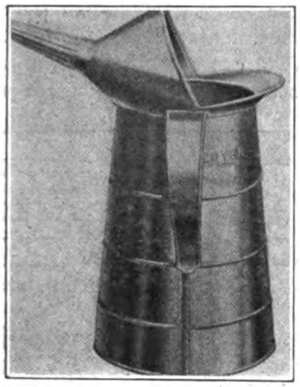

Fig. 2—Combination measure and funnel

Then there are the questions of labor cost. If a workman has to discover a pin-hole leak in an inner tube and he takes, say, three hours in the process, his time, at 60 cents per hour, may foot up to a sum total greater than the value of the inner tube. There are a considerable number of like problems scattered through the average large garage, and the Dover Stamping & Manufacturing Company, of Cambridge, Mass., has given all of these matters a considerable amount of attention, with the result that this study and investigation has brought out the various types of equipment which it recommends for use. Referring to Fig. 1 of the new Dover testing tank, it will be observed that the inner tube is permitted to rest in a suitably shaped pan, and by means of a rod with a gooseneck extremity the tube is held in its natural shape, thus permitting the workman to quickly determine whence the leaks come by observing the source of any trouble that might rise up in the water in the tank. The pan is made of heavy steel suitably galvanized, with a double seam construction, capable of being filled and emptied quickly, and occupying but little room on the shelf when it is not in actual service.

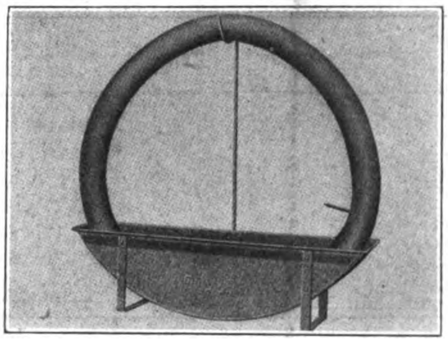

Fig. 1—New tank for testing tires, with support for the top

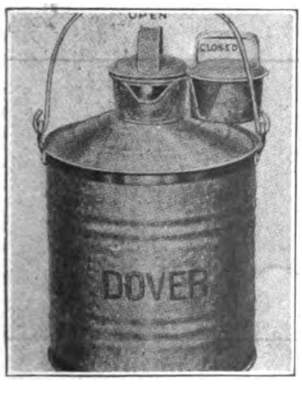

Fig. 4—Non-evaporating gasoline measure

In order to avoid the spilling of lubricating oil and gasoline, the company has brought out what is known as the "duplex" combination measure and funnel as shown in Fig. 2. The features of this combination measure are manifold; among them these four may be mentioned: No. 1 is the pouring lip, which is used when a funnel is not necessary and fast pouring becomes desirable. Feature No. 2 is the advantage of the funnel for pouring, thus making it possible to replenish an oil tank, even though it may have a small filler orifice, without losing a part of the oil. Feature No. 3 is the handle on the side, by means of which it is possible to use the measure with certainty and without the discommoding feature which would be represented were the handle in the wrong place where it would be likely to get in the way. Feature No. 4 has to do with the measuring marks, which are graded to half-pints, pints and quarts, which is a great convenience.

Referring to Fig. 3 of the Dover radiator filler, the funnel scheme is retained, but it is also fitted with a brass strainer so that foreign matter is excluded from the radiating system, and the work is done with greater efficiency; moreover, the spilling of water over the varnished surfaces of the car is avoided. Fig. 4 shows the new non-evaporating gasoline measure which is designed to hold five gallons of gasoline, it being 11¼ inches in diameter and 18 inches high over all, with a filling opening which is 4 inches in diameter. In this can the pouring lips and filler opening are combined. The filler opening has a cover plug which is so arranged that by turning it one-half around the pouring lip is shut off and the remaining gasoline is prevented from evaporating.

Fig. 5—Rust-proof steel 5-gallon wagon measure

Fig. 3—Radiator filler, with funnel and brass strainer

Fig. 5 shows the new five-gallon wagon measure, which is made of extra heavy steel and galvanized after it is made so that the seams and other crevices are rendered rustproof. The body and bottom of this measure are heavily reinforced and the bail is provided with a large boss so that the measure is easy to carry. This type of measure is used by dealers for the most part in connection with the gasoline delivery wagon. Fig. 6 presents a type of garage funnel with a capacity for six gallons. This funnel is provided with a chamois strainer and is intended for rapid work. It is made of heavy steel, and, like other Dover products, is galvanized after it is made. The chamois-skin is held by a large hook which has the effect of stretching it tight across the bottom for the full diameter of the funnel, and it is supported by a wire rack to prevent sagging.

Fig. 6—Garage funnel for rapid filling

Among the Accessory Makers

A NEW TYPE OF ROLLER BEARING; RHEOSTAT FOR CHARGING BATTERIES; WORK UNDER A CAR MADE EASY; HAZARD GEAR-SHIFTING LEVERS

GILLETTE TYPE OF ROLLER BEARING

The modern trend in roller bearing work is in the direction of the narrow type so that roller bearings will fit into substantially the same space as is normally required for annular types of ball bearings, and the Gillette roller bearing as shown in Fig. 1 is so designed that the distance N is about on a par with standardized space, which distance varies of course with the different sizes of bearings, and the sizes in turn are in keeping with the loads that the bearings will have to carry. The over-all diameter A is ground to a definite size, and the inside diameter E is very carefuly ground, thus making it possible to fit the bearing on a ground shaft, so that it will tap on and if suitably endwise clamped will serve without burrowing into the shaft. The rollers are tapered and traverse a pair of truncated cones, the outer one of which is shown separately, and the inner cone, or raceway, is presented in the assembly. The several other dimensions as indicated in the illustration by letters are given in a tabulation which the company sends out. The R. G. Peters Mfg. Co., Grand Rapids, Mich., are the makers.

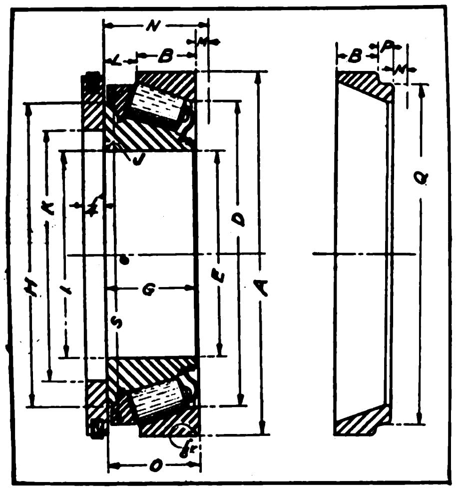

Fig. 1—Illustrating the Gillette type of roller bearing

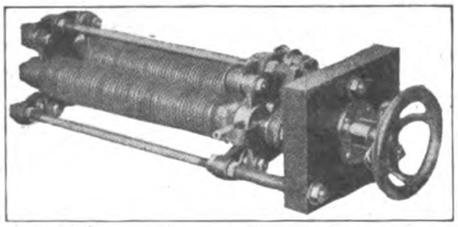

Fig. 2—One of the three types of Allen-Bradley battery-charging rheostats

BATTERY-CHARGING RHEOSTATS

Referring to Fig. 2 of the Allen-Bradley H2 panel type of rheostat as made by the American Electric Fuse Company of Muskegon, Mich., it will be observed that the resistance is varied to suit the charging conditions of the battery by turning on a hand-wheel at the right and the extent to which it is necessary to alter the resistance in circuit will be known to the operator since he will observe the ampere readings of the meter, varying the resistance to suit the charging rate of the particular battery that is undergoing treatment in any given case.

This illustration shows that one of the three types of charging rheostats listed by this company. The principle of the rheostat is that involving the use of graphite discs which are manufactured subject to a temperature of 7,000 degrees Fahrenheit, and are thereafter tested for mechanical strength. These discs offer a high resistance to electricity, and the amount of this resistance is varied by altering the contact condition between discs by changes in pressure. The device is very simple and owing to the high temperature which obtains during the manufacture of the resistance units it is scarcely to be supposed that overheating will take place during the use of the rheostat. Temperature is kept down by having the units open to air currents and under ordinary charging conditions it is plain that the temperature does not elevate to a point that is worthy of notice. These charging units are of the greatest importance to the man who owns an electric vehicle and who wishes to charge the same in his own garage, and they are also made in the several forms which facilitate their use in connection with charging boards in central station work.

PORTLAND REPAIRMAN'S COUCH

Referring to Fig. 3 of the Portland Repairman's Couch as manufactured by the Spear Auto Company of Portland, Me., it will be observed that it is a substantially constructed platform with four castors fastened to the cross-members and so arranged as to avoid eating up much of the headroom under the automobile where this repairman's couch is adapted for use. The head of the couch is provided with an adjustable cushion so that the operator is enabled to change the headrest to suit the varying conditions, and it is claimed for this couch that it very materially facilitates the repairman's work, thus earning the cost of it perhaps within a week.

HAZARD GEAR-SHIFTING LEVERS

Among the accessories as manufactured by the Hazard Motor Mfg. Co., of Rochester, N. Y., a complete line of gear-shifting lever sets occupies a prominent place, and Fig. 4 is an illustration of the unit method of assembling the gear shifting and emergency brake levers, including the connecting details so that the unit may be assembled separately and then applied to the automobile on which it is intended to go. The various designs of the Hazard company are in keeping with the structural requirements of the various makers of automobiles, and among the selective hand-control sets available is one, for instance, which is adapted for use in connection with rear axle transmissions. The company states: "Our controls are made from malleable steel castings, the handles being heavily brass plated and polished. We can also furnish the controls cast in solid manganese bronze and highly polished." The outfits are furnished complete including shafting tubes and brake-shafts, ready to be bolted to the chassis frame.

Vol. XXIII New York—Thursday, December 29, 1910—Chicago No. 26

The Automobile

1911 Promises Many Innovations

APPROACHING the end of the year brings with it the awakening of interest in the things that are promised for the immediate future. Doubtless many of the innovations which will become familiar to the 1911 automobilist by the time the touring season opens are hidden beneath the surface, with here and there just a little speculation bearing upon some of the matters which seem to be in an unsettled state. Observation seems to point conclusively to certain heretofore unobserved body refinements, and Fig. 1 is offered as an indication of the trend in body work. It does not necessarily follow that bodies will have but one side door, but it is believed that there is a distinct inclination on the part of body designers to bow to the necessities from the machinery point of view, and the glass cowl as shown in this example is specifically referred to for the purpose of indicating that it is no longer considered good form to so design bodies that there will be dark "cubby holes" hiding the machinery and its relating members, thereby preventing the owner of the car from inspecting and oiling the parts at sufficiently frequent intervals to maintain that noiseless state which reigns in orderly quarters.

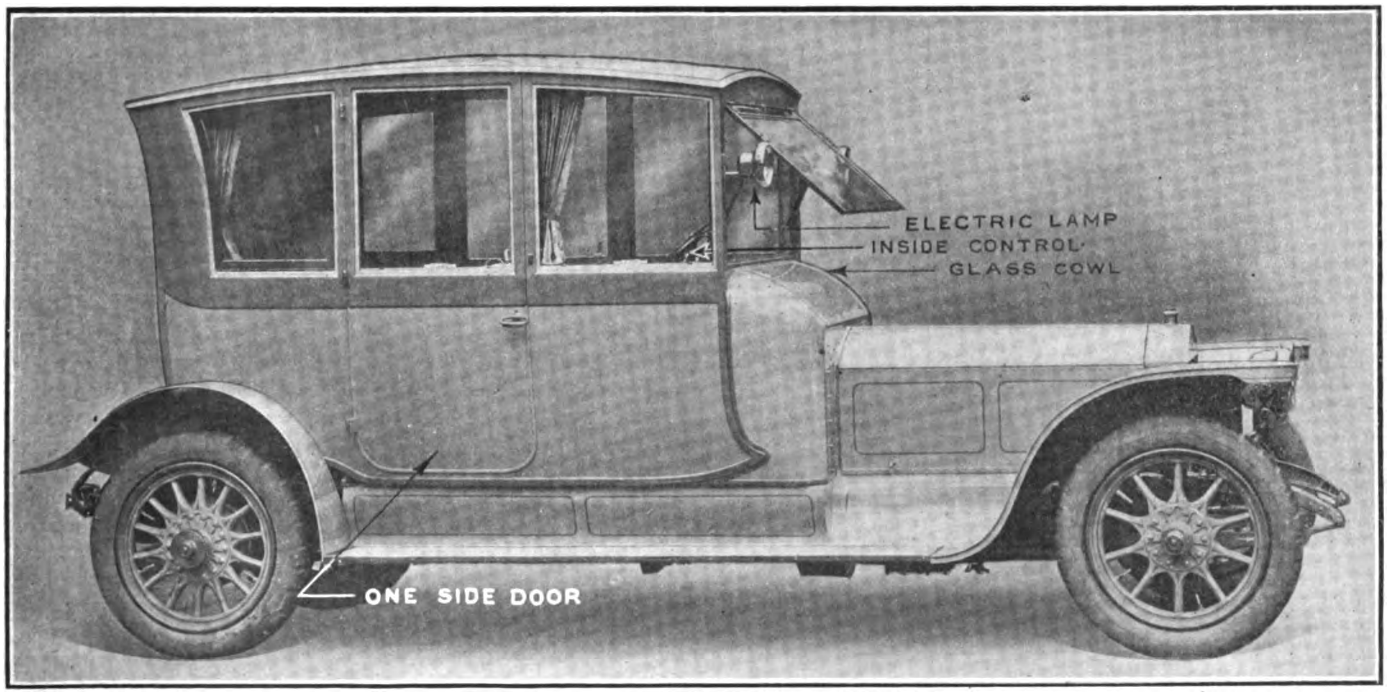

FIG. 1—1911 BODY WITH SINGLE SIDE DOOR, TRANSPARENT COWL, ELECTRIC LIGHTING AND INSIDE DRIVE

Dismissing the facility of the inside control with mere mention for the time being, it remains to point out that electric lighting is now the regular order of procedure; dynamo-electric machines are so perfected that they may be attached to the automobile motor, and despite the fact that the speed of the motor is a widely varying quantity, the dynamos are so contrived that they will run at a constant speed, and this improvement in the equipment for lighting permits of the use of lamps of large candlepower and a full set without having to cope with the overloading of batteries and the resultant depreciation. Moreover, in this plan the battery employed "floats" on the circuit so that it is charged automatically and is available for the supplying of electrical energy during the periods of time when the automobile motor is shut down, thus affording to the automobilist a continuous supply of electrical energy and all that it implies, not only when the automobile is running, but also when the car is standing in the garage, so that through the good office of a flexible cord and a portable lamp the automobile may be gone over and inspected in the minutest detail.

Too much importance cannot be attached to these improvements in lighting; it is not enough to merely provide illumination when the automobile is on the road; it cannot be kept upon the road unless it is maintained in good working order, and it is impossible to properly inspect and care for a car if it is run into a more or

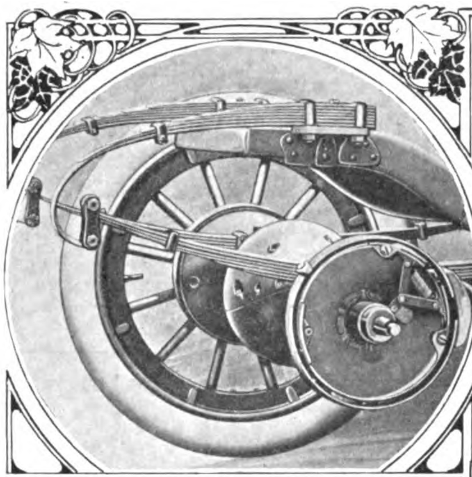

Fig. 2—Rear End View of the Cole Thirty Chassis

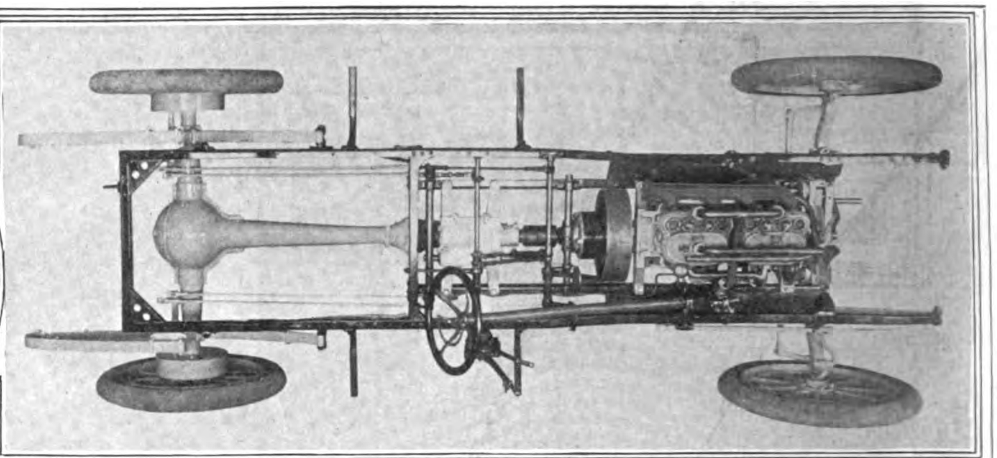

Fig. 6—Stripped Chassis of the Henry Automobile

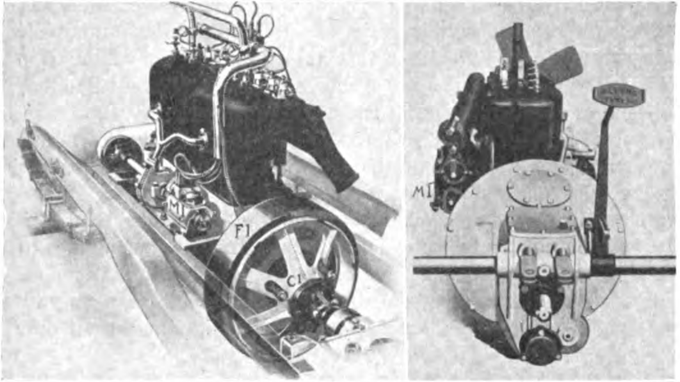

Fig. 3—Perspective of Firestone-Columbus Power Plant

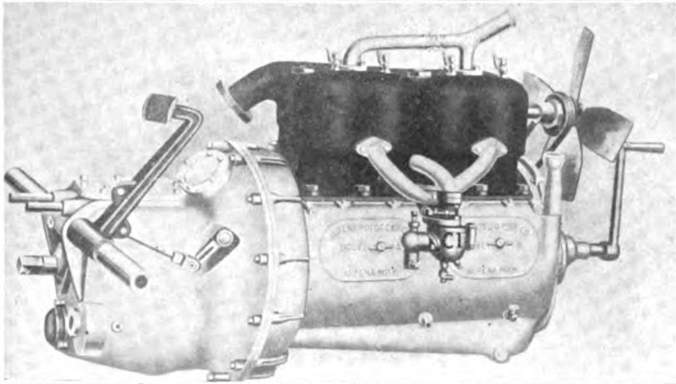

Fig. 4—Side Elevation of the Alpena Motor

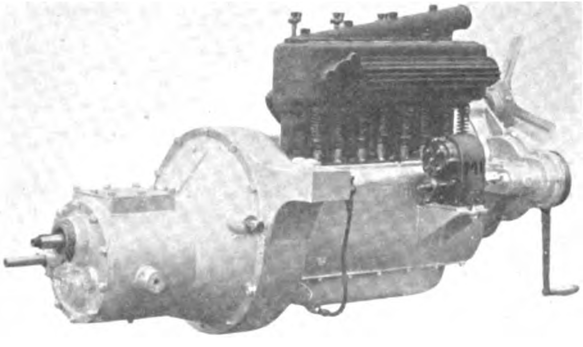

Fig. 5—Magneto Side of the Parry Block Type Motor

less dark garage and nothing better than a candle is available as the source of illumination when the automobilist starts out with a squirt can for the purpose of distributing lubricating oil. Among the many refinements in addition to those in body work and accessories there are the matters of machinery adjustment which are being handled somewhat differently from the process as it obtained heretofore.

In order to show that accessibility and stability of design are uppermost, 10 more cars were picked at random this week and the general dimensions are given in a tabulation on a comparative basis. The body work will be appreciated by examining the illustrations of the completed cars, and for the purpose of bringing out the 1911 trend in machinery designing, mechanical illustrations were picked at random, with an eye to bearing out the contention that there is a certain cleanness attending the work, thus satisfying the complaint, which was more or less justly made in the past, that designers were inclined to be slovenly.

Black Crow

EIGHT models of this make of automobile are included in the tabulation. Three of these models are equipped with a power plant that is rated at 25.6 horsepower A. L. A. M. rating, the motor having a bore of 4 inches and a stroke of 4 1-2 inches. The motor is of the four-cylinder, water-cooled type, with the cylinders cast *en bloc* equipped with a honeycomb radiator, using the thermo-syphon system of water circulation, and among the other refinements mention is made of a high-tension (magneto) ignition system, with a dry battery auxiliary ignition system. Lubrication is positive, and the clutch, which is of the multiple-disc type, is designed to afford an extra measure of flexibility of performance under severe road conditions. The transmission is designed for three forward speeds and reverse, is of the selective type and is swung on the rear axle. The wheelbase is 109 inches, and the tread is standard. The tires are 32 x 3 inches. The power plants for the remaining models are along conventional lines, sizes considered. The cylinders are cast in pairs, water cooling obtains in each example, and the radiator is of the honeycomb pattern, but the water is circulated by the thermo-syphon system in each case. In all examples the means for lubrication are positive, and the high-tension magneto is aided by a supernumerary battery system. In the larger cars the wheelbase is extended, being 112 inches in models 13 and 14, reaching up to 120 inches in the remaining models.

Firestone-Columbus

PRESENTING two models in detail in the tabulation, it will suffice here to refer to Fig. 3 of the 4 1-2 x 5-inch bore and stroke, respectively, water-cooled motor, showing the same in perspective, looking at the left-hand side. The cone type of

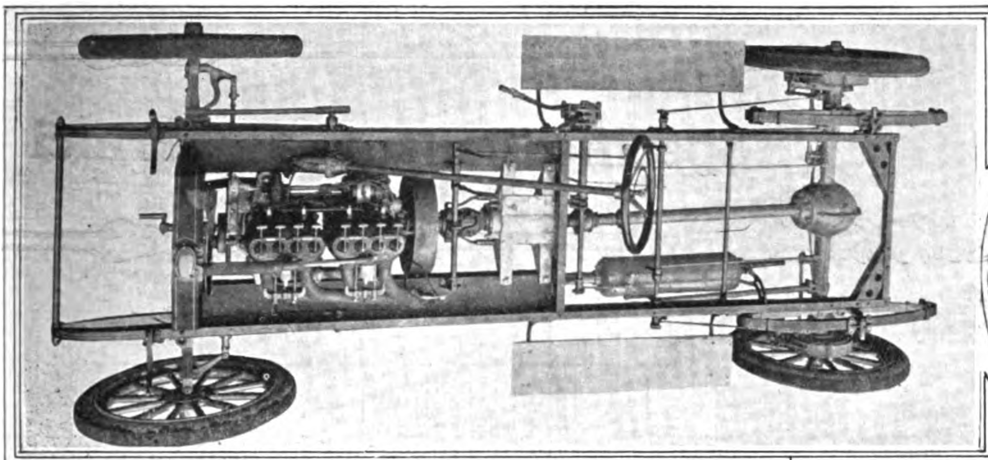

Fig. 7—Stripped Chassis of One of the Parry Models

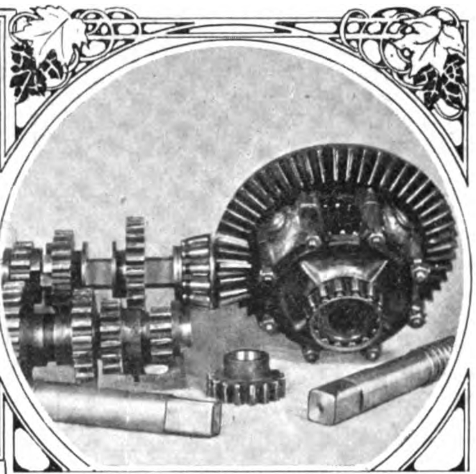

Fig. 8—Showing Crawford Transmission Gears

clutch C1 is shown to advantage in the flywheel F1 and the magneto M1 rests on a shelf back of the water pump of the centrifugal type W1, both being driven by a common shaft which takes power from the half-time gear system; the gears are encased in a grease-tight housing in front. The carbureter is placed upon the side opposite to the motor; this is also the camshaft side. The cylinders are T-type, cast in pairs. The power plant rests upon a sub-frame. As the tabulation shows, the power plant is made in two sizes; the A. L. A. M. ratings are given in the tabulation. The Firestone rating of the motor as here shown is 40 horsepower.

Krit

WITH four models shown in detail in the tabulation as here presented it remains to observe that the Krit power plant is of the type using *bloc* cylinders and a two-ball bearing crankshaft. The power plant is also of the self-contained design, that is to say, the clutch and transmission gear are within an extension of the motor case. The design is compact without being so cramped that it will be difficult to get at the working parts to note how they function, and a magneto of the high-tension type is used for ignition purposes. Other refinements, including the four-cylinder motor with a bore of 3 3-4 and a stroke of 4 inches, will be noted. The A. L. A. M. rating of the motor is given as 22 1-2 horsepower. The crankshaft, which is short, and of stout section, is accurately centered on a pair of silent type ball bearings, and the lubrication is carefully contrived.

Paterson

SEVEN models of this make of car are tabulated in this article, two sizes of power plants are listed, and the main characteristic of the motor work lies in a certain simplicity along lines including the unit construction. The cylinders are cast in pairs, of smooth exterior, and the motor, clutch and transmission are protected by a common oil-tight case. The clutch is of the cone type, faced with leather, and the transmission is of the selective type affording three speeds and reverse. In the system of lubrication, while splash is relied upon, the level of the oil is maintained by means of a system of plunger pumps. Cooling is done by thermo-syphon, including an efficient radiator. Ignition is accomplished by magneto with a coil and battery auxiliary. Models G and H differ in detail from the model using the "thirty" motor, but the main considerations are on a common level; the good points for one model are retained in all.

Abbott-Detroit

THE general appearance of the touring car of this make is depicted in the illustration, and the data of the cars is given in the tabulation. The motor is of the four-cylinder, water-cooled type, has an A. L. A. M. rating of 25.6 horsepower, and

CRAWFORD—Crawford Automobile Co., Hagerstown, Md.

the cylinders have a bore of 4 inches and a stroke of 4 1-2 inches. The compression is 54 pounds per square inch above atmosphere, and the inlet valves are located in the head; the exhaust valves are located in the side. Lubrication is by splash, with a sight feed on the dash. Ignition is by means of the Splitdorf dual system, including a magneto. The car is delivered to the purchaser complete at the price named in the tabulation, including combination oil and electric lights for the side and tail, also a 6-inch electric headlight and a 120 ampere-hour storage battery, horn, tool-kit, pump and jack are included.

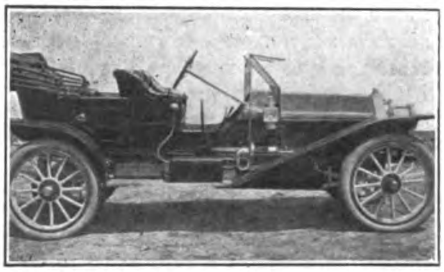
Alpena

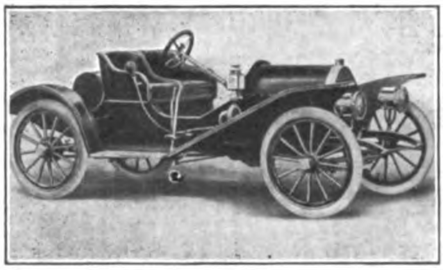
AMONG the automobiles that are tabulated in this article the Alpena Flyer is included. In addition to a photograph of one of the models, the unit power plant is illustrated with a side view in Fig. 4, and a rear-end view at the right in Fig. 3. Referring to Fig. 4, the right-hand side of the motor, the Schebler make of carbureter C1 is located in the mid-position, and glancing at the rear-end view it will be observed that the magneto M1 is located on the side opposite to the carbureter. In addition to the clean placing of the accessories of the motor, attention is called

Henry 40 h.p. fore-door touring car

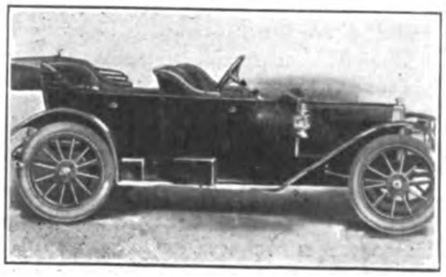


Parry Model 37 baby tonneau

Paterson "30" 5-passenger touring car



Krit two-seated runabout



Firestone-Columbus torpedo

to the method of bolting the transmission case to the crankcase and to the well-contrived pedal placed for the manipulation of the clutch, observing that the pedal shaft is of a healthy diameter.

Parry

FOR details of the Parry line of cars reference may be had to the tabulation and, representative of the general appearance of the automobiles, one illustration of a complete car is presented. Mechanically, the class of work from this plant will be appreciated by examining Fig. 5 of the unit power plant, looking at the right-hand side, showing the magneto M1 on a shelf driven by a shaft out of the half-time gear housing in the front end of the motor. Still another motor from this plant is shown in Fig. 11, looking at the right-hand side, presenting the magneto M1, driven by the same shaft as the centrifugal water pump W1, taking power from the half-time gear in the front of the motor case. Lubrication is positive with a pump P1 incorporated in the lower half of the crankcase. The valves are overhead and the tappet rods come up on the side shown, they being straight and well proportioned for the work. In other respects the motor shows the earmarks of the designer; observe that the water connections are not only short but direct. Fig. 7 shows a stripped chassis, giving an excellent idea of the layout of the machinery.

Cole

MECHANICALLY the Cole "30" motor is shown in Figs. 9 and 10, with the unit power plant, looking at the left-hand side, presenting the carbureter C1 in a mid-position and the oil pump P1 in the lower half of the case near the front of the motor. The transmission gear is in the extension of the crankcase of the motor, being flanged to the enlargement which encompasses the flywheel, and among the other features which distinguish the Cole design from motors in general, the method of assembling, which obviates the splitting of the crankcase horizontally in the plane of the crankshaft. The scheme of design of the chassis is shown in Fig. 2 of the rear end, presenting three-quarter elliptic springs on a symmetrically fashioned live rear axle, and a channel section frame with a pronounced kick-up, thus bringing the center of gravity of the car well in the direction of the ground, leaving sufficient clearance for practical purposes under severe road conditions.

Henry

THIS make of car will best be appreciated by examining Fig. 6 of the stripped chassis in conjunction with the tabulation, which affords the detailed information necessary, and in the examination of the chassis as shown in Fig. 6 it will be observed that the motor sets back of the front axle, bringing the radiator on the axle center, and the transmission gear lines up on a subframe with the motor. The live rear axle is provided with a torsion tube concentric with the propeller shaft, and the universal joint is fixed to a cross-member just back of the transmission gear so that the axle is free to respond to road inequalities under the flexible control of three-quarter elliptic springs. The general appearance of the finished car is also shown.

Crawford

INSPECTING the illustration of the Crawford car shows a torpedo type of body with a fore door, and a straight line effect which is pleasing to the eye. The details of the car are given in the tabulation and in order to indicate the general idea of the designer the transmission gears removed from the care are presented in Fig. 8. It will be observed that the gears are of wide face, symmetrical design, and that the sliding set is provided with broached holes for a square shaft, which runs on conical roller bearings, and that the bevel gear, which is flanged to the differential housing, is combined with the differential unit separable from the axle housing, into which it may be placed after it is assembled and inspected.

The Auto in Distant Lands

STATUS OF THE INDUSTRY AS GATHERED FROM REPORTS OF UNITED STATES CONSULS IN MANY COUNTRIES

WESTERN Canada is to have its first automobile show in Winnipeg, from February 13 to 18. The exhibition will be held under the auspices of the Winnipeg Motor Trades Association. Advantage will be taken of "bonspiel" week, during which period hundreds of thousands of visitors flock to Winnipeg from all sections of Western Canada. There is to be a limit to the number of exhibits, owing to lack of space, the greatest number of automobiles that can be accommodated being sixty. For this reason, the exhibitors will be confined to firms which have been members of the Association for ninety days prior to the exhibition. The promoters intend to make the show an annual affair. It is aimed to provide ample space for all comers by the year 1912.

An automobile reliability tour is being planned for next Summer, the start to be made and ending in Winnipeg. The route will embrace the Provinces of Manitoba, Saskatchewan and Alberta. This test will be open to all makes of cars, for the purpose of creating a greater interest in the tour throughout the route, as well as to encourage the improvement of roads and bridges, the ultimate object being to determine approximately the type of automobile most suitable for use on prairie roads, of the order of those over which the contestants will travel. Other features of the run will be for the purpose of educating the public to the advantages of rapid automobile transit, both as a means of carrying passengers and goods.

The distance to be traversed will approximate 2,300 miles, the territory embracing the most valuable and alluring portions of mighty Western Canada—which drew more than 120,000 Americans across the line last year to take up agricultural pursuits. The tour will thread through the following named towns: Winnipeg, Moose Jaw, Napinka, Morris, Carnduff, Estevan, Swift Current, Medicine Hat, Lethbridge, Macleod, Calgary, Edmonton, Lloydminster, Saskatoon, Regina, Brandon and Portage la Prairie. With such consummate skill has the circuit been planned that fully eighty per cent. of the population of Western Canada will be able to witness the test. The American Automobile Association 1911 rules for reliability contests of the second grade will be adopted. Each car will be taxed $150 for an entrance fee. It is estimated that the cost per car will be $500, bringing the total expense up to about $3,000.

If any person has a mind that Paraguay is a paradise for automobilists, the only word to be heeded, is Don't! There is absolutely no use for the automobile in Paraguay. Not but that the people of that far-away country would like to take their place beside the other moderns who are making use of the automobile. But the fact is there are no roads in Paraguay over which a machine could be driven. The only highways—and these are practically byways—in the country are available for bullock-carts. The people of the land travel principally on horseback. There are myriads of swamps—where there are no sandy stretches. The roads are of the roughest description. The city of Ascuncion does not furnish an exception. The streets are raggedly paved, making it a hard job for two horses to snail along hitched to a victoria holding two fares. It would be a bold automobilist who would attempt to ride over the streets. There is but one machine in Ascuncion, and its expression is really one of melancholy, as though pitying its owner when he sometimes ventures driving it over the jagged pavements.

There are no automobile manufactories in Russia, considered from the American standpoint. A number of carriage and bicycle manufacturers have for some time been in the habit of importing parts of automobiles, including engines, tires and the more complicated pieces, and they have made the rougher parts on the premises. As an industry, automobile making has not thrived to any important degree in Russia; and for the reason that the Russians who are financially able to keep automobiles demand the very best that they can find in the market. The majority refuse to buy a cheap machine. There is, however, a continuous growing demand for good cars. The customs returns carry out this statement, as the following figures relative to imports into Russia show: The year 1906, 245 cars; in 1907, 555 cars; in 1908, 860 cars; in the last six months of 1909, 628 cars. It is expected that the 1910 imports will reach 1,500 machines. The principal makes are French, Italian, German and English. There is but one American firm represented in Russia, so far as can be ascertained. The roads within the Czar's Empire are as rough as the worst roads found in the United States. Even in Moscow the streets are paved irregularly with rough stones, which severely try the enduring power of the strongest machines.

Reichenberg, Austria, sets the price of gasoline at $9.75 per 220 pounds, or 18 gallons. At the same time automobiles are exempt from the internal revenue tax of $2.63 per 220 pounds. Government, however, proposes to feel the way towards the imposition of this tax on gasoline which is used by the owners of automobiles.

Bergen, Norway, an enterprising city, is provided with 15 automobiles, all of which, with one exception, are of European make. The exception is an American-manufactured machine. It is considered that the field offers a good future for the automobile trade provided it is carried on persistently and systematically. The lack of these requisites on the part of agents has more to do with the small number of cars found in Bergen and vicinity than to any strength of effort.

Care and Repair of Tires

UNLESS THE SPARE TIRE RECEIVES ATTENTION IT CANNOT BE EXPECTED TO PERFORM WELL WHEN PUT INTO USE

UNLESS the spare tire that the autoist carries with him on the car receives proper attention the life of this tire when put into use will by no means represent the money paid for it. Unless it receives such attentions as will be later on suggested deterioration will grow apace, and once rot has set in or the outside layer of rubber becomes inanimate and deprived of its resilient properties its ultimate utility will not represent 50 per cent. of what it should possess.

The spare tire should be wrapped in a case of some waterproof material, and in this connection leather or pantasote answer very well, provided they are not too thick and prevent adhesion all round the circumference of the tire. Such coverings are illustrated in Figs. 1 and 2. It is not sufficient to place such covers over the tires, but they must be so fitted that rain and damp are entirely excluded. If moisture of any description finds its way into the spare tire there is no telling where the damage will end. In Fig. 2 the joint J1 is at the top. It is good to have a covering of some description, but the utility of the case is partly done away with if the tires are carried in this way. In a heavy downpour of rain the wet will assuredly find its way in, whereas if the joint were placed half-way down toward the front, below the strap S2, there would be less likelihood of such a thing happening. Reference to Fig. 1 shows how this should be done.

Unless the spare tires are carried in some case or cover rain will find them an easy prey. Fig. 4 shows two tires being carried without any protection, and the first drop of rain will enter the outer casing O1 and the rim of the demountable will rust up so that when it will be required for use it will have to be cleaned off with emery paper to make a good fit.

It is only necessary that the tire be carried in this fashion for a few days in the rain to render the inside linings practically useless, as one lining of canvas after the other absorbs the moisture and starts the rotting. Segregation of the layers intervenes, ending up with decay. The method of wrapping shown in Fig. 5 is similar to those already shown, with this difference—that the tires should be taken out of their wrappings oftener and well dusted over with soapstone, at the same time removing any traces of dust. Covers should be taken off the spare tires every week in the Summer and every fortnight in the Winter, to clean off the dust which will find its way through the smallest crack.

Fig. 3 tells a frequent tale. During a few minutes that the

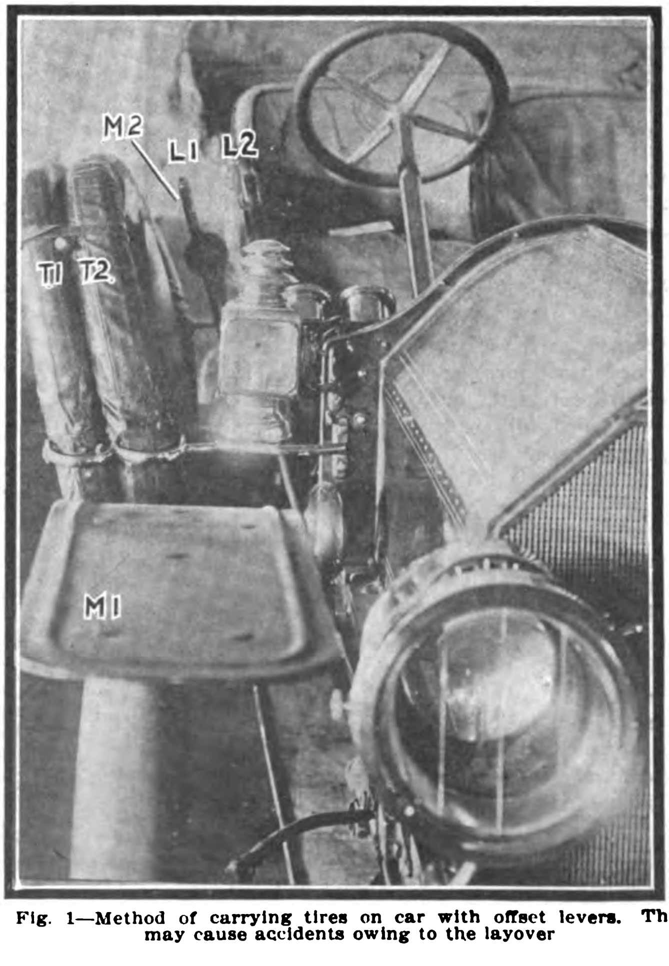


Fig. 1—Method of carrying tires on car with offset levers. This may cause accidents owing to the layover

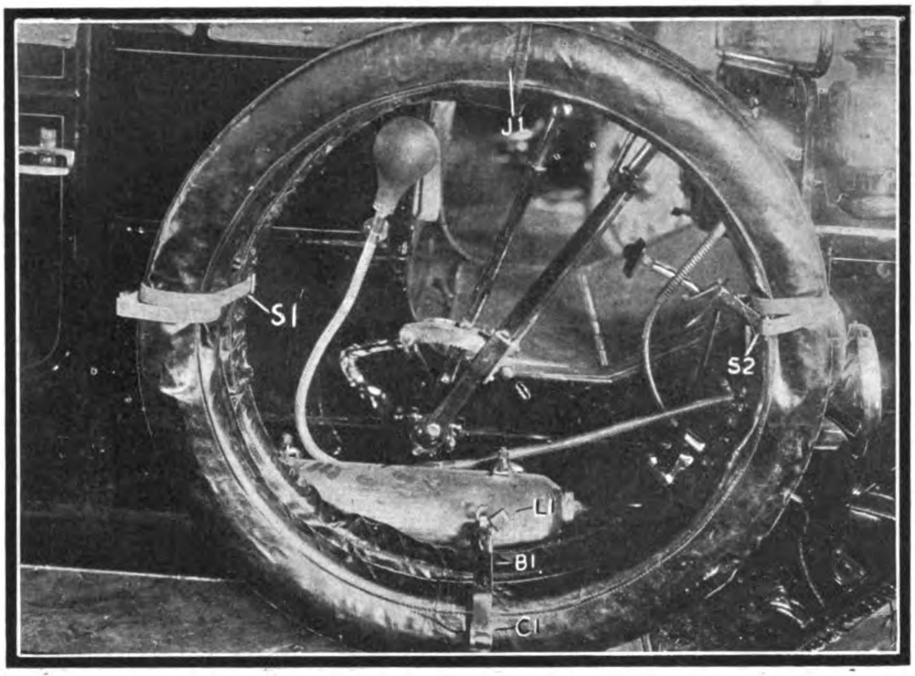

Fig. 2—A good method of carrying spare tires enclosed in waterproof covers and padlocked to prevent theft

driver goes into a store to make a purchase he carefully takes off his fur rug and throws it over the radiator and hood to prevent the motor being damaged by the inroads of frost. The poor spare tire is subjected the whole Winter through to snow, rain, sleet, frost and dust without the slightest protection. It is a very good practice to cover the radiator, but the care is misplaced. There is no use covering the tire with a fur rug; it would be satisfied with a common piece of canvas for want of something better, and would recompense the owner for his trouble by ekeing out a longer existence. The padlock P1 in this case is like bolting the stable after the horse has gone, because if one is content to allow the tire to rot it would be as well to give the tire away to some one for the time being and let him have the amount of use in a legitimate manner that is being taken out of it by neglect and failure to properly protect it.

When washing the car the spare tires must be removed and placed in a dry place off to one side, that they cannot be splashed. Tire covers are pretty ornaments, and are treated by some in this light only. They certainly add to the appearance of the car as compared with carrying tires unwrapped, but in the choice of covers the main point is utility combined with beauty and not the latter adjunct alone.

The next point after establishing the fact that the tires should be covered is how they should be carried. In a great measure this is a matter that is dependent on the type of body and the disposition of the levers. The most common method employed is that shown in Fig. 2, but it is not possible to carry tires in this manner on every car. Take, for example, Fig. 1; owing to the offset levers the tires extend about six inches beyond the extreme width of the mudguards. In a tight corner such as it is possible to get into, it is common belief that if the mudguards pass the rest of the car will also pass. Again, in stopping at the side of the curb these tires will protrude over the foot-path for several inches, and there is the possibility of knocking some one over with them or passers-by catching their clothing in the straps or irons. In such cases it is better to either carry only one tire, or if two are carried have some means similar to that shown in Fig. 5. In this case the bracket bears the weight of the tires T1 and they are supported at the sides by the irons I1 and I2. This method does not in any way interfere with the rear lamp L1 and number plate N1, as they fit conveniently inside, as the illustration shows. Besides the straps S1 it is as well to have a leather-covered chain with a padlock for prevention against theft. Some time ago curious thefts of tires fitted in this manner occurred in France, and the culprit was caught one day red-handed. He rode with an accomplice behind the car on a bicycle and cut the straps. A small jerk and the tire came loose, while the car sped on without its occupants being aware of what had happened.

The brackets to hold the tires should not be too small or weak, as the weight may snap them at some time or other and the constant friction due to chafing through not being steady will wear out the cases. The type of iron here illustrated is very handy, as the tires are locked to the running board by bar B1 and lock L1, Fig. 2.

Fig. 4 shows the same bracket with tires without covers over them. The straps are so tightly pulled that the tire is distorted, much to its detriment, due to the irons being set out too far for the size of tire. The chafing that the case ordinarily receives will be inflicted on the tire itself, if carried as in Fig. 3, and after several hundred miles of running under these conditions a perceptible rib will be cut in the tire, causing a weak spot.

Where detachable rims are used the irons should be stronger than for ordinary tires to withstand the extra weight. If they are placed at the rear of the car the exhaust outlet should be borne in mind, as heat will deteriorate rubber very quickly.

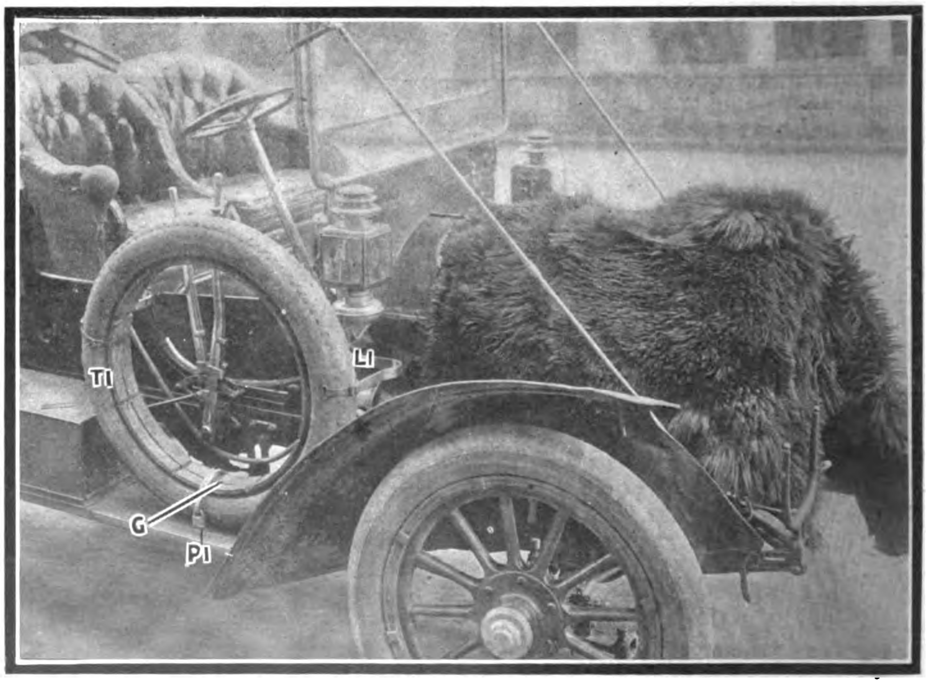

Fig. 3—The spare tire is allowed to go unprotected, while the motor has a fur overcoat. "Penny wise, pound foolish"

As soon as a spare tire has to be put into use the tire that it replaces should be sent to the repair shop, if it is worth repairing. It is no use carrying a damaged tire around, and it should always be replaced by a new one. Spare tubes should always be carried in a bag or box and if possible in a separate compartment from the tools. Before placing the tubes in the bag do not be satisfied with sprinkling some soapstone in the bag and trust to chance that it will find its way on the tube. Take a rag well covered with soapstone and wipe the tube all over with it.

When it becomes necessary to replace a tube it frequently happens that parts are missing or valve thread damaged—always pack away carefully.

Whenever the tire has to be taken off take the valve parts and put them back on the tube. In the case of spare tubes it is a good plan to tie a piece of canvas around the valve over the dust cap. An emergency spare tire can be made from stout rope wound around the rim either lengthwise or crosswise, and a combination of the two is even better. This temporary makeshift has been known to answer for several miles, and has the advantage that the rim is protected and the damaged tire saved from being torn to ribbons.

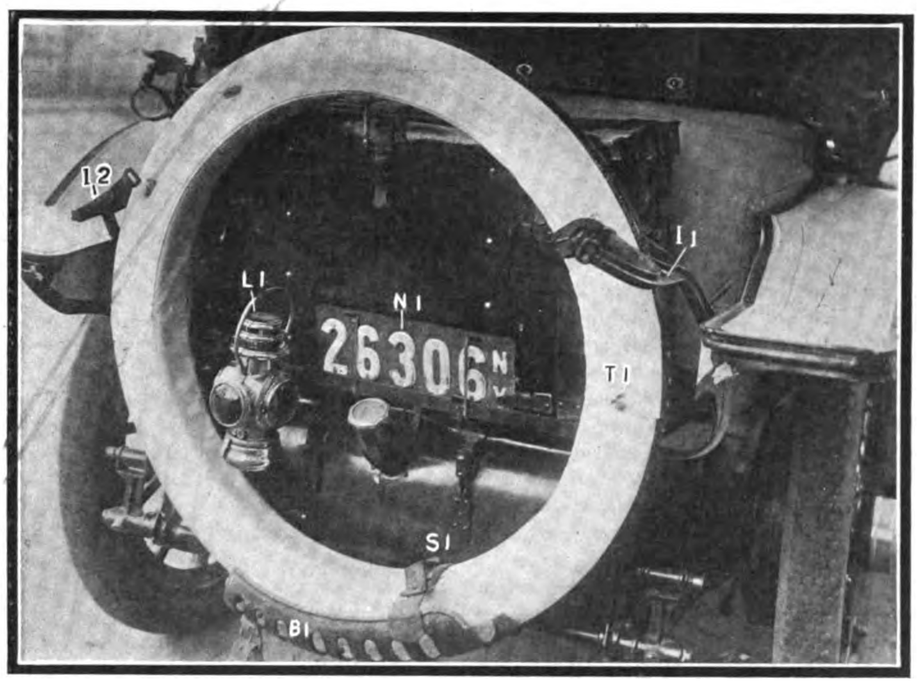

Fig. 5—A good way to carry tires out of the way of the levers. It may resemble a lifebuoy, but the utility is there

Speed-Changing Gears

Discussing Arithmetical and Geometrical Progressions in the Sliding Gear Systems

SLIDING GEARS do not always work well; sometimes the gears refuse, perhaps on second, or, in other cases, on third, but always to the great annoyance of the driver, and, if he is also to be classed as the owner of the car, his pocketbook is reminded of the cast of a new set of gears, for, as one might well suppose, it is not in the nature of things to go on clashing metal to metal and not have the parts give out as a result. In determining the proper increments of change of the gear-ratio as it is brought about through a sliding gear system, there seems to be very little data from which to establish a case. If the gear system affords four speeds and the final speed is to be so arranged that the automobile will go at, say, 60 miles per hour, the question is what should be the speed of the car considering the remaining speed changes, assuming that the motor is maintained at a constant speed?

Fixing the changes on a basis involving a geometrical progression would result in changes as follows:

8-16-32-64 (which is near enough for the purpose here).

This would make the difference between the third and the fourth speed very great, but the idea is not so bad, due to the fact that the greatest difference in speed would correspond with the best ability of the motor, and the flywheel effect of the wheels of the automobile would be maximum. A slight modification is as follows:

7½-15-30-60.

The assumption is that the reverse gear would give a lower speed than the low gear. The difference might be quite a little. It is comparatively seldom that an automobile is required to back up at high speed.

In comparison with the geometrical plan as above outlined there is the arithmetical ratio which might read as follows:

15-30-45-60.

This idea, while it sounds good, does not seem to accord with the main considerations, and, while there may be cases in which it might seem desirable to provide for the narrowing of the gap below that which obtains when a geometrical ratio is used, the fact remains that, when a motor is overloaded, it is generally on a patch of bad roadway, or when the motor is out of order, so that it is a very low gear that will be needed.

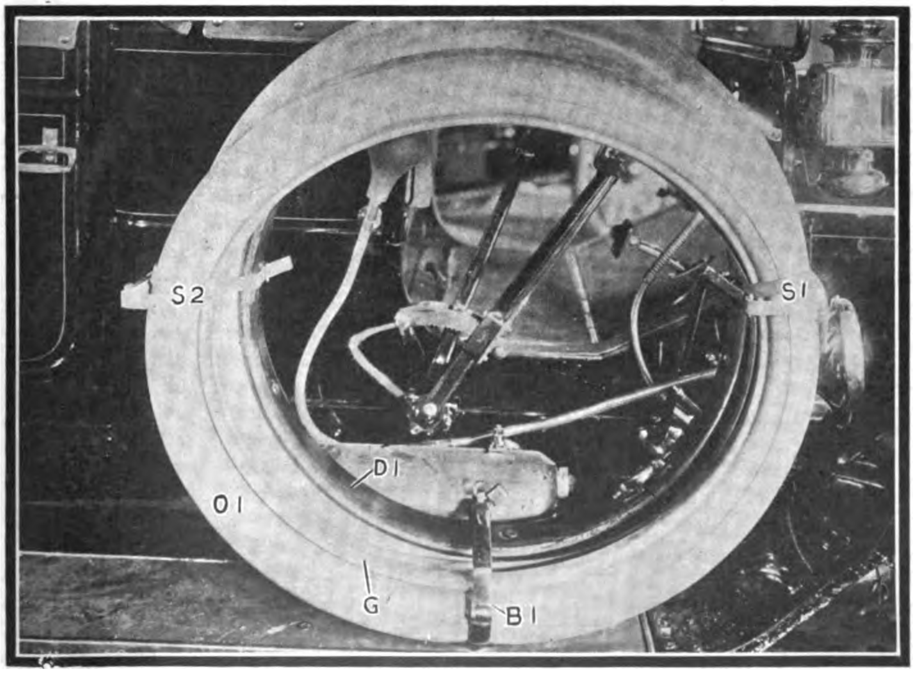

Fig. 4—Showing how tires should not be carried. Dirt and rain will soon rot them and cause rapid depreciation

Avoid Broken Wheels

CHARACTERISTICS AND TESTS OF HICKORY AS IT IS USED FOR SPOKES AND FELLOES FOR AUTOMOBILE WHEELS, SHOWING HOW TO AVOID DEFECTIVE WOOD

THE technical qualities of woods used in automobile wheel construction are of first importance. It is to its toughness, strength, and elasticity almost entirely that hickory owes its value for this purpose. It is therefore important to know to what extent it is actually superior to other woods and also which of the different species are most valuable, and under what silvic conditions the best timber may be produced. It is also important to know the range of strength and toughness of different kinds of hickory, so as to be able to distinguish good hickory from poor by its physical characteristics, and to know from what parts of the tree the best wood can be secured to furnish the raw material.

To answer these questions a series of tests was undertaken at the Forest Service laboratory at Purdue University. The material was various hickories secured from four different localities and included seven different species. Thirty-three trees were secured from Sardis, Miss.; 40 from near Napoleon, Ohio; 30 were obtained from Holly, Webster County, W. Va., and 39 in Chester County, Pa.

From each of these trees one flitch was cut through the center of the butt log from bark to bark. The flitches were 4 inches thick and from 7 to 12 feet long, depending on the length of the log.

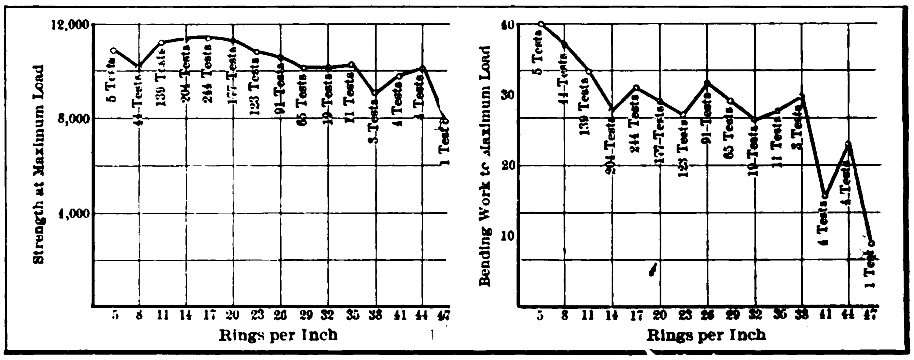

Fig. 3—Strength and work as affected by rate of growth, as shown by tests on green hickory

Upon arrival at the laboratory the flitches were cut into sticks 2½ by 2½ by 30 inches, and the specimens intended for green tests were immersed in water until the time of test to preserve them in the green condition. The temperature of the wood at the time of test was about the same for all specimens, so that the relative strength would not be affected by this cause. Shortly before the time of test the specimens were removed from the water, planed to 2 by 2 inches, and sawed to a uniform length of 28 inches for the bending test. After the bending test specimens were cut from the uninjured portion of the beam for other tests.

In cutting the individual test pieces from the flitches no attempt was made to select pieces which might yield the highest results. However, specimens were selected so as to avoid shakes and culls and to include the various kinds of growth found in any given flitch, and specimens that contained visible defects which would certainly lower the strength were not included in the tests.

The specimens were all accurately measured and weighed, the per cent. of sapwood measured, and the number of rings per inch counted. The non-porous part of the annual rings was measured and its proportion given in per cent. of the whole growth; the moisture content was determined in per cent. of oven-dry weight.

Static bending tests were the most important of the tests made.

Beams 2 inches square and 28 inches long were supported on knife edges 26 inches apart. Plates and rollers were used to avoid crushing the specimen and to do away with any friction at the end bearings. The load was applied at the center by a screw testing machine. The moving head of the machine descended at a uniform speed of 0.09 inch per minute. The amount of bending was noted for each 100 pounds increase in load up to the point where the stick began to give away, after which the loads were read for each 0.1 inch increase in deflection. The load bending curve was platted at the time of test, and the load and deflection were recorded at first visible failure and at maximum load.

The following points were determined: Specific gravity as tested and oven dry, weight per cubic foot as tested and oven dry, fiber stress at elastic limit, modulus of rupture, modulus of elasticity, horizontal shear at maximum load, work or resilience to elastic limit, work to maximum load, and total work.

Of these, the most important, in the consideration of a timber like hickory, are the strength at maximum load, as shown by the modulus of rupture, and work to maximum load.

Strength at maximum load is a measure of the ability of the timber to hold a load applied without shock.

Work to maximum load is a measure of the ability of the timber to withstand a shock or blow of any very suddenly applied load. It is a measure of toughness.

Other tests were also made in compression parallel to the grain, compression perpendicular to the grain, shear, abrasion, shrinkage, impact, and torsion.

Fig. 1, which includes all the commercial hickories, shows that the work or shock-resisting ability increases in proportion to the dry weight of the wood. The strength at maximum load also appears to increase almost in direct propor-

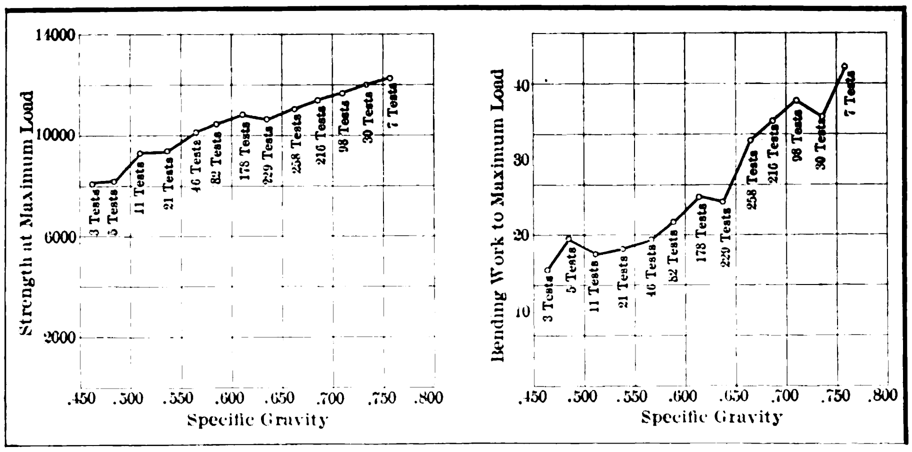

Fig. 1—Strength and work as affected by specific gravity, as shown by tests on green hickory

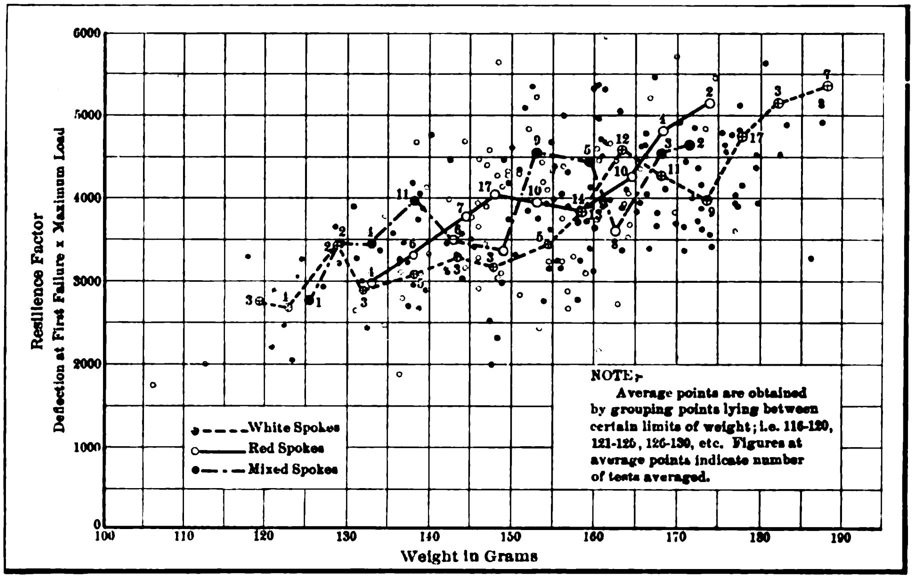
tion to the dry weight. The deduction from Fig. 1 is that hickory may be inspected upon a basis of weight, and the heavier the wood the better. Additional confirmation of this is found in Fig. 3, which shows that the strength and resilience of spokes increase with the weight of the spokes. This relation of weight to strength is true of various species, as is confirmed by many recent tests.



NOTE.—Average points are obtained by grouping points lying between certain limits of weight; i.e. 116-120, 121-125, 126-130, etc. Figures at average points indicate number of tests averaged.

Fig. 2—Spoke-test chart, showing relation between resilience factor and weight in clear spokes

Usually woods are selected on the basis of appearance, very largely on the rate of growth, as shown in the cross section. In hickory the wide-ringed wood, often called “second-growth” hickory, is preferred. Fig. 3, based on commercial hickory grown in good situations, shows that the work of shock-resisting ability is greatest with wide-ringed wood that has from 5 to 14 rings per inch; is fairly constant from 14 to 38 rings, and decreases rapidly from 38 to 47 rings per inch. The strength at maximum load is not so great with the most rapid-growing wood; it is at a maximum with from 14 to 20 rings per inch, and again becomes less as the wood becomes more closely ringed.

The natural deduction is that wood of first-class mechanical value shows from 5 to 20 rings per inch, and that slower growth yields poorer stock.

Experiments conducted by the Forest Service show that the user of hickory should not discriminate against heartwood in buying stock. It is true, however, that sapwood usually is more free from latent defects than heartwood.

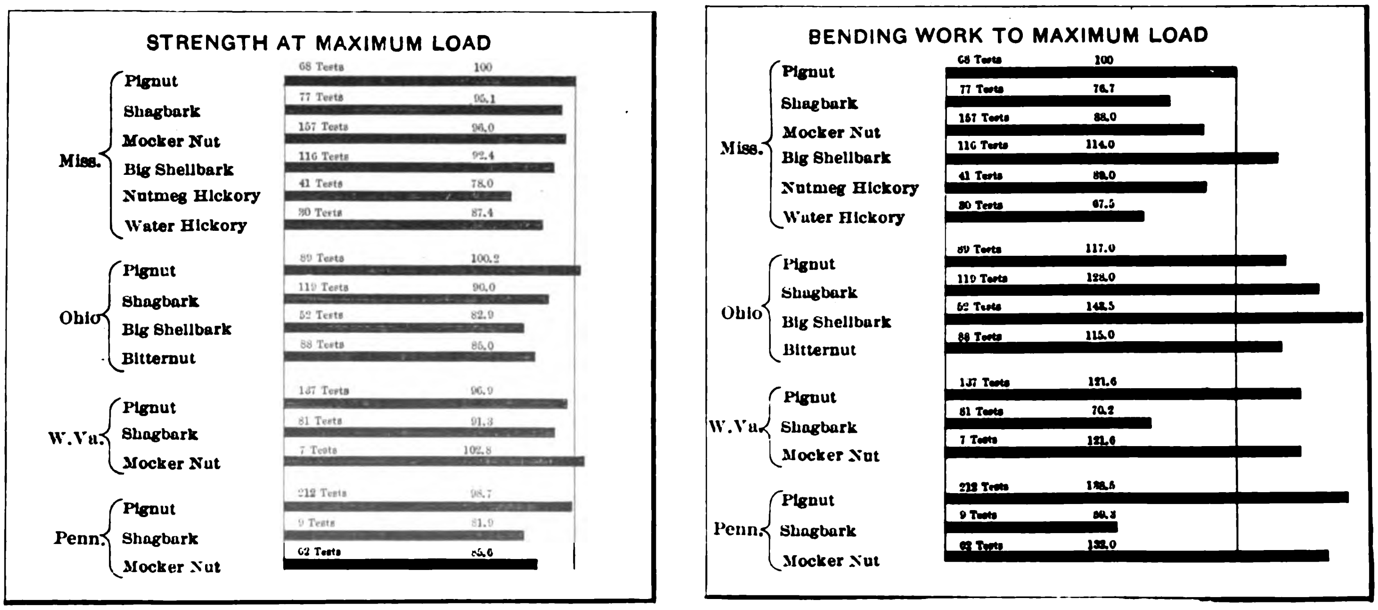
Trees about 150 years old have the maximum average strength, but the average work to maximum load is less with increasing age, and the youngest trees are toughest. Therefore, to obtain the best wood, the trees should not be allowed to become overmature.

One of the moot questions among hickory men is the relative value of northern and southern hickory. The impression prevails that southern hickory is more porous and brash than hickory from the north. Southern hickory is as tough and strong as northern hickory of the same age. But the southern hickories have a greater tendency to be shaky, and this results in much waste. In trees from southern river bottoms the loss through shakes and grub holes in many cases amounts to as much as 50 per cent.

It is clear that the difference in northern and southern hickory is not due to geographic location, but rather to the character of timber that is being cut. Nearly all of that from southern river bottoms and from the Cumberland Mountains is from large, old-growth trees; that from the north is from younger trees which are grown under more favorable conditions, and it is due simply to the greater age of the southern trees that hickory from that region is lighter and more brash than that from the north.

Figs. 4 and 5 show that pignut, which is generally considered best, is actually the strongest and toughest of the hickories, and is comparatively uniform for all regions. Shagbark is only slightly inferior to pignut; big shellbark is of only medium strength, but is inferior to no other species in toughness; mockernut is somewhat stronger than big shellbark, but lacks toughness. Strength and toughness, however, vary greatly within the same species, and the selection of the best hickory cannot be based on anything but a most rigid inspection and grading.

Iron streaks and birdpecks of small size do not appear to affect the strength or toughness of hickory. Hair checks are usually found in the heavier and better timber, and have but little effect upon the strength and toughness. Cross and spiral grain and dips in grain are all serious defects, and greatly reduce strength and toughness. The weakening effect of knots is due chiefly to the cross grain which they cause.



Figs. 4 and 5—Relative values of the various species of hickory, as compared on the basis of static bending tests

Killing the Motor

STRANGULATON DUE TO OVER-GRINDING OF THE VALVES IS OFTEN THE CAUSE OF A MOTOR DROPPING OFF IN POWER, AS THE GASES CANNOT ESCAPE FREELY

IN designing a gasoline motor to operate satisfactorily, besides the actual sizes of the parts employed and the chóice of suitable materials there remains an all-important factor, sometimes overlooked, and this is correct balancing and equalization of the working parts. As an example, supposing a piston or connecting rod of one of the cylinders of a four-cylinder motor was slightly heavier than the other three, it would be impossible to make such a motor run evenly till this fault were remedied. There is not much likelihood of such a thing happening in the latest method of construction, where nearly every part is stamped that can be so handled with advantage. The controlling of all machined parts before being handed out from the stores to the assembly shops checks inaccuracies down to 1000ths of an inch, and so prevents unequal parts. The lack of balance is set up by undue wear and other contributory causes. And the greatest of these is compression. A motor cannot be expected to perform well if the compression in the several cylinders varies more than 5 pounds per square inch either way from the mean pressure, which is usually determined by the manufacturers after exhaustive experiments with different pressures. After the car finds its way into the user's hands it depends largely on the care he takes of the valves apart from lubrication and carburetion as to the good running of his motor.

When valves are made from the proper material they do not require grinding every week, but the grinding should be done often and little rather than at long intervals, when it requires almost a machine cut to remove the pit from the valve head and seating. Fig. 1 represents the cross section of a valve chamber of a gasoline motor when the valve is new. It will be noticed that the level of the top of the mushroom is level with the top of the seating and that the seat is a perfect fit. A valve so designed, with the proper water jacketing as shown, should give good service if attended to regularly. The amount of lift required to allow the gases to escape freely without causing a back pressure on the motor depends largely on the design of the cams, and is a predetermined amount that is beyond the control of the user as far as adjustment is concerned. In the majority of cases it is safe to assume that this lift should be about 5-16ths inch, and with present-day practise, when silence plays such an important part in design, the lift of both exhaust and inlet valves is the same, although the angle of the cam varies according to the amount of time it has been found necessary to keep the valve open to perform its function. The main point to be borne in mind is that the valve must seat properly at all speeds, and this brings one to the point of clearance between the valve and the push rod directly actuated by the cam. One motor will work well with a clearance of 1-64th of an inch, or the thickness of a thin visiting card, but if this clearance was applied to a motor designed to allow a clearance of say 1-32d or even 3-64ths of an inch the valve would in all probability never seat and cause loss of power. There must be, so to speak, a dead point, or fractional amount of play in the roller which touches the cam, and to obtain this, if the setting is not known, it is better to experiment with the adjustment (taking for granted that the push rods have an adjustment, as every well-designed motor should have), starting from a small clearance and increasing this evenly till the best results are obtained. If the valves do not seat properly overheating will result, and this can be overcome in some motors by slightly increasing the clearance in the manner just referred to.

It is no use taking for granted that the manufacturer has set this correctly and leaving it at that. It is true that if properly set at the beginning it should not require touching for some time; but the wear on the different parts affected, viz., valve seat, valve head, valve spindle and push rod, roller parts and cam, after a time necessitates some resetting, and this is what the adjustment is for.

After the valve has been ground in for the first time a small amount of metal has been taken off the seat and valve consecutively, allowing the valve to drop a corresponding amount. Unless the adjustment of the clearance has been altered, how can the valve seat properly and hold the compression? It cannot, and the result will be that the valve will wear all the quicker, for instead of closing it only chatters on its seat and picks up every little bit of carbon deposit that passes through the motor until it becomes coated with it, and then only, and not before, does it seat. Granted that it does seat, what does the seat consist of? A mass of pitted matter that takes hours of labor to remove unless turned in the lathe. The seating receives a corresponding amount, with the result that the seating and valve become worn away in a similar manner to that shown in Fig. 2 after this pit has been removed.

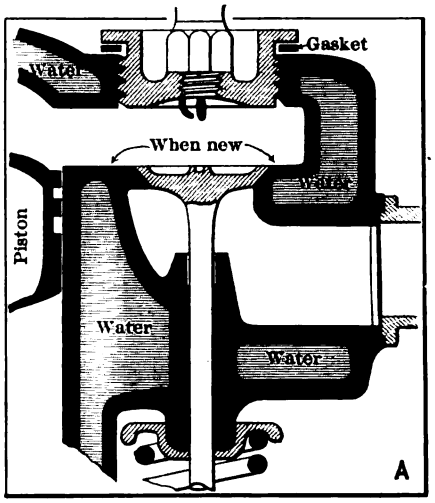


Fig. 1—Cross-section of a valve chamber, showing the valve on its seating when the motor is new

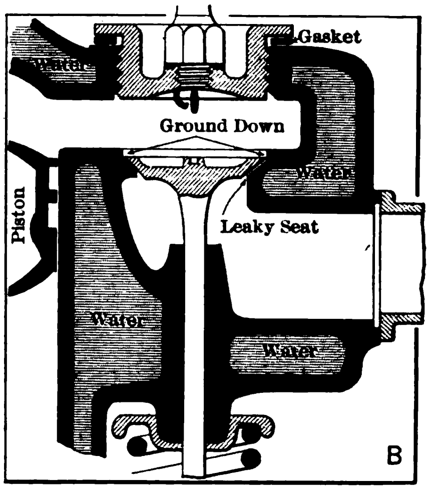

Fig. 2—Showing how the valve has sunk and the seat worn away, due to grinding, also a leaky valve, due to improper adjustment of the push rods

Fig. 3 clearly represents what happens then. The throat, or passage, instead of being free, is partly blocked, and the gases bunch when they are forced out by the piston, and unless the passage is free back pressure results, which acts in the same manner as if one were to put a brake on the motor. The points where the top of the seating originally was have by this time become sharp, as the result of much grinding, and will become red-hot and cause preignition. This shows that although all the carbon may be removed from the cylinders and pistons, yet a small particle of rough metal may become incandescent and thus upset the running of the motor. There is one way of overcoming this strangulation effect of the gases, and that is by chamfering the edges off in the manner indicated in Fig. 4. Care must be exercised in doing this, as if too much metal is removed and the wall of the water jacket is not over thick at the points A and B, in Fig. 4, a leak in the water circulation will be produced, and it will necessitate new cylinders, as it is inadvisable to attempt to repair a defective valve seating.

Anti-Oxidation

Treating Metallic Surfaces With Alcohol Vapor and Method of Producing Bright Surfaces

THE difficulty in the case of some alloys, e. g., those of aluminum, of preventing polished surfaces from being coated with oxide film, rendering them, in some instances, impervious to treatment such as soldering, is well known to the metallurgist in the laboratory and the mechanic in the shops. Particulars are published in a German scientific paper of a treatment devised by one C. Benedicks, of Upsala, who employs alcoholic vapor in a vessel immersed in a water bath. The vessel required for use (laboratory use is here referred to) is placed in the alcohol and heated until no more alcohol will condense in it. It is then removed and wetted. If the wetting is not uniform the treatment has to be repeated. When a fractured piece of steel is to be etched it should be held for a few seconds over boiling alcohol. This is generally to be recommended for metallographic analysis, because the slightest trace of grease would alter the color and appearance of the etched surface. Small articles to be galvanized are cleaned in the same way. When the grease has to be removed from the inner wall of a tube or pipette, the vapors are introduced at the top of the tube, and allowed to escape below. The treatment will not be unknown in some laboratories; but it is not generally practised, and a good deal of alcohol is wasted in the ordinary washing and rinsing. Another process recently patented in Germany has for its purpose the production of a bright surface electrolytically in baths of ordinary temperature. The end is attained by glucocides or similar substances, or nitrogenous glucocides or their derivatives. Instead of these substances, the extracts of plants or barks, as, for instance. althea, panama, or liquorice extract, may be used.—*Motor Trader* (England).

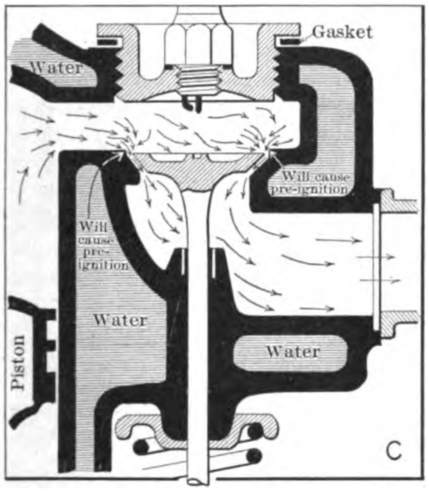

Fig. 3—Passage of the exhaust gases strangled owing to the dropping of the seat, leaving acute points to cause preignition

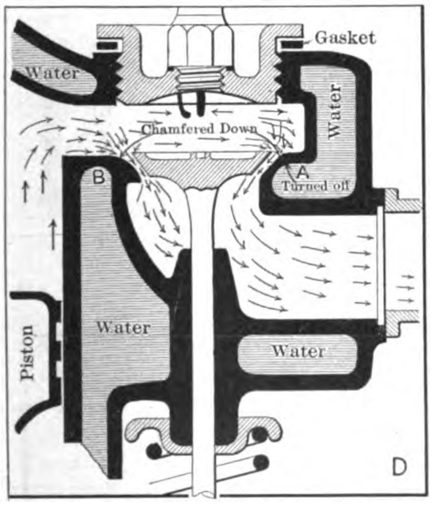

Fig. 4—Acute points chamfered off, allowing the gases free exit and doing away with the protuberances

Cover the Radiator

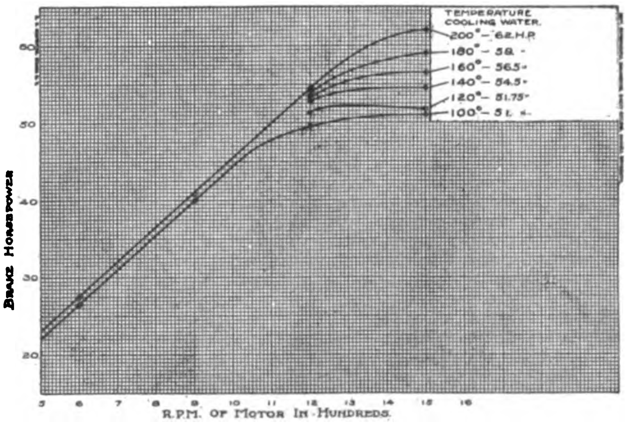
Automobile Engineer Says by so Doing the User Will Get the Benefit of More Power

MANY people imagine that a gas engine should be run as cool as possible. This belief is usually the result of some Summer experiences with a car that has had a radiator or fan inadequate to dissipate the heat of the jacketing water as fast as the engine has produced it. The cooling operation in a gas engine is very simple. At the time that the charge of gasoline and air is exploded the piston is just starting downward. But a moment before, it was on the upper dead center, and was entirely stopped. Starting from rest the piston is traveling quite slowly for the first part of its stroke. It is while the piston is moving slowly that the pressure and temperature are highest in the combustion chamber of the cylinder. The heat inside the cylinders probably reaches at least 2500° Fahrenheit. The water which is just outside of the cylinder walls is at a low temperature, comparatively speaking, for water boils at 212°. As the transfer of heat depends on the difference in temperatures there is a rush of heat through the cylinder walls and the water in the water jacket. The water takes up this heat and carries it to the radiator, where it is dissipated. If the water is heated by the cylinders faster than the radiator can throw this heat away then the car steams and the water boils away. If the radiator is of ample capacity to dissipate this heat in Summer it has too much heat-dissipating capacity for cold weather, the engine is surrounded by colder water than it should be, and more heat is lost by the charge of gas at the moment of explosion, and afterwards as the gas forces the piston downward.

The owner is, to a greater extent than necessary, buying gasoline at 20 cents a gallon and attempting to heat "all out of doors." But he is also losing engine power. The curves of horsepower shown were taken on the electric dynamometer in the engineering laboratory of the E. R. Thomas Motor Company. All of the readings were taken, of course, with same carbureter and engine.

The motor was a six-cylinder T-head type of 4 1-4 bore by 5 1-2 stroke. It will be noticed that with the water in the water jacket at 200° the horsepower developed at 1500 R. P. M. was 62, while with the water at only 100° at the same speed of 1500 R. P. M. the horsepower developed was only 51. In other words, by keeping the jacket water at 200°, instead of 100°, 21 per cent. more power was obtained.

The reason for covering a part of the radiator becomes obvious from an examination of this chart. In regard to how much of the radiator to cover, it is easy to put a "dairy" thermometer (which may be purchased for 25 cents) into the radiator filler, where the water is pumped in from the engine; or the radiator could be covered enough to allow steam to be formed, and the height or area of the shield could then be reduced until no steaming was noticed.



POWER-SPEED CURVES OF MOTOR SHOWING EFFECT OF TEMPERATURE OF JACKET WATER ON POWER

Letters From Subscribers

THIS DEPARTMENT IS DEVOTED TO THE ANSWERING OF LETTERS FROM SUBSCRIBERS ON ANY SUBJECT RELATED TO THE RUNNING OF AUTOMOBILES

Heating the Car in Winter

Editor The Automobile:

[2,460]—I was very interested in your reply to a letter in a recent issue dealing with the point of heating the automobile by allowing hot air from the motor to pass through a trap door under the rugs, but the problem I would like you to help me solve is what is a good way to heat the inside of the rear of a car. No doubt it is possible to extend the idea. I have a large touring limousine and should be very thankful if you can suggest anything. Mrs. F. C. B.

The method shown in Fig. 1, an English idea, is easily adapted to any make of car and can be turned on and off at will. It consists of two radiator plates for hot water being let in to the floor-boards of the car at the points required and the necessary piping and tank to encircle the exhaust pipe. A supply tank must be placed higher than the radiators to insure water reaching them.

Broken Gasoline Pipes Quickly Repaired.

Editor The Automobile:

[2,461]—In reading over your issue of The Automobile of November 17, we note on page 840, question 276: "How can a cracked or broken gasoline pipe be temporarily repaired?" We wish to advise that a way to make a quick and permanent repair is to use what is known as a compression coupling, of which we enclose a sketch (Fig. 2) showing the three sections, and the complete outfit of the pipe with coupling attached. This coupling makes it impossible for any leakage to occur after once applied. It is made up in elbows and T-shape; it is quicker than the course you advise.

You also suggest pulling a piece of rubber tube over the pipe or wrapping a piece of sheet rubber around it and binding with tape and string or put soft bar soap on the leak. We do not think that this is very good, as little particles may get in the gasoline and cause more trouble than the leak itself.

Philadelphia. F. R. Ash, Jr.

We appreciate your letter and the information contained therein. In giving the reply to the question referred to we would like to point out that such parts were recommended as could be reasonably expected to be found on any car. Some cars go out without a spanner of any sort and there is the type that takes a pair of pliers and a hunk of copper wire and are willing to meet all emergencies. The part you mention is no doubt a very useful accessory.

Heating the Intake Pipe

Editor The Automobile:

[2,462]—I have a car the carbureter of which is fitted very low down, and in the present cold weather in spite of hot air and hot rags the pipe persists in covering with frost. Using heated rags is all right for starting, but it is too much of a job to hold them there for five to ten minutes. Could you suggest anything to overcome this? Annoyed.

Bethlehem, Pa.

Presuming that it is not possible to shorten the intake manifold so as to set the carbureter nearer to the motor, the following method could with advantage be employed. It should have two effects:

1. Prevent freezing on the outside of the pipe.
2. Heating the ingoing gases and cause better evaporation.

Fig. 3 shows the intake manifold around which a copper pipe connected with the water circulation from the cylinders has been wound.

To facilitate dismantling the carbureter and manifold a rubber connection has been placed near the bottom and the continuation of the pipe can be carried to the lower part of the radiator. It may be found that two taps are necessary and these could easily be inserted where most convenient to get at.

There is a drawback in altering the length of the induction pipe on any car, as it may have been so designed by the makers of the motor for reasons of their own and after experiments with different lengths of piping.

Once Bit, Twice Shy

Editor The Automobile:

[2,463]—Having been recently fined for allowing my car to emit smoke, and wishing to avoid a recurrence, I write to ask

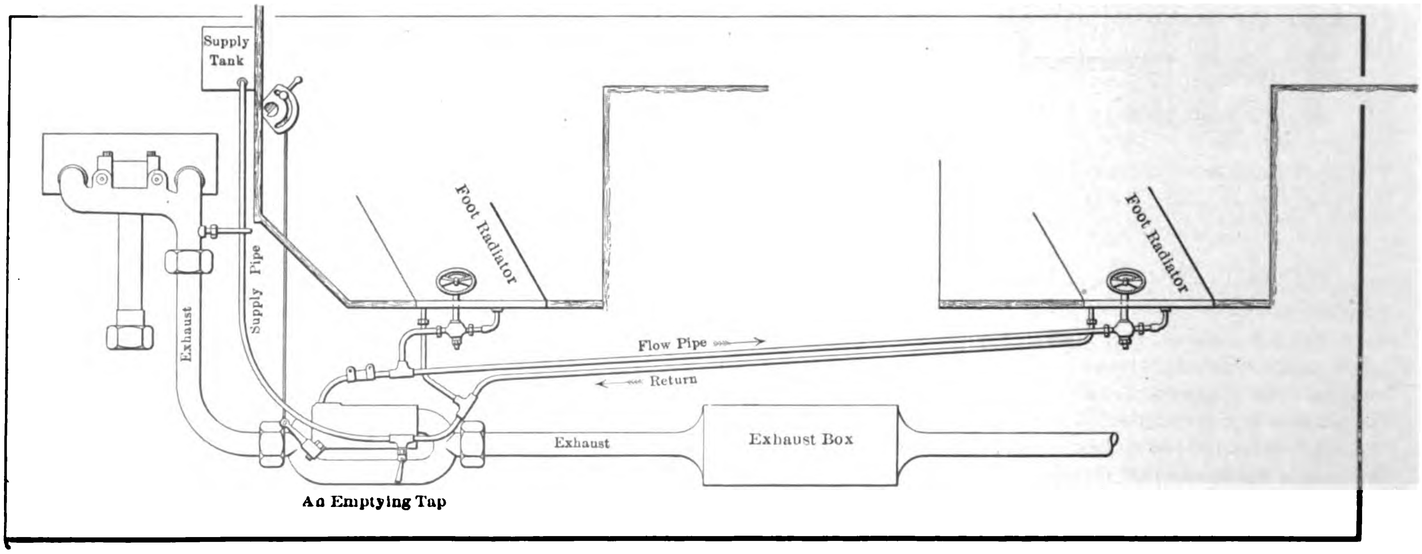


Fig. 1—Method of heating a car in winter by using small water radiators, heating the water by a casing around the exhaust pipe

you how I can fit some means of draining superfluous oil quickly out of the base chamber. I do not allow the smoke to appear wilfully, but as my car is fitted with splash lubrication only I would not like to have my bearings seize up, hence my over-anxiety in sometimes using a little too much oil.

Yonkers, N. Y. X. Y. Z.

We quite appreciate your feelings and it would be difficult to find anyone who deliberately lets his car smoke; but there is no doubt that a good deal of the trouble is due to want of care on the part of the drivers of cars, even though they have means of draining some of the oil off. Again there are some cars that always have a film of smoke exuding from the exhaust pipe, but hardly enough to be noticeable. Fig. 4 shows the lower half of the aluminum base chamber fitted with two standpipes, to the bottom of which are fitted taps.

First ascertain the proper level and cut the pipes inside the motor so that the oil will drain down to the level if there is too much when the taps are opened. It may happen that the existing plug holes may be used, but if, as in this case, they are just below the part where the connecting rods strike the oil new holes will have to be drilled midway between the two rods.

Impossible to Say Without Making a Test

Editor The Automobile:

[2,464]—Will you please inform me what horsepower would be developed in a six-cylinder gas engine having 4 3-32-inch bore and a 5-inch stroke? Also a six-cylinder engine having 4 1-4-inch bore and 5 1-4-inch stroke? Kindly state, also, in the columns of your magazine what is meant by the term "horsepower."

John Kiev.

St. Louis, Mo.

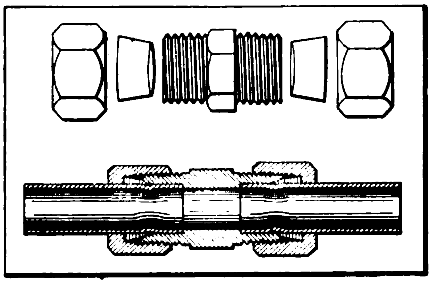

Fig. 2—Handy coupling to carry on the car in the event of a broken feed pipe

No man living can tell what a motor will do in the matter of the delivery of power without running a proper test for the purpose of finding out. All formulæ utilized in the determination of power are recognized by engineers as being empirical and comparative.

The horsepower, so called, is represented when a weight equal to 33,000 pounds is lifted vertically to a height of 1 foot in one minute.

Perhaps Some Reader Can Supply Information

Editor The Automobile:

[2,465]—Being a subscriber to The Automobile and greatly interested in aviation, I would thank you to give me the name of some aeroplane factory in the United States where I may send an application to become an aviator.

Chicago, Ill. B. R.

Oxygen May Be Had for Nothing in the Air

Editor The Automobile:

[2,466]—Under "Letters Interesting Answered and Discussed" I would like to have the following questions answered:

1. Would oxygen costing three cents per cubic foot be too expensive to use in an automobile engine with a 4-inch bore and a 4-inch stroke?

2. What proportion in volume of the mixture of the air and gasoline vapor would the pure oxygen have to compose to be called a strong mixture? How many times would a cylinder containing 100 cubic feet of free oxygen gas compressed to 1800 pounds fill a cylinder 4 x 4 inches to its maximum compression pressure (which is 60 pounds) mixed with the air in what you would call strong proportions? How long would a cylinder of oxygen of this size last?

Paul E. Pritchard.

Great Bend, Kan.

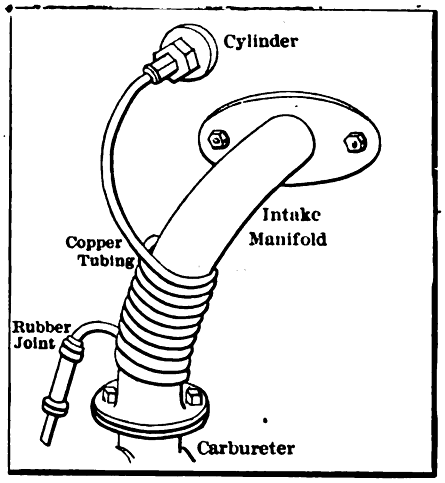

Fig. 3—Method of heating the intake manifold

1. There are two reasons why oxygen at 3 cents per cubic foot will scarcely prove attractive, although the price given is very low. To begin with, oxygen may be had from the surroundings by anyone at no cost, but the fact remains that using pure oxygen in combination with hydrocarbon fuel will produce a detonating explosive mixture which would only be fit for use in a well-built gun.

2. If you will read Cantor lectures, recently published in The Automobile, you will obtain an excellent understanding of what gasoline is for and how it works.

Tried Hard To Ruin the Radiator

Editor The Automobile:

[2,467]—I want to ask a little information from you and trust you can help me out in the matter.

I am driving a 1910 special seven-passenger car. A few days ago I stuck a small wire through the radiator and punctured it, making a leak. I tried to stop this leak by pouring a double handful of meal in the radiator. This, however, did not stop the leak at all. I then took the radiator off and had it soldered up, making a good job of it. Now I notice the radiator does not stay as cool as it did before; it gets hotter but does not boil the water at all. When it gets hot this way I can smell the meal cooking. I have an idea that this meal has caked up in the radiator and does not allow the air to get in as it did before, and this makes it get hotter. Now, what I want to know is how to get this meal out. I have washed it out several times for several hours at the time by running water through the system with the motor running, but as yet I have not succeeded in getting it out. Please advise me if there is any way. I would appreciate this information very much. W. F. Miller.

Fort Valley, Ga.

The probabilities are that the meal formed in a cake and is responsible for your present trouble. It stands to reason that it would cake up and the probabilities are that the best way to get rid of the formation will be to send steam under considerable pressure through the radiator. If the same trouble should occur again it would be as well to make a temporary repair by cutting two pieces of rubber about two inches square and two pieces of metal the same size, drill a hole through the center of all four and clamp over the leak with a small bolt.

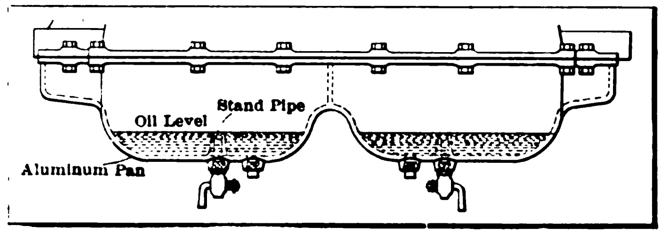

Fig. 4—Showing how standpipes can be fitted to motors to drain off superfluous oil

In the Building of Balloons

PROFESSOR WILLIAM B. ENNIS PRESENTS TECHNICAL INFORMATION UPON AERIAL SUBJECTS FOR THE PURPOSE OF CLEARING UP SOME OF THE PROBLEMS THAT DEFY SOLUTION BY A CUT-AND-DRY METHOD—SECOND INSTALLMENT

Fifth Method: Ballast.—The common plan of former practice—and one which is still a feature of all present methods of control—incolves the use of temporary detachable loads, or ballast. Suppose, in our previous illustration, the 1,900 pounds of load to consist of 1,000 pounds of bag, car and occupants, and 900 pounds of sand bags. By throwing away 5 pounds of gas we have descended 80 feet. Should we now desire to ascend we may drop some of the ballast; the balloon will then have more lifting power than load and will rise to a new equilibrium level. The loss of more gas will again enable it to descend and the discarding of more sand bags will subsequently elevate it, and so on, but not *ad infinitum,* for a sword of Damocles is over our heads, and every necessary or accidental change of level brings us nearer the moment of exhaustion both of ballast and gas.

Sixth Method: Supplementary Gas Supply.—Suppose, instead of ballast, we carry tanks of gas at high pressure to be later expanded into the gas bag so as to make up for gas vented or leakage. Will the additional gas thus obtained be of any considerable consequence in comparison with the ballast load involved? A drum of 60 pounds weight may easily hold ¼ cubic foot of hydrogen at 2,000 pounds pressure. At 60° F. the gas in the drum gives (Equation A)

$$D_H = 2{,}000 \div (5.347 \times 520) = 0.721 \text{ pound,}$$

and the weight of hydrogen in the drum is $\frac{1}{4} \times 0.721 = 0.541$ pound, capable, when expanded into the bag, of sustaining, say,

$$1{,}900 \times \frac{0.541}{162} = 6.36 \text{ pounds*;}$$

not much over 1/10 the weight of the drum which contains it. Pressure tanks containing gas might then be a little better than ordinary ballast, but not sufficiently so to offset the danger of explosion added to dangers necessarily involved in carrying an inflammable gas like hydrogen in an elastic, fragile and severely stressed envelope. The plan might be satisfactory if we had a metal as strong as steel that weighed only 1/10 as much as steel. *The carrying of ballast*—a necessary measure of safety under present conditions—immensely increases the necessary size and cost of the balloon, and is *entirely insufficient in most cases to provide the desirable degree of altitude regulation.*

Seventh Method: Vertical Propulsion.—The plan proposed of using propellers on a vertical shaft to provide for vertical movement or equilibration at pleasure belongs rather to the kinetics of the subject. It may be noted here, however, that the net vertical force is a substitute for twice the corresponding weight of ballast, since it may be used for either ascent or descent.

Eighth: Air Ballast.—Consider now the Vaniman arrangement, involving the use of a series of compartments in the bag, containing *air,* at a pressure kept close to that of the external atmosphere (Fig. 6). Under the previous conditions, suppose a single compartment of 10,000 cubic feet capacity to have been added to the original balloon, making the total sea level displacement 36,820 cubic feet. For simplicity assume the pressure of this air to be that of the external atmosphere at 1,000 feet elevation, where it has been found that $D_A = 0.0798$. The weight of air in its compartment is then $10{,}000 \times 0.0798 = 798$ pounds. At any higher elevation this air of course detracts from the buoyant power of the balloon, but this effect may be avoided by opening the escape valve for a moment.

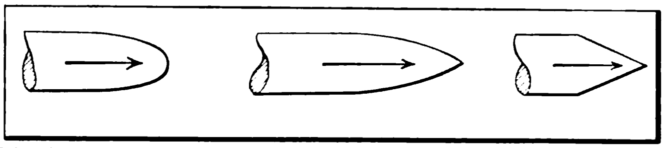

Fig. 8—Illustrating the idea that a rigorous formula does not hold

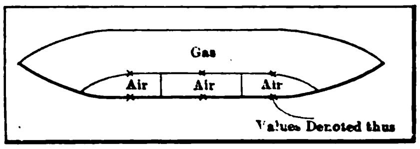

Fig. 6—Vaniman arrangement of air-ballasting of gas-bags

Now while at 2,200 feet elevation suppose we vent *into the air bag from the main hydrogen bag* 5 pounds of the latter gas. Disregarding elasticity of the air bag, the density of the mixture therein is now $(798 + 5) \div 10{,}000 = 0.0803$ pound, and its pressure† is made up of the partial pressure of the hydrogen, $5.347 \times 530 \times \frac{5}{10{,}000} = 1.417$ pounds (Equation B), plus that of the air, 14.2 pounds, making a total pressure of $14.2 + 1.417 = 15.617$ pounds. The whole balloon (gas bag plus air bag) now displaces $26{,}740 + 10{,}000 = 36{,}740$ cubic feet, and its contents weigh

$$(26{,}740 \times D_H = 26{,}740 \times 0.00589 = 157) + 803 = 960 \text{ pounds.}$$

If it is to be in equilibrium at a load of 1,900 pounds, the weight of the displaced volume of air must be $1{,}900 + 960 = 2{,}860$ pounds, and its density

$$2{,}860 \div 36{,}740 = 0.0778 \text{ pound.}$$

Its pressure is then (Equation B) $0.3706 \times 0.0778 \times 480 = 13.8$ pounds, so that the altitude of equilibrium is $2{,}000\ (14.7 - 13.8) = 1{,}800$ feet. We have descended 400 feet. *Have we lost 5 pounds of our gas?* Not quite, yet. When we again wish to ascend *let the air bag vent be opened,* the pressure falling to that of the external atmosphere, 13.8 pounds. If the vented gas has the same composition as the whole mixture, and the temperature does not change, the density of the mixture will vary directly as its pressure, becoming

$$\frac{13.8}{15.617} \times 0.0803 = 0.076,$$

and its weight will become 760 pounds. We shall now have lost

$$\frac{803 - 760}{803} \times 5 = 0.2684 \text{ pound}$$

of hydrogen, irrecoverably: we now have, however, a total weight of $157 + 760 = 917$ pounds of gas and air, requiring that the density of the air at equilibrium level be

$$\frac{1{,}900 + 917}{36{,}740} = 0.0766 \text{ pound,}$$

the pressure $0.3706 \times 0.0766 \times 480 = 13.62$ pounds, and the altitude $2{,}000\ (14.7 - 13.62) = 2{,}160$ feet. The net effect of the whole proceeding—first venting the gas into the air bag and afterward venting the air bag—is a descent of 40 feet, at a loss of 0.2684 pound of hydrogen. But this loss has given us an

---

*Hydrogen weighing 162 pounds sustains a load of 1,900 pounds.

†A mixture of relatively inert gases exerts a pressure equal to the sum of the pressures which would be exerted by each of the gases if each in turn occupied the whole of the containing space alone.

altitude control between 1,800 and 2,200 feet. As with ordinary gas-venting, we must eventually succumb; but the time of succumbing has been far postponed. *Without the air bag we lost 18½ times as much hydrogen in descending only twice as far.* Besides, steering and control horizontally may be facilitated by providing a number of air compartments, with a circulating pump.

Aerial Kinetics

Resistances to Locomotion.—In a locomotive or an automobile the resistances to propulsion include journal friction, grades, curves, acceleration, etc., of which *air resistance* ("head end" resistance) is the only one to be considered in connection with a balloon. In Fig. 7, let a flat surface S-S be subjected to a perpendicular wind velocity of v feet per second: or, *what is precisely equivalent, let such a surface itself move, in still air,* at this velocity. Then if p represents pressure per square foot due to either of these movements (or both together), and D the density of the air, we have the fundamental dynamic formula,

$$v^2 = 64.4\ \frac{p}{D}.$$

Let V be the relative velocity between flat surface and air[*] (under conditions referred to in the footnote) in miles per hour. Then $v = \frac{5{,}280}{3{,}600} V$, $v^2 = 2.15\ V^2$, and

$$p = \frac{Dv^2}{64.4} = 0.0334\ DV^2.$$

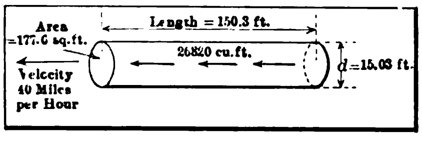

Fig. 9—Dealing with shape, power and resistance problems

At sea level and 32° F., $D = 0.0809$ and $p = 0.0334 \times 0.0809\ V^2 = 0.00269\ V^2$. At 2,000 feet elevation and 20° F. the pressure (static) of the air, in pounds per square inch, is 13.7, $D = 13.7 \div (0.3706 \times 480) = 0.0826$, and

$$p = 0.0334 \times 0.0826\ V^2 = 0.00275\ V^2.$$

Since atmospheric density decreases with both elevation and temperature the pressure on a plane surface due to a given velocity also decreases. It should be noted also that this pressure varies *as the square of the velocity.*

Experiments show that the rigorous formula given does not precisely hold in any case, and that if a moving body has a rounded, pointed, parabolic or ogival end (Fig. 8) the resistance due to velocity, per square foot of "head end" area, may be as low as $0.0020\ V^2$ at sea level and 60° F. At extremely high velocities, also, the resistance appears to vary as a higher power of the velocity, intermediate between the square and the cube. It will be safe and simple to use for our purpose the expression $p = 0.0025\ V^2$.

Shape, Power and Resistance.—Assume our balloon to be a perfectly plain horizontal cylinder (Fig. 9) with flat ends. Let a be the ratio of its length to its diameter. Its volume is then (d being the diameter in feet)

$$0.7854\ ad^3 = 26{,}820 \text{ cubic feet,}$$

whence $d = 32.5 \div \sqrt[3]{a}$.

Its head end area is $0.7854\ d^2 = 0.7854\ (1{,}056 \div a^{\frac{2}{3}}) = 1344 \div 0.7854\ a^{\frac{2}{3}} = 1715 \div a^{\frac{2}{3}}$ square feet. Call this b. Let its velocity relative to the air be V miles per hour. The total resistance due to velocity is then $0.0025\ bV^2$. This resistance is continuously exerted while the balloon moves $\frac{5{,}280\ V}{60} = 88\ V$ feet per minute, and the horsepower necessary to overcome the resistance at this speed is

$$\frac{\text{force} \times \text{distance}}{33{,}000} = \frac{0.0025\ bV^2 \times 88V}{33{,}000} = 0.000006667\ bV^3$$

(Equation C)

or, $$\frac{bV^3}{150{,}000} = \text{(say) H.}$$

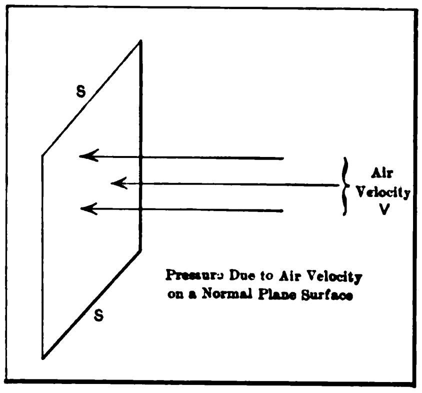

Fig. 7—Diagram used to make a point in pressure characteristics

This is *independent of the bulk or weight of the balloon.* A perfectly similar formula, though with a different constant in the denominator, would apply to a hypothetical *cubical* balloon, in which *the power would vary as the square of the linear dimension* while the *bulk and carrying capacity varied as its cube.* Large balloons are therefore highly advantageous from a power standpoint. Also, a *long* balloon is to be preferred rather than a *short* one; but this may involve difficulties in longitudinal stiffening as well as necessitating great steering power. Fig. 10 shows in part the complicated system of bracing necessary in a well known balloon having a length of about 12 times the diameter. This bracing constituted a large part of the load lifted. Adequate steering power is absolutely essential; for if the balloon turns its side to the wind the pressure due to velocity is increased in the ratio of

$$\frac{\text{side area}}{\text{end area}} = \frac{ad^2}{0.7854\ d^2} = a \div 0.7854,$$

which becomes unity only when the length is less than the diameter.

Importance of Head End Resistance.—In a locomotive, the head end resistance is rarely half the total resistance, and the highest wind velocities experienced could scarcely reduce the speed of a train 25 per cent. But in the balloon the head end resistance is the whole resistance. If power is provided adequate to move the balloon at a speed of 30 miles per hour in still air, a head wind of 30 miles per hour will stop the car; a 60-mile wind will drive it backward at 30 miles per hour. If the steering gear fails to hold the head up to the wind the area exposed to wind velocity may become ad^2, and the total wind pressure $0.0025\ ad^2V_A{}^2$, whereas the total pressure which the engine is designed to overcome at a speed V_B is only $0.0025bV^2 = 4.283V^2 \div a^{\frac{2}{3}}$. Even if the propeller were so arranged as to act in a line at right angles with the cylindrical axis of the balloon, since wind resistance varies as the area exposed and as the square of the velocity, the engine running at the rotative speed already fixed, we should have a retrograde velocity of

$$V' = \sqrt{\frac{0.0025\ ad^2V_A{}^2 - 0.0025\ bV_o{}^2}{0.0025\ ad^2}}$$

in which Vo is the relative velocity for which the engine is designed and V_A is the velocity of the wind against the side of the balloon with the steering gear inoperative. If, as is in practice the case, the engine cannot work in this position, $V_o = 0$ and the retrograde velocity of the car will equal V_A; it will drift at the speed of the wind. We must have ample steering power.

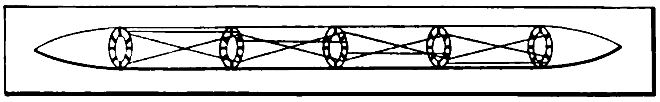

Fig. 10—Presenting a cigar-shaped car as an illustration

---

[*] If the surface is moving in the same direction as the air, v or V represents the difference of the two velocities; if the movements are in opposite directions, then v or V must be taken as their sum.

Don'ts for the Autoist

GENERAL INJUNCTIONS TO THE WISE—AND THE OTHERWISE—NOT ALONE AMONG THE AUTOMOBILE FOLK, BUT IN OTHER WALKS OF LIFE AS WELL

Don't forget that the urchin, as soon as he can totter out of doors, pulls off his chapeau to the passing mob.

Don't extol the virtues of your idle thoughts, nor forget that letters patent are not issued for mere ideas; they are invariably certificates of real activity.

Don't be led astray by catch-words; if they create a favorable impression about an equipment that is not favorable, they are canny falsehoods.

Don't suppose that articulated nothings will swell the author of them into a Plato.

Don't rub elbows with every animated stick in a commonwealth of blunderers; incorporate a fertilizer company and use the material available for its true purpose.

Don't sweep the vision over a wide and luminous circle of acquaintances and say, "I wish I were as big as that." You might be looking at a potato.

Don't turn sculpturer if you propose to add to the census of pigmy thoughts.

Don't hold yourself to your promise if you discover that the idea is a poor one.

Don't indulge in unkind words; they kindle hate.

Don't wrap your ideas in a rag and totter off like old age.

Don't express your thoughts in cipher; the audience may not care to take the time to unravel the mystery.

Don't yield to a suggestion unless it is one that chimes in with the music of your sense of right.

Don't hesitate on the brink of a sound decision; the moment is more terrible than you think.

Don't circle around on gloomy wing; the monotony of the process will kill activity.

Don't manufacture the delusion to which the soul would afterward abandon itself.

Don't forget that ignorance recoils at intelligence.

Don't sink into a delirium of blind, unreasoning superstition; poke a stick into the suspected cavity and see what it contains.

Don't invoke the ghost of a dead and buried thought, nor ramble over the wild and unexplored future.

Don't stray into darkness more dense than that of night; men who make it for you would appropriate your welfare to their own use.

Don't be a partner in a sad piece of business; if you can't hook up to a good job, go home and wait until the world rolls around to a new spot—earth is twirling at the rate of 17 miles per second; you will have but a short wait.

Don't forget that a thousand misfortunes are amply paid for by a single success.

Don't give away your most poverty-stricken thoughts; it will leave you no incentive to replace them and a void will grow up in the mind.

Don't slay your adversary; you would then be without a friend to practice upon.

Don't link arms with vulgarity, nor form a trust of all the virtues.

Don't try to be as diminutive as was Cæsar—he thought himself so inconsequential that there was nothing for him beyond the grave.

Don't be late in the morning; business might get beyond you, and you would then have to run to catch up.

Don't play the part of a ruined man staggering for lack of wisdom.

Don't be a weed in a garden just because it affords you an opportunity to associate with cabbages.

Don't father a despotism on the ground that the means is justified by the end.

Don't imagine that the gold you obtain by transmuting stolen lead is yours because you are the transmuter.

Don't make rules to follow and then become the most persistent delinquent.

Don't become ambitious if you have a petty aim.

The German Trade

Staff Man, Now in the Kaiser's Kingdom, Sends Some Pertinent Pointers as to Automobile Conditions There

COMPARATIVELY few private automobiles are seen at the German capital at this time. Most people who are progressive enough to take to the motor car make use of taxicabs, whose number is "legion" there.

German buyers of automobiles are without exception members of the most well-to-do class of business men residing in the principal German towns. German farmers, or rather peasants, absolutely decline to see the advantages of the automobile, partly owing to their not being so prosperous as American farmers and partly on account of their being skeptical concerning all new inventions which they do not fully understand. Nevertheless, self-propelled agricultural implements are coming there.

Roughly speaking, there are about thirty automobile factories in Germany. Germans cannot understand how hundreds of automobile makers in America can live and prosper, nor do they see how an annual output of 200,000 cars may be sold. A superficial inspection of Berlin automobiles seems to indicate that chauffeurs take much better care of their cars than do their American brothers. The German chauffeur, who has been taught in the army to love his horse, gives his machine a great deal of loving care. Bearings and all parts that are doing work are conscientiously lubricated just as often as they need it; and tires seem to be well inflated most of the time.

If American automobiles are only slowly entering into the German Empire the reason lies in the fact that Germans are always conscious of the fact that the Atlantic is wide and the American maker is far away. The German buying an American car finds it is almost an impossibility to replace a broken or lost part of his auto, and it is his everlasting consideration for this point which keeps many of them from buying American machines.

Another handicap to a more general introduction of American makes into Germany lies in the fact that the American price of, say, $3,000—which is probably the minimum price at which the quality satisfying German buyers may be produced—means 12,000 marks in Germany, to which must be added the cost of transportation across the "pond."

German automobile consumption is not large enough to justify standardization of tools, which state of things applies to the whole continent. A large lumber firm ordered ten big trucks from the factory recently, making the condition that the makers guarantee their product to satisfy certain requirements which were outlined. The firm, which apparently has had little experience in this line so far, would not undertake to guarantee its products, and the order will now go to one of the great German firms which is fortunate enough to own a modern plant permitting of economic and standardized production of trucks.

It Stands to Reason

SHORT PARAGRAPHS DEALING WITH MATTERS WHICH SHOULD APPEAL TO THE REASON, TO SERVE AS REMINDERS OF DUTIES TO BE PERFORMED

That a proper warning signal is as much of a necessity as a wheel or a tire; it is neither safe nor comfortable to ride in an automobile that is equipped with a mute signaling equipment.

That it is no longer considered fashionable to build automobiles that are not fitted with magnetos for ignition purposes; the results are so much better that even a novice would hanker after a magneto.

That in addition to a magneto it is usual to employ an auxiliary ignition system of some kind; if a battery is used, get a good make.

That a suitable battery may be had of the "dry-cell" type; the name of the maker and the date of shipment should be stamped upon the case.

That the storage battery should be properly sealed so that the acid will not slop out and spoil the part of the automobile that it contacts with.

That the battery should be protected from the cold of Winter and the silt of the road.

That it is useless to try to make an automobile give good satisfaction if the wiring from the battery is kicking around under the feet of every person who comes around.

That it is necessary to make good electrical connections; the high resistance of a single bad joint is enough to put the ignition system out of whack.

That it might cost $100 to find out what is the matter with an automobile only to learn that there is a bad joint in the wiring system.

That the garage repairman is entitled to pay for looking for trouble just as much as he is for fixing it after it is found.

That an automobilist who looks three days for trouble should not expect a repairman to locate it in a minute.

That the automobilist who is unreasonable with the repairman is bound to be disappointed; the man will do his best to satisfy the owner on this score.

That the actual trouble is deeper seated; examine the automobile before making the purchase and note if it is likely to disappoint; select the kind that is friendly.

That the best guide to the purchase of an automobile is common sense; take along a good supply; use it.

That price is not the measuring instrument to use in making a selection; appropriateness must be recognized; imagine a sailor going to sea in a skiff.

That what your neighbor has may be wrong for you; it might even be wrong for him; will he tell you of his trouble?

That your wife would like to have a thundering big tonneau to set off her 24-inch-in-diameter head-gear; the tonneau, like the hat, costs much and depreciates rapidly.

That a big tonneau belongs on a full-sized chassis; be sure and purchase the foundation for the house.

That there is a place for everything, even the big tonneau; if you have the place fill it.

That the awkwardness of the situation generally appears after the check is drawn and cashed; it is then too late.

That the salesman's guarantee is never better than the written guarantee of the maker; look in the back of the maker's catalogue.

That it would be unreasonable to expect any maker to allow his salesman to append promiscuous guarantees; there is no telling how far some of them would tote the joke.

That a good automobile is made in a plant rather than in a guarantee.

That it is foolish to go around trying to purchase a law-suit if all that is wanted is a good automobile.

That there are now so many good automobiles to be had that it would be as one chance in a hundred were one to get a bad car.

That nearly every failure or disappointment from the purchaser's point of view is due to bad judgment in making the selection—few makers have time to misrepresent.

That the man who is so unskilled as not to know what he wants would be better off taking same maker's word for it than he would taking free advice from a piker.

That the longer it takes to accumulate the purchase price, the more cautious the purchaser should be.

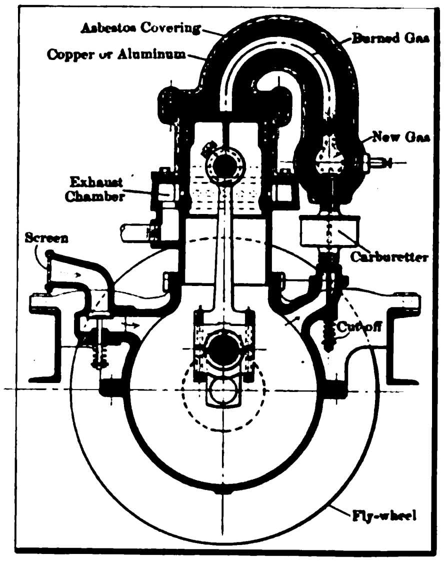
Possibly Valuable Idea

Motor Designed to Increase Thermal Efficiency

REFERRING to the accompanying illustration of a new motor, it will be observed that the combustion chamber, instead of being in the top of the cylinder, is in the form of a neck in an extension, and that provision is made to prevent the transfer of heat from the chamber to the surroundings. It is well appreciated by designers that the average motor leaks heat to the water or air jacket, as the case may be, and that this heat detracts from the thermal efficiency of the motor so much that the actual thermal efficiency of a good motor is around 20 per cent. Any plan that will prevent the heat from passing out through the cylinder walls will have a good effect, provided, of course, that the motor will function properly.

True, if the heat is not gotten rid of as fast as it is formed by the burning of fuel it will pile up, and the motor will be prevented from delivering power, partly on account of the swelling of the incoming mixture, but in the long run due to preignition. In designing water-cooled motors it is the practice to restrict the flame-swept surface as much as possible, and it is the aim to turn as much as possible of the heat into mechanical work. The great main idea is to transform the energy into mechanical work as quickly as possible; it is the heat that remains after the power stroke that does all the damage.

At all events the motor as here depicted is along unconventional lines; it offers food for reflection, and the designer, Jos. E. Bissell, Pittsburgh, Pa., claims that the motor operates with a high thermal efficiency.



Motor designed to prevent the transfer of heat from the combustion chamber to the surroundings

Power, Speed and Efficiency

ECONOMY OF PERFORMANCE OF A MOTOR DEPENDS UPON SPEED AND LOADING; IF THE MOTOR IS OVERLOADED THE ECONOMY WILL BE LOWERED; LIKEWISE, IF THE LOAD IS TOO LIGHT THE ECONOMY WILL FALL OFF

PERHAPS, in time, carbureters will be so refined that the mixture will be exactly right at all speeds. But until this time comes it is useless to expect that a motor will run at any speed and load and deliver its power at a constant thermal or mechanical efficiency.

What is thermal efficiency? Let it be understood that the horsepower of a motor, so called, is but a measure of the heat value (calorific) of the fuel used, let it be coal, gasoline or automobile gasoline, as the case may be, and it will then be easy to understand that by measuring the heat that is turned into mechanical work and comparing it with the total heat in the fuel it will then be possible to determine the thermal efficiency of the motor. When this efficiency is found in some way it will also be observed that much of the heat of the fuel is lost; that is to say, there are no devices used in power work that seem to be capable of utilizing a large percentage of the heat; they cast off the major portion, as the following tabulation will testify to:

THERMAL EFFICIENCY OF VARIOUS TYPES OF POWER PLANTS

	Automobile motors working 4-cycle, water cooled	Marine engines working under the most advantageous conditions	Single expansion steam engines in isolated plants
From	25 per cent.	17 per cent.	10 per cent
To	15 per cent.	12 per cent.	7 per cent.

From the above comparison it will be observed that the best results are realized in the internal combustion motor.

What is mechanical efficiency? It is the difference between the power that is exerted by the gas against the piston of the motor and the power that is realized at the end of the shaft after it passes through the flywheel of the motor. The mechanical efficiency is more or less dependent upon the character of the bearings, efficacy of lubrication, rigidity of the design and all such matters.

It would not be too much to expect that the mechanical efficiency of an automobile motor would equal 80 per cent. There is small chance of it being greater under average conditions; it could be much lower.

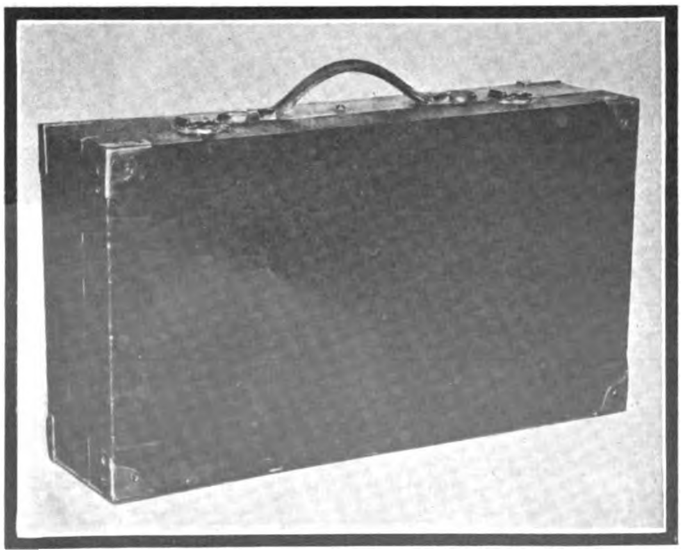


Fig. 1—A neat and compact method of carrying tools—note the corner protectors that make for long service

What are thermic losses and how are they detected? When the manograph is connected to the cylinder of a motor and its use is regulated under proper conditions it will be found that the back pressure, due to the use of a muffler, and, perhaps, on account of restricted passageways, will show; and this back pressure constitutes one of the serious thermic losses.

A second thermic loss may be traced to a depression in the intake, that is to say, the piston sucks a depression in the intake, and this depression is at the expense of power of the motor.

Still another thermic loss is to be traced to heat; if the motor is maintained at a proper temperature the gas, as it is sucked in, will swell up; a given weight of the gas will then occupy a larger space; this is the same as lowering the capacity of the cylinder for gas. The power of a motor is in direct proportion to its capacity for gas, and this capacity, considering a given piston displacement, is regulated by the temperature. If the temperature is high the quantity of gas will be lower than when the temperature is maintained at a lower point.

But there are other considerations that complicate what would seem to be a relatively simple situation. If it is true that more gas will be coaxed in at a low temperature, why not have the temperature low and be done with it? Fine! Let us rivet our gaze upon another phase of the plan. The gas must be in a receptive mood, or else it will not burn. The receptivity of the gas depends upon (a) the ratio of gasoline to air, (b) upon the compression, and (c) upon temperature. If the gasoline is rightly mixed with the air—and this is a difficult problem to solve under conditions of varying speed and changing load—it then remains to adjust the compression to suit the temperature and the inflammability of the gas; this property of mixtures is a variable over broad ranges, with limitations about as follows:

PROPORTIONS OF MIXTURES THAT WILL INFLAME UNDER COMPRESSION

Leanest mixture that will burn	Approximately the best burning mixture	Richest mixture that will burn
1 of gasoline to 26 of air by weight	1 of gasoline to 15 of air by weight	1 of gasoline to 7 of air by weight

It is fairly well appreciated that the mixture, if it is leaner than 1 of gasoline to 17.5 of air by weight, will fail of its purpose, due to popping back in the carbureter. Beyond this point in the scale of lean mixtures the rate of flame travel, or propagation, is so slow that the mixture will still be burning at the end of the stroke, and it will "fire" the incoming charge. The higher the speed of travel of the gas in the intake manifold the leaner the mixture can be without causing back-firing.

In some experiments that were completed for the purpose of observing the conditions that obtain in the intake manifold a spark plug was placed in the manifold and the gas therein was ignited at the time of igniting the mixture in the cylinder. It was found that if the manifold is sufficiently limited in area there will be no back-firing at all, and it was concluded that the ruling factor is the speed of travel of the mixture in the intake manifold; that if the gas travels faster than the speed of travel of the flame in the gas, there could be no back-firing trouble.

Double Sparking Serves a Good Purpose

The widest possible range of working of the mixture, hence the greatest possible thermal efficiency under flexible conditions, will follow if the sparking equipment is so contrived that two sparks will be delivered into the body of the charge simultaneously, but at points remote from each other. The reason why this is so will be found by inspecting the following table:

SPEED OF FLAME IN THE MIXTURE OF DIFFERENT STRENGTHS

Strength of Mixture		Travel of flame
Weight of gasoline	Weight of air	in feet per second
1	8	1.5
1	9	4.3
1	10	6.2
1	11	7.2
1	12	7.5
1	13	7.45
1	14	7.0
1	15	6.4
1	16	5.65
1	17	4.8
1	18	3.8

It has been found that it is more practical to burn slow rich mixtures than it is to burn slow lean mixtures. It is for this reason that a mixture of 1 to 17.5 is looked upon as the leanest one that can be used, although the rate of flame travel is about four feet per second under this condition, whereas it is barely 1.5 feet per second in a mixture holding 1 of gasoline to 8 of air by weight. The trouble with lean mixtures seems to lie in the isolation of the oxygen and the time taken by the hydrogen, carbon and methane in hunting around for oxygen mates. There is also great uncertainty, and the mixture therefore becomes very unreliable. In rich mixtures, on the other hand, the reverse is true; the oxygen is surrounded by fuel elements, and no time is lost in the search; here the difficulty is of another caliber; the flame is quenched by the heat-absorbing ability of the large amount of non-inflammable gas that is present; it must re-kindle hundreds of times perhaps and time is taken in this process.

To recapitulate, lean mixtures are so rich in non-inflammable gases, mostly nitrogen, that the flame is rendered feeble by a process of asphyxiation, whereas rich mixtures are rendered feeble by the heat-absorbing ability of the surfeit of mixture that cannot burn in the absence of oxygen sufficient to accommodate all the oxygen-soaking molecules.

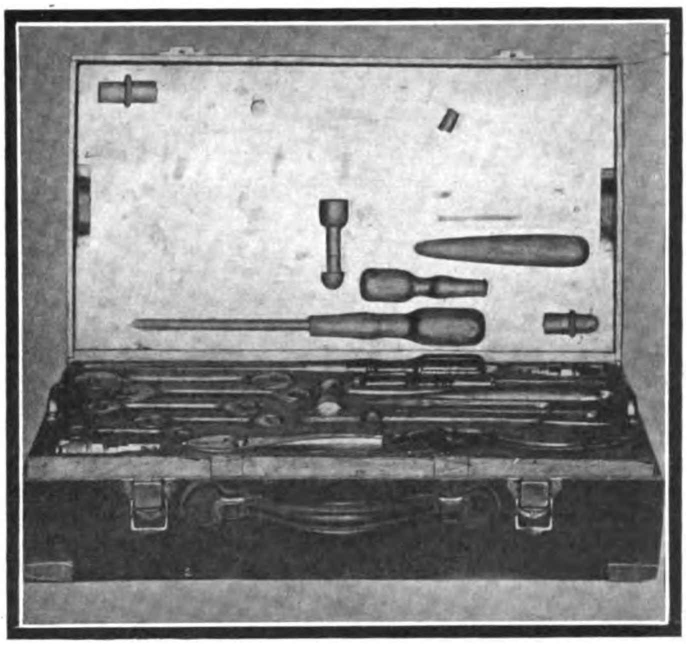

Fig. 2—The lid of the tool case thrown back, showing "a place for everything and everything in its place"

By employing a double spark, in view of the low rate of flame travel in the mixtures that are not of the best proportion, it is possible to hasten the flaming by the simple process of shortening the distance that the flame will have to travel. This idea will also have great efficacy in good mixtures if the speed of the motor is high. It will be readily determined that the whole of the working stroke of a motor running at 3,000 revolutions per minute is barely 0.01 of a second. This is but little time; but two sparks properly placed, firing simultaneously, would have the effect of doubling this time.

Select Good Tools

ILLUSTRATING AND DISCUSSING THE REPAIRMAN'S KIT AND THE METHOD OF ITS PRESERVATION, WITH POINTS FOR THE REPAIRMAN IN PARTICULAR AND OWNERS IN GENERAL

IN the busy world of to-day first impressions count for much, since often there is no time for a second. To have a traveling mechanic come into an owner's garage to repair a car and to see him unroll the tools of his craft from a greasy suit of overalls is likely to create a most unfavorable impression that heavily discounts any work which the mechanic may do. The effect of orderliness on the human mind is worked to advantage in almost every shop which has a really high-class output, so that there can be no doubt of the very real advantage of having a place for everything and everything in its place.

The photographic reproduction shown in Fig. 1 illustrates a neat-looking tool case that is leather covered, and fitted with the proper corner protectors to stand the wear incident to the service Fig. 2 shows the tool arrangement with the top thrown back. A set of solid end wrenches of the best make obtainable will be noted, together with a drop-forged S wrench, two cold chisels two screwdrivers, pliers and a hammer that cannot "lose its head" under the most trying circumstances, because the head and handle are drop-forged of one piece of steel.

Fig. 3 shows the top tool tray removed. The special automobile monkey wrench has a jaw opening of 2 1-4 inches. The socket wrench fits the spark plugs and the large solid end wrench fits front and rear hub caps.

Immediately beneath the hub cap wrench is an oil gun that can be used instead of an oil can, and has the advantage that it may be used in an emergency to draw oil from any oil reservoir on the car. The valve puller takes but little space. Near-by are two recesses cut for cotter pins.

Those interested in something of this character will immediately think of modifications that can be made to advantage. The outside dimensions of the box are 5 3-8 x 11 3-8 x 20 1-2.

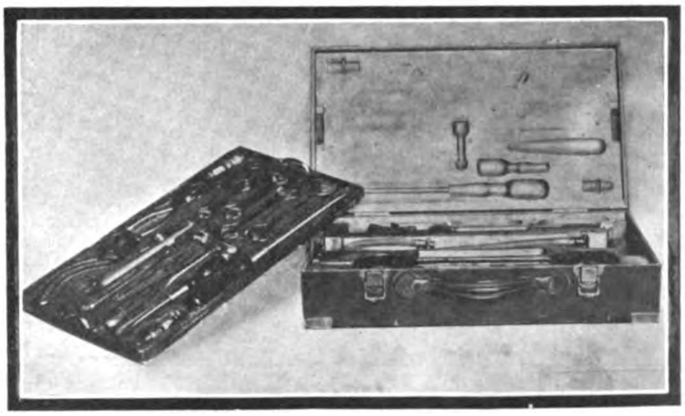

Fig. 3—Showing the top tool tray removed, giving easy access to the lower part of the case

Questions That Arise

SOME OF THOSE THAT COME UP IN EVERY-DAY AUTOMOBILING ARE ANSWERED BY THE MATTER WHICH IS BEING PREPARED BY FORREST R. JONES IN THE NEW EDITION OF THE "AUTOMOBILE CATECHISM" THAT WILL SOON GO TO PRESS

[327]—When the gasoline tank is below the carbureter how is gasoline made to flow to the carbureter?

By pressure of air or gas inside the tank and above the gasoline (compression fuel supply).

[328]—How is the pressure produced and maintained in a compression gasoline tank?

In some systems a small hand air-pump is used to pump air into the gasoline tank until sufficient pressure is secured to start the motor. The exhaust of one cylinder of the motor is then used to maintain the pressure by means of a small tube leading from the pipe at a point near the engine cylinder to the top of the gasoline tank. A check-valve in the tube allows the flow of a portion of the exhaust gas into the tank at the instant the particular cylinder to whose exhaust pipe it is connected is exhausting, but prevents return of the exhaust gas from the tank.

The following modification of the above compression system eliminates the necessity of the hand air-pump. A small tank through which the gasoline passes on its way to the carbureter from the compression tank is placed above the level of the carbureter, and a little of the gasoline always remains in the small tank. When starting the motor it will supply the carbureter long enough for the pressure in the larger tank to be brought sufficiently high by the exhaust to force the gasoline to the carbureter.

When the main gasoline tank becomes empty, it is indicated in the small tank by the lowering of the gasoline level. The small tank is usually placed where visible, as on the dashboard; it often has a capacity sufficient to run the car a few miles.

[329]—Should the compression tube between the exhaust pipe and gasoline tank have a small inner diameter for any reason other than for lightness of weight and cost?

Yes. If a tube with a large opening is used there is possible danger of its becoming filled with a combustible mixture if the cylinder to whose exhaust pipe it is connected misses explosions several times in succession. The combustible mixture in the tube may then become ignited by the hot exhaust gases. In a large tube the flame might pass through to the tank and if considerable air has just been pumped into the latter an explosion might result. When the tube is small the cooling effect of its walls will prevent the flame from passing through it to the tank.

[330]—What means to prevent complete emptying of a gravity fuel tank is sometimes used?

A small compartment in the tank will not allow the fuel to flow from it till a valve is opened by hand. When the fuel from the main body of the tank is all drawn out the motor, of course, stops. Then, by opening the valve to the small reserve compartment, the fuel retained in it becomes available.

[331]—What heats the combustion chamber and cylinder walls when the engine is working properly?

The heat of combustion, of compression, and that produced by the friction of the piston and its rings against the cylinder walls. The heating is chiefly due to combustion. Friction causes but little heat under correct conditions (proper fitting of parts and lubrication).

[332]—How is the engine kept cool enough for working?

Generally by a jacket of circulating water, or by air cooling. Oil is used for cooling sometimes.

[333]—What is a water jacket?

A comparatively thin layer of water surrounding the combustion chamber, ports and part of the cylinder. It is retained by an outer casing of metal, either cast integral with the cylinder or attached as in the case of a copper outer casing.

[334]—How much of the cylinder is surrounded by the water jacket?

From one-third to two-thirds of the part of the bore (measured lengthwise of the cylinder) which is next the combustion chamber.

[335]—In an air-cooled cylinder what provision is made for sufficient cooling?

Metal projections in the form of thin rings, lugs, rods, wires or teeth of a comb are provided to present a maximum amount of radiating surface to the air which (in the motor-in-front type) enters the engine space under the bonnet through a grating in front that occupies the place of the radiator used in water-cooled cars. The flow of air is usually assisted by fans driven by the engine. The projections are sometimes surrounded by a sheet-metal casing and air is forced or drawn through the enclosed space by a fan.

[336]—How is the circulating water kept sufficiently cool?

By causing it to flow through a cooling pipe, coil or radiator connected by tubing or piping with the water-jacket.

[337]—Describe a radiator.

In the simplest type a pipe is bent to form a fairly compact group of convolutions. Thin copper or brass pipe is used. Numerous fins or collars of the same material are placed at a small distance apart along the pipe in order to increase the heat-radiating surface. The hot water coming from the jacket passes through the entire length of the coil, which is cooled by air blowing against it.

Numerous types of radiators are used. Many have flattened pipes (cellular radiators) which contain only a thin layer of water and present a large radiating surface to the air. Copper, or its alloy, brass, is used on account of its great capacity for conducting heat; it also has mechanical advantages such as ease of forming and soldering.

Four-cylinder aviation motors have been developed by the Austrian Daimler company. One is of 30 to 40, the other of 65 to 70 horsepower. Among the details of construction the following are given: The cylinders are cast singly. All valves are worked from above and from one camshaft. The inlet valves are placed at the right and are inserted in special valve housings. The exhaust valves communicate directly with the outlets at the left. The crankshaft is offset, to the left, with relation to the cylinders and works in five bearings, and the bolts securing the cylinders to the crankcasing go through from top to bottom to increase the rigidity between shaft and cylinders, or shaft bearings and pistons, this being apparently a new feature of special value in a very light motor in which the dimensions of materials are much reduced. The pistons are of steel and very light. The centrifugal water pump and the high-tension Bosch magneto are both driven from a cross-shaft passing between the two middle cylinders, the object of this arrangement being to fit the motor for driving either right or left and either one or two propellers, according to the design of the aeroplane. A force-feed oiler, Friedmann patent, is placed on the crankcasing between the cylinders and the flywheel and is driven from the camshaft, whose location is on the right side in the casing. The lower half of the casing is removable without interference with the bearings. The waterjackets are formed by precipitation of copper. The weight of the smaller motor is 70 kilograms (154 pounds) and that of the larger one 95 kilograms (200 pounds).—*Automobil-Welt.*

Quick and Good Painting

M. C. HILLICK SETS FORTH THE METHODS TO PURSUE IN THE REFINISHING OF A CAR ON A BASIS OF EXCELLENCE OF RESULT AT SMALL COST

THE AUTOMOBILE has in previous issues intimated that the tendency in automobile work is to cheapen the cost of production. To accomplish this end the painter must fall in line with the artisans of the other departments and seek to get to rock bottom conditions in the matter of cost of painting the horseless vehicle.

This cannot be done by "skimping" the work or cheapening the finish, because these things stand out in sight of all men. Defects in the surface, or in other parts of the construction work, are passed on to the painter for him, through his art and ingenuity, to conceal under the various plastic pigments with which he deals.

How the desired result may be accomplished follows in brief detail: First the body surface, presumably of aluminum or some other metal. Coming from the body maker let it be gone over if necessary with a patch of emery cloth, or emery paper, or a fine wire brush, and in the absence of these mediums, with some coarse sandpaper. Thus rid the surface of foreign substances and condition it to receive and hold the pigment applied to it.

As to the best available primer. Use, if opportunity affords, a purchased ready to use metal primer, to be applied with a soft point round or oval bristle brush, the coat being brushed out smooth and uniform. If shop prepared, use 2 parts raw linseed oil and 3 parts pure turpentine, to a pint of which mixture add a teaspoonful of pale drying japan. For coloring matter and to give body to the primer add enough oil ground lead colored in the direction of the to be finally chosen color. Another primer that some painters have found to work out very strong and well upon the metal surface consists simply of elastic finishing varnish brushed out thinly over the surface.

As soon as the primer is dry, good and secure, beat up some keg lead in 1 part raw linseed oil and 6 parts turpentine, give it the proper coloring, and apply with a soft chisel point brush.

After allowing for secure drying proceed either with a ready prepared knifing material, of which there are numerous makes, or with a shop-mixed one prepared of 3 parts dry white lead and 1 part best bolted whiting, worked into a plastic glazing condition in equal parts of rubbing varnish and coach japan. letting the mass down a bit with a little pure turpentine. Apply with a broad 2 1-2 inch French scraping knife, half elastic, working the pigment out so uniformly smooth and fine as to necessitate little if any sandpapering.

Permit this coat of knifed-in surface to dry for 48 hours, at which time, using first No. 1 sandpaper and last No. 0 to polish with, fetch the work up to a smooth, glossy condition.

Over this foundation lay a coat of color ground work, or, in other words, a coat of color to serve as the ground or foundation color. Prepare this color by using 1 part raw linseed oil to 5 parts turpentine, which, in case of a japan ground color, will furnish requisite elasticity, durability, and a ground color devoid of glass yet not drying out to a dead appearance—the latter to be avoided at this point in the finish.

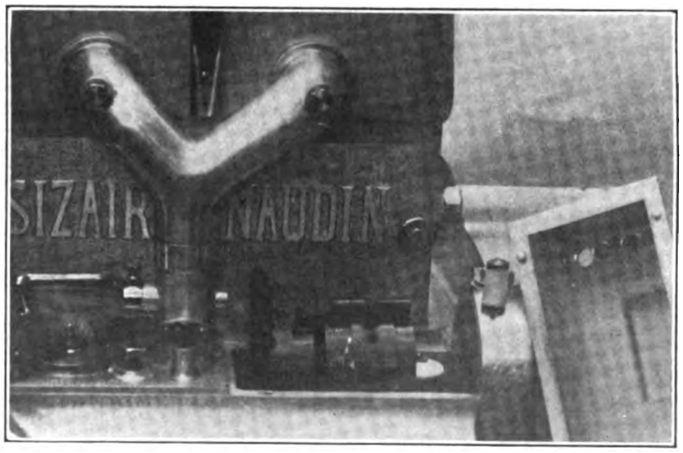
In the event of using lake pigments for the final color the next coat over this preparatory ground color should be a coat of the lake whipped in turpentine to dry flat. Then over this use the lake floated in elastic rubbing varnish. When the color is of the ordinary opaque pigment, or, at most, semi-opaque, such as for example, ultramarine blue, wine color, or carmine, make a varnish color, for the opaque pigments consisting of 1-4 pound of color to 2 pounds of varnish, and for the semi-opaque or transparent pigments, following a solid ground, use 3-4 ounce of color to 1-8 gallon of varnish.

After 36 hours this varnish color, or the transparent glaze will have dried so that it may be lightly rubbed with water and pumice stone flour to the extent of flicking away any dirt nibs, an elastic body finishing varnish of the very best grade obtainable.

For the next coat reduce by one-half the amount of color used in the varnish and apply freely to the surface. Let this coat stand two days, at the expiration of which time again rub with water and pumice stone flour, wash up, stripe and apply such other ornamentation as may be desired. Then apply a coat of clean rubbing varnish. After three days rub this coat moderately with water and pumice stone flour, wash up and finish with an elastic body finishing varnish of the very best grade obtainable.

Bring the chassis meantime along practically the same lines, using one coat of primer, then a coat of surfacing pigment containing enough raw linseed oil to insure adequate elasticity, upon which foundation use the knifing putty to level up the inequalities of the surface and to "face up" any other existing defects. Sandpaper this body of pigment down sleek and smooth, after which apply one coat of flat color, then one coat of transparent glaze or one coat of varnish color as the requirements of the work may indicate. upon which, in due time, after breaking down the gloss with a light rub over with a soft sponge, moist and saturated with pumice stone flour, stripe, and apply one coat of clean rubbing varnish. Give this coat plenty of time to dry, three days or more if possible, then surface thoroughly with water and pumice stone flour, wash up sleek and clean and finish with an elastic chassis finishing varnish.

Enclosed Magneto and Carbureter—The latest model Sizaire & Naudin car exhibited at the Paris Salon shows two innovations in engine practice. On the intake side of the engine the magneto and carbureter are both encased. The magneto is buried in the crankcase casting and is yet on a level with the side frame. It is covered by a light aluminum cover held down by a spring clip, only the four terminals being visible. The carbureter is treated in the same way, the float chamber being entirely under cover, yet instantly revealed by the removal of a spring clip. A Y-shaped tube leads up from the carbureter to the intake ports, the whole being dismountable by withdrawing two bolts. The magneto wires are neatly led up through a brass tube between the forked branches of the intake pipe and the body of the motor.



Showing Sizaire & Naudin magneto and carbureter uncovered. The aluminum cover is shown at the right

Practical Repairing

THE OXY-ACETYLENE WELDING PROCESS APPLIED TO STEEL; ALSO SHOWING HOW BROKEN TEETH CAN BE MADE AS GOOD AS NEW

THE uses of the acetylene flame as applied to welding are so varied that there does not seem to be a part of the car that is broken that cannot be repaired. As has already been stated and shown, aluminum, that had defied the repairman for such a long time, can now be handled with comparative ease and assurance that the repair will last. Welding by electricity is not nearly so recent as the acetylene process, and while the former method has its advantages, the ease with which the latter can be handled recommends it strongly. It goes farther than any other method, and one only has to look at the broken cast-iron gear box illustrated in Fig. 1 to understand what a money-saver it is to the autoist if he will only avail himself of the invention in order to reduce expense in case of accident. The gear box here depicted has been broken owing to a gear wheel coming loose; several of the parts were lost and the repairman has to piece together those parts that remain and build up to them. A year ago this wheel would have been relegated to the scrap heap and there are a good many to-day who would do the same thing. There is no necessity for this, and provided the bearing parts are left and the alignment can be reinstated the job offers very little difficulty. Even if the alignment cannot readily be found, any inexactitude can be made up by the addition of metal and reboring the part.

The parts G1, G2, G3 are parts of the grooves that encircle the ball bearing B1, and the part P1 forms the mainstay of the breakage; it is with this that the repair is started. The two edges are beveled, allowing a small gap between the parts, and metal is run into them. As this is cast iron, a scaling powder is employed to cleanse the parts from dirt, as well as serving in a way as a flux.

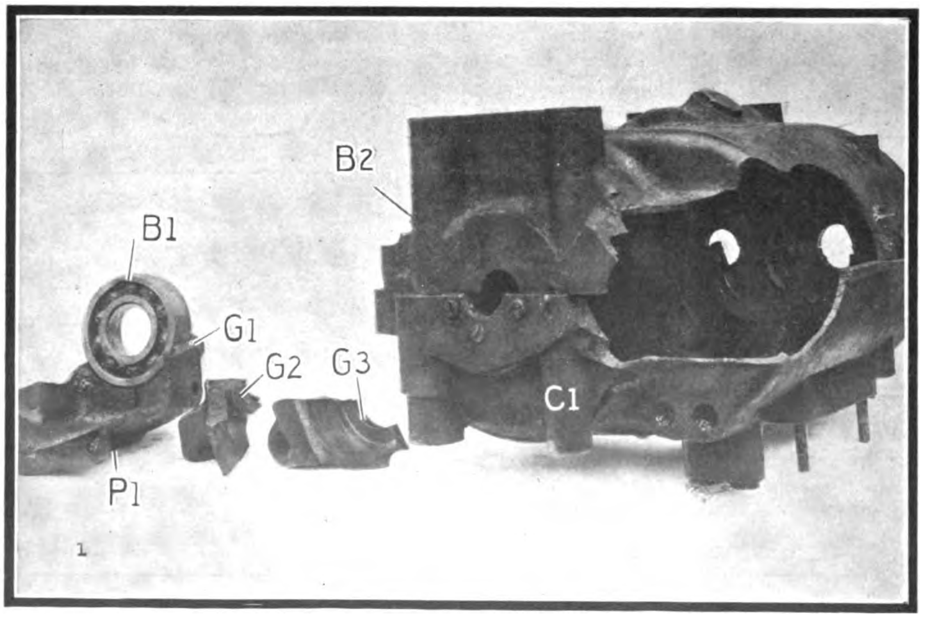


Fig. 1—Broken transmission case in cast iron that can be repaired although several pieces are missing

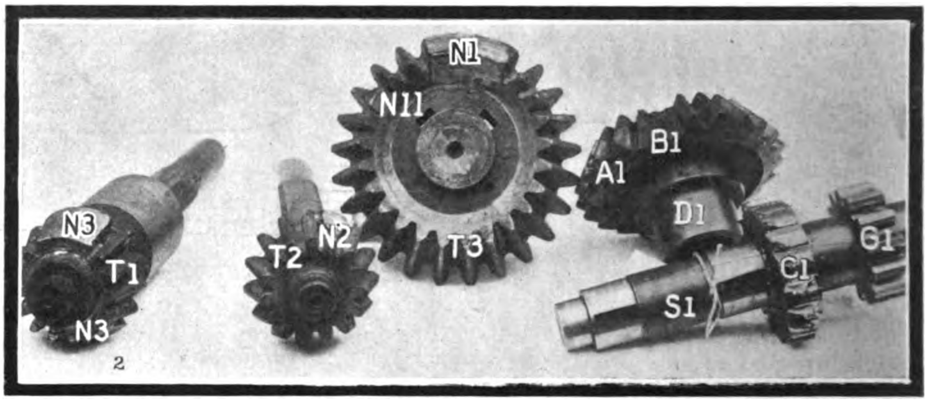

Fig. 2—Showing gear wheels in the broken state and after the welding repair has been effected

The method of welding steel parts that have been broken is similar to that employed in other metals, only steel does not require the scaling powder. The illustration of the method of repairing broken gear wheel teeth can be seen by reference to Fig. 2. Reading from left to right are depicted two driving pinions that have come to grief and have several teeth chipped out of them. The method of treating such parts is as follows: The entire piece is placed in a fire and annealed or softened, so that the case-hardening is removed and the metal restored to its natural hardness, permitting the operator to file away sufficient metal to make a clean and slightly V-shaped joint. A deposit of metal is then welded on by heating the portion of the wheel where the teeth have been broken, and in the same way that sealing wax is applied to a letter so is steel deposited on the part, slightly more in size than the new teeth will occupy. The new metal N3 and N2 will be seen to be circumferentially the same size as the teeth T1 and T2, as the shaft has been placed in the lathe and turned down to size. The next process is to cut the new teeth in just the same manner as if the whole was a solid blank, and the repairers claim that the new metal so deposited is stronger than the original teeth. Be this as it may, it is a fault on the right side. The wheel is then case-hardened in the ordinary way, that is to say, by one of the processes that can be employed to give a satisfactory hard surface. The owner of part D1 had the misfortune to break two teeth A1 and had it repaired. He ran the car for some time, highly delighted with the repair, and thinking to himself how he had saved by not buying a new wheel. One day, however, to his chagrin something went amiss in the gear box, and thinking that the repair had given way, he hied himself to the repair man to tell him about it, and so on. The repair man was sure his work would hold even if the whole car were to give way, and said so. The only way to solve the matter was to take the gear box apart. True enough, the old repair had held, and it was a new break that had caused the trouble. The teeth B1 were then treated as A1 had been,

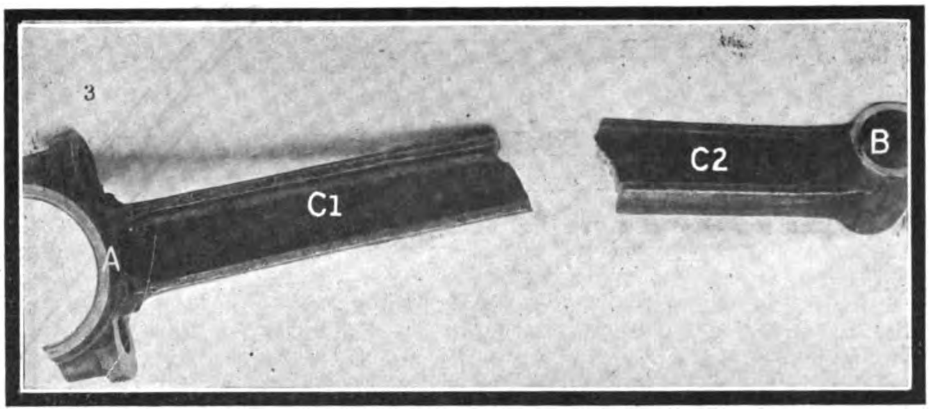

Fig. 3—A broken connecting rod before being repaired; it will be seen that the break is clean and sharp

and the car is now running as well as ever. It is false economy sometimes to have repairs carried out if the body is not in good shape.

N1 and N11 are other illustrations of this work on a slightly larger scale.

In the case of a connecting rod that had snapped, as shown in Fig. 3, there is more skill required than with ordinary cracks and breaks; the distance between the parts A and B must under no circumstances be increased or reduced, otherwise the balance of the motor would be upset, as the compression would be altered should the smallest fraction of an inch elongation or contraction creep in. The parts are joined together, if possible, on a flat metal table (as can be done in this case, as the break is clean), and carefully measured off. If this cannot be done it is necessary to remove another rod and measure the length from that. Should either of the parts be bent slightly they must be heated and straightened, and the place where the joint is to be made V1 double slotted top and bottom, in the manner shown in Fig. 4. Enough metal must be removed to allow for hammering and elongation afterwards, and 1-8 inch is sufficient for this. The parts C1 and C2, in Fig. 4, are then placed in the manner shown, patching up till they are level, and with the above-mentioned gap allowed for. The welding is then carried out in the ordinary way. The part is then filed up in the manner shown in Fig. 5, and the time it took to effect this repair from the arrival of the part in the shop was one hour.

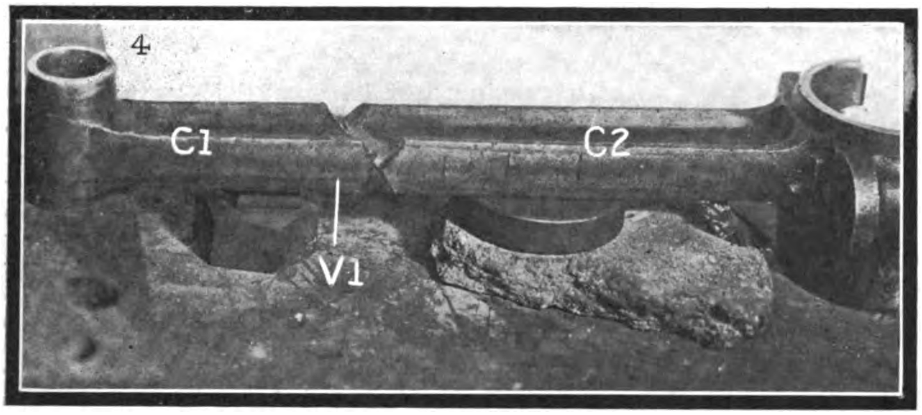

Fig. 4—The two halves placed on a surface plate and slotted prior to being joined

It may be found when measuring after the joining is completed that the part is slightly short; this is easily lengthened on the anvil. It might be as well to mill out some of the metal, but it is inadvisable to take off too much and perhaps weaken the repair.

Ceylon and the Rubber Trade—Something new and unique is going on in Ceylon, namely, the selling of rubber by auction. The first of these public vendues was held in Colombo on the 4th day of November, 1910. Many of the older colonists can remember the auction sales of tea that took place about 1885, the year that they were inaugurated. These persons, who grew to realize the colossal development of the tea industry, are of the mind that the auctions of rubber will ultimately become quite as important. Twenty-two tons of rubber were put up for sale the first day. Ceylon has been led to take the step, owing to her relative position to the big consuming countries. The buyers from the neighboring lands find it very convenient to go to Colombo for their supplies. But a note of interest is sounded in the fact that the largest bidder during the initial vendue made the purchase on behalf of the United States. The plan is to hold the auctions weekly. Already the enterprise has received the mark of success. Ceylon to-day has 185,000 acres planted in Para rubber, 12,000 acres of which are bearing. A Ceylon authority, writing upon the subject of rubber in that country, gives it as his belief that 220,000 acres will be the maximum area planted with rubber in the island. He estimates 140 trees to the acre, which, at one and one-half pounds per tree per annum would yield a sufficient amount by 1920 to guarantee an export of 20,000 pounds per acre. In 1909 there were 681 tons of rubber exported from Ceylon. Plantation rubber there, as in the Malays, British Guiana and other sections, appears to be the only solution of the problem of supplying the demand, which is recent years has increased rapidly owing to the rapid growth of the automobile trade.

Radiator Refutes Chicken and Egg Story—A darky was engaged to drive the automobile of a well-known citizen. Next Sunday he entertained the parson with a pair of chickens for dinner.

Parson (with a sad twinkle in his eye)—"Jackson, wha did de fus chicken come frum?"

Jackson—"You all ma think it kum from an aig, pa'son, but dis chicken was hidin' in de radiata when I captur'd it, and fo' fear you might strain youa curiosity, parson, ah kin voluntea de informashun dat de second fowl was in de flywheel—dar ain't no aig story in konnecshun wid dis hea dinnah."

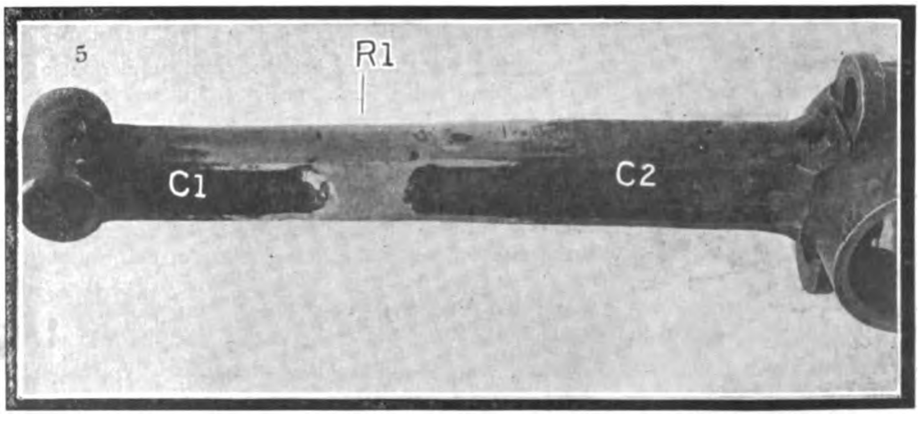

Fig. 5—Same connecting rod joined. It is possible to see the new metal that has been run in after filling

Keen and Apropos Observations

SOME OF THE READERS OF "THE AUTOMOBILE" OFFER SUGGESTIONS OF A PRACTICAL CHARACTER WHICH SHOULD BE OF EXCELLENT VALUE TO THOSE WHO ARE LACKING IN EXPERIENCE

YOUR system of lubrication expounded on pages 992-993 of your December 15 issue, and the diagram and schedule which accompanied same, have given me just the practical guidance I need in correctly solving the lubrication problem.

I should like to tell you the scheme I have devised that I may automatically have my memory jogged at just the right time when certain oiling operations are to be performed. I took a large calendar for 1911, pasted the diagram of the car you printed and the index giving key to the letters showing oiling locations above the pad, then I began with January 7—the first date in the year which appears on your schedule—and on each date throughout January I marked—in the square occupied by the figures representing that date—the letters denoting the exact spot where oil was required on that particular day.

To distinguish between oil and grease I made the letters representing the former in red and the latter in blue. The same plan was then followed leaf after leaf throughout the year, and my "Oiling Calendar" was hung in the most prominent location on my garage walls.

Look at my calendar page for January now: Beginning with the 7th day we find in blue, A-M-R-LA, and in red, B-C-F-G-J-L-P-Q-S-U-W-Z-AA-CA-GA-HA, a row of bewildering hieroglyphics, but to me, with the diagram and key before me, an ever-present reminder of what must be done on this day to keep my car in perfect condition.

Since I have prepared my calendar it has occurred to me that I could have made the characters much plainer if I had used one where each week is represented on a separate page and comfortable writing space left opposite the date.

Medina, O. THOMAS P. HALLOCK.

Why Do Springs Break in the Center?

Let us reason. Heretofore your minds have been riveted on your motive power, transmissions, clutches and various perplexing things that go with the building of an automobile. I feel that you have paid too little attention to the matter of breakage of springs in the center. If the center attachments are planned strong enough and are perfect fits, so you could use a broken spring, you would never have one break. Make them break outside and then it is the fault of the spring maker. Below are a few recommendations that I would like to make:

Have your spring seat, or lower bearing, of proper length and made the exact radius of the spring normal.

If you use two clips make them of liberal size.

Plan a top plate to go underneath these clips with a slightly sharper curve than the radius of the spring normal, and have it strong enough in thickness so it will be impossible for a spring to move underneath it at the center. I would recommend using between the spring and its lower bearing, duck No. 6 or No. 8, saturated with lead and oil. This will preserve the fibre and when drawn down tight there will be no material to displace; you do not want to use material under a spring that will displace while in use. Use as heavy a spring washer under the nuts as the stem of the clip will compress without injury.

I would recommend for a light runabout where you use 1 3-4-inch steel, a clip with 1-2-inch shank. For a 5-passenger car where 2-inch steel is used, 9-16-inch shank.

For a 7-passenger car where 2 1-4 or 2 1-2-inch steel is used, 5-8-inch shanks. And in each case use spring washers as thick as you possibly can crush without injury to the clip shank.

Many are using a single clip. When these are used care should be taken that the inside of the clip is of the same radius as the spring is normal, so it will absolutely bind the spring tight in the center.

If you will observe these recommendations I think you will eliminate the breakage of the springs in the center, which is no fault of the spring maker.

Some are using springs that are called "beaded center." In my mind there is nothing gained by this. If a spring is held down firmly in the center and not allowed to move it cannot crystallize and will not break. Just bear in mind, if you plan your attachments so you can use a broken spring, you will have none break. R. D. WOODFORD.

Discussing the Phases of Self-Starters

For a number of years there has been considerable discussion regarding the advisability of using self-starting devices for explosive motors. We find as far back as 1882 an applicant for a patent stating "An objection to the use of ordinary gas engines is the necessity of starting them by hand, or by some power stored up for the purpose," and while this referred to stationary engineers, it is even more applicable to automobile motors.

There can be no argument as to the advantage of having a motor start at will, without the necessity of cranking, and we have this in its ideal form, as far as simplicity goes, when the motor starts on the spark, even taking into account the remote possibility of injury due to its firing with crank on dead center.

It is to be very much regretted that no motor will always start on the spark, and to make conditions such that this will even frequently happen often requires such an adjustment of the carbureter as to make it give poor results for running. As this method of starting cannot be relied upon, we must resort to cranking or else use a self-starter. Custom has decreed that a number of devices should be so-called, though, technically, few accomplish this result. Self-starters should, therefore, be divided into two classes: Those which work by the expenditure of manual force, and those which are the real self-starters and depend upon some outside stored-up energy. Neither of these takes into account the numerous aids to starting, such as safety cranking arrangements, spark shifting levers and compression relief cams.

The first of these classes generally consists of a lever or combination of levers connected by ratchet or other device to crankshaft, and arranged so that they can be operated either by hand or foot from the driver's seat, and, by so operating, accomplish the same result as cranking. It can be seen that the advantage of this type is very doubtful, the only gain being that the work is done in a more convenient position, while the complication and possibility of getting out of order is very much increased.

Of the second class of starters one of the most common forms is the spiral spring arrangement which is wound up by the motor when running and which in turn starts it as it unwinds.

An electric motor, operated by storage battery, has also been tried, the battery in turn being charged by the motor run as a dynamo.

Acetylene and other explosive gases under pressure have been used, as have cartridges filled with powder or other explosives, in the latter case the explosion taking place in a separate chamber connected with the cylinder. This system is being used to some extent for large stationary engines.

A system which has met with success consists in utilizing compressed air which is secured from the cylinders of motor and stored in tank. It would seem that some mild form of explosive in combustible cartridges, like celluloid, for instance, with automatic feed, worked and fired by the regular ignition system, would eventually solve this problem. W. G. Wall.

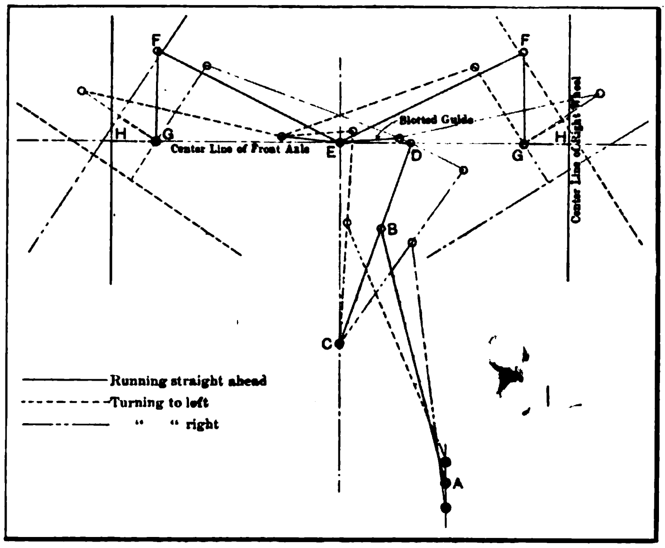
Scheme for a True Automobile Steering Gear

Some time ago I designed a steering gear for automobiles which may have sufficient points of interest for auto manufacturers to warrant its publication in your journal.

When the steering gear of an automobile is constructed so as to turn the two front wheels through the same angle. The plan for well-known reasons, is injudicious, since it causes the wheels to exert a side thrust to the detriment of both the car and the roadbed. Especially on turns and curves of the roads the effect of this side thrust is noticeable.

To overcome this difficulty the steering gear here shown was designed. The length of the turning radius was measured from the center of the car midway between the front and rear axles. The maximum throw shown on the accompanying sketch is for a 5-foot radius.

To explain more in detail, it may be stated that the essential parts of this gear are: A properly determined slotted guide in which a pin E moves, actuated by a set of levers from the usual steering wheel; onto this pin E two reachrods E F are connected which in turn manipulate the elbow levers FGH, on which the wheels are fastened in the usual manner. The sketch shows the position of the gear for running straight ahead and for turns to the right and to the left.



Design of a steering gear, submitted by a reader of "The Automobile," which possesses many points of merit

The knuckle joint A connects rod A B to the worm screw, which is moved by the hand wheel. C is a fixed pivot conveniently located on the longitudinal axis of car, or near it. B and D are pin joints giving some play to the several rods and their angular positions. The slotted guide is cut in a steel plate, both ends of which are fixed to the front axle, and a sufficient distance above same to allow the arm E D to pass between. For easier motion a grooved wheel and a pin would be better than just a pin at E. Above the guide plate we have the two reachrods E F, which swing about pin E and pin F. The elbow lever FGH turns the wheels on the pivot at G through the desired angle.

Necessarily for different wheel gauges different rods and guide plates are required. The curvature of the slotted guide is such as to compel the wheels to assume at all times positions which are tangent to their radius about the instantaneous center of rotation of the car. O. von Voigtlander.

Coming Events

CALENDAR OF FUTURE HAPPENINGS IN THE AUTOMOBILE WORLD THAT WILL HELP THE READER KEEP HIS DATES STRAIGHT—SHOWS, ANNUAL MEETINGS AND OTHER FIXTURES

Dec. 31-Jan. 7, '11	New York City, Grand Central Palace, Eleventh Annual International Automobile Show.
Jan. 2-7	New York City, Hotel Astor, Annual Importers' Salon.
Jan. 7-14	New York City, Madison Square Garden, Eleventh Annual Show, Pleasure Car Division, Association of Licensed Manufacturers.
Jan. 11-12	New York, Annual Meeting, Society of Automobile Engineers.
Jan. 14-28	Philadelphia, Annual Show, Philadelphia Licensed Automobile Dealers' Association, First and Third Regiment Armories.
Jan. 16-21	New York City, Madison Square Garden, Eleventh Annual Show, Commercial Division, A.L.A.M.
Jan. 16-21	Detroit, Mich., Tenth Annual Show, Detroit Automobile Dealers' Association, Wayne Pavilion.
Jan. 14-20	Milwaukee, Wis., Annual Show, Milwaukee Automobile Dealers' Association, Auditorium.
Jan. 25-28	St. Paul, Minn., Annual Show, Automobile Dealers' Association of St. Paul, Auditorium.
Jan. 28-Feb. 4	Chicago Coliseum, Tenth Annual National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Pleasure Cars and Accessories, Exclusively.
Feb. 6-11	Chicago Coliseum, Tenth National Automobile Show Under the Auspices of the National Association of Automobile Manufacturers, Inc., Commercial Vehicles, Pleasure Cars, Motorcycles and Accessories.
Feb. 6-12	Buffalo, N. Y., Ninth Annual Show, Automobile Trade Association of Buffalo, Broadway Arsenal.
Feb. 13-18	Washington, D. C., Annual Show, Convention Hall.
Feb. 13-18	St. Louis, Mo., Fifth Annual Show, Coliseum.
Feb. 13-18	Winnipeg, Man., First Annual Show, Winnipeg Motor Trades Association.
Feb. 13-19	Kansas City, Mo., Annual Show, Motor Car Trade Association.
Feb. 14-19	Dayton, O., Second Annual Show, Memorial Building.
Feb. 15-18	Grand Rapids, Mich., Annual Show.
Feb. 18-25	Minneapolis, Minn., Annual Show, Minneapolis Automobile Show Association, National Guard Armory.
Feb. 18-25	Brooklyn, N. Y., Annual Show, Brooklyn Motor Vehicle Dealers' Association, 23d Regt. Armory.
Feb. 18-25	Binghamton, N. Y., Second Annual Show, Binghamton Automobile Club and Chamber of Commerce, State Armory.
Feb. 18-25	Newark, N. J., Fourth Annual Show, New Jersey Automobile Exhibition Co.
Feb. 20-25	Cincinnati, O., Annual Show, Cincinnati Automobile Dealers' Association.
Feb. 20-25	Portland, Me., Sixth Annual Show, Auditorium.
Feb. 20-26	Omaha, Neb., Annual Show, Omaha Automobile Association.
Feb. 21-25	Baltimore, Md., Annual Show, Automobile Club of Maryland, Fifth Regiment Armory.
Feb. 22	Cleveland, O., Annual Show, Cleveland Automobile Show Company.
Feb. 24-27	New Orleans, La., Annual Show, New Orleans Automobile Club.
Feb. 25-Mar. 4	Toronto, Ont., Automobile Show, Ontario Motor League.
Feb. 27-Mar. 4	Kansas City, Mo., Fifth Annual Show, Kansas City Automobile Dealers' Association, Convention Hall.
Mar. 4-11	Boston, Mechanics' Building, Ninth Annual Show, Licensed Automobile Dealers' Association.
Mar. 7-11	Des Moines, Ia., Third Annual Show, Des Moines Automobile Dealers' Association, Coliseum.
Mar. 14-18	Syracuse, N. Y., Third Annual Show, Syracuse Automobile Dealers' Association, State Armory.
Mar. 14-18	Denver, Col., Annual Automobile Show, Management Motor Field, Colorado Auditorium.
Mar. 15-18	Louisville, Ky., Annual Show, Louisville Automobile Dealers' Association, First Regiment Armory.
Mar. 18-25	Pittsburg, Annual Show, Pittsburg Auto Show Association (Inc.), Exposition Hall.
Mar. 25-Apr. 1	Buffalo, N. Y., Fourth Power Boat and Sportsmen's Show, Sixty-fifth Regiment Arsenal, Buffalo Launch Club.
Mar. 25-Apr. 8	Pittsburg, Fifth Annual Show, Duquesne Garden, First Week, Pleasure Cars; Second Week, Commercial Trucks. Automobile Dealers' Association of Pittsburg, Inc.
Apr. 1-8	Montreal, Can., Automobile and Motor Boat Show, Automobile and Aero Club of Canada.

The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly), July, 1907.

MR. SALESMAN, you will succeed admirably only upon one condition, and that is that you tell the truth.

* * *

MR. SALESMAN, when you pick out "selling points" and enlarge upon them it is as much as to say that the other points rank as defects.

* * *

MR. SALESMAN, you cannot make a good impression upon a prospective if you intimate that some parts of your automobile are not good.

* * *

MR. SALESMAN, you have no right to set yourself up as the judge of the automobile that you are selling. What is the matter with the chief engineer of your company?

* * *

MR. SALESMAN, you cannot possibly tell the truth about the automobile that you are selling unless you know it.

* * *

MR. SALESMAN, you should be able to swap all your fine-phrased selling points for true statements of fact, which are, of course, known to the designers of your car.

MR. SALESMAN, you cannot make a good impression upon a purchaser by trying to sell him what he does not want.

* * *

MR. SALESMAN, you waste your time trying to sell a truck to a man when he wants a touring car, or a touring car when he wants a runabout, or your car if it is not what he wants.

* * *

MR. SALESMAN, you do not have to know your man, but you should know your car.

* * *

MR. SALESMAN, you do yourself a great injustice when you try to imitate the alleged salesman who claims that he can sell anything, and who makes no pretense at considering the purchaser's welfare.

* * *

MR. SALESMAN, your automobile must be a good one, otherwise your engineering department would build another kind.

* * *

MR. SALESMAN, it is your business to know what it is good for, and then find the class of customers who will have need for your kind of a car.

* * *

MR. SALESMAN, you have no right to tell your story with variations which will be a departure from the truth simply for the purpose of pleasing your prospective.

* * *

MR. SALESMAN, you will become the most pronouncedly successful salesman on "automobile row" within a twelvemonth after you learn all about your product and then tell it to the customer.

* * *

MR. SALESMAN, you imitate a book agent when you trot out a bundle of stock arguments which do not fit your automobile any better than they would a wheelbarrow.

* * *

MR. SALESMAN, your customer would not have money enough to buy an automobile were he to be so shallow as not to know that you are merely talking against time.

* * *

MR. SALESMAN, it is an ancient fallacy that is wrapped up in the idea that the truth sounds too plain, and that you must be a "diplomat" to sell a car.

* * *

MR. SALESMAN, you compel attention when you know what you are talking about and you say it straight from the shoulder.

* * *

MR. SALESMAN, are you afraid of the truth? If you are so anxious to please your customer, why don't you give him a dose of it? The truth is exactly what he is after.

MR. BUYER, when you go in quest of an automobile don't say that you know all about it unless you do.

* * *

MR. BUYER, you should not put on a mysterious air and try to conceal from the salesman the object of your mission.

* * *

MR. BUYER, if you know what kind of a car you have a need for, ask the salesman if he has that kind for sale.

* * *

MR. BUYER, if you don't know what you want, you have no right to take up the salesman's time.

* * *

MR. BUYER, if you are merely looking around on a speculative basis, all you have to do is to say so; the salesman will then know that you are in need of information and he will give it to you.

* * *

MR. BUYER, if you want a $500 automobile, what possible excuse can you offer for going to a place where they have only the $5,000 kind?

* * *

MR. BUYER, if you examine a given make of automobile, knowing perfectly well that you have preconceived notions of designs that are not embodied in that make of car, what excuse do you offer yourself for expending your time in the examination of that which you know you do not want?

* * *

MR. BUYER, it stands to reason that you cannot make changes after an automobile is finished without killing the harmony that should reside therein.

* * *

MR. BUYER, if you insist upon having material alterations made in the car that you finally select, you should ask the maker to cancel his guarantee.

* * *

MR. BUYER; it is scarcely to be expected that a maker of a car should guarantee the good performance of your "improvements"; the maker pays for the services of an engineer upon whom he relies for what he wants.

* * *

MR. BUYER, if you discover an automobile that will go like the dickens on a level, hard road, why should you expect it to be a racing car on a 20 per cent. grade?

* * *

MR. BUYER, the rules that should govern the purchase of an automobile are not unlike the methods to pursue when you go in quest of a pound of tea. If you ask for what you want, in precise terms, the chances are that you will get it.

MR. BUYER, there is a tradition among salesmen which has to do with the making of a "favorable impression" at any cost; you will have to pay the cost.

* * *

MR. BUYER, you may not fully realize just what you are after when you race around like a March wind, but the salesman—he knows.

* * *

MR. BUYER, when you finally come upon a car that attracts your discriminating notice, and you go for a demonstration, why should you wish to give the dust to racing automobiles?

* * *

MR. BUYER, you know that "you cannot eat your cake and have it, too," nor can you expect an automobile to be economical of maintenance, an indefatigable hill climber and capable of outstripping racing cars on the level roadway besides.

* * *

MR. BUYER, it is impossible to accentuate each of three virtues; to whatever extent you add to one you must subtract from the other, and you might better invest in something that has moderation for its foundation.

* * *

MR. BUYER, you probably belong to the class of purchasers who would insist upon a larger driving sprocket. When you go looking for trouble in this direction, it is yours for the asking.

* * *

MR. BUYER, nearly all dissatisfaction may be directly traced to lack of preparedness on the part of the purchaser.

* * *

MR. BUYER, the salesman cannot be expected to understand your needs, save only to the extent that you inform him.

* * *

MR. BUYER, you should not take your money out of the bank where it is staying at 4 per cent. and trade it off for an automobile of the kind that will not give you an equal return.

* * *

MR. BUYER, you will be able to more than double your income if you buy and use an automobile, but it must be the kind that you can use.

* * *

MR. BUYER, if you are a doctor, and your radius of travel is now one mile, making the area four square miles, you can easily extend this radius another mile, which will give you an active area of 16 square miles, but you do not have to incur the cost of a touring car.

* * *

MR. BUYER, if you are a bank clerk on a small income, you can get enough fresh air through the intelligent use of a $500 runabout to fit you out for the presidency of a bank.

News Section

HAPPENINGS OF THE WEEK IN VARIOUS SECTIONS OF THE COUNTRY AS GATHERED BY THE 84 SPECIAL WRITERS AND CORRESPONDENTS OF "THE AUTOMOBILE"

Palace Show Will Be Thrown Open to the Public on New Year's Eve—The Salon Follows on Monday Night—The Big Garden Display in the Throes of Active Preparation—News of the Other Shows—Chicago's Space Assignments Announced—Private Exhibitions Will Be a Feature of the Metropolitan Show Season—Jersey's Inter-Club Row Takes on a New Phase—News of Maker and Dealer in Many Fields, Etc.

Palace Show First to Greet New York Motordom

COMING first on the list of metropolitan automobile shows, the Eleventh Annual International Exhibition, which will open at the Grand Central Palace New Year's eve, is awaited with considerable interest. The show, according to announcement, has been promoted by the American Motor Car Manufacturers' Exhibit Association, although the organization has not been completed. The managers, Messrs. Longendyke and Conant, encountered many difficulties in the preliminary work, but succeeded in assembling about seventy automobile manufacturers and district agents on their rolls.

Fore-doors are most in evidence. Among the makers who have adopted this type of body are the Alpena, Warren, Washington, Michigan, Abbott-Detroit, Parry, Unit, Velie, Lion, Paterson and others. Torpedo bodies, shaped like big projectiles with oval openings for passengers, are shown by numerous companies. There is more of tendency to the hooded dash than formerly. Several concerns will show convertible bodies, thus making one chassis serve for pleasure car or light truck with small effort. The commercial cars will be represented by a large line of trucks of various sizes, powers and purposes.

The accessory exhibit will not be large, but will be representative of a number of interesting features of the industry.

The feature of the show will be the exhibition of aeroplanes, several record-making and breaking machines having been secured by the management.

The management has announced that a contract calling for $1.600 has been made with a 35-piece orchestra.

The full list of car manufacturers who are down for space includes the following names:

Abbott Motor Co.	Detroit, Mich.
American Motor Truck Co of Michigan	Detroit, Mich.
Atterbury Motor Car Co.	Buffalo, N. Y.
American Motor Truck Co.	Lockport, N. Y.
H. H. Babcock Co.	Watertown, N. Y.
Louis J. Bergdoll Motor Co.	Philadelphia, Pa.
C. S. Baeder (Lexington Motor Car Co.)	210 W. 76th St., New York
Chase Motor Truck Co.	Syracuse, N. Y.
Chicago Pneumatic Tool Co.	Chicago, Ill.
Cortland Motor Wagon Co.	Cortland, N. Y.
Clarke-Carter Auto Co.	Jackson, Mich.
Columbus Buggy Co.	Columbus, O.
J. M. Cunningham & Sons Co.	Rochester, N. Y.
Findlay Motor Co.	Findlay, O.
Gramm Motor Car Co.	Bowling Green, O.
Harry S. Houpt Mfg. Co.	2010 Broadway, New York
Imperial Auto Co.	Jackson, Mich.
Johnson Service Co. (Commercial)	Milwaukee, Wis.
Johnson Service Co. (Pleasure)	Milwaukee, Wis.
Krit Motor Car Co.	Detroit, Mich.
Lion Motor Car Co.	Adrian, Mich.
Metz Company	Waltham, Mass.
Martin Carriage Works	York, Pa.
Michigan Buggy Co.	Kalamazoo, Mich.
New Haven Truck and Auto Works	New Haven, Conn.
Oliver Motor Car Co.	Detroit, Mich.
Albert T. Otto (Saurer Truck)	1876 Broadway, New York
Owosso Motor Co.	Owosso, Mich.
Parry Auto Co.	Indianapolis, Ind.
W. A. Paterson Co.	Flint, Mich.
Pennsylvania Motor Car Co.	Pittsburg, Pa.
Penn-Unit Car Co.,	Allentown, Pa.
J. M. Quinby & Co. (Isotta Car)	Newark, N. J.
Roader Car Co.	Brocton, Mass.
Scioto Auto Car Co.	Chillicothe, O.
Spencer, Llano, Briner Co. (Petrel Car)	1777 Broadway, New York
Staver Carriage Co.	Chicago, Ill.
Warren Motor Car Co.	Detroit, Mich.
West Side Garage and Motor Co. (Seitz Commercial Car)	160 W. 101st St., N. Y.
Whiting Motor Car Co.	Flint, Mich.
C. W. Kelsey Mfg. Co.	Hartford, Conn.
Crawford Automobile Co.	Hagerstown, Md.
Coleman Motor Car Co.	Ilion, N. Y.
Cass Motor Truck Co.	Port Huron, Mich.
Victor Motor Truck Co.	Buffalo, N. Y.
Otto Motor Car Co. of N. Y. (Otto Car)	1964 Broadway, New York
The Only Car Co.	1919 Broadway, New York
Alpena Motor Car Co.	Alpena, Mich.
Henry Motor Car Sales Co., (Henry Motor Car Co., Muskegon, Mich.)	Chicago, Ill.
Correja Motor Car Co.	1851 Broadway, New York
Gaylord Motor Car Co.	Gaylord, Mich.
Geneva Wagon Co.	Geneva, N. Y.
Richard B. Darre (Cyklonette)	2 W. 90th St., New York
The De Tamble Motors Co.	Anderson, Ind.
L. M. Hartman Sales Agency (Hart-Kraft Commercial Car)	York, Pa.
Maytag-Mason Motor Co.	Waterloo, Ia.
Ideal Motor Co. (Sage & Creighton Trucks)	701 Grand River Ave., Detroit, Mich.
Velie Motor Vehicle Co.	Moline, Ill.
Colt-Stratton Co. (Cole "30")	New York, N. Y.
Flanagan Motor Car Co. (Monitor Trucks)	679 73d St., Bklyn., N. Y.
Otto Motor Car Co. of New York (Crown Truck of Milwaukee)	1964 Broadway, New York
Carter Motor Car Corporation	Washington, D. C.
Beyster-Detroit Motor Car Co.	Detroit, Mich.
McFarlan Motor Car Co.	Connersville, Ind.
Paige-Detroit Auto Co.	Detroit, Mich.
International Harvester Co. of America	Philadelphia, Pa.
Clarke-Norwalk Co.	1236 Pacific St., Brooklyn

The F. A. L. car will not be shown and the Carhartt Automobile Corporation and the Kelley Motor Truck Company have withdrawn. Whether the Parry Automobile Company will show or not was not announced by the management. The Black Crow car will also be among the absentees, but aside from these there will be a large number on show.

The aeroplane exhibits are to be shown in the names of the following and include seven types:

D. & F. Radiator
U. S. McAdamite Metal Co.
E. J. Willis
Dean Mfg. Co.
Elbridge Engine Co.
Vanco Mfg. Co.
Aerial Equipment Co.
American Aero. Supply Co.
Grady Mfg. Co.
Am. Met. Fusing & Cutting Co.
Na. Finkelstein

The list of accessory makers and handlers who will show are as follows:

Economy Tread Co.
A. H. Kasner
Standard Metal Works Co.
William R. Winn
A. J. Meyers, Inc.
Auto Club of America
Calmon Asbestos & Rub. Wks.
New York Coil Co.
Rector Eng. Co.
B. E. Mfg. Co.
Automobile Supply & Mfg. Co.
Troy Sunshade Carriage Co.
John F. Galvin
A. H. Green & Co.
Fabrikoid Works
Sterling Machine & Stamp. Co
Bushey Demountable Rim Co.
Auto Wind Deflector Co.
American Pedal Co.
Behringer Radiator Co.
F. Z. H. Part Co.
John W. Rapp Co.
Safety Tire Co.
Ross Heaton Mfg. Co.
Bristol Co.
C. A. Buffington
Wm. C. Myron

Poultry Show to Give Way to Automobiles

WITH only a little over a week more before the opening of the show of the Association of Licensed Automobile Manufacturers at Madison Square Garden, preparations for the event are humming along with intensity.

Piled in and near the building, which is occupied at present by a poultry show, are vast heaps of structural steel and temporary lattice work which will be used to form the interior alterations of the big building.

Only part of the building is being used for the poultry exhibit and everywhere else within the structure gangs of men are busy making ready for the automobile show. Already the basement is practically complete and ready for the installation of the numerous exhibits that will be displayed there.

The Rathskellar will be particularly complete this year, as in fact will be every other detail of the show.

Each beam and girder to be used in bringing about the metamorphosis of the Garden has been carefully numbered and a place for it is all ready and as soon as the men can get to work the steel will be placed in quick time.

None of the exhibits are ready at this time, but the installation of the cars and accessories is the least difficult portion of the undertaking. When all is ready to put them in their places it will be only a matter of a few hours to accomplish what seems like an enormous job.

During the first week of the show it has been estimated that there will be at least 700 factory salesmen assigned to the exhibition. In past years some fault has been found with the men who were supposed to be expert salesmen. It was frequently noted that the men in many of the spaces did not seem to have an intimate knowledge of the goods on display. In recent shows this has been corrected, and this year the men who will be stationed at the various booths to explain the lines to possible customers will be drawn from the very flower of the selling forces of the factories. In addition to this big force of salesmen, there will be experts by the hundreds and officers by the scores to tell the public all about their exhibits.

The total number of persons who will be engaged throughout the week in the building is estimated at about 2,000.

Invitations, handsomely engraved, are being made ready for mailing, and special efforts are being exerted to make the opening night by far the greatest in point of attendance in the history of the automobile show.

The co-operative feature of the A. L. A. M. function has been brought emphatically to public notice this year. General Manager Reeves, in speaking of this feature, said: "The profits that may arise from the show go back to the exhibitors after the bills are paid. The dividends in the past have been material, and I have no doubt that they will be comfortable this time."

Salon Cars Represent Olympia and Paris Types

MOST of the concerns that will exhibit in the Importers' Automobile Salon at the Hotel Astor ballroom from January 2 to 7, have cars or chassis that won favorable comment at the recent Olympia show in London, or the Salon in Paris.

The Renault exhibit will include two polished chassis shown at both London and Paris, a 25-35 horsepower American Special and a 35-45 horsepower, both four-cylinder models. The Demarest exhibit will include a 40-horsepower Itala show chassis that was displayed at both London and Paris, and an English Daimler chassis that was displayed at Olympia. The De Dion exhibit will include two chassis of models built especially for American roads, the De Dion-Bouton firm making a practice of preparing chassis for each country in which it sells cars.

The Benz exhibit will include the racer with which David Bruce-Brown won the Automobile Club of America's Grand Prize gold cup and a show chassis of a 50 horsepower shaft drive model.

The Panhard exhibit will include a number of the new valveless engine models and it is expected that a 30-horsepower valveless car, with a Labourdette limousine body, shown at London and Paris, will get here in time for the Salon. The C. G. V. exhibit will include a six-cylinder 18-24-horsepower C. G. V. limousine shown at Paris and a four-cylinder 12-horsepower Zedel inside drive landaulet. The limousine body was built by Kellner and is finished inside in mahogany.

The Napier exhibit will include two show cars that were displayed at the Olympia show in London, both models being fitted with removable wire wheels. The Darracq exhibit will include a six-cylinder 60-horsepower touring model, with a seven-seated Rothschild body that was shown at both London and Paris and a four-cylinder 20-24-horsepower model brought here especially for the Salon. The Quinby exhibit will include two Isotta-Fraschini models that were shown at the Paris Salon.

The Peugeot exhibit will include models from the Paris Salon. The S. P. A. exhibit will include cars sent from Italy especially for the Salon in this city. The S. P. O. exhibit will include a runabout and Vinot town car, the coachwork having been mounted here especially for the Salon.

Managing Director Wright Is in Town

The latest promise in the shape of foreign-made automobiles comes with the appearance of Warwick Wright, managing director of the English firm which handles the entire output of the factory where the Metallurgique car is made. When Director Wright paid a visit to THE AUTOMOBILE he disclosed enough of his immediate future plans to indicate that he will enter the Metallurgique car in the Salon, and a limousine fitted with Louis XIV furnishings will be here on time for the opening of the Salon. This limousine is one of the latest and most elegant creations of the firm, and it differs in many respects from the general run of cars of this character, notable among which mention is made of a wood finish for the interior, clusters of electric lights for illuminating purposes, and comfort is assured to the occupants of the limousine, due to the fact that the cushions are from 18 to 22 inches deep. It will be understood that this particular Metallurgique model will be something worth going to see when it is stated that the price is about $18,000. The body is the work of craftsmen in the establishment of Vandan Plas. It would seem that there is quite a market abroad for these rather high-priced automobiles, the output of the Metallurgique Company being something like 3,000 cars per annum. It is the idea to establish an American branch for this well-known make of automobile, although it is unlikely that there will be a very large sale for such costly automobiles.

News Notes of the Coming Automobile Shows

CHICAGO, Dec. 26—Following is the complete official list of firms, corporations and individuals to exhibit at the forthcoming national automobile show:

Pleasure Vehicle Section

January 28th to February 4th, 1911

AUTOMOBILES, COLISEUM (Main Floor)

A1. Winton Motor Carriage Co.
A2. Buick Motor Co..

All Space Taken at Cincinnati

CINCINNATI, O., Dec. 28—The directors of the Cincinnati Automobile Dealers' Association announced to-day that the exhibition space arranged for in Music Hall by the association for the annual automobile show to be held from February 20 to 25 has been more than subscribed.

The figures compiled by the executive committee to-day indicate that there is 30 per cent. more floor area desired than is available.

This is an extraordinary condition, as the space reserved for the show this season is greater than that of any previous exposition of this kind in Cincinnati. In order to accommodate all the applicants, an adjustment of the spaces reserved will have to be made. For that purpose a meeting of the executive committee and the exhibitors will be held Saturday afternoon at 2 o'clock at the headquarters of the association. The hearty cooperation of the automobile club and all local automobile interests is responsible for the happy results.

Dates for Baltimore Exhibition

BALTIMORE, MD., Dec. 26—The Baltimore Automobile Show from February 21 to 25, inclusive, at the Fifth Regiment Armory, will be conducted jointly by the dealers and the Automobile Club of Maryland. This decision was reached at a meeting of the committees representing the dealers and the club and at which the sub-committees to handle the show were named.

The sub-committees selected are composed of two members each, one from the dealers' organization and one from the club.

The sub-committees are as follows: Lighting—Joseph M. Zamoiski and H. J. Sturdevant. Decorations—Joel Nassauer and W. L. Duck. Tickets and advertisements—Thomas Young and C. L. Callahan. Rental and floor space—H. M. Luzius and A. Stanley Zell. The club committee at the meeting was composed of Joel G. Nassauer, Thomas G. Young, Joseph M. Zamoiski and H. M. Luzius. The dealers' committee consisted of A. Stanley Zell, C. L. Callahan, Leo A. Shaab and William Duck.

A big feature of this year's show will be the commercial display, while the accessories and airships will be well represented. On the Friday or Saturday night before the show a big banquet will be held for the dealers and club members.

British Columbia to See Show

VANCOUVER, B. C., Dec. 26—Vancouver, B. C., is to come to the front with an automobile show, to be held in the big horse show building for eight days, from Friday, January 27, to Saturday, February 4. This will be the first automobile show ever held in British Columbia, and is to be a comprehensive display of pleasure cars, commercial cars, accessories and motor boats.

The Vancouver Motor Trade Association, Ltd., which has charge of the show, realizes the value of the show from the standpoint of the general public as well as the dealers.

During 1910 the sale of automobiles in Vancouver and British Columbia increased 120 per cent. over the previous year. The dullness noticeable in commerce in some portions of the United States has had no effect on trade across the line, and conservative business men there are preparing for a big year to come.

Space Is Going at Pittsburgh

PITTSBURGH, PA., Dec. 26—Floor plans for the annual show were first given out on December 9 and thus far 38 makes of pleasure cars and 14 makes of trucks and delivery wagons have signed and selected space. Inquiry from manufacturers not now represented in this district indicate that there will not be enough space to go around.

Pittsburgh's three automobile factories—The Pittsburgh Motor Car Co.; the Penn Motor Car Co., and the Packers' Truck Co.—will show their products for the first time at this show.

Inquiries for accessory space have been received from all automobile centers.

Will Meet at Milwaukee Show

MILWAUKEE, Dec. 26—A number of important meetings will be held in Milwaukee, Wis., during the third annual motor show in the Auditorium, January 14 to 20. The Wisconsin State Automobile Association will hold its semi-annual or winter meeting and the Wisconsin Retail Automobile Dealers' Association will hold its first annual meeting.

Private Exhibitions Show Season Feature

SEVERAL of the makers of automobiles represented in New York whose cars will not be shown at either of the big displays in the Garden, Palace or the Hotel Astor, will conduct exhibitions in their salesrooms during the show period.

Among these are the Rambler, Ford, Carhartt, Black Crow, S. G. V. and Fiat. The Rambler line, consisting of a landaulet, towncar, coupé, touring car and chassis, will be shown at the rooms of the Rambler Automobile Company, of New York, 38 West Sixty-second street. The exhibition will open January 7 and continue to January 21.

The Ford Motor Company, 1723 Broadway, will show runabouts, touring cars, coupé and a stripped chassis, the exhibition covering the two weeks of the Garden affair.

The Carhartt Auto Sales Company has engaged an extra room at the Plaza Hotel for exhibition purposes during the metropolitan show season. In addition to the five-passenger, fore-door model now on display, there will be shown a chassis and a limousine.

Otto F. Rost, the Eastern representative of the Crow Motor Car Company, has issued elaborate invitations to the trade to attend the exhibition of Black Crow cars at his salesrooms, 1595 Broadway, throughout the Garden show. He will display a racy roadster and a Dreadnought.

The "S. G. V." cars, although licensed under the Selden patent, will not be shown at the Garden.

Instead they will have a private exhibit in the reception room of the Waldorf, at the Thirty-third street entrance, for ten days, from January 5 to January 14, inclusive, thus exhibiting for three days of the Importers' Salon and the entire week of the Garden show.

The Fiat Automobile Company will conduct a show from January 2 to 21 at its salesrooms, near Columbus Circle. A full line of 35-horsepower cars built at the Poughkeepsie works of the company will be displayed, in addition to several of the Turin models. The line will include a chassis, seven passenger touring car, runabout that can be converted into a four passenger car, several types of fore door cars and others.

Students to Visit Brooklyn Show

For the first time in this country, at least, a class of students in motoring will be seen in session at an automobile show during the exhibit of the Brooklyn Dealers' Association, at the Twenty-third Regiment Armory, in February.

The Bedford Branch, Y. M. C. A., was the first to take space outside of the dealers, with the idea of showing sectional parts of engines, etc., books and charts. Supervisor C. F. Shulz decided to take one section of each class to the armory, four nights a week, shifting the division regularly. It is possible, too, that the afternoon classes may be similarly transferred.

Auto Associations to Meet at Show

During the coming A. L. A. M. show there are seven important meetings of organizations scheduled to take place. These run all the way from the conventions of important committees to annual meetings of big societies and a series of great banquets.

On January 10 the executive committee and the national board of A. A. A. will assemble for a series of open meetings that will continue until the close of the show.

January 11 will find the Executive Committee of the A. L. A. M. in session at headquarters, 7 East Forty-second street. The same day the Executive Committee of the National Association of Automobile Manufacturers will convene and the organization of the National Show will be reviewed.

In the morning of January 11 the Society of Automobile Engineers will meet at the Automobile Club of America and will hold sessions during the day; banquet in the evening, and continue the work of the convention on the following day.

January 12 the Board of Managers of the A. L. A. M. will meet. During the evening the annual banquet of the association will be given at the Hotel Astor.

On January 13 the Motor and Accessory Manufacturers will enjoy a sumptuous banquet at the Waldorf-Astoria, after business meetings at headquarters, 17 West Forty-second street.

Altogether the week will have a distinct social tinge.

Fine Roads for British Columbia

VANCOUVER, B. C., Dec. 26—The present government of British Columbia, headed by Hon. Richard McBride, is making a record in road building which, taking into consideration the population of the province, is excellent.

With an estimated population of a little over 300,000, the British Columbia government will expend something like $4,500,000 this year in the building of roads. All this money is drawn from the treasury and is not specially levied for any one period.

The argument is that even with the other vast natural resources of the province, agriculture must in the final event be the mainstay of its prosperity, and agriculture first of all must have good roads.

Among the many roads now under construction under the supervision of Thomas Taylor, Minister of Public Works, is the road from Alberni district through to Ucluelet and Clayoquet on the west coast. This road will be a marvel of wonderful scenery and at the same time will open up large tracts that will become excellent agricultural country. This road will cross rivers and extend along the lakes of the central and western portion of Vancouver Island and from a point of picturesque attractiveness will afford a never-ending variety of scenery to the lover of outdoors.

New Traffic Law at Spokane

SPOKANE, Dec. 26—Spokane at last has a traffic law, and motorists who have been talking "rules of the road" and comparing Spokane unfavorably with other cities for the past few months are awaiting the practical application in this city of the rules which regulate the conduct of horses and horseless vehicles on the public highways.

Fifteen miles per hour has been fixed as the rate of speed within the fire limits, and 20 miles without.

Portland Club Defies A. A. A.

PORTLAND, ORE., Dec. 26—The Portland Automobile Club will hold a race next summer during the annual Rose Festival, and it will be without the sanction of the A. A. A.

After a year of rest the Portland club has taken some definite steps on the announcement of a policy for the coming year and from all indications it will be a busy one.

Streator Co. Puts in Sprinklers

STREATOR, Ill., Dec. 26—The Streator Motor Car Company has just completed the installation of a sprinkling system in its plant. This system will sprinkle and make fire-proof five and one-half acres of buildings.

The buildings are all fire-proof in construction, but this additional protection has been taken on account of the stock.

Jersey Inter Club Row Has After-Clap

NEWARK, N. J., Dec. 27—Summoned to a special meeting Wednesday night, the members of the New Jersey Automobile and Motor Club will act upon a resolution to be offered on behalf of the sympathizers with the Associated Automobile Clubs of New Jersey to overthrow the recent action of the club in splitting away from the state body and the A. A. A. A big attendance has been indicated and all around the meeting holds out much promise of lively doings.

The big Newark club cut away from the A. A. A. through the action of its trustees who objected to what was described as taxation without representation and from the state organization because, while it is claimed that 60 per cent. of the membership in the state body was furnished by the Newark club, the plan of the club for prospective legislation was not received kindly by the state body.

The crux of the whole matter seems to be the failure of a law to pass the Jersey legislature at the last session, which was rejected by the associated clubs, it is said, because a rider was attached to the bill, providing for the free admission of outsiders to Jersey for thirty-two days each year, conditioned upon the registration of such visitors and the granting by them of a power of attorney to the Secretary of State, giving him the power to accept service of legal processes in the event of violation of the laws.

The administration of the Newark club points out that this law should not have been declined, because it was a step in the right direction and a concession to motordom even in New Jersey.

It is claimed that in the event of the passage of the law, New Jersey motorists would not now be obliged to take out New York and Pennsylvania state licenses and thus would have been saved much annoyance and expense.

On the other hand, the representatives of the Associated Clubs declare that there is a deep, dark political plot underlying the whole situation.

They state that no self-respecting citizen of Jersey would countenance such a law as was presented, where the visitors would be obliged to surrender some of their legal rights and privileges in order to tour in the state.

The administration of the club goes into the meeting to-morrow night with much confidence that the action of the trustees will be sustained and that the severance from the state body and A. A. A. will be approved. The opposition is hopeful of rejecting the resolutions and a stiff battle is impending.

No matter which way it turns out there is likely to be a new club in Newark. If the administration of President Clarence H. Bissell is sustained there certainly will be made a determined effort to organize a new club, and if it is defeated there is already talk of reorganization.

Gould to Finance Richmond Road

WASHINGTON, D. C., Dec. 24—Washington motorists are greatly interested in the news that Frank J. Gould, the New York millionaire, has donated $100,000 for the construction of a highway between this city and Richmond, Va. The only proviso he makes is that the route is to be so arranged as to include Fredericksburg, Va. According to the announcement, Mr. Gould leaves the matter of selecting the route of the proposed highway to the motorists of Washington and Richmond.

President W. S. Duvall, of the Automobile Club of Washington, stated that as soon as the club receives official notification of the Gould gift, it will immediately appoint a survey committee to select the route and after the work is completed will lay it before the financier. In addition, the club, acting with the Automobile Club of Richmond, will form a finance committee to raise a portion of the total sum needed to build the highway.

"The idea of building a public highway between Washington and Richmond," said President Duvall, "will meet with the approval of all Washingtonians interested in good roads, as well as the great mass of motorists in the eastern part of the country. The club is prepared to join hands with the business men of the city in an effort to raise funds needed to complete the work that Mr. Gould's donation will inaugurate. A road of this kind has been one of the ancient needs of both Washington and Richmond."

Framing New Nebraska Law

LINCOLN, NEB., Dec. 26—Addison Wait, the new secretary of state of Nebraska, has drawn up a number of important amendments to the present automobile law of this State. He will have this introduced into the legislature which meets in January.

His proposed law will change the annual license fee of $1 to one of $5 for automobiles and $2 for motorcycles, but these fees are to be in lieu of all other state taxes as levied by the state board of equalization and assessment. One-half is to be paid by the secretary of state to the state treasurer for the benefit of the state general fund, and the other half to be distributed on the first of each year to each county on an equal per capita basis, according to the national census for the year 1910, the latter fund to be used for the improvement of the public highways in said counties under, and by the supervision of, the authorities provided by statute.

Auto-Sleigh at Kalamazoo

KALAMAZOO, MICH., Dec. 26—Sleigh riding in automobiles is the latest fad in Kalamazoo. Thomas H. Midgely originated the idea in this city. Mr. Midgley had his Cartercar equipped with runners on the front wheels. The runners are slid along the snow by the power of the rear wheels.

The rear wheels serving as drive wheels carry anti-skid chains and the machine runs well. The car attracted much attention and stirred up considerable comment when first seen on the streets.

For Good North Carolina Roads

WADESBORO, N. C., Dec. 26—With U. B. Blalock as president, the Anson County Good Roads Association has been permanently organized, with the idea of promoting a number of good roads throughout the county.

A bond issue of $250,000 is proposed and, judging by the enthusiasm of the citizens, bids fair to be easily carried.

Hoxsey's New Altitude Record.

LOS ANGELES, Dec. 26—Arch Hoxsey, in a Wright aeroplane, made a new world's altitude record to-day, when he flew over two miles in the air. His barograph showed 11,474 feet, something over 1,000 feet higher than the mark set last week by Legagneux at Pau, France.

License Money for Roads

LANSING, MICH., Dec. 26—The various automobile clubs of the State are to join forces with good roads officials in an effort to have the Legislature pass a bill similar to the law which formerly was in effect, turning over to the State highway commissioner at least a portion of the money secured from automobile licenses. This money is to be used in promoting the Michigan Good Roads movement.

News of Maker and Dealer in Many Fields

DETROIT, MICH., Dec. 26—Announcement is made that C. A. Magee, of St. Louis, has been appointed auditor of the General Motors Co. and will assume his new duties the first of the year. He has been identified with the Laclede Gas Light Co., of St. Louis, for some years as comptroller. Mr. Magee will have his headquarters in Detroit, where the general offices of the company are to be located.

Directors of the Lozier Motor Co., at the recent annual meeting, elected the following officers: President, Henry A. Lozier; vice-presidents, Gilbert W. Lee and Fred C. Chandler; treasurer, Charles H. Hodges; assistant treasurers, Samuel Regar and Henry H. Sanger; secretary, Cyrus E. Lothrop. Members of the executive committee were all re-elected, as follows: George G. Booth, Charles H. Hodges, Lewis H. Jones, Gilbert W. Lee, Cyrus E. Lothrop, Charles B. Warren and Henry A. Lozier, ex-officio.

Harry Knott, who formerly was connected with the Frank Seaman advertising agency in New York, is the new advertising manager for the E-M-F Co., filling the vacancy caused by the resignation of E. LeRoy Pelletier last summer.

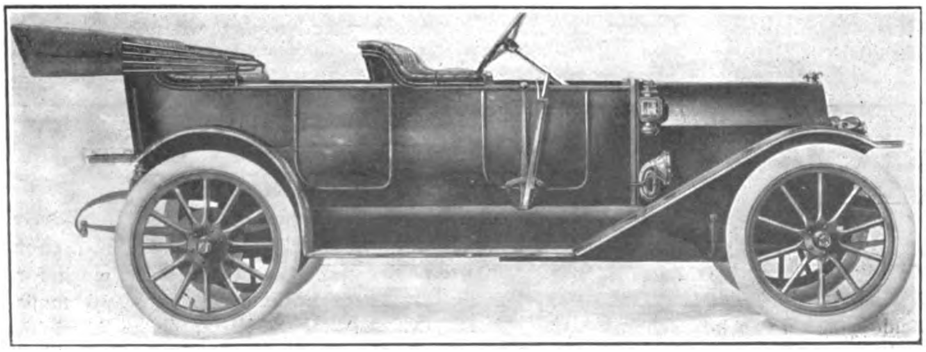
Vernon C. Fry, whose purchase of the assets of the bankrupt Detroit-Dearborn Motor Car Co. was noted, announces that he will continue the business with the present facilities, turning out the same kind of cars that were manufactured by the old company. A new corporation will be organized at once, which will be headed by Mr. Fry as president. A company is in process of formation for the manufacture of a puncture-proof inner tube, invented by E. A. Marsh. The tube, on the tread side, is constructed of coils, which permit much greater elasticity than is the case with the ordinary tube.

Work is being pushed on the extensive plant of the Universal Motor Truck Co., which is being erected at the Grand Trunk railroad and Theodore street. It is hoped to have it ready for occupancy by January 15. The site comprises three acres. The main building will be 84 by 258 feet, four stories high and of reinforced concrete construction. It is being built on the flat-slab system, without beams or girders. The company is capitalized at $350,000.

Sampson "35" Looks Smart

The Alden Sampson Manufacturing Company will exhibit the Sampson "35" at the Garden Show. This is the first touring car the Sampson Company has built. It is also the newest member of the United States Motor Company family of passenger cars. The price is $1,250.

A man of average size can rest his elbow on the back of the tonneau seat, which is the highest part of the new car. Foredoors are another feature. It is built on long straight lines. The body line and hood line are one.



Sampson "35"—latest of the United States Motor Company's family

Auto Parts Company Expands

DETROIT, MICH., Dec. 26—The Auto Parts Company has purchased entire plant of Widman & Company, furniture manufacturers, occupying an entire block on Grand Trunk railway, for $65,000 and has started moving in.

The purchase greatly increases the company's facilities, making a total floor space of 60,000 square feet instead of 20,000 square feet. The officers are: President, Alfred O. Dunk; secretary, Lewis A. Austin; treasurer, V. C. Anderson.

Southwestern Dealers to Organize

KANSAS CITY, Dec. 26—The Kansas City Automobile Dealers' Association is engaged in forming the Southwestern Automobile Dealers' Association.

About 6,000 letters have been sent out and a meeting has been arranged to take place in Kansas City during the fifth annual automobile show, the week of February 27. The exact date of the meeting has not as yet been decided upon, but will probably be about March 1.

Lawton Maxwell Agency Moves

LAWTON, Okla., Dec. 26—Thompson's Garage, Lawton, Okla., is removing to 618-620 D avenue this month, having bought out the McDuffie Motor Car Company, formerly located there. Thompson's has been in Lawton since 1902, and is the Maxwell agency for Southwest Oklahoma.

The new location is in a cement building, 50 by 140, with 50 by 40 basement, and is up-to-date in every line of garage service.

Father of Nickel-Chrome Steel Dead

Otto Thallner, inventor of nickel-chrome steel, and known all over the world as an authority on steel, died at his home in Reinscheid-Hasben, Germany, December 11, after a protracted illness.

Mr. Thallner was an ardent advocate of the electrical process of making steel, and for a number of years held the position of chief metallurgist of the Heil Works, Rich Lindenberg.

Briggs New Brush General Manager

DETROIT, Dec. 26—President Frank Briscoe, of the Brush Runabout Company, has appointed Claude S. Briggs to the position of General Manager of the Brush forces.

Mr. Briggs is, perhaps, best known to the automobile trade as the principal organizer and first president of the Krit Motor Car Company, a Detroit concern incorporated in 1909. In July, this year, Mr. Briggs joined the business staff of the Brush Runabout Company.

Brown-Lipe Divides Line

SYRACUSE, N. Y., Dec. 26—On January 1 the differential gear department of the Brown-Lipe Gear Company will be operated in the new factory of the Brown-Lipe-Chapin Company, but a short distance from the old factory.

The Brown-Lipe Gear Company owns a controlling interest in the Brown-Lipe-Chapin Company.

Revelations Regarding the Rubber Industry

WHILE no serious root disease has attacked the rubber trees in the Malaysia plantations, there are great armies of white ants to be contended with. These industrious little creatures manage to burrow in the soil of the estates with all the energy of their black kin of other countries. They have their officers who cut out their work for them and the "privates" delve away while their superiors look on, the slaves meanwhile scurrying about as though they were controlled by the inflexible rules of a labor union. The fondness that the white ants of the Malaysia territory show for the roots of rubber trees as a steady diet has the effect of devastating whole plantations at a time, and efforts are on foot to devise plans for the extinction of the white pests.

Inasmuch as the Philippines lie within the zone of the rubber belt, if we consider the location of the Malay States, the soil is especially adapted to the cultivation of plantation rubber. The five thousand Para rubber seeds recently ordered to be sent from Singapore are intended to start the industry on the right track. Wild rubber is being gathered in the Philippines at the present day. The method is to cut down the trees, instead of tapping them for the latex, as is being done in the Bartica section of British Guiana and in the Malay States. The proposed extension of the railway system throughout the islands by the United States government will, it is expected, have the effect of stimulating the plantation rubber industry to a paying commercial basis.

Experts claim that in time the oil produced from rubber seeds within the zone of the Malay States will become a marketable commodity and as such will develop into an important commercial factor. The Botanical Gardens in Singapore, which are regarded as being the birthplace of the plantation rubber industry of Malaysia, and which have furnished great quantities of rubber seeds to the plantations in other sections, seem to be incapable at the present time to supply the demand for Hevea seeds, and it will no doubt be spring before it is possible to fill the orders that are now on file.

While it is true that the natural resources of the Province of Mozambique, Portuguese East Africa, are but slightly developed, it is a fact that wild forest rubber has been exploited here commercially for upward of half a century. Within the last few months the possibilities of developing the trade in rubber so that it shall become a greater source of revenue have merged into bright probabilities. Various species of the root called landlophia have been found growing in profusion in Lourence Marquez, which is in the extreme south of the Province; also as far north as Ibo, the very extreme northern end of Portuguese East Africa. The plan is being exploited extensively from Inhambane, Biera, Quelinane, Moma, Angoche and Ibo, respectively, the plants in the case of the last three named places being handled through the town and island of Mozambique. The landlophia grows south of Zambezi. As a vine it frequently attains to great length, and many specimens are found as thick as a man's arm. There is also the vine distinguished as landlophia kirkii, which is capable of producing rubber after it has grown to be one inch in diameter. The method of tapping is by a series of long blazes.

What is said to be the largest rubber plantation in the world, containing twenty-nine square miles, is located in the Department of Soconusco, Mexico. It is situated at an elevation of from fifty to three hundred and fifty feet. It consists of seven million trees. The first plantings were made in the shade, as the planters of that day deemed it necessary to protect the young plants from the excessive heat. But it has since been decided that shade is not a necessary factor in the rubber plantation industry. Several trees that were planted by the original owners now form "a beautiful forest, with an absolutely clear 'floor,' and there are numberless seedlings" within the space. The plantation is divided into areas, or blocks, of about 1,148 feet on each side, the individual areas containing approximately thirty and one-half acres. Each acre is intended to hold 300 trees. Avenues twenty-four feet wide run between the respective areas. Small hills are thrown up six feet apart as soon as possible after the work of clearing and burning off the waste and undergrowth is finished. Lines are run every twelve feet, thereby producing plats of ground each six feet by twelve. The tappers go out at 2 o'clock in the morning and by sunrise they complete their task, the early hour being chosen because the cool morning temperature aids the flow of the latex. An expert tapper will get on an average of five gallons of sap, representing five pounds of rubber.

Down in British Guiana, where the Colonial government is interested in the cultivation of plantation Para rubber, 250 acres of the hills out of the 15,000 acres have been planted with sisal and 200 more acres will soon be planted. Along the division lines 3,200 Para rubber trees have been planted and clearings are being made as fast as possible to plant the remaining part of the territory with rubber trees.

The first tapping of plantation rubber trees in British North Borneo, the whilom camping-ground of the vicious "head-hunters," took place on June 11, 1910. The operation was absolutely successful, and the latez flowed freely. The occasion marked a new epoch in the development of the interior of this Rajah-ruled country. Appropriate celebrations were observed. One factory has been built and plantation rubber is already being exported as a commercial commodity.

In certain parts of the Isthmus of Tehuantepec, Mexico, the ground is prepared for planting after a system of staking off the plats in the areas, instead of throwing up the soil into small hills.

Many coffee plantations in Dutch East India have changed hands and have been laid out into rubber plantations since the industry was introduced there. The capital involved is mainly foreign. The sum of $33,000,000 has been invested. People criticise the enterprise pro and con. By some it is considered gratifying that the new industry is proceeding on a large scale. They claim that its effect upon the general prosperity of the Dutch Colonies will result favorably. Other people do not look upon the enterprise in such a charitable light.

It is estimated that by 1915 the facilities of the Malay States will be sufficient to warrant the production of 90,000,000 pounds of plantation Para rubber yearly.

Dr. Carlos Spegazzini, government botanist, is authority for the statement that guayule rubber of the sort found in Mexico does not exist in Argentina. He says that the rubber found in the latter country is a growth of guayule arbustivo, known as yarillas. The product being poor in rubber and rich in resin, it is only fit for use in the manufacture of varnishes.

Fine Para rubber is the standard in the manufacture of automobile tires. No other rubber will withstand the strain and the wear and tear.

Plan Country-Wide Race Circuit

SPOKANE, WASH., Dec. 26—Promoters and supporters of the international automobile race meeting, for purses aggregating $40,000, in Spokane next summer, are enthusiastic boosters for the grand circuit of speedways and they will urge the projectors to include Spokane in the circuit, pledging financial and other support to the plan.

Waldo G. Paine and R. W. French, who is one of the promoters of the international meet in Spokane, both declare that the people of this city and the rich district tribuary to it will give every possible assistance to the plan.

News in Brief from the East, West and South

BROOKLYN, Dec. 26—Open house will be kept by the Long Island Automobile Club on New Year's eve.

NEW YORK, Dec. 26—Fred Manning, formerly with the Warner Instrument Company, has joined the sales department of the National Motor Vehicle Company.

SAN FRANCISCO, Dec. 26—The Frank O. Renstrom Company is now located at Van Ness & Golden Gate avenues. The company acts as agent for the Kline-Kar.

NEWARK, N. J., Dec. 26—The Rt. Rev. John J. O'Connor, bishop of New Jersey diocese, was presented with a Lozier limousine by the members of his diocese. The car was a Christmas gift.

CHICAGO, Dec. 26—The Badger Motor Car Company, of Columbus, Wis., has secured quarters at 1223 Michigan avenue for a general sales agency and F. W. Stewart, sales manager, will be in charge.

NEW YORK, Dec. 26—Harry S. Houpt has announced that he will assume charge of the Alco sales department in the metropolitan district. Mr. Houpt will be assisted by A. D. Frost and Fred S. Titus.

BOSTON, Dec. 26—Smalley Daniels, handling several accessories at 23 Motor Mart, has returned from an extended trip to the Pacific Coast. He reports excellent business and good prospects for next year.

DETROIT, Dec. 26—Thomas J. Wetzel, of the Thos. J. Wetzel Company, 17 West 42d street, New York City, will sell the output of the C. M. Hall Lamp Co. for 1911. Mr. Wetzel is vice-president of the company.

MIDDLETOWN, CONN., Dec. 26—The Fisk Garage, 140 Washington street, has been opened. Charles R. Fisk is manager. The Locomobile and Marion cars will be handled. Robert L. Beach is in charge of the sales department.

MILWAUKEE, Dec. 26—The biennial report of the secretary of state of Wisconsin, issued early this week by Secretary James A. Frear, shows that up to December 1, 13,753 motor car licenses had been issued during the past year.

ST. LOUIS, Dec. 26—Milton B. Strauss, formerly sales manager of the Parry Automobile Company, Indianapolis, Ind., has accepted a similar position with the Moon Motor Car Company, of St. Louis, Mo., and has already entered upon his duties.

BALTIMORE, MD., Dec. 26—The application of Charles J. F. Steiner to build an automobile factory at Monument and Eleventh streets has been granted. The plans call for a brick and concrete structure with a slag roof. It will front 80 feet on Monument street and have a depth of 160 feet.

TACOMA, Dec. 26—The Thurston County Good Roads Association held its annual meeting the past week at the State Capital, Olympia, and re-elected C. B. Mann as president for another year. The association will entertain the Pacific Highway Association in that city on Jan. 18, 1911.

OMAHA, Dec. 26—The Ford Motor Company's new branch building at Twentieth and Harney streets has just been completed and the Omaha representatives have moved in their stock. The building cost the Ford company $40,000. It is of brick, concrete and tile construction throughout, two stories and basement, and 60 by 132 feet.

LOGANSPORT, IND., Dec. 26—The Western Motor Co., manufacturers of the Rutenber Motors, will have its general offices and sales department transferred from Logansport, Ind., to Marion, Ind., where a new, modern, fire-proof factory and office building has been erected, fully equipped to handle the building of all of the Rutenber models. The 1911 output will be, approximately, 10,000 motors. New models of 4 and 6-cylinder motors for heavy duty work are being built and will be brought out in the early part of next year.

NEW YORK, Dec. 26—J. B. Hulett, known to the automobile trade through his connection with the Owen Company, of Detroit, and formerly with the Pope-Toledo works, has joined the Lozier forces, and is making a western trip in the interests of Lozier cars. C. L. Simmons, formerly western traveler, is now covering the southern states.

BALTIMORE, MD., Dec. 26—The purchase of the Baltimore and Frederick turnpike by the state roads commission has been consummated and all the tollgates on this pike from Baltimore to Boonsboro have, therefore, been closed. The tollgates from Boonsboro to Hagerstown have been closed for a month past, pending repairs to the road.

DALLAS, TEX., Dec. 26—An automobile highway across Texas from Texarkana to El Paso along the lines of the national highway from New York to Atlanta is proposed by the automobile clubs of Dallas and Fort Worth. Such a highway was proposed after this year's Glidden Tour, but interest was allowed to lag until recently the project was taken up by Dallas and Fort Worth newspapers.

RACINE, WIS., Dec. 26—The addition to the boiler shops of the J. I. Case Threshing Machine Co. is just being completed. This is a building 60 feet by 215 feet, which will be used exclusively for a stock room for the Case boiler shops. A boiler storage has been completed 230 feet by 60 feet. This is equipped with a traveling train for movement of boilers from one part of the building to another.

PORTLAND, Dec. 26—A resolution has been adopted by the Good Roads Association of Oregon to tax automobiles 25 cents per horsepower on all automobiles in the State of Oregon up to 50 horsepower and 50 cents per horsepower for all machines over 50 horsepower, the proceeds to be collected by each county and to revert to the county in which collected and to be used in the maintenance and oiling of permanent roads.

SEATTLE, Dec. 26—To provide room for their large stock of Chalmers, Overland and Thomas cars, the Pacific Car Company, of Tacoma, has entirely remodeled the third floor of its garage. The office space has been greatly enlarged and a separate office has been given to the taxicab department. Frank Veazie has assumed charge of the taxicab department, while George A. Stewart has been made sales manager.

KOKOMO, IND., Dec. 26—Byrne Kingston & Company and the Kokomo Electric Company, Kokomo, Ind., have opened a branch at 475 Woodward avenue, Detroit, with Forrest J. Alvin manager. They are represented in New York by W. E. Kemp, with headquarters at 1650 Broadway, and in Boston by Smalley Daniels in the Motor Mart. Arrangements are also being made to open a branch in San Francisco and which will be announced at an early date.

MILWAUKEE, Dec. 26—The inventory of the estate of Thomas B. Jeffery, of Kenosha, Wis., late president and founder of the big Rambler works, shows an estate valued at $3,731,306.77, the largest ever probated in Kenosha county. The largest single item in the inventory is the interest of Mr. Jeffery in the Rambler works, amounting to $2,007,346. The remainder consists of personal property and real estate in Kenosha and other counties and interests in a number of the largest industries of America.

OMAHA, NEB., Dec. 26—Articles of incorporation have been filed with the secretary of state in the sum of $50,000 for the establishment of a new automobile firm known as the National Supply Company. The firm has leased for a term of years spacious office quarters and salesroom at 1115 Farnum street. It will put in a line of National cars and one or two cheaper lines. The company has elected H. E. Wilcox as president, W. H. Baugh, of Hastings, Neb., as secretary and treasurer, while A. M. Baugh, of Fremont, Neb., will manage the sales department.

New Sleeve Type of Motor

ROBERT MILLER, OF NEW YORK CITY, HAS HAD ISSUED TO HIM LETTERS PATENT OF THE UNITED STATES RELATING TO 4-CYCLE INTERNAL COMBUSTION MOTORS OF THE SLEEVE TYPE (SERIAL NUMBER, 546,714)

JUST now, when there is so much interest taken in the sleeve type of internal combustion motor for automobile work, it is more than likely that new patents, bearing upon this subject, will be of unusual interest, and for this reason it is the purpose here to present the Miller invention, which was issued December 20, in full.

Robert Miller has invented a 4-cycle internal combustion motor, of which the following is a specification.

Similar letters refer to similar parts throughout the drawings.

Figure 1 is a sectional elevation of the motor taken in a plane at right angles to the axis of the crank shaft; Fig. 2 is a sectional elevation of the engine taken in the plane of the axis of the crank shaft; Fig. 3 is a horizontal section of the device taken on the plane X X (Fig. 1), with the ports Q on the same level as the ports O; Fig. 4 is a horizontal section of the device taken on the plane Y Y (Fig. 2), with the ports R on the same level taken on the plane N (Fig. 1), with the ports N‴ on the same as the ports P; Fig. 5 is a horizontal section of the device level as the port N′; Fig. 6 is a diagrammatic section in elevation of the device at the top of the compression stroke, at about the moment of firing; Fig. 7 is a diagrammatic section in elevation of the device at the bottom of the explosion stroke; Fig. 8 is a diagrammatic section in elevation of the device at the top of the exhaust stroke; Fig. 9 is a diagrammatic section in elevation of the device just before the bottom of the intake stroke.

For the sake of clearness and simplicity in Figs. 6, 7, 8 and 9, the ports are the only parts of said figures which are lettered.

A is the cylinder head; B is the cylinder; C is the water jacket space in the cylinder; D is a sliding sleeve traveling vertically inside of cylinder B; E is a flywheel; F is the main crank; G is the main connecting rod; H is the piston; J is the spark plug; K is the crank case; N′ is an auxiliary exhaust port in cylinder B, so located that its bottom is level with the top of piston H at lower dead center; N″ is the auxiliary exhaust connection; N‴ are auxiliary exhaust ports in sleeve D; O are the main exhaust ports in cylinder B; P are the intake ports in cylinder B; these ports have their bottom about level with the top of the auxiliary exhaust ports N′; P′ in the intake connection; Q are the main exhaust ports in sleeve D; R are the intake ports in sleeve D; S is the main crank shaft; *a* is a gear wheel; *b* is a pinion half the diameter of the wheel *a* and meshed into wheel *a*; pinion *b* is fixed with reference to main shaft S; *f* is a crank connecting wheel *a* to connecting rod *d*; *d* is a gear connecting rod joining crank *f* to sleeve D.

The operation of the device is as follows: Fig. 6 shows the engine at the top of the stroke, at full compression, and at the moment of firing. At this point, the ports are all closed. As soon as the charge explodes in cylinder B, piston H is thereby driven downward, and crank F is thereby rotated in the direction shown by the arrow in Fig. 6. Thereupon by reason of the relation between pinion *a* and gear wheel *b* and connecting rod *d*, sleeve D begins to descend, with the result that at the bottom of the explosion stroke sleeve D has descended so far that auxiliary exhaust ports N‴ and N′ register with each other, and the auxiliary exhaust takes place, as shown in Fig. 7. It will also be noted by reference to Fig. 7, that while the auxiliary exhaust ports N‴ and N′ are fully open, the main exhaust ports Q and O are just beginning to open. As the rotary motion of crank F continues, the piston H begins to rise until it reaches the top of the exhaust stroke, as shown in Fig. 8, at which time exhaust ports Q and O are fully open. It will be noted, by reference to Fig. 8, that sleeve D is now traveling upward, so that ports Q and O are closing. As the revolution of crank F continues on the downward intake stroke, the piston H descends and the sleeve D ascends, until they reach the relative positions shown in Fig. 9, at which time exhaust ports O and Q are closed, auxiliary exhaust ports N′ and N‴ are closed, and intake ports R and P are open. As piston H has been descending with exhaust ports O and Q closed, a partial vacuum has been created inside of cylinder B, and as soon as intake ports R and P open, the charges rush into cylinder B. As the rotary motion of crank F continues, the intake ports P R close, the main exhaust ports O and Q remain closed, and the charge is compressed up to the

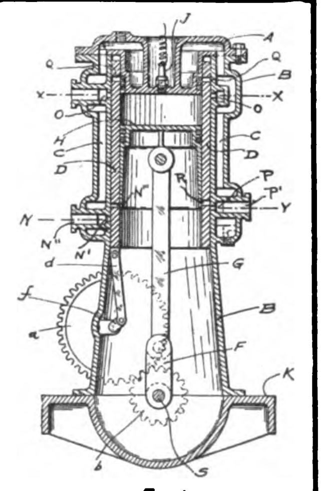


Fig. 1.

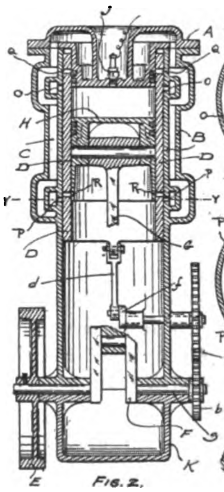

Fig. 2.

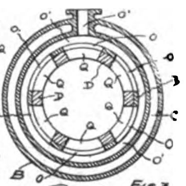

Fig. 3.

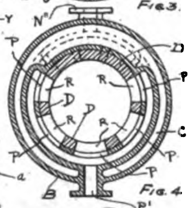

Fig. 4.

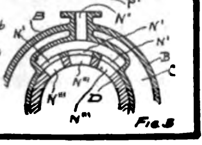

Fig. 5

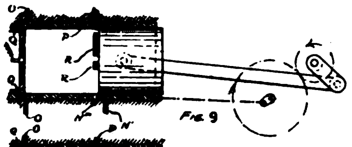

Fig. 9

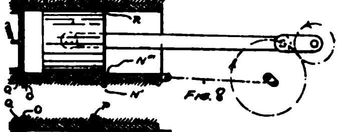

Fig. 8

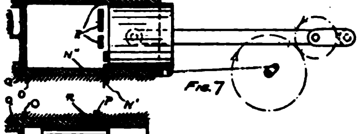

Fig. 7

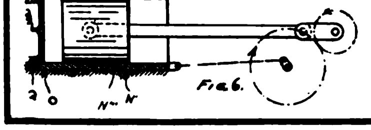

Fig. 6.

moment of firing, as shown in Fig. 6, thus completing the cycle of the engine's operation.

The construction allowing in a four-cycle engine a charge admission very much delayed from what is usually done is essentially new, and alters not only the structure but the results achieved as well. For example, the residual gases remaining in the clearance have a longer time to cool before the admission of the new charge. This cooling results in their shrinkage and allows a larger live charge to be drawn in. Also the residual gases being thus cooled are less apt to ignite the entering charge if said charge be lean. Also, by delaying the admission of the charge until a considerable vacuum is built up in the cylinder, the charge enters with a rush so that inertia effects can be utilized to ram a full charge into the cylinder. In this respect, the construction allowing an inlet port encompassing the cylinder, said inertia effect has little to oppose it, so that a full charge is assured.

Claims of the Patent

1. In four-cycle internal combustion engines, in combination, a piston; a main crank shaft; a connecting rod connecting said piston and said crank shaft; a cylinder having main exhaust ports in its upper portion, having auxiliary exhaust ports in its lower portion and having intake ports slightly above said auxiliary exhaust ports; a sleeve fitting closely within said cylinder and outside of said piston, and free to move to a limited extent up and down with relation to said cylinder, said sleeve having main exhaust ports in its upper portion (said ports registering in plan with said main exhaust ports in said cylinder), and having auxiliary exhaust ports in its lower portion (said ports registering in plan with said auxiliary exhaust ports in said cylinder), and having intake ports slightly above said auxiliary exhaust ports (said intake ports registering in plan with said intake ports in said cylinder); a gear wheel; a gear connecting rod connecting said gear wheel to said sleeve; a pinion of one-half the diameter of said gear wheel and meshed into said gear wheel, said pinion being fixed to and concentric with said main crank shaft; said crank shaft, pinion, gear wheel, gear connecting rod, sleeve, piston and connecting rod all co-operating whereby all of said ports are closed during the compression stroke and until almost the bottom of the explosion stroke, and whereby said auxiliary exhaust ports open at the bottom of the explosion stroke, and whereby said main exhaust ports remain open during the entire exhaust stroke, and whereby said main exhaust ports and said auxiliary ports remain closed during the intake stroke, and whereby said intake ports open near the bottom of said intake stroke.

2. In four-cycle internal combustion engines, in combination, a piston; a main crank shaft; a connecting rod connecting said piston and said crank shaft; a cylinder having main exhaust ports in its upper portion, having auxiliary exhaust ports in its lower portion, and having intake ports slightly above said auxiliary exhaust ports; a sleeve fitting closely within said cylinder and outside of said piston, and free to move to a limited extent up and down with relation to said cylinder, said sleeve having main exhaust ports in its upper portion (said ports registering in plan with said main exhaust ports in said cylinder), and having auxiliary exhaust ports in its lower portion (said ports registering in plan with said auxiliary exhaust ports in said cylinder), and having intake ports slightly above said auxiliary exhaust ports (said intake ports registering in plan with said intake ports in said cylinder); means for moving said sleeve to a limited degree up and down in said cylinder; said crank shaft, sleeve, moving means, piston and connecting rod all co-operating whereby all of said ports are closed during the compression stroke and until almost the bottom of the explosion stroke, and whereby said auxiliary exhaust ports open at the bottom of the explosion stroke, and whereby said main exhaust ports remain open during the entire exhaust stroke, and whereby said main exhaust ports and said auxiliary exhaust ports remain closed during the intake stroke, and whereby said intake ports open near the bottom of said intake stroke.

3. In four-cycle internal combustion engines, in combination, a piston; a main crank shaft; a connecting rod connecting said piston and said crank shaft; a cylinder having exhaust ports in its upper portion, and having intake ports in its lower portion; a sleeve fitting closely within said cylinder and outside of said piston, and free to move to a limited extent up and down with relation to said cylinder, said sleeve having exhaust ports in its upper portion (said ports registering in plan with said exhaust ports in said cylinder), and having intake ports in its lower portion (said intake ports registering in plan with said intake ports in said cylinder); a gear wheel; a gear connecting rod connecting said gear wheel to said sleeve; a pinion of one-half the diameter of said gear wheel, and meshed into said gear wheel, said pinion being fixed to and concentric with said main crank shaft; said crank shaft, pinion, gear wheel, gear connecting rod, sleeve, piston and connecting rod all co-operating whereby all of said ports are closed during the compression stroke and until almost the bottom of the explosion stroke, and whereby said exhaust ports remain closed during the intake stroke, and whereby said intake ports open near the bottom of said intake stroke.

4. In four-cycle internal combustion engines, in combination, a piston; a main crank shaft; a connecting rod connecting said piston and said crank shaft; a cylinder having exhaust ports in its upper portion, and having intake ports in its lower portion; a sleeve fitting closely within said cylinder and outside of said piston, and free to move to a limited extent up and down with relation to said cylinder, said sleeve having exhaust ports in its upper portion (said ports registering in plan with said exhaust ports in said cylinder), and having intake ports in its lower portion (said intake ports registering in plan with said intake ports in said cylinder); means for moving said sleeve to a limited degree up and down in said cylinder; said crank shaft, sleeve, moving means, piston and connecting rod all co-operating whereby all of said ports are closed during the compression stroke and until almost the bottom of the explosion stroke, and whereby said exhaust ports remain open during the entire exhaust stroke, and whereby said exhaust ports remain closed during the intake stroke, and whereby said intake ports open near the bottom of said intake stroke.

Superior Truck Makes Debut

Detroit, Dec. 26—The latest delivery car to appear on Detroit streets is the "Superior," built by the Superior Motor Car Co., which, nearly a year ago, secured the original Ford factory on Mack Ave.

The company, of which F. N. Cooper is president, C. W. Dreyer, secretary, Stephen A. Pratt, vice-president, is composed of business men of Detroit. The board of directors consists of the above named, together with George Moore, Albert Strelow, C. J. Netting, John D. Templeton and John L. Austin.

J. L. Austin is the managing director, while the engineering department is in charge of B. F. Wright.

For 1911 the company is building three models, consisting of a high-grade merchants' delivery car of large capacity, the normal rate being 1,200 lbs., a stakebody express-truck and an open combination delivery car, which is adapted for country use.

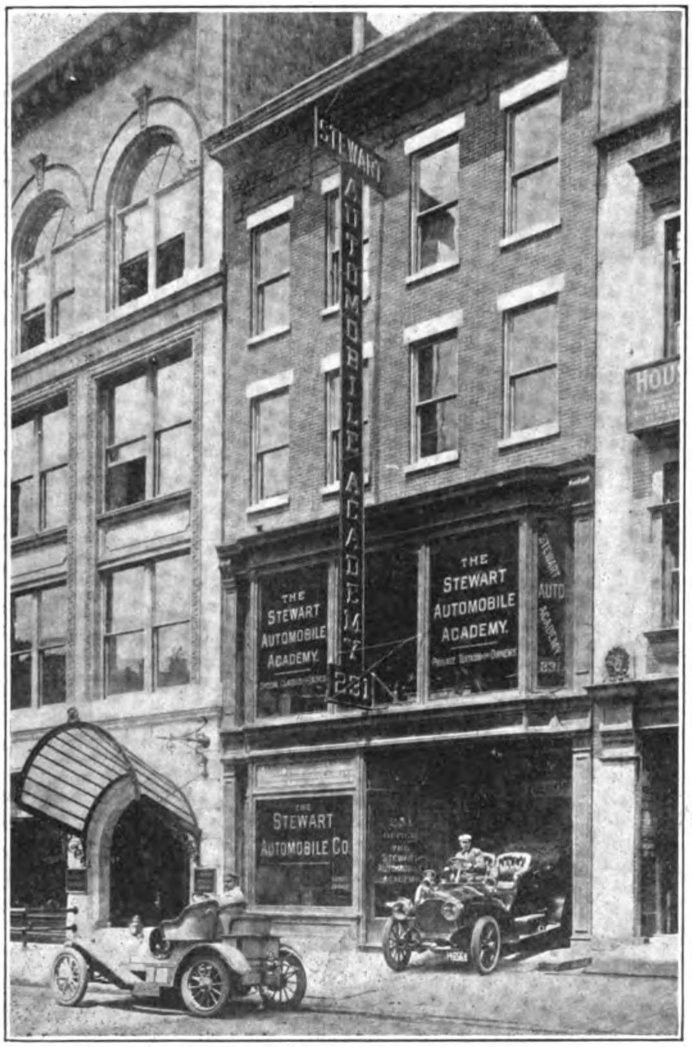
Open Branch Welding Plants

Springfield, Mass., Dec. 26—The Autogenous Welding Equipment Company recently opened plants for the repair of broken parts of all descriptions, making a specialty of automobile work, such as frozen cylinders, broken aluminum cases, at 62½ Church street, Hartford, Conn., and at Southampton street, junction with Massachusetts avenue, Boston, Mass.

Batzell Goes With Mossberg Co.

Attleboro, Mass., Dec. 26—A. Edwin Batzell, formerly with the United Manufacturers of New York City, is now sales representative with the Frank Mossberg Co., of Attleboro, Mass.

Prominent New York City Garages—Stewart

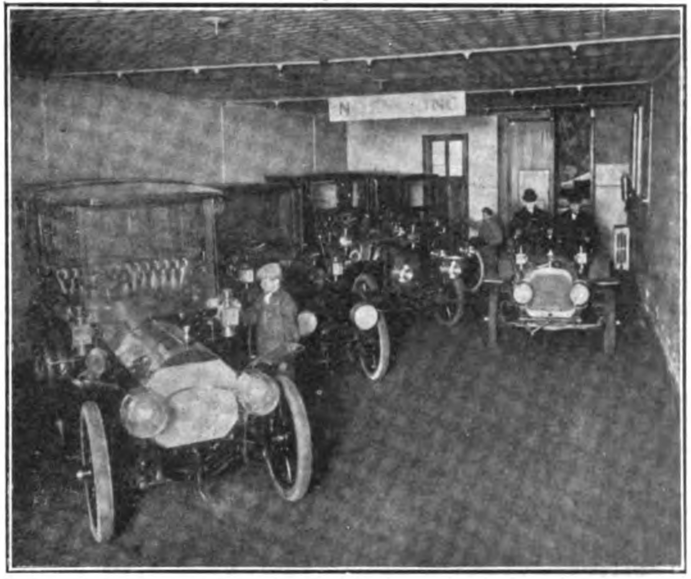


Exterior of Stewart Garage, New York City

IN connection with an automobile school, the garage of the Stewart Automobile Company, 231 West Fifty-fourth street, New York City, presents two sides, the useful one, in that the students of the school may have reference to the cars there housed,. and the more practical one, conducting a garage for a profit. The garage and school are housed in a rather narrow building, just West of Broadway, in the same block with the Automobile Club of America, the school having the second floor only, while the garage occupies the balance of the four-story building, including the basement.

On the ground floor, as one enters from the street, there is the car entrance at the right, this being a 12-foot door, and at the left is the entrance to the office, the latter being in such close proximity to the former, that by the aid of a glass partition the checker may stay in the office at all times, and still keep track of the incoming and outgoing cars.

The position of the elevator will at once be noted. this being set squarely



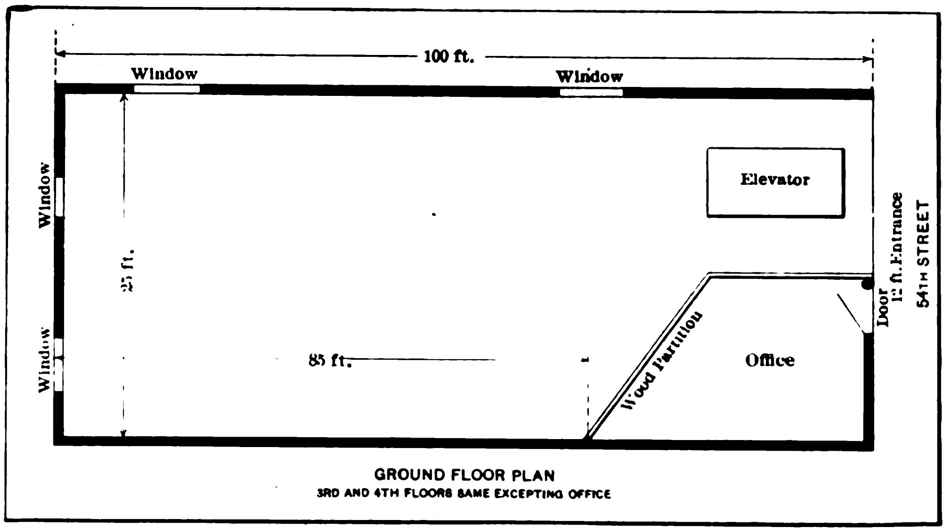
One upper floor of Stewart garage. cars in place

in the middle of the entrance for the cars. While some garage owners and keepers might object to this, in the main it is a position which is favored. If not actually followed in practice, it is at least advocated. In garage location and arrangement, the placing of the elevator arouses the most discussion.

The first floor is reserved for the cars upon which work is to be done, while the third floor carries the balance of the live storage, and the floor above it, the top one, other live and all of the dead storage. Another view shows the cars on the third floor, revealing the cleanliness and order, which is maintained there. The view is from the rear, facing the elevator at the front, where a car has just come up.

The building is of brick, opening on one side, the easterly, onto a blind court, while the rear end goes back nearly to the center of the block. This may not yield much light, but it has an advantageous side, in that the fire risk is lessened, which is well worth while to both garage keeper and owners of cars housed there.

Gasoline and oil are stored in the basement, the former being located underground, but so as to be available for drawing off on the ground floor, where the natural demand for it comes.



Floor plan showing arrangement with elevator at entrance

Among the Accessories

THE BROWN STEERING GEAR; AUBURN LABOR-SAVING TIRE PUMP; CAR BODY POLISH; PROTECTOR FOR THE TIRE

THE NEW BROWN STEERING GEAR

It is worthy of note that in the steering gear as here presented, in Figs. 1 and 2, ample provision is made for irreversibility, and the surfaces which are designed to take pressure are so liberally provided that the unit pressure is maintained at a low point under the most severe conditions of service. The type of gear is an unusual one, and it is being marketed by the Baldwin Chain & Manufacturing Company, of Worcester, Mass. Referring to the illustrations, it will be observed that the crank movement is obtained by the eccentric movement of a spider in combination with a crank arm on a spindle. When the steering wheel is rotated the spider is rotated also by means of a bevel gear and pinion, and the cheek of the crank spindle, being provided with a bearing face which engages in slots formed by two sectors, which fit in the eccentric cavity of the spider, imparts motion to the crank, which is duly transmitted to the steering arm. The wearing parts are profusely lubricated, and means for replenishing the lubricant are at hand.

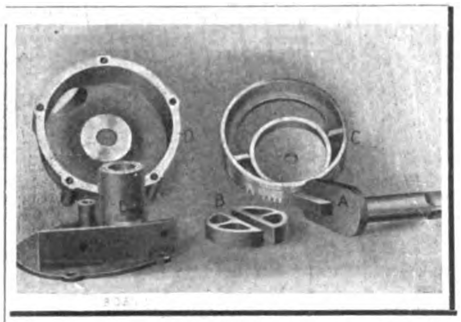


Fig. 1—Brown steering gear, showing the different component parts

LABOR-SAVING TIRE PUMP

This pump, shown in Fig. 3, is of the friction-drive type operated from the flywheel of the engine. One of its features is the method employed to insure positive contact under any pressure and with no more strain to the friction face than is actually required to carry the load. The pump body is hinged to a supporting arm and carries the friction wheel. It has two cylinders, the main or compressing cylinder, and the auxiliary cylinder, or contact cylinder. The auxiliary cylinder is used to hold the friction wheel in contact with the flywheel and has direct communication with the tire when hose is attached. Both cylinders are fitted with suitable pistons.

When connection is made with the tire the back pressure enters the contact cylinder, forcing its piston against the supporting arm. This pressure causes the pump body with the friction wheel to swing outward into contact with the flywheel. Detaching hose from the tire allows the pressure to escape from the contact cylinder and the friction wheel swings freely out of contact.

The contact cylinder is accurately proportioned so that only a small amount of pressure is required to put the pump into operation, and as the pressure increases the force of contact increases in the right proportion to preserve a contact under a varying pressure.

The piston employed is made in two parts, telescoping each other with an asbestos filler between them. The increasing air pressure on the piston forces the two parts together, expanding the asbestos filler against the walls of the cylinder, thereby sealing the joint against leaks, and yet by the flexibility of the asbestos filler the piston draws apart when the air pressure is removed, permitting the piston to move freely in the cylinder. The piston used in the compression cylinder is similar to engine pistons. It is fitted with two expansion metal rings having lapped joints, and, like the cylinders and pistons, they are ground to size. Lubrication is by grease forced through grease cups. The whole pump is made reversible and the friction wheel may be used on either side.

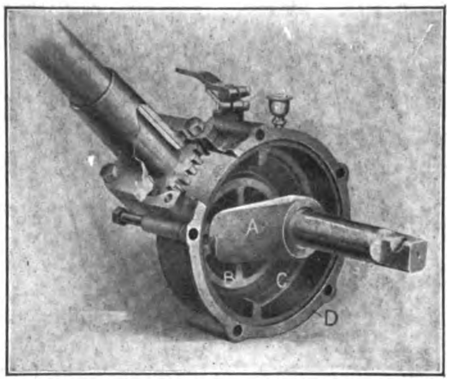

Fig. 2—View of Brown steering gear with one cover removed

With the pump sufficient rubber hose is furnished to reach all tires, also a reliable pressure gauge and necessary brass connections, including a coupling to be inserted in the hose just outside the body, permitting the uncoupling of the longer piece when not in use. All necessary fittings are furnished with the pump.

The pump is manufactured by the Auburn Auto Pump Company, 87 Church Street, Boston, Mass.

POLISH FOR CAR BODIES

In order to obviate the necessity of polishing a car daily a tarnish preventive, known as Stay Shiny, has been placed on the market by Fred A. Schmoeger, of Sterling, Ill. It is claimed by the makers' that a coating of this material will stay on the bright parts of the car for quite a long time without requiring renewal and that the coating is invisible and is non-injurious to metals of any description, also that heat and weather conditions have no eeffct on it. The liquid is applied with a brush supplied with the tin.

. PROTECTS THE SPARE TIRE

The Hopewell Tire Case is a continuous casing, which wraps about the spare tire, and is held in position by two endless spiral springs. The use of these spiral wound japanned piano wire springs eliminates all fastening devices. The inherent adjustability of these springs allows the case to fit all treads as well as new and worn tires. This construction prevents wrinkling, and gives an absolutely water-tight and perfect-fitting case. When not in use, case can be folded in a very small package. The tire case is sent enclosed in an enamel duck bag suitable for an inner tube bag. The case is made by Hopewell Brothers, Newton Mass., and it is being extensively adopted by the class of automobilists who are trying to economize cost without reducing the utility of their automobiles.
